The impetus for preoperative rehabilitation has been prompted by evidence that the best predictors of the outcome of arthroplasty are the patient's preoperative status, including the knee range of motion (ROM), distance walked, and Western Ontario and McMasters Universities (WOMAC) OA Index scores.[14–16] Patients with advanced OA have a variety of options available, both surgical and nonsurgical. From a rehabilitation perspective, the programs established for patients in an effort to delay surgical intervention also offer the opportunity to address many impairments and functional limitations that can impede a patient's progress after surgery; therefore continuation of these programs is recommended right up to the time of surgery. Most rehabilitation programs aimed at preoperative TKA patients have attempted to address impairments in ROM, strength, and limited aerobic capacity or endurance, as well as functional limitations in ambulation, stair climbing, and performing activities of daily living (ADLs), such as dressing and bathing (Table 23-1).

Advanced OA results in an overall decrease in functional mobility as pain and deformity worsen. This gradual decline in functional status ultimately contributes to the patient's loss of strength in the involved limb and overall endurance and strength. Programs designed to address these deficits include a variety of exercise interventions, such as functional training activities, aquatic programs, and strength training programs.

Functional training activities incorporate functional movements, such as sit to stand, squatting, and step ups, as a way to improve strength and function. Targeted areas of weakness most commonly involve the quadriceps and the gluteal musculature. All of these tasks can address strength deficits; however, pain usually is a limiting factor in the patient's ability to tolerate these activities because of the high loads they create in the knee joint. Strategies to unload body weight (e.g., upper extremity support) may allow the patient to continue with these exercises without exacerbation of pain symptoms.

If patients are unable or unwilling to use functional movements for strengthening, more traditional exercises can be incorporated into the patient's program, such as straight leg raises, cycling, seated knee extension exercises, and supine or side-lying hip abduction exercises. Resistance from the weight of the limb often is sufficient early on, and as the patient progresses, low-load cuff weights or resistance equipment can be used to maximize the patient's strength.

Aquatic programs designed for patients with OA are commonly offered in community and rehabilitation settings. These programs use the buoyancy of water to facilitate movement in very weak limbs. Patients perform slow movements that require initiation of movement through the patient's musculature; however, the patient does not have to move the entire weight of the limb against gravity. As the patient progresses in these programs, increased speed of movement creates additional resistance, so that patients are always challenged to increase their strength. Aquatic programs typically are held in heated pools that induce relaxation and help reduce the joint stiffness commonly associated with OA. In addition to strengthening exercises, the pool can be used to address aerobic capacity and endurance limitations through swimming, jogging, or walking in the water. Again, slow movements are facilitated by the buoyancy of the water, and faster movement creates additional resistance to these activities.

Even though the preoperative level of physical function (ROM, strength, and the distance the patient can walk) are predictors of the success of TKA,[8,9,17] intervention studies that have examined the effect of preoperative rehabilitation on outcomes currently do not support the use of preoperative physical therapy for patients undergoing TKA.[18–23] However, the literature on preoperative rehabilitation is limited, and factors such as the specific impairments measured, measurement tools used, timing of outcome measurements, and intensity of the exercise programs may all contribute to this lack of evidence.

Patient education has been an additional focus of preoperative arthroplasty programs. Patients who fully understand the postoperative expectations and clinical care protocol have demonstrated better coping strategies postoperatively.[20,24,25] Clinically this is quite evident in patients who undergo a second arthroplasty because they are familiar with the expected daily progression of the rehabilitation program and the effort required of them for a successful outcome. Many hospitals have reduced the length of stay (LOS) after arthroplasty to reduce the overall costs associated with this procedure. Currently the acute care stay can range from 1 to 3 days after TKA.[26] Given this much shorter LOS, the effect of preoperative education should be examined more closely with regard to patient anxiety, coping strategies, and achievement of functional milestones after surgery.

TABLE **23-1**

Preoperative Goals and Intervention Techniques

Goals	Types of Interventions
Maintain or maximize knee range of motion (ROM)	ROM exercises Stretching Joint mobilization
Maintain or maximize strength of lower extremity muscles, especially the quadriceps and hip musculature	Strengthening exercises Functional training activities
Maintain or improve aerobic capacity	Aerobic activities: • Walking • Stationary biking • Swimming

SURGICAL TECHNIQUE

The aim of TKA is to resurface the deficient and damaged tibiofemoral and patellofemoral joint surfaces with metal components and provide a low-friction articulation with a polyethylene bearing. The mechanical alignment and soft tissue balance around the knee should be anatomically restored for optimum function and longevity of the knee replacement.

The selection of regional or general anesthesia is made after a preoperative discussion between the anesthesiologist and the patient with input from the surgical team. This decision is affected by the patient's medical condition, although the cardiovascular outcomes, cognitive function, and mortality rates of regional and general anesthesia have not been proven to be significantly different.

The knee joint is accessed anteriorly through a medial parapatellar approach (although some surgeons use a lateral or subvastus approach). Osteophytes and intra-articular soft tissues are cleared. Bone cuts in the distal femur are made perpendicular to the mechanical axis, usually using an intramedullary alignment system. The proximal tibia is cut perpendicular to the mechanical axis of the tibia using either intramedullary or extramedullary alignment rods. Restoration of mechanical alignment is important to allow optimum load sharing and prevent eccentric loading through the prosthesis. Sufficient bone is removed so that the prosthesis will recreate the level of the joint line (Figure 23-1). This allows ligaments around the knee to be balanced accurately and prevents alteration of the height of the patella, which can have deleterious effects on patellofemoral mechanics. It is important to note that some extra-articular ligaments may be contracted secondary to preoperative deformity. These ligaments need to be carefully released in a stepwise fashion to balance the soft tissues around the knee and allow optimum knee kinematics.

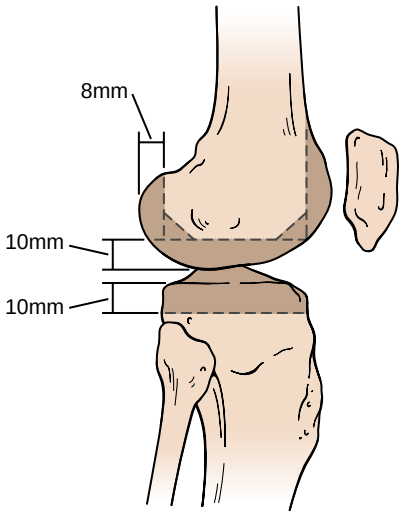

Figure 23-1 In the measured resection technique, as much bone and/or cartilage is removed as will be replaced by the thickness of the arthroplasty components. This method attempts to restore the anatomical joint line level.

If the patellofemoral joint is significantly diseased, the patella is resurfaced with a polyethylene button. Patellofemoral tracking is assessed with trial components in place. The definitive components usually are cemented into place with polymethylmethacrylate cement. In younger patients, some surgeons are using cementless implants; however, this does not change the postoperative rehabilitation program. The wound then is copiously irrigated, the tourniquet is deflated, hemostasis is achieved, a Hemovac drain is placed in some cases to prevent hematoma formation, and an occlusive dressing is applied.

Many implant options are available to the orthopedic surgeon for primary TKA. Most surgeons select a specific implant with which they are most familiar and that has worked well in their practice. The two main types of implant designs are described by whether or not the posterior cruciate ligament (PCL) is retained or removed. With the cruciate retaining (CR) design, the anterior cruciate ligament (ACL) is removed and the PCL is retained to provide anterior-posterior stability to the knee joint. The cruciate-sacrificing, posterior stabilized (PS) design involves removal of both the ACL and PCL, and the role of the PCL in knee motion is replaced by a post within the implant. There is great debate as to which is the better design; however, there is no conclusive evidence to point to one system being superior.[27]

The term *minimally invasive surgery* (MIS) has been used to describe operations that involve smaller skin incisions and therefore less soft tissue dissection. Typically, MIS TKA techniques involve smaller incisions, a proximal incision that goes through the vastus medialis oblique (VMO) rather than along the quadriceps tendon, and the patella is subluxed laterally rather than everted. The theoretical advantage of this approach is less pain and improved postoperative quadriceps strength.

Computer-navigated or -assisted surgery is employed in some centers. The role of this technique is to improve implant position with respect to the mechanical alignment of the limb. This is accomplished by placing several markers on the leg and using a computer to determine the femoral and tibial cuts. Although this has been shown to decrease outliers, there is no consensus on whether this improves patient outcomes.[28]

POSTOPERATIVE ACUTE CARE REHABILITATION

Clinical pathways have been developed as a standardized way to organize patient management after common surgical procedures, including TKA. The driving force behind the use of clinical pathways is the fact that early identification of deviations from optimum care can be identified and addressed, which streamlines the overall care of the patient and should reduce the overall cost of care. These pathways outline all aspects of care provided for the patient from all disciplines involved in the individual's care. The literature supports the use of clinical pathways

for postoperative care of patients who have undergone TKA. Quality of care improves and LOS can be reduced without any increase in complications, readmissions, or changes in the patient's overall function.[29–34] Further studies are warranted to examine the cost effectiveness of clinical pathways for TKA.

Considerations for rehabilitation begin once the patient leaves the operating room. A major goal after TKA is to restore knee ROM as quickly as possible because this has been linked to improved functional mobility. Early restoration of ROM prevents the development of postoperative fibrosis, which may require manipulation or additional surgical intervention.

Use of continuous passive motion (CPM) was considered standard care for patients during the acute care stay in previous decades. Research examining the effect of CPM on outcomes is not conclusive; however, most research fails to find a significant long-term benefit of CPM use after TKA in terms of ROM results, pain, LOS, cost, and complications.[35–47] CPM has been shown to improve ROM in the early phases of rehabilitation,[36,48,49] but no long-term carryover has been seen 1 year after TKA.

Protocols for the use of CPM have not been studied. Reports on the initial ROM settings, amount of progression per day, and amount of time spent in the CPM are limited in the literature.[50] CPM may be used to augment the patient's rehabilitative care starting with a setting of 0° to ≥ 30° of knee flexion on postoperative day 1 (POD 1). Progression of the range is determined by the patient's tolerance. The duration of daily CPM use has not been studied specifically in patients who have had TKA. Most surgeons prefer their patients to use the CPM for several hours a day, but continuous use is discouraged because it limits the patient's ability to practice functional mobility training, as well as the amount of time out of bed. The overall use of CPM has declined, given the limited research supporting its use, the expense, and constraints on functional activities while in the device.

Rehabilitation interventions are developed based on a comprehensive examination of the patient, and goals are tailored to the specific needs of the individual patient (Table 23-2). Intervention on POD 1 focuses primarily on initiating ROM exercises to the involved knee and initiating therapeutic exercises for the lower extremities. Isometric contractions that target the quadriceps and gluteal muscles, as well as active exercises for ankle plantar flexion and dorsiflexion, are commonly prescribed. Prevention of thromboses is addressed by means of active ankle exercises and mobilizing the patient out of bed in addition to pharmacological and mechanical measures. The pulmonary system also is addressed because the patient is at risk for developing secondary complications as a result of the effects of anesthesia and from being in a supine position for prolonged periods. Instruction in deep breathing exercises, effective airway clearance strategies, and manual techniques as needed are of paramount importance in the days immediately after surgery.

TABLE 23-2

Goals for Acute Rehabilitation and Types of Intervention

Goals	Types of Interventions
Maximize knee range of motion (ROM): 0° to 120° flexion	ROM exercises
Prevent secondary complications	Pulmonary toilet Breathing exercises Active exercise of the lower extremities Functional training
Improve strength and motor control	Therapeutic exercise focusing on strength
Achieve independent transfers	Transfer training
Achieve independent ambulation	Gait training with assistive device
Achieve independent basic self-care, activities of daily living	Assistive devices and training

Pain control is another factor that must be considered because pain greatly affects the patient's ability to participate in exercise and functional training. Various methods of pain control have been described for patients who have undergone TKA, and a number of factors must be considered for each individual patient to achieve adequate pain control while avoiding significant side effects of altered mental state, nausea, or vomiting. Finding the right balance for each patient is the goal of the health care team; the patient's pain complaints must be addressed, yet the person must be able to participate fully in the rehabilitation process. TKA procedures can be very painful for patients, especially in the first 24 to 48 hours after surgery. However, patients usually report progressive improvement in their pain levels over the course of their acute care stay and are able to be discharged on oral analgesics. Administering a patient's pain medication before rehabilitation is important because functional mobilization, especially ROM, can escalate pain significantly. Reports on the options available for pain control show that the use of multimodal pain management strategies is the most effective way to manage post TKA pain immediately after surgery. These pain management strategies may include the use of "preemptive" medications (including acetaminophen or selective nonsteroidal anti-inflammatory drugs [NSAIDs], antineuropathic and antinausea agents), femoral nerve blocks or periarticular injections, and scheduled dosing with oral opioid analgesics.[51–54] Despite improvements in pain control, further research is needed to determine the optimum dosing,

timing, and anesthetic agents to provide the most pain relief with minimal side effects.

Rehabilitation Goals following Knee Arthroplasty

- Increase or restore ROM
- Prevent thrombosis
- Prevent secondary pulmonary complications
- Control pain
- Provide functional training (transfers, gait training)
- Improve strength
- Improve aerobic capacity

With the patient premedicated, the clinician can address ROM and strength issues through exercise. The other focus of treatment on POD 1 is functional training, which includes teaching the patient how to transfer into and out of bed and to begin pregait training activities in the standing position. Progression to gait training on POD 1 depends on the patient's pain level, tolerance of change in position, and overall well-being. In addition to pain, common problems that limit the patient are lightheadedness, nausea, and/or vomiting, often associated with orthostatic hypotension (low blood pressure when standing up), or side effects from narcotic medication. If abnormal, vital sign responses occur with changes in position or increased activity, the clinician must determine whether the intervention should be discontinued. Patients with underlying co-morbidities in the cardiovascular and/or pulmonary systems need to be monitored carefully for adverse responses in the first days after surgery. A full discussion of these responses is beyond the scope of this chapter; however, any indications of cardiac arrhythmia, ischemia, or oxygen desaturation should warrant careful progression with functional training.

Functional Training

Functional training includes teaching the patient how to transfer effectively from a supine to a sitting position. Some institutions use a knee immobilizer or brace that limits any knee flexion during the initial days of functional training. If this is available, it can be helpful to patients while the quadriceps are inhibited by pain, swelling, or residual effects from a femoral nerve block because it allows the patient to control the leg independently during transfers; otherwise the patient will require assistance to move the limb. Patients can use a direct supine to sit or a supine to side-lying to sit transfer, depending on their ability and preference. Sit to stand transfers can be facilitated early on by elevating the bed and/or chair to minimize the workload on the uninvolved limb in attaining full upright standing.

Patients require an assistive device to begin ambulation training. Most often, they will use a walker, although crutches can be used; this also depends on the patient's skill and agility. Weight bearing as tolerated (WBAT) usually is allowed immediately after surgery; therefore an assistive device is required primarily because of motor control problems in the limb. Patients can be advanced to less restrictive devices (one crutch or cane) as strength and motor control return. Most patients are allowed to discontinue the use of any assistive device at 6 weeks after surgery if the patient can demonstrate adequate motor control and at least 4 out of 5 strength of the involved limb on manual muscle testing of the quadriceps that allows for safe, stable ambulation. Before discharge and depending on the patient's home environment, instruction on stair ascent and descent may be required. Even if the patient does not have any stairs outside or in the home, instruction and practice are important for community ambulation and street curb negotiation.

Therapeutic Exercise

For most patients, the area of focus for strengthening immediately after surgery is the quadriceps muscle to allow the individual to gain motor control of the leg and knee during functional transfers. Isometric quadriceps setting exercises are initiated on POD 1. Often, facilitation techniques, such as tactile cueing, overflow feedback from the uninvolved leg, biofeedback, or even electrical stimulation, may be required to overcome the reflexive inhibition of the quadriceps that commonly occurs because of swelling in the knee joint.[55] Once the patient is able to actively contract the quadriceps, exercises can be advanced to include terminal knee extension or short arc quadriceps exercises consisting of knee extension from a slightly flexed position over a bolster or towel or pillow roll (Figure 23-2). Additional progressions using the weight of the limb for resistance can include eccentric lowering of the leg from a fully extended position in sitting and concentric knee extension in sitting. For the more advanced patient, manual resistance, cuff weights, or resistive bands can add additional resistance. However, most patients are not ready

Figure 23-2 Quadriceps strengthening using terminal knee extension exercise.

Figure 23-3 Positioning for passive knee extension ROM.

for any additional resistance beyond the effect of gravity on the lower leg during the first few days after surgery.

ROM exercises are initiated passively and progressed to active-assisted exercises. Emphasis on knee extension is more easily accomplished with the limb fully supported on the bed and with additional towel rolls or bolsters under the heel to passively stretch the knee into extension (**L3D technique - low load, long duration**) (Figure 23-3). For patients who have difficulty gaining knee extension, sleeping with the knee in an immobilizer can be effective for prolonged low load stretching. When working on knee flexion ROM, patients should be in the sitting position to allow gravity to assist with the motion. Once patients can place the foot on the floor, they can use a variety of techniques to enhance their own knee flexion, including sliding the foot under the chair, pushing the leg into more knee flexion with the opposite leg, or planting the foot firmly on the ground and scooting forward in the chair to flex the knee. Providing various methods for patients to gain ROM independently allows the knee to be ranged multiple times per day because most patients, while in the hospital, work with a physical therapist only once or twice a day at most.

Aerobic Capacity and Endurance Training

Early focus on aerobic capacity training often is accomplished merely by the effort required of patients for basic functional mobility. For the more advanced patient, increasing the distance ambulated in the hospital and the frequency of ambulation taxes the cardiopulmonary system adequately for a training effect. For patients with underlying co-morbidities in these areas, specific training parameters should be set, and the patient should use either heart rate or the **Rating of Perceived Exertion (RPE)** scale as a guide to the amount of activity that is appropriate for aerobic capacity training.

Discharge Planning

Because the LOS after TKA has declined significantly since the late 1990s, patients routinely are discharged from the acute care setting in 1 to 3 days.[26] Many patients return directly home, whereas others need additional care in a post-acute care setting. The clinician is responsible for providing input on discharge planning, and this begins on the initial day of intervention. Interdisciplinary collaboration among the patient's health care providers is important for determining the best discharge plan for the patient's unique needs. Factors that are important to consider include the presence and extent of any co-morbidities that will influence the expected rate of recovery; the amount of support the patient will have at home from family or friends to assist in ADLs, basic household management, meal preparation, and food shopping; and the physical environment to which the patient is returning. Patients who live alone, have multiple co-morbidities, or have an environmentally challenging home situation may need to be discharged to an inpatient facility for ongoing rehabilitation until the patient has achieved a level of function sufficient to return to their home setting.[56–58] In contrast, patients with minimal medical issues, available social support, and a home setting that has minimal environmental and structural obstacles should be able to go directly home from the acute care facility and continue their rehabilitation either through home care services or in an outpatient setting.

Oldmeadow et al.[59] have developed a preoperative screening tool to assist in determining the likely discharge destination after the acute care stay. The **Risk Assessment and Prediction Tool (RAPT)** (see Figure 19-3) for total joint arthroplasty patients generates a score and the likelihood of discharge directly home or to an inpatient rehabilitation setting based on information, such as age, gender, preoperative walking ability, preoperative use of assistive walking aides, and available social supports. The use of this tool has been validated in several studies to aid in early discharge planning.[60–62]

Factors to Consider in Discharge Planning

- Presence and extent of co-morbidities
- Social support for the patient at home
- Physical environment to which the patient is returning
- Patient's level of function (physical capacity)
- Patient's ability to use or need for assistive devices

Regardless of the discharge destination after the acute care stay, patients need some training and support with assistive devices for basic ADLs before they are discharged home. For some, this training occurs in the acute care facility; patients transferred to a post-acute facility receive their training and equipment there. The most common items issued for patients include long-handled implements, such as a bathing sponge, dressing aid, and reacher to assist the patient in gaining complete independence in bathing and dressing activities. Additional items may

include elastic shoelaces, depending on the type of footwear the patient owns and wears. For a taller patient who may have difficulty with sit to stand transfers, a raised toilet seat may help the patient gain complete independence in toileting, and a tub bench is recommended to allow the patient to remain seated during showering for safety reasons. Additional modifications to the home may include grab bars in the bathroom for safety and ramps for home entrances if the patient has difficulty on stairs.

POST-ACUTE CARE INPATIENT REHABILITATION

The post-acute care level of rehabilitation may be provided in an inpatient facility, such as a rehabilitation hospital, a transitional care unit, or skilled nursing facility. Regardless of the setting, the goal of rehabilitation is an extension of the care initiated in the acute care setting (Table 23-3). Patients typically remain at this level of care after discharge from the acute care setting, often on POD 2 to 4, and continue care for 9 days on average.[63] Predictors of increased LOS for inpatient rehabilitation include age more than 80 years, revision surgery, and multiple co-morbidities or illnesses.[64]

One of the main goals during inpatient rehabilitation is to progress the patient's mobility and safety to a level sufficient to allow the patient to return home. As with discharge from the acute care setting, social supports, environmental constraints, and the patient's overall physical capacity affect how quickly the individual returns home. Many patients discharged from a post-acute care inpatient facility continue their rehabilitation through home care services until they are ready for an outpatient setting.

Interventions in the post-acute care inpatient setting primarily continue with the treatments established in the acute care setting. Attention to maximizing ROM of the knee and quadriceps strength to allow independence in transfer and ambulation is the prime focus of treatment. Many of these patients have additional co-morbidities that slow their progress in achieving independence in functional milestones. Frequently co-morbidities in the cardiovascular and/or pulmonary systems require a slower pace in this rehabilitative setting. These patients tend to be more deconditioned going into surgery and require pacing strategies until their aerobic capacity increases. If they have significant limitations because of an underlying pathology that is not amenable to treatment, compensatory strategies need to be implemented, such as pacing strategies and modifications of home environmental constraints to allow the patient to achieve safe and effective functional mobility.

Strength training and aerobic conditioning are additional components of the rehabilitation program that can be implemented in the post-acute care setting because patients typically have less pain that limits their tolerance of treatment. Exercises such as upper body ergometry and progression to stationary biking can be initiated once the patient has sufficient ROM to allow full cycling with the pedals. Discharge from the post-acute care inpatient setting to home occurs when the patient can demonstrate the ability to achieve independence in transfers, ambulation, ADLs, and instrumental activities of daily living (IADLs), including household management for patients returning to home alone (see volume 1 of this series, *Orthopedic Physical Assessment,* Chapter 1).

TABLE **23-3**

Goals of Post-acute Care and Home Rehabilitation and Types of Interventions

Goals	Types of Interventions
Maximize knee range of motion (ROM): 0° to 120° flexion	ROM exercises Prolonged stretching
Improve strength and motor control	Therapeutic exercise focusing on strength
Achieve independent transfers	Transfer training
Achieve independent ambulation	Gait training with assistive device
Achieve independent basic self-care, activities of daily living	Assistive devices and training
Maximize aerobic capacity and endurance	Aerobic capacity training

HOME CARE REHABILITATION

Once the patient has arrived home after discharge from either the acute care or post-acute inpatient setting, home care services can provide ongoing rehabilitation services if deemed necessary. Home care rehabilitation services often are provided to evaluate the patient's ability to negotiate the home environment safely and to provide ongoing interventions for functional training and therapeutic exercise. The primary reason patients continue with home care services after a post-acute care inpatient stay is inadequate knee ROM (<90° flexion) for functional activities. Patients can follow independent exercise programs to maintain and gain ROM independently, but the shift in home exercise programs now focuses more on strength gains and endurance training (see Table 23-3). Patients can use walking, swimming, or stationary biking for endurance and aerobic capacity training in addition to strengthening exercises that emphasize the quadriceps and hip musculature.

OUTPATIENT REHABILITATION

When the patient is able to get out into the community and has transportation to an outpatient rehabilitation facility, care is transitioned from the home care setting

to the outpatient setting. At this point the patient is not considered homebound and in the United States does not qualify for ongoing home care services under Medicare rules.[65] In addition, the outpatient clinic offers a variety of options in equipment to supplement the rehabilitation process.

The primary focus of treatment in the outpatient setting is strengthening, to facilitate the patient's return to full function. Residual deficits in ROM also are addressed through passive stretching and exercises that can be augmented with modalities as indicated (e.g., superficial heat, ultrasound). For patients with residual strength deficits, electrical stimulation can be used to enhance strength training regimens.[66,67] Quadriceps weakness, due in part to muscle activation deficits, often contributes to long-term limitations in functional ability. Emerging trends in high-intensity strengthening programs[68] and the use of neuromuscular electrical stimulation (NMES) as early as 2 days postoperatively are showing promise in reversing this pervasive impairment associated with TKA.[69] The continuum of rehabilitation in the outpatient setting takes the patient to the end point in functional rehabilitation after TKA and should include return to sport-specific activities if the patient so desires. Additional exercise equipment, such as isokinetic devices, pulley systems, and stair climbers, can be used for strengthening purposes of the lower extremities. Aerobic conditioning can be performed with walking, stationary bicycles, upper body ergometers, elliptical and standard treadmills, or cross-country ski machines, depending on the patient's overall endurance, balance, agility, and preferred mode of exercise.

Rehabilitation programs continue to be supplemented by progressive home exercise programs that focus on the goals of the rehabilitation program (Table 23-4). These most often include resistive exercises with cuff weights, resistance bands (Figure 23-4), or body weight in closed chain exercises, as well as ROM exercises with an emphasis on prolonged stretches to regain end range flexion or extension, depending on the patient's presentation. Gait training often continues in the outpatient setting; initially the patient is weaned off any assistive devices, and then the gait is fine-tuned as ROM and strength improve to restore a normal gait pattern and minimize any excessive loading on the joints from abnormal gait patterns. The frequency and duration of treatment are based on

TABLE 23-4

Goals of Outpatient Rehabilitation and Types of Interventions

Goals	Types of Interventions
Maximize knee range of motion (ROM)	ROM exercises Prolonged stretching Manual techniques
Maximize strength	Aggressive strength training
Achieve normal gait without assistive device	Gait training Balance training
Achieve independence in self-selected activities (sports, leisure)	ROM Strengthening exercises Balance exercises Endurance training as required for activity

Figure 23-4 Quadriceps strengthening in closed chain using resistive elastic bands. **A,** Starting position (knee flexed). **B,** Finishing position (knee extended).

the patient's presentation and goals; however, a greater number of visits may be required if the patient needs manual techniques and stretching to improve ROM or if a treatment requires specific equipment (e.g., electrical stimulation). Outpatient rehabilitation often lasts at least 6 to 8 weeks because of the time needed to achieve true strength gains.

Regrettably, many presurgical patients have stopped participating in sports-related activities because of the pain associated with increased activity and advanced arthritis. For an increasing number of patients, TKA offers the hope of returning to meaningful activities, including a variety of sports and leisure activities. Sport-specific training often is included at the end of the rehabilitation process. A number of high-loading, repetitive sports activities, such as running, basketball, soccer, high-impact aerobics, singles tennis, squash, racquetball, and Alpine skiing, are not recommended after TKA because these types of activities have been associated with early arthroplasty failure.[70] Lower-load activities, such as walking, biking, golfing, swimming, tai chi, and bowling are encouraged because these activities help maintain strength gained in rehabilitation and provide the overall health benefits derived from regular physical activity.

When patients have completed rehabilitation after TKA, they may choose to seek out additional assistance in returning to a specific leisure activity. Their sport or activity of choice may have specific ROM, strength, or endurance requirements that call for additional training to allow the patient to participate fully at peak performance. Patients who want to return to cycling may need adjustments to their bicycles and additional work on ROM to maximize their tolerance of this activity. Golfers may need to address balance issues for the uneven terrain of the golf course to function confidently in this sport and may also need additional knee flexion ROM to allow them to squat to view lines for putting. Often the patient can identify the obstacles that impede their ability to participate fully in a sports activity, and this information can help guide both the examination and treatment focus of sport-specific rehabilitation.

Caution: High-Load Activities Not Recommended after Total Knee Arthroplasty

- Running
- Basketball
- Soccer
- High-impact aerobics
- Singles tennis
- Squash
- Racquetball
- Alpine skiing

ADDITIONAL SURGICAL CONSIDERATIONS FOR KNEE ARTHROPLASTY PATIENTS

Unicompartmental knee arthroplasties (UKAs) increasingly are performed for patients with advanced arthritic changes in one compartment of the knee, most often the medial compartment. These patients undergo a similar surgical event except that the prosthesis implanted resurfaces only one compartment (medial or lateral) of the tibiofemoral joint (Figure 23-5). After surgery, these patients follow a rehabilitation protocol that parallels that of patients who have had a TKA. The primary difference in patients with a UKA is that they undergo a less invasive surgical procedure that preserves more of the joint anatomy. Therefore they often have less blood loss at surgery, a shorter duration of anesthesia, and often less postoperative pain.[71,72] All these factors result in a faster recovery. Most of these patients are discharged directly home after the acute care stay, and they often are discharged home on POD 2.[73] They may require some rehabilitation services in the home initially but are moved into the outpatient setting more quickly and follow an outpatient rehabilitation process similar to that for primary TKA.

The other surgical arthroplasty consideration involves patients with bilateral knee OA. Because of the pathophysiology of OA, more than 80% of patients presenting with debilitating knee pain for evaluation have bilateral symptoms. In fact, in a study by Mont et al.,[74] 43% of

Figure 23-5 Anteroposterior radiograph of unicompartmental knee arthroplasty.

those presenting for unilateral TKA eventually had the other knee replaced as well; other researchers have had similar findings.[75–77] Patients who need bilateral knee replacements have a choice regarding the timing of the two procedures. A one-stage bilateral TKA may be performed, in which one TKA is performed, the tourniquet is deflated, and the contralateral tourniquet is inflated and the second TKA is performed, or both knees are done simultaneously by two teams at the same time. As an alternative, the patient may opt for two separate procedures done days, weeks, or months apart (two-stage TKA).

The overall complication rates in patients undergoing bilateral rather than unilateral TKA are similar, which suggests that for the average patient, the larger bilateral surgery appears to pose no increased risk.[78–80] However, it is clearly evident that the operative insult of bilateral one-stage procedures is greater, involving increased blood loss, greater hemodynamic effects, an increased risk of anesthetic complications from longer operative times, and a greater risk of embolization of fat and marrow contents. For these reasons, patients older than 75 years and those with significant cardiovascular co-morbidities are at increased risk of fatal complications and therefore should undergo a two-stage procedure.[79,81–83]

Patients who undergo a two-stage TKA follow the rehabilitation course outlined previously. Depending on the surgeon's and patient's preferences, the second TKA may be performed as early as 10 days after the first, or the two stages may be performed 3 or more months apart. For patients with a short interval between the two surgeries, the primary focus after the first procedure is to gain sufficient ROM and strength in the quadriceps muscle to allow this leg to act as the "strong" leg after the second procedure. These patients then follow a rehabilitation process similar to that outlined in the next paragraph for patients who undergo a one-stage bilateral TKA. Patients who have several months between procedures focus on fully rehabilitating the first knee before the second surgical procedure is performed.

One-stage bilateral TKAs present a unique challenge to the patient and rehabilitation professional. These patients need intensive rehabilitation services because both knees require treatment to address ROM and strength issues as outlined for single TKAs. Early postoperative functional training poses additional challenges because the patient often does not have sufficient knee ROM or strength to succeed in sit to stand transfers. Compensatory strategies, such as elevating the bed (Figure 23-6) and using knee immobilizers, may help the patient succeed with transfers the first few days after surgery. If CPM is used, it is alternated between the knees because the size of the CPM machine makes it difficult to position the patient on two at one time. CPM use should be considered judiciously as the increased time in the device for each knee will limit the patient's ability to be out of bed and working on functional activities. Sufficient pain management is paramount in these patients because pain often impairs motor control. These patients usually require discharge to an inpatient rehabilitation facility for ongoing rehabilitation because most patients who have simultaneous bilateral TKAs do not achieve independence in functional mobility until 10 to 14 days after surgery. These patients' overall condition is also influenced by longer anesthetic times and increased blood loss and their associated side effects, which hamper progress in rehabilitation. The advantage of this procedure is that once patients have progressed through the initial phases of rehabilitation, they do not have a knee with advanced OA impeding their progress in rehabilitation, as is often seen in patients with bilateral knee OA who opt for two procedures many months apart.

Figure 23-6 Assisted sit-to-stand transfers using elevation of the bed.

COMPLICATIONS AFTER TOTAL KNEE ARTHROPLASTY

Common complications immediately after surgery include pulmonary complications, such as postoperative atelectasis and pneumonia, vascular complications (including deep vein thrombosis [DVT] and pulmonary embolus [PE]), and local wound problems or infection. For the clinician, a knowledge of the complications that may arise after TKA is important for early detection and referral to appropriate providers for management. Careful monitoring of the patient's heart rate, respiratory rate, oxygen (O_2) saturation levels, and body temperature can aid early detection of pulmonary complications. Interventions such as instruction in deep breathing exercises and manual techniques can help prevent and/or treat these pulmonary complications, which can be life threatening in older patients.

The frequency of thromboembolic disease in individuals who do not receive prophylactic therapy can be higher than 50%.[84] The risk of DVT is highest in the early postoperative period. Warfarin and low molecular weight heparins (blood-thinning drugs) reduce the risk of postoperative DVT in patients with TKA. Physical methods, including compression stockings, pneumatic compression devices, and early mobilization are useful adjuncts for preventing DVT but have not been proven to substitute for pharmacological prophylaxis. Although the overall incidence of symptomatic DVT after TKA is low,[85,86] the seriousness of this complication warrants close observation and prophylactic anticoagulation.

Patient reports of increased pain, swelling, warmth, and/or redness in the leg may accompany the development of DVT, but these clinical findings are poor predictors of the presence or absence of DVT.[87] Homan's sign is neither sensitive nor specific for the presence of DVT and should not be used to determine if a DVT is present.[88,89] Wells developed a clinical prediction rule (Table 23-5) to provide guidance on the probability of DVT. **Wells Clinical Prediction Rules for DVT** has been well validated for clinical probability assessment of DVT. A total score of <1 indicates low probability, 1 or 2 moderate, and >2 high probability that a DVT is present.[90,91]

TABLE **23-5**

Clinical Model for Predicting Pretest Probability of Deep Vein Thrombosis (DVT)* (Wells Clinical Prediction Rules for DVT)

Clinical Finding	Score
Active cancer (treatment ongoing, within previous 6 months, or palliative)	1
Paralysis, paresis, or recent plaster immobilization of lower extremities	1
Recently bedridden for 3 days or more, or major surgery within the previous 12 weeks requiring general or regional anesthesia	1
Localized tenderness along the distribution of the deep venous system	1
Entire leg swelling/calf swelling at least 3 cm larger than that on the asymptomatic leg (measured 10 cm below the tibial tuberosity)	1
Pitting edema confined to the symptomatic leg	1
Collateral superficial veins (nonvaricose)	1
Previously documented DVT	1
Alternative diagnosis that is at least as likely as DVT (e.g., cellulitis, calf strain, postoperative swelling)	−2

*In patients with symptoms in both legs, the more symptomatic leg is used. A cumulative score of >2 is likely DVT, whereas <2 means DVT is unlikely.

Modified from Wells PS: Advances in the diagnosis of venous thromboembolism, *J Thromb Thrombolysis* 21:32, 2006.

Complications of Total Knee Arthroplasty

- Atelectasis (collapse of alveoli)
- Pneumonia
- Deep vein thrombosis (DVT)
- Pulmonary embolism (PE)
- Wound problems
- Infection
- Medial collateral ligament injury
- Extensor mechanism failure (patellar tendon rupture)
- Arthrofibrosis (stiff knee)
- Periprosthetic fracture
- Unstable or loosened prosthesis
- Heterotopic ossification

Immunosuppression, diabetes, smoking, previous knee surgery, and obesity are known risk factors for postoperative knee infection, which can be a devastating complication requiring emergent irrigation and debridement and long-term intravenous (IV) antibiotics. Infection can be prevented by perioperative use of IV antibiotics and attention to careful surgical technique and soft tissue handling, which have been shown to minimize wound healing problems. In addition, laminar airflow and having a dedicated surgical team and reduced surgical time have been shown to reduce the risk of infection in patients with TKA.[92,93] Early signs and symptoms of infection, which present primarily in the area of the incision, include increased redness, warmth, edema, and possibly drainage from the surgical wound. Infection after wound closure can be either superficial (e.g., a cellulitis) or a deep infection in the joint or bone. Symptoms of progressively worsening pain accompanied by cardinal signs of systemic infection (e.g., fever, rigors [shivering]) should prompt the clinician to notify the surgeon because early management of infection is critical for a successful outcome.

Additional mechanical complications in TKA can include medial collateral ligament (MCL) injury, extensor mechanism failure, arthrofibrosis, and/or periprosthetic fracture. Iatrogenic intraoperative disruption of the MCL during TKA typically has been treated with implantation of a more constrained prosthesis that provides varus-valgus restraint. In addition, repair and/or reattachment of the ligament has proven successful, with postoperative knee scores and ROM equivalent to those in knees without this complication. Rehabilitation for these patients must be modified slightly because they wear a brace for 6 weeks after surgery and follow an MCL injury protocol to allow healing of the ligament.

Rupture of the patellar tendon is another rare but devastating complication of knee arthroplasty. Nonsurgical

treatment and primary repair have not proven successful. Reconstruction with fresh-frozen extensor mechanism allograft is preferred because of the improved ability of both bone and tendon to incorporate. Nonabsorbable suture fixation of the allograft tendon onto a broad base of healthy quadriceps musculature allows reliable incorporation. Furthermore, fracture of the patella may also occur. Three aspects of the extensor mechanism must be assessed: whether the patellar component is loose, whether the extensor mechanism is partly or completely disrupted, and the extent of the remaining patellar bone. Nonsurgical treatment is successful if the extensor mechanism remains functional and the patellar component remains well fixed. Surgery is indicated in patients showing marked disruption of the extensor mechanism.[94,95] Postoperative management must initially allow for healing of the tendon repair, which will significantly impact the rate of progress in gaining ROM, strength, and functional mobility.

Postoperative stiff knee is a sign of failure of TKA and remains an unsolved problem. The best predictor of postoperative ROM is preoperative motion. When arthrofibrosis is diagnosed early, it can be managed successfully with manipulation under anesthesia. Late treatment of stiffness is less likely to respond to manipulation.[96]

Although the prevalence of postoperative periprosthetic fracture is fairly low (less than 2% of cases), treatment remains a challenge to all orthopedic surgeons, and the complication rates remain high. The main goal of treatment is to maintain alignment and fracture stability, and early ROM is essential to prevent stiffness. Surgery is indicated when the fracture is significantly displaced, stability of the prosthesis is compromised, and quality of bone is suboptimal. Failed prosthesis, demonstrated by a loose implant, requires revision arthroplasty. Displaced fractures associated with well-fixed implants are best treated with reduction and rigid fixation to allow early ROM.

Heterotopic ossification, another potential complication, results in calcium deposition within soft tissues around the joint. Although uncommon, this complication may directly impede progress with ROM and possibly strengthening exercises. Management may involve medication, radiation therapy, and possibly surgical excision, which will clearly alter the goals and rehabilitation treatment program.

The survival rate for primary TKA implants is>90% 10 years after the surgery.[97] Late complications after TKA primarily include prosthetic loosening.[98] A new onset of pain in either the distal thigh or leg may indicate loosening of the prosthesis, and these symptoms typically worsen with weight-bearing activities and progressively worsen over time. Again, early referral to the surgeon is indicated because appropriate surgical intervention is required. A painful TKA requires a broad systemic workup that includes both intrinsic (knee-related) and extrinsic sources of pain. It is important to note that despite the widely taught precept that knee pain can originate outside the knee, patients continue to present to referral centers with pain in a replaced knee following an extensive and inconclusive workup of the knee joint when the origin of their pain is from an arthritic hip or lumbar spine.[8] Therefore protocols for evaluating a painful TKA begin with clinical and radiographic examination of extraarticular sites. Routine aspiration should be performed for a replaced knee suspicious for infection. White blood cell counts of 25,000/mm^3 or higher provide a strong suspicion for an infected TKA that needs to be surgically debrided.[92,93,99]

Failure of a replaced knee results in rapid acceleration of pain symptoms, functional decline, and the need for revision arthroplasty. Revision surgery is indicated for gross loosening of the implants, instability, infection, malalignment, wear, osteolysis, or disruption of the extensor mechanism. Gross loosening of the implants may occur secondary to wear and osteolysis, malalignment, or infection. Therefore routine knee aspiration is indicated.[100] A midline incision is made, but when multiple incisions are present, it is important to use the most lateral incision because of the soft tissue blood supply. It also is important to assess the bone integrity, remaining bone stock, and the extensor mechanism and collateral ligament integrity. Furthermore, it is important to restore the anatomical joint line, which generally is 1.5 cm (0.6 inch) proximal to the tip of the fibula. Elevation of the joint line results in patellar impingement and reduced quadriceps strength. The complication rate for revision TKA is much higher than for primary TKA, approaching 25%. Infection, dysfunction of the extensor mechanism, instability, fixation failure, and periprosthetic fracture all can compromise the outcome of revision surgery. Although most of these complications require intervention from providers other than the physical therapist, early recognition of complications and appropriate referral are important.

OUTCOMES OF TOTAL KNEE ARTHROPLASTY

Outcomes after TKA have been reported in the literature for decades, and the majority of studies have focused on the technical aspects of prosthetic implant survivability and design. More recent research has embraced the need also to address the impact of this procedure on quality-of-life issues important to the patient. More standardized outcome tools are being used to assess patient outcomes, with the most common ones being the WOMAC, Oxford-12, and Short Form 12 (SF-12); however, a single ideal outcome tool to assess patients after TKA does not exist.

Overall, TKA for patients with end-stage OA is considered a successful surgical intervention, with implant survivability reported to be greater than 81% to 92% 15 years after surgery.[12] The primary factor that influences ROM outcome is preoperative ROM. Despite the intent of PCL-sparing or substitution (high flexion) prosthetic designs, studies have failed to find a significant difference in ROM

outcomes using these implants compared with standard posterior constrained devices.[101–104] It is important for the clinician to have an understanding of the type of implant used and the expected ROM that can be achieved to establish realistic ROM goals for the patient. Constrained and rotating hinge devices, which are inherently more stable by design, may limit flexion ROM and have the potential to transfer more shear and rotatory forces to the bone-prosthesis interface, potentially contributing to early loosening of the prosthesis.[98]

UKA has a reported greater than 80% survival at 10 years. These devices tend to be used in younger patients who have a higher preoperative level of function, but also have higher expectations of functional performance post surgery. The most common reason for early failure of UKA is a lack of symptomatic improvement resulting in conversion to a TKA. Appropriate patient selection is the key to preventing early conversion to TKA.[105–108]

Additional considerations on prosthetic design have focused on the effect of preserving the PCL as a soft tissue structure that can contribute proprioceptive and kinesthetic input to the knee. The rationale for leaving the PCL intact is to enhance joint position sense and provide important feedback for balance mechanisms. Studies have shown that proprioception and kinesthesia improve after TKA, most likely because of the reduction in pain and inflammation and postoperative changes to the capsuloligamentous structures, not necessarily because of preservation of the PCL.[109] Further studies that specifically address balance and proprioceptive training after TKA with both PCL-sparing and PCL-substituting devices may shed more light on this design feature.

The strongest predictors of outcomes following knee arthroplasty surgery include preoperative pain, function, and WOMAC scores.[14–16,110] Patients with anxiety or depression, pain in the operative or contralateral knee, or preoperative knee weakness have poorer outcomes and residual participation restrictions.[108,111,112]

The timing of measurement and the tools used to measure function vary in the literature. The **WOMAC OA Index** and the **6-Minute Walk Test (6MWT)** have been reported to be most responsive when patients are examined 0 to 4 months after surgery.[113] Performance-based testing after TKA needs to consider the recovery time frame. Early postoperative assessments should include the 6MWT as the most responsive test. The timed stair ascent is not responsive early on because many patients are unable to complete this task in the first 4 months after surgery.[113] The 6MWT has also been shown to be predictive of functional ambulation and correlates well with longer walk tests in individuals 12 to 18 months post TKA.[114]

The **Knee Society Clinical Rating Scale** and the WOMAC are the most responsive outcome measures for TKA.[115] Both are disease-specific scales that rate function, pain, and stiffness—the primary symptoms associated with OA. Patient perception of functional recovery has multiple interactions, including psychological issues, which may influence the patient's report of function.[116–118] Comprehensive management, which includes psychological aspects, should be considered in the overall patient care plan.

A major focus in recent outcomes studies on patients who underwent TKA has been the correlation between strength and function. Many studies have reported residual weakness in patients who have completed rehabilitation,[116,118–121] which affects the patients' gait speed[122,123] and stair ascent strategy.[124] Experimental designs that focus specifically on additional interventions to address strength deficits have shown promise in improving strength and related functional activities.[67–69,122,125–127] Further research into interventions is important to determine the optimum treatment for developing postoperative protocols that will rehabilitate patients to their fullest potential and restore their functional ability to that of age- and gender-matched controls. As patients' expectations for postoperative function change, rehabilitation programs must evolve to meet these needs fully.

SUMMARY

TKA is a successful intervention for patients with end-stage arthritis of the knee. Rehabilitation is an essential component of the overall management of these patients. Coordinated, individualized care from all health care providers, from the preoperative phase through the continuum of postoperative rehabilitation, maximizes the patient's functional level and ability to resume meaningful activities. Ongoing advancements in surgical instrumentation and techniques, coupled with progressive rehabilitation programs, will continue to improve the long-term results and expectations for TKA.

CHAPTER 24

Rehabilitation of Leg, Ankle, and Foot Injuries

D.S. BLAISE WILLIAMS III, JAY HERTEL, CHRISTOPHER D. INGERSOLL, DAVID P. NEWMAN

INTRODUCTION

Injuries to the lower leg, ankle, and foot often result in disability because of the loss of the ability of the foot and ankle complex to support and drive the gait cycle. Rehabilitation for injuries to this region requires restoration of mobility as early as possible. It is imperative that the clinician balance the focus on early mobility with protection of injured tissues in order to allow for optimal healing and restoration of normal neuromuscular recruitment strategies for movement execution. Overuse injuries are common at the foot and ankle complex and even more so in the lower leg as a result of the need to eccentrically control motion during landing activities. Because the foot and lower leg motion are tightly coupled during walking and running, forces are transferred up the kinetic chain. This places an even greater importance on the evaluation and treatment of foot and ankle morphology and mechanics during weight bearing. A quick return to activity after an acute injury without proper assessment of lower leg and foot structure and mechanics to guide rehabilitation may predispose the patient to a subsequent injury. For these reasons, clinicians must exercise sound clinical judgment in assessing patient function and structure when designing and implementing rehabilitation programs for injuries to the lower leg, ankle, and foot.

PRINCIPLES OF REHABILITATION PROGRESSION FOR LOWER LEG, ANKLE, AND FOOT INJURIES

When treating injuries to the lower leg, ankle, and foot, the clinician must consider functional limitations in the entire lower extremity. Such limitations typically fall into the categories of restricted range of motion (ROM), reduced muscular strength and endurance, and impaired proprioception and neuromuscular control. A paradigm such as the rehabilitation pyramid[1] (Figure 24-1) is useful for designing treatment and rehabilitation programs.

The base of the rehabilitation pyramid emphasizes control of pain and inflammation and provision of a treatment environment that allows injured tissues to heal. Each of these components will vary greatly, depending on the patient's specific pathology. Initial treatment should be focused on the promotion of healing tissue and reduction of inflammation. Rest, ice compression, and elevation (RICE) are the accepted protocol for acute injuries. Pain and inflammation can be controlled further with physical agents such as compression cryotherapy and electrical stimulation, as well as with analgesic and anti-inflammatory medication. Provision of an environment that allows tissues to heal often is accomplished with some type of immobilization device, such as a cast, brace, or walking boot (Figures 24-2 to 24-4). Devices that assist ambulation, such as crutches and canes, also are often critical elements in creating an environment conducive to protection, tissue healing, and mobilization.

Progression through the rehabilitation pyramid centers on issues of neuromuscular control. The left side of the pyramid comprises three levels of neuromuscular control: control of volitional contractions, control of reflex reactions, and control of functional movement patterns. When neuromuscular control is established at multiple levels of rehabilitation progression, patients may be less likely to develop inefficient and potentially deleterious movement strategies that may slow their recovery or predispose them to subsequent injuries. Although neuromuscular control training has been shown to be of great importance in rehabilitation of particular injuries,[2] other functional limitations, such as restricted ROM and reduced muscular strength and endurance, must be addressed simultaneously.

Levels of Neuromuscular Control

- Control of voluntary movements
- Control of reflex reactions
- Control of functional movement patterns

Figure 24-4 Walking boot (cam walker).

The cause of reduced ROM must be considered before efforts are initiated to restore this motion. After long periods of immobilization, ROM in the joints of the ankle and foot often is reduced, and tissue adaptations have occurred in the musculotendinous and collagenous structures, such as the joint capsule. Early emphasis on joint mobilizations often is helpful for alleviating capsular adhesions and reducing joint stiffness.[3] Before these treatments are started, it is important for the clinician to make sure that no contraindications exist to joint mobilizations, such as the use of surgical intra-articular fixations to stabilize fractures. Active and passive ROM exercises may also yield increases in joint ROM soon after immobilization has ended. Specifically, if musculotendinous structures are tight, exercises and muscle-specific mobilization techniques targeted directly at improving flexibility in these structures may be initiated (Figure 24-5).

Muscle strengthening of foot and ankle muscles, as well as muscles surrounding the hips and knees, must also be addressed. Muscle strength is easily compromised after injury and immobilization. It is important to emphasize adequate neuromuscular control over volitional isometric contractions before advancing to isotonic contractions. Inability to initiate strong isotonic muscle contractions may be the result of **arthrogenic muscle inhibition (AMI)**. AMI is a reflex inhibition of the musculature surrounding

Figure 24-5 Stretching. **A**, Gastrocnemius (knee straight). **B**, Soleus (knee bent).

a joint after distension caused by swelling or damage to the joint structures.[4] As a result of AMI, fewer recruitable motor units are available during a voluntary contraction, which may lead to decreased force production. Attempting to progress exercise intensity or complexity while a muscle is in an inhibited state may cause a patient to develop compensatory motor unit recruitment patterns. With continued muscle inhibition, clinicians may observe severe muscle weakness, pain, and muscle atrophy that can prolong the rehabilitation period.

Strategies to reduce AMI, including cryotherapy and transcutaneous electrical nerve stimulation (TENS), should be used before the patient is progressed through a rehabilitation program. Cryotherapy may decrease the firing of the inhibitory interneuron involved in the reflex, thus reducing the inhibition of the voluntary muscle contraction. TENS, on the other hand, stimulates cutaneous type I nerve endings, which may disrupt the flow of information from joint receptors in the injured area to the spinal cord through competition with the same type I afferent fibers. Cryotherapy and TENS have been reported to diminish AMI and, if incorporated, should be applied before therapeutic exercise.[5] Cryotherapy before exercise or TENS before and during exercise creates a more normal muscle state, allowing the muscle to contract with increased and therefore more normal, motor unit activity.

Once volitional control has been established, isotonic, single-joint resistance exercises performed in an **open kinetic chain (OKC)** can begin. OKC exercises can be used to isolate specific joints or muscles to improve ROM, strength, and movement patterns while controlling compensatory movement patterns or forces that may occur during weight-bearing exercises. Similarly, the acuity of the injury or postoperative restrictions may require limited weight bearing. Therefore, OKC exercises may be an option for early strengthening. Resistive exercises performed with resistive bands or tubing are particularly useful for strengthening the muscles about the ankle, provided the movement is performed in a controlled fashion (Figure 24-6).[6] Both concentric and eccentric contractions should be performed.

After adequate neuromuscular control and strength have been restored in isolated open-chain activities, **closed kinetic chain (CKC)** exercises can be initiated. CKC exercises are more consistent with functional activities (e.g., walking, squatting, stair climbing) and involve all the joints of the lower extremity.[7] Most CKC exercises are multijoint in nature, although activities such as heel raises, emphasize primarily one joint. As the patient improves, both OKC and CKC activities can be advanced. However, advancing exercises must progress slowly and carefully in an attempt to maintain protection of injured structures and decrease the risk of reinjury.

Returning to athletic or recreational activities requires the development and maintenance of muscular endurance. Muscle endurance is the ability or capacity of a muscle group to perform repeated contractions against a load.[8] **Muscle endurance** usually takes much longer to return than strength, and many patients may not regain normal muscle endurance until they reverse the muscle atrophy that accompanies musculoskeletal injuries.[9] It is crucial to include muscle endurance activities later in rehabilitation programs so that patients are able to return to full activity.

Figure 24-6 Four-way tubing exercises. **A,** Dorsiflexion. **B,** Eversion. **C,** Inversion. **D,** Plantar flexion.

Muscular endurance is trained with high repetitions at lower loads. It is important to have the patient perform exercises at speeds that simulate the speed of the functional activity or athletic performance. Power training during rehabilitation is important for strength at various speeds.[10] Most sport activities, even endurance activities, include components that require powerful muscle activation. **Power training** is the inclusion of exercises at low repetition under load and increasing velocities. This is important because it is a necessary component in the complete rehabilitation of the patient and for full, unrestricted return to play.

Exercises to address impairments in neuromuscular control and proprioception should be used throughout the rehabilitation process. Specifically, activities that challenge balance and postural control can aid in the restoration of normal proprioception, kinesthesia, and neuromuscular control. Exercises such as squatting, performing a plié in dancing, and bridging can be used effectively for balance training.[11] Progressions for balance training are presented in Table 24-1 and Figure 24-7.

In the final stages of rehabilitation, eccentric exercises and controlled plyometrics play an important role in ensuring the patient can return to normal activity. The eccentric exercises help train the muscles controlling the leg and foot to act as shock absorbers during motion and also to function as "dynamic brakes" to slow motion down.

Because prolonged limping may reinforce faulty neuromuscular recruitment and movement patterns, gait training should be incorporated in the rehabilitation process as early as possible for any lower extremity injury. An asymmetrical gait pattern (i.e., limping) at any point during rehabilitation is cause for concern because it may result in prolonged compensatory movement patterns. Assistive devices such as axillary crutches or a cane can be used initially to reduce weight bearing through the injured extremity. These can be discontinued when the patient can execute a symmetrical gait pattern. In addition, these devices can be used during rehabilitation sessions to help train the symmetrical pattern. When using axillary crutches, the patient should use a heel–toe gait pattern and bear weight as tolerated (or as allowed per postsurgical protocol). Before full weight bearing, gait training activities such as weight shifts forward and backward or sidestepping can be performed in the parallel bars or in a pool. To further challenge the patient, treadmill ambulation while changing the incline or speed can be incorporated.

TABLE **24-1**

Variables That Can Be Manipulated during Balance Training*

Stance	Visual Input	Surface	Arm Position	Patient Attention
Double limb	Eyes open	Firm	Outstretched	Concentrate only on balancing
Single limb	Eyes closed	Foam or Airex pad	At side	Recite by rote memory (ABCs), closed eyes
		Unstable (wobble board, trampoline)	Across chest	Perform simple computations (serial 7 s—counting in increments of 7; e.g., 7, 14, 21, and so on)
		Balance beam		External stimuli (ball toss, ball throw, rhythmic stabilization)

*Conditions are listed from easiest to hardest in each column.

Figure 24-7 Balancing on different surfaces and the Star Excursion Balance Test (SEBT). **A**, Balancing on a firm surface (the floor). Perturbations can be added to increase the difficulty. **B**, Balancing on foam. **C**, Balancing on an air disc. **D**, Star Excursion Balance Test; point toes in different directions around the body.

Clinical Point

During the rehabilitation process, if a patient can only walk with a limp, assistive devices such as crutches and canes should be used.

The clinician must identify and address specific limitations that lead to gait abnormalities (e.g., inadequate dorsiflexion ROM). These limitations should be addressed with specific interventions aimed at improving ROM or strength *and* during gait retraining activities, such as heel walking, toe walking, and backward walking (retro-walking). Performing these activities in front of a mirror can provide the patient with feedback and can be particularly effective.[12]

EXERCISE-RELATED LEG PAIN

Exercise-related leg pain (ERLP) encompasses several disorders characterized by diffuse pain along the tibia caused by exertional or overuse activities.[13] Tissues and structures in the lower limb often are unable to withstand repetitive bouts of mechanical loading, which may result in tissue fatigue and eventual tissue failure. This is true for passive strain placed on the tissues and active strain from muscle activation. In general, these pathologies may progress from acute tendonitis to periostitis (commonly called *stress reaction*). If left untreated, tibial periostitis is likely to progress to a stress fracture or, possibly, to a complete fracture (see Chapter 26 for more detailed information on stress reactions and fractures of the lower leg).

Medial Tibial Stress Syndrome

Medial tibial stress syndrome (MTSS), a common overuse syndrome, is a periostitis or stress reaction characterized by diffuse pain along the posteromedial border of the tibia and associated with the tendon of the soleus.[14] The term *shin splints* traditionally has been used synonymously with MTSS. However, this term is ill defined and can encompass multiple causes of leg pain. Pain associated with MTSS typically is exacerbated by weight-bearing activities, such as walking, running, jumping, or standing for prolonged periods. MTSS often is linked to faulty lower extremity mechanics related to hyperpronation, as well as to a rapid increase in the intensity and duration of the aggravating activity.[15]

The actual pain generator for MTSS is the subject of debate. Suggestions include the proximal tendon of the tibialis posterior tendon, the proximal tendon of the soleus, and the tibial periosteum.[16] Anatomically, the origin of the tibialis posterior is more lateral than the typical origin of MTSS. However, the tibialis posterior, flexor digitorum longus, and soleus all attach to the distal tibial fascia placing stress on the posterior medial tibia.[17] When designing a rehabilitation plan, the clinician should recognize what MTSS is not. MTSS clearly is not a compartment syndrome of the deep posterior compartment of the leg, nor is it a tibial stress fracture. Differentiation of MTSS from a stress fracture is best confirmed by a bone scan (Table 24-2).[18,19]

General Treatment Considerations of Exercise-Related Leg Pain

- Treat the symptoms
- Eliminate or modify the cause
- Maintain or restore fitness
- Design rehabilitation programs to return the person to the previous level of function

Management of MTSS involves eliminating the potential biomechanical causes of the pathology and treating the patient's symptoms. Addressing abnormal pronation is an issue clinicians often face when treating overuse injuries of the lower extremity. It is important to emphasize that abnormal pronation is a dynamic issue that occurs during landing during walking, running or jumping. Many static malalignments, such as pes planus, hypermobile first ray, excessive forefoot varus, excessive rearfoot valgus, excessive lateral tibial torsion, excessive

TABLE 24-2

Differential Diagnosis of Repetitive Stress Shin Pain

	Chronic Exertional Compartment Syndrome	Shin Splints* (Stress Reaction)	Stress Fracture	Tumor
Type of pain	Severe cramping, diffuse pain, and tightness	Diffuse along medial two thirds of tibial border	Deep, nagging, and localized with minimal radiation	Deep and nagging (bone) with some radiation
Pain with rest	Decreases or disappears	Decreases or disappears	Present, especially at night	Present, often night pain
Pain with activity	Increases	Increases	Present (may increase)	Present
Pain with warm-up	May increase or may manifest eventually	May disappear	Unilateral	Unilateral
Range of motion	Limited in the acute phase	Limited	Normal	Normal
Onset	Gradual to sudden	Gradual	Gradual	?
Altered sensation	Sometimes	No	No	Sometimes
Muscle weakness or paralysis	Maybe	No	No	Not usually
Stretching	Increases pain	Increases pain	Minimal pain alteration	No increase in pain
Radiography	Normal	Normal	Early, negative; late, positive (?)	Usually positive
Bone scan	Negative	Periosteal uptake	Positive	Positive
Pulse	Affected sometimes	Normal	Normal	Normal
Palpation	Tender, tight compartment	Diffuse tenderness	Point tenderness	Point or diffuse tenderness
Cause	Muscle expansion	Overuse	Overuse	?
Duration and recovery	None without surgery	None without rest	Up to 3 months	None with treatment

*Shin splints and stress fractures are different stages of tibial stress syndrome.

genu valgum, and excessive femoral anteversion, have been associated with abnormal pronation during gait. If these structural abnormalities are present in patients who exhibit abnormal pronation, foot orthotic devices may be used to reduce the magnitude or velocity of pronation during gait (Figure 24-8). Patients with MTSS who demonstrate abnormal pronation have benefited from intervention with foot orthotic devices.[20]

The symptoms associated with MTSS are often self-limiting. The intensity and duration of irritating activities must be modified to allow tissues to heal. Anti-inflammatory and analgesic medications and some therapeutic modalities may also be used initially to treat the symptoms, with limited success.[21] There is some evidence to suggest that mobilization of trigger points in the posterolateral leg results in positive outcomes for performance and pain (Figure 24-9).[22] Once symptoms begin to reduce, treatment of MTSS should include strengthening exercises focused on the muscles of that dynamically control pronation (i.e., tibialis posterior tibialis anterior and peroneus longus) and the soleus. Also, the flexibility of the lower leg musculature should be addressed for the gastrocnemius, soleus, and anterior lower leg muscles.

Once symptoms resolve, return to full activity must proceed gradually and cautiously. Non–weight-bearing or reduced weight-bearing activities, such as cycling or underwater running, should be mixed with weight-bearing activities. As long as symptoms continue to improve, non–weight-bearing activities gradually can be reduced while weight-bearing activities, such as light plyometrics and gait activities, can be initiated. If faulty biomechanical parameters are present, they must be addressed with gait training or foot orthotic devices. In addition, the patient must maintain adequate muscular strength, endurance, and flexibility once he or she returns to full activity.

Figure 24-9 Trigger point therapy to the anteromedial leg for medial tibial stress syndrome.

Tibial Stress Fractures

The tibia is the most common site for a stress fracture in the lower extremity. Matheson et al.[23] reported that more than 50% of stress fractures in athletes are in the leg, and they usually are seen in running and jumping athletes. Furthermore, females appear to be more susceptible than men with prevalence in runners as high as 28%.[24] Stress fractures are a result of overuse that result in failure of the bone along a continuum of failed adaptation from accelerated osteoclastic remodeling to a complete fracture. With stress fracture, bone attempts to remodel in response to repetitive subthreshold stress. Particularly with muscle fatigue, there is a reduction in the dampening or shock absorbing effect of normal muscle activity in response to repetitive ground reactive forces present in walking, running, or jumping. Constraint overload leads to a stress reaction and potentially a stress fracture.

Stress fractures also can occur at sites of repetitive muscle tension on bone, such as at the insertion of the soleus to the medial border of the tibia. Stress fractures can also occur in individuals with weakened bones. Female runners who may develop disordered eating, secondary amenorrhea, and resultant osteopenia (female athlete triad) are particularly at risk.[25] Complaints of night pain or a focal area that is acutely sensitive to ultrasound as the sound head is passed over it are indicative of stress fractures.

Red Flags for Tibial Stress Fracture

- Night pain
- Focal pain (not diffuse pain)
- Tender area that is acutely sensitive to ultrasound

The treatment of uncomplicated stress fractures involves modified rest with non–weight bearing, pool running, swimming, or cycling until the patient can perform pain-free hopping. Modified rest should last at least 3 weeks from the confirmation of the stress fracture, and all symptoms must subside before a graduated return to activity program can be initiated (Table 24-3).[26] Patients with tibial stress injuries may be fitted with an Aircast brace with anterior compression during the period of modified rest, although improved results with the Aircast are questionable.[27] As weight-bearing activity is gradually increased, emphasis must be placed on *pain-free* activity. If any symptoms recur during or after activity during rehabilitation, the intensity of the activity should be reduced to ensure optimal healing conditions for the fracture. The entire lower extremity will require functional strengthening and retraining because of likely disuse atrophy resulting from the extended period of modified rest. The average tibial stress fracture completely resolves over 8 to 12 weeks after the offending stress has been removed.[23]

Clinical Note

With tibial stress fractures, emphasis must be placed on pain-free activities.

Rehabilitation efforts for stress fractures focus on determining the cause and alleviating the factors that led to the problem. Appropriate footwear and orthotics should be considered for patients who may require control of pronation or shock absorption. Increased loading rates after initial contact is a common occurrence in individuals with stress fractures, and reductions have been realized through feedback.[28] Tibial stress fractures also are seen commonly in individuals with excessive pronation and resultant medial tibial rotation. Most are training errors such as overtraining, inadequate rest, or rapid increases in activity duration and intensity. These training errors must be avoided in an attempt to prevent recurrence (Table 24-4).

TABLE 24-3

Sample Walk–Run Program for Return to Activity after Gastrocnemius–Soleus Strain and Stress Fracture*

Week	Monday	Wednesday	Friday
1	10-min walk	20-min walk	30-min walk
2	6×(4.5-min walk+0.5-min run)	6×(4-min walk+1-min run)	6×(3.5-min walk+1.5-min run)
3	6×(3-min walk+2-min run)	6×(2.5-min walk+2.5-min run)	6×(2-min walk+3-min run)
4	6×(1.5-min walk+3.5-min run)	6×(1-min walk+4-min run)	6×(0.5-min walk+4.5-min run)
5	30-min run	30-min run	30-min run

* The walk–run program is started after a patient has demonstrated the ability to walk 30 minutes consecutively, without injury, three times per week on alternate days. The goal is to run pain free for 30 minutes three times per week. The program involves a total activity period of 30 minutes, which is structured into six sets of 5 minutes on alternate days. Each set involves a combination of running and walking, and the running component is increased after each session by 30 seconds.

TABLE 24-4

Common Exercise Training Errors That May Lead to Overuse Injuries in the Lower Extremity

Mode	Error
Duration	• Increasing total time of exercise bouts too quickly
Frequency	• Increasing number of weekly exercise bouts too quickly
Intensity	• Increasing the physiological demands of exercise bouts too quickly
Environment	• Sudden change of surface (especially softer surfaces to hard surfaces) • Not alternating sides when running on crowned roads or sidewalks • Not alternating directions when running on oval tracks (especially indoors)
Equipment	• Poorly fitting or worn down shoes

CHRONIC EXERTIONAL COMPARTMENT SYNDROME

Chronic exertional compartment syndrome (CECS) must be considered as a cause of lower leg pain in athletes, especially those in endurance sports. The lower leg usually is divided into four discrete compartments (anterior, lateral, superficial posterior, and deep posterior; Figure 24-10), and CECS may occur in any of them. Some authors add a fifth compartment containing the tibialis posterior muscle as an occasional separate unit within the deep posterior compartment.[29,30] Each compartment encompasses muscles and the associated neurovascular bundle. Rarely, compartment syndromes can occur in the foot and can have causes similar to those in the leg of active individuals.[31]

CECS presents with transient symptoms that usually present during exercise or activity. The volume of exercising muscle may increase by as much as 20%, a result of an increase in blood volume and transcapillary filtration of intravascular fluid.[32] Venous and lymphatic return are limited by the increased volume within the compartment. Because the fascial sheath cannot significantly stretch to accommodate the abnormally increased volume, CECS occurs during exercise (see Table 24-2). CECS is characterized by severe cramping, diffuse pain, and tightness in one or more of the leg compartments. The patient will report compartment tightness that occurs during and/or after exercise, which is often more intense the next day. Associated swelling of the affected compartment occurs, although it may be difficult to visualize. This swelling is often palpable through increased turgor (i.e., rigidity) over the muscle. In some cases the patient may have a sensation of fatigue, weakness, or heaviness of the compartment muscles.

CECS may be difficult to diagnose because the symptoms present during exercise and begin to subside with rest. However, the signs and symptoms are fairly consistent in that they will occur at the same time, distance, and intensity of exercise and are consistent with deep aching pain, nerve pain (i.e., stinging, burning, numbness), and decreased function of the ankle dorsiflexors (i.e., foot slap or drop). A treadmill stress test with measurement of intracompartmental pressures may be necessary for a definitive diagnosis of CECS because this is considered the gold standard.[33] However, there has been some question as to the validity and necessity of such testing.[34]

Treatment of CECS may involve both conservative and surgical measures. Conservative measures have been questioned in terms of their effectiveness.[35] Fasciotomy is the definitive treatment, but in some cases, the condition resolves with activity modifications such as reduction in training volume or intensity. Other conservative treatment involves icing, stretching, muscle strengthening, proper footwear, and orthotic intervention, when appropriate. Recently evidence from a case series of two runners suggests that modifications in heel strike pattern may be successful in reducing symptoms.[36] If these measures are successful, a gradual return to activity and loading can be initiated. If these conservative measures fail, fasciotomy is commonly recommended. After surgery, the patient may be able to return to running in approximately 3 weeks.[37] The results are usually good, unless the area of fascia cut was not sufficient or ischemic changes and morphological muscle damage have occurred as a result of intense training in the presence of CECS.

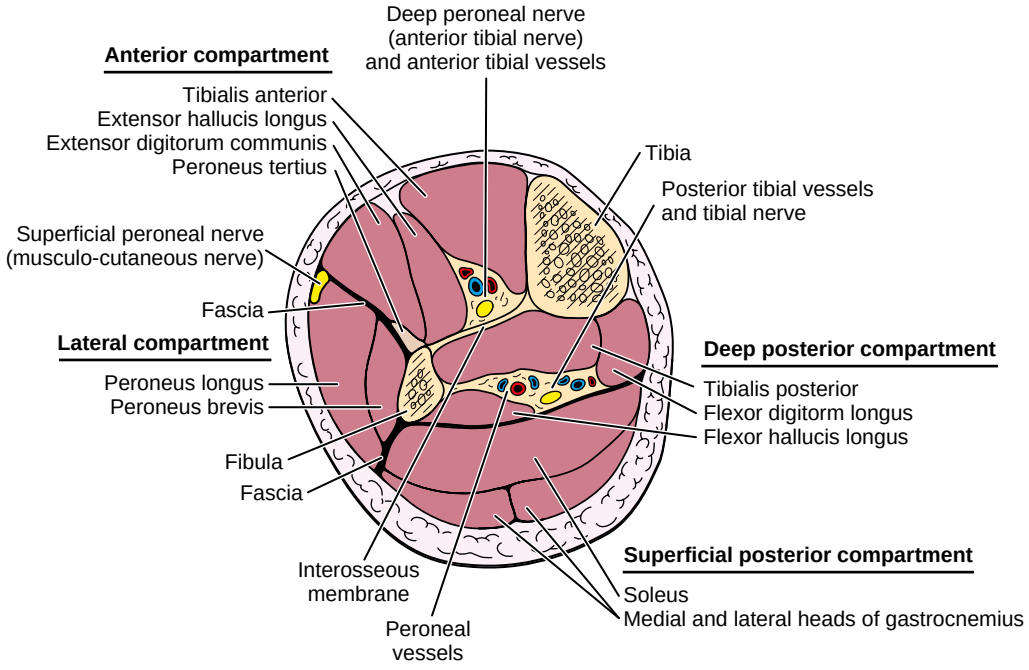

Figure 24-10 Compartments of the lower leg.

FRACTURES OF THE TIBIA AND FIBULA

Many different types of fractures can occur to the tibia and fibula (Figures 24-11 to 24-13). Complete fractures of the tibia and fibula may occur during sport activities that involve high torques and compression loads commonly placed on the lower leg. Fractures of the tibia may require internal fixation for stabilization and long periods of immobilization because the tibia is the primary weight-bearing bone in the lower leg. Prolonged immobilization can lead to severe disuse atrophy of the entire lower extremity if not properly managed during the immobilization phase. It is crucial to maintain strength and mobility of the muscles surrounding the more proximal knee and hip joints as well as the joints of the foot. Some fractures of the fibula may require internal fixation, but immobilization time is shorter compared with the time required for tibial fractures. The integrity of the healed fracture and any related injured structures, such as the tibiofibular syndesmosis ligaments, must be ensured before rehabilitation begins. If the tibiofibular ligament is compromised, the integrity and stability of the ankle mortise has been lost. This may require surgical correction and will prolong the rehabilitation process.

Figure 24-11 Fracture of tibia and fibula. (From Frank ED, Long BW, Smith BJ: *Merrill's atlas of radiographic positioning and procedures*, ed 11, St. Louis, 2007, Mosby.)

Figure 24-13 Displaced long spiral fracture of tibia fixed internally with interfragmentary screws. (From Canale ST, editor: *Campbell's operative orthopaedics*, ed 10, Philadelphia, 2003, Mosby.)

Immobilization results in the majority of the problems that need to be addressed during rehabilitation. Prolonged immobilization results in limited ROM of the joints of the foot and ankle, particularly of ankle dorsiflexion. This limitation should be addressed with careful progression of joint mobilizations (Figure 24-14) and stretching of the posterior calf muscles. Because muscular atrophy is likely to be present throughout the entire lower extremity, strengthening of the major muscle groups that act on the hip, knee, and ankle should continue to be addressed. Weight-bearing exercises, including gait training activities, should be incorporated as tolerated throughout the rehabilitation process for patients recovering from tibial and/or fibular fractures. Balance and proprioceptive intervention will also be compromised and should be addressed as early in the rehabilitation process as possible.

GASTROCNEMIUS STRAINS

Gastrocnemius strains, sometimes referred to as "tennis leg," are frequently seen in explosive sports that require quick movements in multiple directions. Sports such as tennis require the athlete to bear weight on the forefoot (i.e., balls of the feet) and make powerful movements in different directions. The common mechanism for this injury is forced dorsiflexion while the knee is extended or forced knee extension while the foot is dorsiflexed. Both of these movements cause passive stress or stretch to the gastrocnemius muscle, which crosses the posterior portion of the knee and ankle. This, in combination with active contraction of the muscles, places the muscle in a poor length–tension relationship. This injury occurs primarily in the medial head of the gastrocnemius muscle and differs distinctly from partial tears or ruptures of the Achilles tendon.

For acute strains, treatment should follow the RICE protocol; weight bearing to tolerance is allowed in the first weeks after injury. A compression wrap (Figure 24-15, *A*) applied from the foot to a point just distal to the knee can be used to provide external pressure to the injured limb. A normal gait pattern is encouraged, with use of an assistive device for partial weight-bearing gait if the patient cannot ambulate without a limp. In all probability, the patient will have difficulty with push-off during gait, and bilateral heel lifts may be temporarily helpful in reducing pain and activation of the gastrocnemius muscle.[38] Heel lifts (Figure 24-16) place the ankle in a plantar-flexed position during weight bearing and reduce the active and passive tension applied to the injured muscle. As dorsiflexion ROM returns, heel lift height can be reduced to allow normal active movement during weight bearing.

In the days after injury, active ROM exercises of the foot and ankle can be performed within the pain-free range. Cryotherapy may be used before and after exercise to control pain and localized inflammation in the early stages of recovery. Aggressive stretching of the gastrocnemius muscle must be avoided throughout the treatment process. Manual resistance exercises for the ankle muscles other than the plantar flexors may also be performed. Low-resistance plantar flexion exercises against elastic tubing are started when the patient is pain free (Figure 24-17). As the patient progresses, standing closed-chain exercises, including partial weight-bearing heel raises, squats, and

Figure 24-16 Heel lift examples. (Courtesy Breg, Carlsbad, CA.)

Figure 24-17 Ankle-Foot Maximizer® (AFX) (Progressive Health Innovations Inc., Port Moody, BC Canada) used to provide ankle exercises. **A**, Plantar flexion. **B**, Dorsiflexion.

lunges, may be initiated. To promote muscle tissue healing and fiber reorganization, low-intensity pulsed ultrasound may be used.[39] Soft tissue mobilization may also be beneficial in promoting healing and decreasing abnormal activation of surrounding muscle fibers.[40]

As ankle ROM returns, strengthening exercises using elastic resistance for all ranges are instituted (see Figure 24-6). The elastic resistance provides easy control over the variables of ROM, load, contraction type (concentric or eccentric), sets, and repetitions and allows control of speed and change of direction, which are difficult to duplicate using other exercise modalities. The intensity of closed-chain exercises should be increased gradually and may be advanced through a progression of leg press, hopping, and jumping activities. Prolonged walking, jogging, or running must be implemented in a pain-free manner. If the patient cannot perform these activities without limping or if the injured area swells with activity or pain is increased, progression is proceeding too quickly.

ACHILLES TENDINOPATHY

The Achilles tendon is the most common site of tendon pathology (i.e., tendinopathy) in the lower leg, ankle, and foot. Injuries can range from peritendinitis (i.e., inflammation of the peritendon sheath surrounding the Achilles tendon), tendinosis (i.e., degeneration of the tendon without inflammation), partial and complete ruptures, and insertional lesions, such as bursitis (see volume 2 of this series, *Scientific Foundations and Principles of Practice in Musculoskeletal Rehabilitation,* Chapter 3).

The Achilles tendon, the common tendon of the gastrocnemius and soleus muscles, inserts into the calcaneal tuberosity. The tendon is enveloped by the superficial and retrocalcaneal bursae near its insertion. The Achilles tendon has a peritendon sheath rather than a synovial (paratenon) sheath. The tendon itself has an area of relative avascularity about 2 cm (1 inch) above its insertion. This is the area where partial tears with secondary nodule formation and degenerative cysts are seen in tendinosis.

Common symptoms of Achilles tendinopathy are stiffness, pain with elongation or stretching, pain under load (e.g., going up onto the toes), and pain with running. The clinical examination may reveal signs of local tenderness, crepitus, palpable nodules in the tendon or peritendon, and limited dorsiflexion ROM. Limited power at push-off is commonly noted as a result of pain and subsequent disuse atrophy. If the condition is chronic, atrophy of the calf muscles may be observed.

Treatment for acute tendinopathy, associated bursitis, and insertional tendinopathy or enthesopathy is conservative in most cases. A careful history and full lower extremity examination (including gait assessment) is important to determine whether the pathological condition is related to overuse, mechanical problem, or possible compensation for other muscle weakness. If overuse is identified as a contributing factor, alterations in training that allow for rest and recovery will be necessary. If mechanical problems are a factor, they must be corrected before recovery can occur. Impairments at both proximal[41] and distal[42] parts of the tendon have been associated with the presence of Achilles pathology. Although there are suggestions that abnormal pronation and associated movements may be related to Achilles tendinopathy,[42,43] the relationships are unclear. Hyperpronation can cause the Achilles tendon to whip or twist when the foot bears weight during running, which can cause increased torque to the tendon.[44]

Early in the treatment process, emphasis should be placed on symptom management. This should include the use of analgesic and anti-inflammatory medications and modalities, as well as rest from aggravating activities. Pain-free ROM and low-intensity strengthening exercises may be implemented early in the treatment process. Temporary heel lifts (see Figure 24-16) made from high-density foam or orthopedic felt may be used in both shoes to reduce stress on the tendon. The height of the lifts can be reduced as pain-free ROM improves.

Once symptoms are under control, progressive stretching and strengthening of the gastrocnemius and soleus muscles may be undertaken. Thermal modalities such as continuous therapeutic ultrasound can be paired with cross-friction massage to help break up tendinous nodules, which are common in patients with Achilles tendinosis. These treatments should be followed by stretching of the Achilles tendon, either in a long sitting using a towel or rope to stretch the Achilles tendon or in the standing position with the patient pushing against a wall or table (see Figure 24-5). Stretching should be done with the knee straight for the gastrocnemius muscle and then in a bent knee position to isolate the soleus muscle. Elastic bands or tubing can be used to perform resistive exercises of the muscles acting on the ankle (see Figure 24-6). Plantar flexion exercises should include open- and closed-chain exercises. Progressions should follow principles described previously for gastrocnemius strains or those outlined by Curwin (see volume 2 of this series, *Scientific Foundations and Principles of Practice in Musculoskeletal Rehabilitation*, Chapter 3). Emphasis should be placed on eccentric training of the plantar flexors.[45]

Clinicians must be alert to the possibility of **Sever's disease** in physically active children and adolescents who present with insertional heel pain. Sever's disease (Figure 24-18) is an apophysitis at the insertion of the Achilles tendon. It is most common in boys ages 10 to 12 and girls ages 8 to 10. Children with Sever's disease must stop physical activity for at least 2 weeks to allow the symptoms to resolve. Upon resolution of symptoms, emphasis must be placed on increasing the flexibility of the gastrocnemius–soleus complex and a gradual return to activity. Typically, these patients have generalized lower extremity tightness, especially in the hamstrings and hip flexors that also require stretching. Footwear considerations should be made because many of these patients participate in sports with restrictive footwear (e.g., soccer).

ACHILLES TENDON RUPTURE (THIRD-DEGREE STRAIN)

Achilles tendon ruptures can be treated either surgically or conservatively. Conservative treatment typically is more successful for sedentary individuals. Nonoperative treatment is seldom used for physically active people, because once the tendon heals after immobilization, tensile strength is reduced to about 30% of normal, and the chance of rerupturing the tendon is greater.[46] In the rehabilitation program for a conservatively treated patient, more caution must be exercised not to aggravate the healing tissue.

Figure 24-18 Radiograph reveals fragmentation of calcaneal apophysis in a child diagnosed with Sever's disease. (From Cuppett M, Walsh KM: *General medical conditions in the athlete*, ed 2, St. Louis, 2012, Mosby.)

Surgical repair of the Achilles tendon may be an open or a closed procedure, although open repair tends to have the best outcome.[47] After surgery, the patient is immobilized for 6 to 8 weeks. After complete immobilization, patients are placed in a cam walker (see Figure 24-4) with heel lifts. Over the next 4 to 6 weeks, weight bearing is progressively increased and the heel lifts are progressively reduced to neutral. The rehabilitation process follows a course similar to that for gastrocnemius strains but at a much slower pace. Special care must be taken not to stress the repaired tissue too soon. Any stretching that is done should be gentle. The foot should be kept in a neutral position (i.e., no inversion or eversion) during stretching, because this position reduces abnormal stresses on the medial or lateral sides of the tendon.

ANKLE SPRAINS

Ankle sprains are one of the most common athletic injuries and are often underestimated by both clinicians and patients. In fact, lateral ligament injuries account for 15% to 25% of all sports injuries.[48] The most common predisposition to an ankle sprain is a previous ankle sprain on the same side. For example, basketball players demonstrate recurrence rates as high as 80%.[49] Overall, up to 30% of individuals who suffer an initial ankle sprain eventually develop chronic ankle instability, which is characterized by long-standing symptoms of pain and instability.[50]

These findings indicate that the treatment of many patients with ankle sprains has been inadequate. One of the primary goals of rehabilitation should be prevention of recurrent injuries.

The lateral ligaments of the ankle are the most commonly injured (Figure 24-19). Specifically, the anterior talofibular ligament and the calcaneofibular ligament are most often affected. The mechanism of injury is plantar flexion and inversion, stressing first the anterior talofibular ligament and then the calcaneofibular ligament. The patient initially presents with pain, swelling, muscle weakness, difficulty with gait, and in some cases, joint laxity. A positive anterior drawer or inversion stress test will indicate that the lateral structures have been injured. The talar tilt is performed by inverting the rearfoot with the talocrural joint in a dorsiflexed position. This is intended to be a specific test for the calcaneofibular ligament.

Initial management should focus on decreasing inflammation and protecting the injured tissues. In the initial days after injury, the ankle should be iced for 20 minutes at least once a day (Figure 24-15, *B*). The ankle should be elevated whenever possible during the acute phase. In addition, a felt horseshoe pad should be held snugly around the lateral malleolus with a compression wrap. Alternatively, an Aircast brace (see Figure 24-2) can be used. Patients who are unable to ambulate without a limp should use crutches or a cane. The ankle should be placed in neutral dorsiflexion to keep the joint stable and decrease capsular distension. During the first 1 to 3 weeks (depending on severity), the ankle should be protected from inversion to prevent formation of type III collagen, which leads to elongation of the ligament.[51] Exercises should be focused in the sagittal plane. Early mobility is important to stimulate collagen type I formation as it responds best to tension.[52]

ROM exercises may begin within a few days of injury in even the most severe cases. Gentle active range of motion (AROM) exercises in a pain-free ROM may be performed to improve ankle mobility and also to help reduce local swelling and edema (Figure 24-20). Pain-free movement of the ankle (i.e., ankle pumps: plantar flexion–dorsiflexion) and intrinsic foot crunches (Figure 24-21) can aid venous and lymphatic fluid return via a pump mechanism of alternating voluntary contraction and relaxation of the muscles around the lower leg. Ankle pumps may be performed in a cold whirlpool to decrease pain and metabolic function in the early stages of the injury. Light isometric resistance exercises can begin in the days after injury. As pain allows, partial weight-bearing activities may be

Figure 24-22 Slant board stretching.

initiated in an effort to restore function. Wobble board exercises with the patient in the sitting position can be initiated and they can be progressed as pain allows.

Limited ankle dorsiflexion is a common occurrence after ankle sprains. Loss of dorsiflexion results in changes in functional activities such as walking and running. At least 10° of dorsiflexion is necessary for normal walking, and running requires 20° to 30° of dorsiflexion.[53,54] Traditional rehabilitation programs have emphasized stretching of the Achilles tendon on slant boards (Figure 24-22). However, talocrural joint mobilizations are also an important intervention,[55] especially if improved ROM is delayed or restrictions in capsular mobility are noted upon assessment. Mobility of the subtalar and calcaneocuboid joints should also be assessed, and joint mobilization of these joints should be used if restrictions are present (Figures 24-23 to 24-25). Posterior mobilizations of the talus on the tibia (talocrural joint) help increase dorsiflexion ROM and result in quicker return to symmetrical gait patterns than traditional treatments.[55] Posterior mobilization of the distal fibula on the tibia have also demonstrated positive results in dorsiflexion ROM.[56]

Strengthening exercises should advance from isometric contractions to isotonic exercises using elastic bands or tubing. Emphasis should be placed on eccentric training of the peroneal muscles and ankle dorsiflexors. Closed-chain strengthening exercises, including heel raises, squats, and lunges, also can be performed as tolerated. Strengthening should not be limited to the ankle, as weakness of proximal muscles has been reported.[57]

Balance exercises are a critical component in the rehabilitation for ankle sprains, particularly because they are

Figure 24-23 Distal fibular mobilization.

effective in preventing the recurrence of ankle sprains (Figure 24-26).[55–60] Single-leg exercises can be started as soon as the patient can perform weight-bearing activities without pain. Progressions can be made by altering the visual input (eyes open, then closed), surface (firm surface, then foam, then balance disc; see Figures 24-7, *A*-*C*), and arm position (arms abducted to 90°, then at the sides, then folded across chest, then catching and throwing balls).

Figure 24-24 Subtalar mobilization.

Figure 24-25 Calcaneocuboid mobilization.

Lunging and squatting exercises can be performed to train dynamic balance. In particular, the Star Excursion Balance Test has proved effectiveness (see Figure 24-7, *D*).

Shoe wear, bracing, and taping may also be important adjuncts to treatment of the lateral ankle sprain. Braces have been reported to reduce inversion velocity, and taping and high-top shoes have been reported to decrease the inversion moment when the ankle is placed in varying degrees of plantar flexion.[61–63] Everter strength has been shown to be important in the decrease of the inversion moment during weight-bearing activities.[64]

Gait training should be incorporated throughout the rehabilitation program. Emphasis should be placed on symmetrical, pain-free gait. For physically active patients, straight ahead jogging followed by running activities should be performed without pain. Once the physically active patient can run straight ahead without pain, movements requiring changes in direction should be emphasized. These may include side-to-side changes in direction and cutting maneuvers (Figure 24-27). Hopping activities also should be performed to prepare the ankle for a return to high-level functional activities. Hopping is characterized by low-amplitude quick landings on the balls of the feet, where most of force is absorbed by the ankle joint. Hopping should be performed in multiple directions in an effort to stress the joint in different planes of motion (Figure 24-28). Once hopping activities can be performed safely and without pain, more ballistic activities can be added, such as jumping and landing from a height.

Patients who suffer mild or moderate ankle sprains often return to activity within a few weeks of injury, even though the clinician knows that the injured ligaments have not had adequate time to heal. This may be the reason recurrence rates are so high. However, conclusive evidence shows that supervised rehabilitation, carried out for at least 4 weeks after an ankle sprain, can reduce the risk of recurrence by more than 50%.[65]

If an ankle sprain does not appear to be improving within the normal time frame, consideration should be given to other pathological conditions, which may require orthopedic referral. Such complications may include syndesmosis involvement (high ankle sprain), sinus tarsi syndrome, osteochondral fractures of the talus, and peroneal nerve palsy (Figure 24-29).

Ankle sprains that include damage to the tibiofibular syndesmosis and/or anterior inferior tibiofibular ligament are referred to as **high ankle sprains**. This injury is less common than lateral ankle sprains but may be seen in conjunction with lateral ankle ligament injuries. The mechanism of injury at this joint is usually one of lateral (external) rotation of the foot and medial (internal) rotation of the tibia (Figure 24-30). These high ankle sprains must be treated more conservatively than lateral ankle sprains so that the ligaments stabilizing the syndesmosis can heal. Therefore, the time frame for return to normal activities is longer for high ankle sprains than for lateral ankle sprains. These injuries should be immobilized for a minimum of 7 days after injury. If the ankle is not immobilized, the healing ligaments will be stressed repeatedly, because the wide anterior portion of the talus will spread the syndesmosis apart each time the ankle is dorsiflexed. Commonly, the average time of return to high-level functional activity after syndesmosis sprain is 6 weeks.[66]

TARSAL TUNNEL SYNDROME

Tarsal tunnel syndrome is a neuropathy of the tibial nerve where it passes posterior to the medial malleolus from the leg to the foot (Figure 24-31). The nerve may be injured acutely in conjunction with a fracture of the medial malleolus, or the condition may be an overuse injury. In the latter case, excessive pronation may contribute to traction on or compression of the tibial nerve. Symptoms typically include paresthesia on the medial aspect of the ankle extending into the plantar aspect of the foot and, in severe cases, atrophy of the intrinsic muscles of the

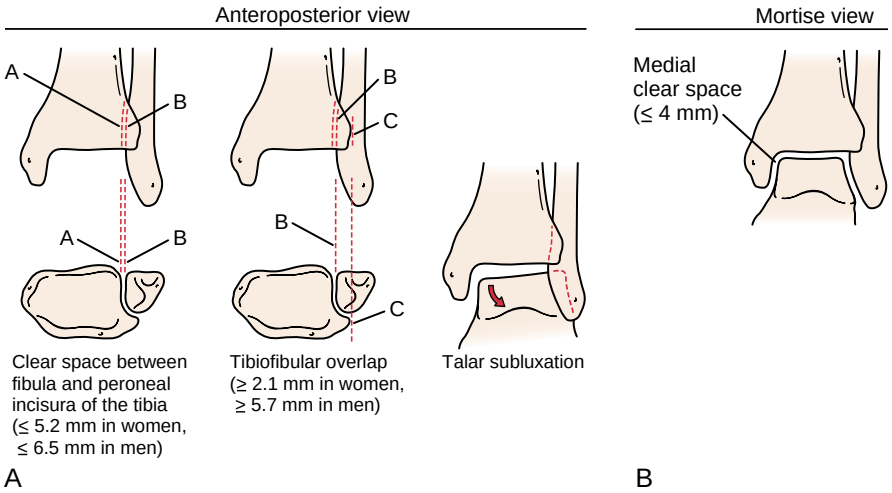

Figure 24-30 Syndesmotic radiographic criteria. A finding outside any of these criteria indicates a syndesmosis injury. **A**, Anteroposterior view. **B**, Mortise view. *A*, Lateral border of posterior tibial malleolus; *B*, medial border of fibula; *C*, lateral border of anterior tibial tubercle. Figure 24-31 Tarsal tunnel syndrome. (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 947, St. Louis, 2014, Saunders/Elsevier.)

foot. Changes in muscle function may be associated with cramping or clawing of the lesser toes. Some cases of tarsal tunnel syndrome, including those in conjunction with tibial fractures, must be treated surgically.

Conservative management of tarsal tunnel syndrome consists of anti-inflammatory medications, rest, ice, and correction of faulty foot mechanics. When excessive pronation is a contributing factor, the patient should be carefully evaluated for orthotic intervention. Strengthening may be necessary for the intrinsic muscles if muscle dysfunction is present. These exercises should include short foot exercises, barefoot single-leg balance on soft surfaces, towel curls (see Figure 24-21), marble pickups, or walking in sand. The short foot exercise[67] is performed by keeping the heel and the metatarsal heads on the floor while contracting the muscles of the longitudinal arch in an effort to lift the arch off the floor. This exercise initially can be performed in a bilateral stance and progressed to a single-leg stance for increased balance demands.

TIBIALIS (POSTERIOR) TENDINOPATHY

Posterior tibialis tendinopathy can be the result of overuse usually related to an inability to adequately control some aspect of pronation. Acute posterior tibialis tendinopathy (i.e., tendonitis) is the injury that is sometimes referred to as shin splints. This injury is seen in runners or in athletes whose sport requires a great deal of running. This is because of the role of the posterior tibialis muscle in controlling pronation eccentrically during the loading phase of gait. The demand on this muscle (and others) becomes increased during running because the joint excursions, velocities, and forces are significantly increased.[68] Posterior tibialis tendinopathy may also result after the tendon has remained in a shortened position for a period of time. This can be the result of immobilization after fracture, a plantar-flexed posture of the rearfoot, or a cavus medial longitudinal arch.

In patients with posterior tibial pathology, there is usually tenderness just posterior to the medial malleolus and perhaps proximally along the posteromedial portion of the tendon on the tibia (Figure 24-32). If pain is significant along the tibia, the pathology should be differentially diagnosed from MTSS, which is more likely referred to as shin splints.[69] Additionally, the presence of paresthesia or radicular pain in the foot may indicate the presence of a tarsal tunnel syndrome. The patient with posterior tibialis

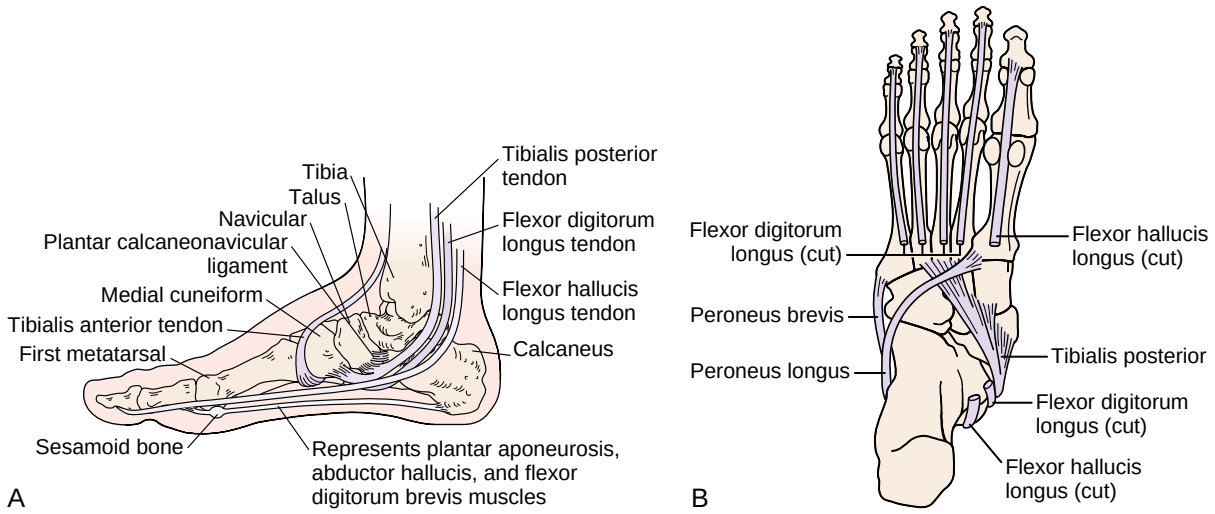

Figure 24-32 Posterior tibialis tendinopathy. **A**, Pathway of tibialis posterior. **B**, Plantar view of the right foot shows the distal course of the tendons of the peroneus longus, peroneus brevis, and tibialis posterior. The tendons of the flexor digitorum longus and flexor hallucis longus are cut. Note the force couple relationship between the two peroneal muscles and tibialis posterior to control inversion and eversion along with the long flexors and extensors. In both **A** and **B**, note how insertion of the tibialis posterior and tibialis anterior control pronation. (**A** from Magee DJ: *Orthopedic physical assessment*, ed 6, p 904, St. Louis, 2014, Saunders. **B** redrawn from Neumann DA: *Kinesiology of the musculoskeletal system: foundations for physical rehabilitation*, St. Louis, 2010, Mosby.)

tendinopathy may also report pain with palpation over the navicular, pain with resisted plantar flexion and inversion, and pain with passive eversion and dorsiflexion. Passive dorsiflexion and eversion can be accomplished functionally with relaxed single-leg stance.

Management of posterior tibialis tendonitis can be challenging because the foot must pronate (and supinate) even during normal ambulation. Therefore, completely decreasing stress on the tendon may be impossible without immobilization or casting. However, this is usually not a necessary nor desired treatment management strategy. The acute phase of rehabilitation should include management of pain and any swelling. Rest or complete cessation of activity appears to be the best for the patient in the acute stage. The patient may still remain active during this stage through cross-training as long as the activity does not increase the symptoms at the posterior tibialis tendon. Nonsteroidal anti-inflammatory drugs, ice, and other inflammation-reducing modalities are also beneficial during this stage.

Passive ROM for eversion and dorsiflexion should be the focus of the next stage of treatment. However, care should be exercised because excessive passive loading of the tendon can result in prolonged healing of the tissue. Regaining a normal resting length of the tendon is imperative in restoring the patient to normal function. Although deterioration of pain and other symptoms should guide treatment, increasing passive ROM is important, because decreased tendon length will likely be a main limiting factor to progress if not regained early. If increased pronation is a major mechanical problem leading to symptoms, this is a good time in the treatment to introduce some support to the medial longitudinal arch. Arch taping (Figure 24-33) or over-the-counter foot orthotic devices

Figure 24-33 Arch taping.

may help temporarily while custom-molded orthoses are being fabricated. Because posterior tibialis pathology is so often associated with *excessive* pronation, external devices such as custom-molded orthoses may be necessary to control excess motion in the midfoot and rearfoot.

CKC activities and eccentric strengthening are the goals of the final stage of rehabilitation. Single-leg standing eccentric controlled heel drops loads the posterior tibialis tendon in a functional situation (Figure 24-34). Wobble boards in both a clockwise and counterclockwise

Figure 24-34 Eccentrically controlled heel drops.

direction provide training of multidirectional control of pronation and supination. Sidestepping and cariocas away from the affected side place increased eccentric demand on the tibialis posterior tendon. Finally, controlled landing activities from progressively increasing step heights train the patient to control pronation during running, and landing from a jump.

PERONEAL TENDINOPATHY

Peroneal tendinopathy is a result of overuse of either the peroneus longus or peroneus brevis tendons (Figure 24-35).

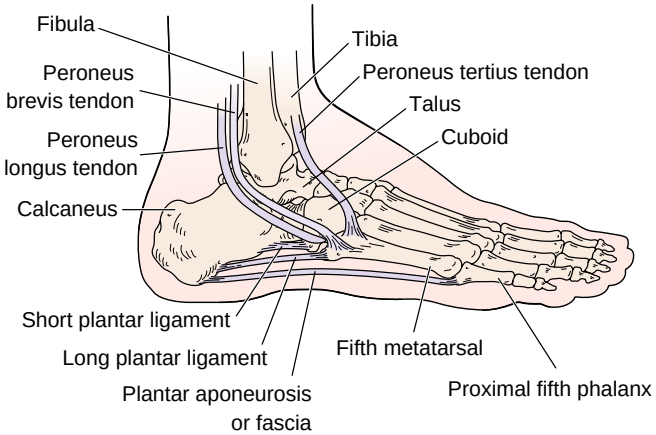

Figure 24-35 Supports of the lateral longitudinal arch of the foot, including peroneal tendons: plantar aponeurosis (including the abductor digiti minimi and the flexor digitorum brevis IV and V); long plantar ligament; short plantar ligament. (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 904, St. Louis, 2014, Saunders.)

This injury is most often seen in conjunction with lateral ankle sprains and may be the cause or the result of lateral ankle instability. However, isolated peroneal tendinopathies are somewhat rare. Peroneal tendinopathy differs in its mechanism of injury depending on whether the longus or the brevis is involved. Peroneus brevis involvement is more commonly associated with supination overuse as it is stressed in the inverted position of the foot and ankle. A slightly different mechanism is usually attributed to peroneus longus tendinopathy. Like the brevis, the peroneus longus plantar flexes and everts the foot running beneath the plantar surface of the foot to attach to the first metatarsal (see Figure 24-32, *B*). Hypermobility of the first ray allows for excessive dorsiflexion, which forces the forefoot into pronation during weight-bearing activities. Therefore, the inability to control pronation by the peroneus longus may result in overuse.

Tenderness to palpation distal and posterior to the lateral malleolus is most common in peroneal tendinopathy.[70] The patient may also be tender proximal to the malleolus and, depending on the structure involved, at the base of the first or fifth metatarsal. Regardless of the specific structure, the patient will experience pain with resisted plantar flexion and eversion. Passive inversion and dorsiflexion may be painful for the peroneus brevis and likely the peroneus longus. Passive first metatarsal dorsiflexion also may be painful if the peroneus longus is involved.

The acute phase of rehabilitation should include management of any swelling and pain. Taping or bracing may help prevent the tendon from further tension injury, especially if any instability or weakness is present. After the acute phase, passive ROM and concentric resistive exercises should begin. Often, a muscle imbalance has developed, so stretching and strengthening antagonists such as the tibialis anterior and posterior muscles may be necessary, especially in the patient with a cavus foot. Eccentric and concentric training of first ray plantar flexion may also be beneficial. However, it is likely that the patient with a hypermobile first ray will not be able to gain enough dynamic strength to control forefoot pronation, and an orthosis or metatarsal support may be necessary.

Functional activities should complete the rehabilitation of the patient with peroneal tendinopathy. Single-leg standing exercises advancing to transverse plane rotations should be included, because patients must regain eccentric control during functional activities. This is especially important in athletes with associated lateral ankle sprains, because they will have decreased proprioceptive ability.[71] Wobble boards and minitramp standing with a ball toss will help control eccentric supination or pronation (see Figure 24-26, *A*). If instability or decreased proprioception remains toward the end of rehabilitation, taping or orthoses may be necessary in order for the athlete to return to play safely.

PLANTAR FASCIITIS

Plantar fasciitis is the result of stress injury to the plantar fascia and typically causes symptoms near its calcaneal origin. The plantar fascia normally stabilizes and locks the foot in supination before push-off. The plantar fascia is put under strain by the "windlass mechanism," which occurs during push-off when the metatarsophalangeal joints are hyperextended. It also is stressed by hyperpronation of the foot, as the medial longitudinal arch collapses. The condition is found in both rigid and hypermobile feet. Decreased flexibility in the gastrocnemius–soleus complex is commonly found, especially if the condition is seen in the cavus foot. A periosteal reaction at its origin can result in hemorrhage and, ultimately, a heel spur. In many cases, heel spurs (Figure 24-36) are asymptomatic, but if present, they are a sign of stress overload to the plantar fascia.

Biomechanical abnormalities of the foot may be significant contributing factors in the development of plantar fasciitis. Excessive pronation and the resulting stretch and wringing of the plantar fascia during the stance phase can lead to straining of these tissues. If tight posterior muscles limit dorsiflexion, they may force the rearfoot into pronation or the midfoot into dorsiflexion about the oblique midtarsal joint axis. These pathomechanics result in excessive stress on and subsequent injury to the plantar fascia.

Treatment of plantar fasciitis is aimed at reducing the inflammation and the tension on the plantar fascia, restoring tissue strength and mobility, and controlling any biomechanical abnormality. Inflammation can be controlled with ice, anti-inflammatory medication, and in recalcitrant cases, local corticosteroid injection.[72] A combination of arch taping (see Figure 24-33), low-dye taping (Figure 24-37), and/or off-the-shelf orthotics can help hold the foot in a neutral position and protect the plantar tissues from constant irritation during the early stages of rehabilitation.

Figure 24-36 Heel spur. (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 959, St. Louis, 2014, Saunders.)

Gastrocnemius and soleus muscle stretching is important to increase dorsiflexion and to prevent the foot from going into increased pronation to compensate for the lack of dorsiflexion in the ankle. Heel lifts, heel cups, modified arch taping, massage of the plantar fascia, joint play mobilizations, and assessment for proper footwear all are important in the management of plantar fasciitis. Assessment and mobilization of the joints of the ankle and foot also are important. Of particular interest are the talocalcaneal joint, which often needs mobilization into adduction, and the talonavicular joint, which needs good translation of the navicular inferiorly on the talus. All other joints of the foot should be assessed, and mobilization should be performed as needed.

If morning stiffness persists, a night splint to maintain dorsiflexion of the plantar fascia may be useful (Figure 24-38). With the rare persistent case, surgical consultation is required. Surgery involves release of the plantar fascia at its origin, removal of heel spurs, and exploration for nerve entrapment in scar tissue.

In some instances, an acute sprain of the medial longitudinal arch (plantar calcaneonavicular or "spring" ligament) may occur distal to the origin of the plantar fascia (Figure 24-39). The medial longitudinal arch is maintained by its bony arrangement, ligaments, and muscles and by the plantar fascia. The soft tissue may become overloaded during weight bearing, resulting in a sprain, often leading to the navicular bone being forced downward as a result of the weight of the body on the foot. This injury may lead to hyperpronation and lower extremity dysfunction. Clinicians should treat the symptoms and restore proper foot mechanics, which may involve intrinsic foot exercises (including the adductor hallucis muscle), proper-fitting footwear, and orthotics.

The spring ligament runs from the sustentaculum tali on the medial side of the calcaneus to the navicular tuberosity. This injury is common in runners and is often seen in conjunction with tibialis posterior tendonitis or dysfunction. The mechanism of injury of this structure is usually traumatic but can also be related to pronation. It is important to differentially diagnose this structure from the plantar fascia, tibialis posterior tendon or peroneus longus tendon. Management of spring ligament sprains is usually conservative and can be difficult if the true cause of the pathology is not determined. The injury is usually traumatic, and the patient will usually describe a hard landing on an uneven surface, which forces the forefoot into dorsiflexion or pronation. The patient will be tender

Figure 24-37 Low-dye taping. (From Nawoczenski DA, Epler ME: *Orthotics in functional rehabilitation of the lower limb*, Philadelphia, 1997, Saunders.)

directly over the spring ligament with deep palpation. Superficial palpation may not elicit complaints. However, there may be a visible and palpable swelling over the area. The patient will likely have no pain with resisted plantar flexion when the rearfoot is neutral, everted, or inverted. Direct tension placed on the spring ligament through passive dorsiflexion of the midtarsal joints may be painful. Finally, patients will usually report discomfort during single-leg standing. They may also often present with a pronated midfoot posture.

The acute phase of rehabilitation should include management of any effusion and pain. Any painful activity should be avoided, and weight-bearing status should be monitored. The patient may benefit from a short period of non–weight bearing if symptoms persist. Lack of motion is not an issue in these patients. In fact, these patients usually have an increased amount of midfoot motion, and further treatment should focus on stabilization of the midfoot.

Once the acute phase of rehabilitation is complete, progressive resistive exercises should be the focus. Special attention should be paid to the strength of the tibialis anterior, tibialis posterior, and peroneus longus muscles. Arch taping or foot orthoses may decrease tension to the structures supporting the medial longitudinal arch. Taping and orthotic management should focus on placing the forefoot in an adducted and plantar flexed position relative to the rearfoot.

CKC activities and return to full function are the goals of the final stage of rehabilitation. Activities that focus on the functional strength of the tibialis posterior and peroneus longus muscles should be included. Single-leg standing on uneven surfaces or on the minitramp will aid in training these muscles. Balance beam activities focusing on eccentric control of pronation may also be beneficial. Long term, patients should be aware of any dorsal foot pain that occurs, because this can be a result of midfoot hypermobility and early dorsal compression syndrome.[73] As the midfoot deforms under load, it is capable of moving in three planes. A mobile midfoot would have a low (medial-lateral) oblique axis and therefore, would have a greater component of dorsiflexion available. Because the bony architecture of the midfoot does not allow for sagittal plane motion, the dorsal surfaces of the cuboid, navicular, and cuneiforms are likely to abut and result in potential chondral or arthritic changes.

MIDFOOT SPRAINS

Sprains to any of the numerous joints between the distal tarsal bones and the bases of the metatarsal heads can lead to considerable instability and disability. Injuries to the first and second tarsometatarsal joints (Lisfranc's joint) can be particularly problematic. This injury often occurs with landing from a height or a jump or rotating on a planted forefoot, resulting in a sprain of the ligaments stabilizing the tarsometatarsal joints and a diastasis, or widening, of the bases of the first and second metatarsals. In severe cases there may be accompanying fractures, and some cases may require surgical intervention.

Many cases are treated conservatively. Initial treatment must emphasize protection of the healing tissues. This early treatment often consists of immobilization in a walking boot (see Figure 24-4) for several weeks. After the boot is removed, an orthotic should be used to provide mechanical stabilization to the midfoot. Rehabilitation should address plantar intrinsic muscle strength and should emphasize the restoration of normal gait mechanics.

NAVICULAR FRACTURES

Fractures of the navicular bone are rare but can be very difficult to diagnose and treat. Injuries include complete fractures, stress fractures, and in skeletally immature patients, traction apophysitis. Fractures and stress fractures of the navicular are notorious for being nonunion fractures.[74] Prolonged immobilization (not modified rest) and bone stimulators are often needed to aid the healing of these fractures. Once the fracture has healed, rehabilitation should emphasize the restoration of ankle and foot ROM, strength, and endurance, as well as normal gait mechanics.

Physically active adolescents, particularly those with excessive foot pronation, can develop traction stress at the insertion of the tibialis posterior into the navicular. Many, in fact, have an accessory navicular bone that develops a traction irritation at the fibrous attachment to the main body of the navicular. This is most commonly seen in patients who participate in sports involving running, jumping, and change of direction (e.g., dancers). The differential diagnosis must always include a stress fracture, which can be determined by bone scan or computed tomography scan. Treatment is directed at inflammation and pronation control through the use of orthotics and appropriate shoes for motion control. Resistant cases of symptomatic accessory navicular irritation may require surgical resection with reattachment of the tibialis posterior tendon to the main body of the navicular.

Clinicians must be cautious of pain at the navicular bone in children 4 to 9 years of age. **Kohler's disease** is an avascular necrosis of the navicular bone that occurs in children, especially boys (Figure 24-40). Rest is the most important treatment for Kohler's disease, although a long leg cast sometimes is needed to accomplish this in an

Figure 24-40 Kohler's disease showing affected navicular (*arrow*). **A**, Anteroposterior view. **B**, Lateral view. (From Chambers HG, Haggerty CJ: The foot and ankle in children and adolescents, *Op Tech Sports Med* 14:173-187, 2006.)

active child. This condition typically resolves on its own, with no lasting effects.

METATARSAL FRACTURES

The most common fractures of the metatarsals involve the second or third metatarsal (**march fracture**) (Figure 24-41) and the shaft of the fifth metatarsal just proximal to the styloid process (**Jones fracture**) (Figure 24-42).[75] Metatarsal stress fractures occur most often in the second and third metatarsals and are common in those who engage in running and jumping sports. Common causative factors, as initially proposed by James et al.,[76] include training errors, changes in exposure to different surfaces, strength/flexibility dysfunction, poor shoes, and biomechanical variants, such as excessive rearfoot and forefoot varus. Crichton et al.[77] noted that the second metatarsal is the most prone to stress fracture because the base of the second metatarsal extends proximally into the distal row of tarsal bones and is held rigid and stable by the bony architecture and ligament support. In addition, if the second metatarsal is longer than the first, as is seen with the Morton-type foot, it theoretically is subject to greater bone stress. Also, in a hypermobile forefoot, the second and third metatarsals are subjected to more rotational stress associated with excessive foot pronation.

These stress fractures heal well when treated for 4 to 6 weeks with modified rest and non–weight-bearing exercise (e.g., cycling, swimming, running in water), which maintain the patient's cardiovascular fitness. A gradual return to running and jumping activities with supportive footwear and orthotics is important in the postimmobilization stage in an attempt to reduce risk of reinjury.

A Jones fracture may be an acute fracture that occurs during sudden changes in direction, or it may be an overuse injury. Overuse injuries are especially common in individuals with rigid, cavus feet. Like navicular fractures, Jones fractures often result in nonunion and must be treated surgically.[78] As with other overuse foot injuries, appropriate shoes with adequate stability and shock absorption are essential for returning the individual to high-level functional activity. Attention must also be given to foot control, if necessary, through the use of orthotics. Rehabilitation should emphasize restoration of ankle and foot ROM, strength, and endurance, as well as normal gait mechanics.

METATARSALGIA

Metatarsalgia is a general term for forefoot pain in the area of the lesser metatarsal heads. However, this common term is nondescript and does not identify the specific source of pathology. Two common causes of metatarsalgia are transverse metatarsal arch sprains and Freiberg's infarction.

Transverse Metatarsal Arch Sprain

Transverse metatarsal arch sprains may be caused by an acute or chronic mechanism of injury. The plantar ligaments supporting the arch are injured, allowing the adjacent metatarsal heads to excessively plantar flex or drop and can lead to clawing of the toes. This can irritate the

Figure 24-41 March stress fracture. **A**, Early findings. In this patient with exercise-induced foot pain, periosteal new bone formation envelops the third metatarsal diaphysis (*open arrows*). No fracture line is seen. **B**, Later findings. In this 34-year-old woman who recently began a jogging program, observe the fatigue fractures of the second and third metatarsal shafts. The findings include transverse radiolucent fracture lines (*arrows*) with surrounding periostitis (*open arrows*). Stress fractures commonly affect the metatarsal bones and accompany marching, ballet dancing, prolonged standing, foot deformities, and foot surgery. The middle and distal portions of the second and third metatarsals are most commonly affected. Such fractures, referred to as march fractures, may be imperceptible radiographically in the early stages. Bone scans, magnetic resonance images, or serial radiographs are often necessary to confirm the diagnosis. Stress fractures of the metatarsal heads are less common than those of the shaft and neck and are more frequently overlooked. (From Taylor JAM, Hughes TH, Resnick D: *Skeletal imaging: atlas of the spine and extremities*, ed 2, St. Louis, 2010, Saunders.)

Figure 24-42 Jones fracture. (From Porter DA, Schon LC: *Baxter's the foot and ankle in sport*, ed 2, Philadelphia, 2008, Mosby.)

metatarsal heads and the subcutaneous tissues on the plantar aspect of the foot. A metatarsal felt pad placed just over the second to fourth metatarsal heads can be used to support the injured structures. If metatarsophalangeal extension is present, suggesting intrinsic weakness, exercises emphasizing strength of the plantar intrinsic muscles should be performed as well.

Freiberg's Infarction

Freiberg's infarction is a painful avascular necrosis of the second or, rarely, the third metatarsal head (Figure 24-43). It typically is seen in adolescents or young adults, who often are involved in running and jumping activities. Early radiographs may be normal, with later development of flattening of the involved metatarsal head. If the condition is caught early, deformity of the metatarsal head, which leads to early degenerative changes, can be prevented. Early treatment consists of exercise modification to eliminate excessive running and jumping plus orthotic foot support with a metatarsal pad or bar to unload the involved metatarsal head. A rocker bar on the shoe may also be required. If pain persists and deformity develops with degenerative osteophytes, surgical consultation is appropriate. Surgical management involves either a cheilectomy (cutting away of bony irregularities on the rim of the affected joint and capsular release) or, with more extensive damage, resection arthroplasty.

Figure 24-43 Radiographic appearance of Freiberg infarction (*circled area*). (From Miller MD: *Review of orthopeadics,* ed 6, Philadelphia, 2012, Saunders.)

MORTON'S NEUROMA

Morton's neuroma, or **interdigital neuritis**, is an injury to one of the common digital nerves as it passes between the metatarsal heads. The classic location is between the third and fourth metatarsal heads, where the nerve is thickest, receiving both branches from the medial and lateral plantar nerves. The digital nerves enter the forefoot between the superficial and deep transverse metatarsal ligaments in the interdigital space. Nerve irritation can then occur, with compression between the metatarsal heads. Narrow shoe width is often cited as a predisposing factor, because women are diagnosed with this pathology more often than men. A flat transverse metatarsal arch and/or excessive foot pronation can also be predisposing factors, with more metatarsal shearing forces occurring with the prolonged forefoot abduction.[79]

Morton's neuroma must be differentially diagnosed from a march stress fracture. Symptoms include a burning paresthesia in the forefoot, often localized to the third web space and radiating to the toes. The symptoms are increased with hyperextension of the toes on weight bearing, as in squatting, stair-climbing, or running. Additionally, the symptoms may be worse in shoes with a narrow toe box and higher heels. With ongoing nerve irritation and surrounding fibrous reaction or neuroma formation, the pain can become constant. Treatment is aimed at reducing inflammation and unloading the interspace between the bones. Anti-inflammatory medications and modalities may be used in an attempt to provide a local reduction in inflammation. Local corticosteroid injections may be helpful, along with an orthotic to prevent excessive pronation and a metatarsal pad to restore the transverse arch and separate the metatarsal heads.[80] Shoes with low heels and a wide toe box are essential. Failure of conservative management requires surgical excision of the neuroma, which is best done with a dorsal incision.

FIRST RAY INJURIES

Injuries to the first ray (big toe) are particularly problematic because the center of force distribution goes through the first ray during the terminal parts of stance and push-off in the gait cycle. Specific injuries include sesamoiditis, hallux valgus, hallux rigidus, and turf toe.

Sesamoiditis

Sesamoiditis involves trauma to the sesamoid bones in the tendons of the flexor hallucis brevis at its attachments to the base of the proximal phalanx of the hallux on the plantar aspect of the foot. This trauma can include a stress fracture, contusion, osteonecrosis, chondromalacia, or osteoarthritis of the sesamoid bones as they slide over and articulate with the head of the first metatarsal. Weight bearing on the toes increases the stress across the sesamoid bones. The patient reports localized tenderness to the medial (tibial) or lateral (fibular) sesamoid, with localized swelling and pain on weight bearing that increases when on the toes. The diagnosis typically is confirmed with a bone scan.

The sesamoid bones are imbedded within the tendon of the flexor hallucis brevis. Sesamoiditis does not refer to the direct inflammation of the bones themselves but rather the soft tissue surrounding the bones. Most individuals with sesamoid pain are those with a cavus foot. These individuals usually present with a rigid midfoot and forefoot and a plantar-flexed first ray.[81] However, individuals who pronate and place excess force on the medial side of the first metatarsophalangeal joint during push-off are also susceptible to sesamoiditis. The pathology can result from repetitive trauma as described earlier or an acute incident of high impact (i.e., landing from a jump).

Because the medial sesamoid is most often involved, radiographs may be inconclusive as to whether a fracture is present and contributing to symptoms. Tenderness to palpation over the involved sesamoid is most often present and may also present with a thickening or swelling of the tendinous sheath. The patient will be painful upon weight bearing, especially with the shoes off. Passive or active dorsiflexion of the first metatarsophalangeal joint will be painful. In addition, rising onto the toes may be painful or difficult for this patient.

The acute phase of rehabilitation should include controlling pain and decreasing first metatarsophalangeal dorsiflexion ROM. Taping the joint in neutral or slight plantar flexion decreases the stress on the flexor tendons and weight bearing on the sesamoids. Additionally, plantar flexion of the first ray should be minimized because this imparts a relative dorsiflexion at the first metatarsophalangeal joint.[70] Therefore, a metatarsal pad placed just proximal to the first metatarsal head will limit plantar flexion of the first ray. Decreasing heel height, especially

in women's shoes, will also decrease the amount of first metatarsophalangeal dorsiflexion.

Management of sesamoiditis is usually handled with orthoses or shoe inserts. Because the symptoms are often a result of a structural deviation, support of the first ray in either a supinated or pronated foot is important. A metatarsal pad under the first ray may be enough to support the medial column. However, in more severe cases, a full custom-molded orthotic device with significant medial midfoot support may be necessary. Cutouts in the orthosis under the first metatarsal head may also decrease pressure on the sesamoids.[82]

Hallux Valgus

Hallux valgus is a condition that has a hereditary factor and is often familial. It is usually seen in patients with excessive foot pronation who use narrow footwear. Hallux valgus may occur with widening of the forefoot on weight bearing, resulting in increased laxity of the ligaments of the forefoot, particularly of the first and fifth metatarsal heads.[83] The metatarsal angle increases with hallux valgus from 1° to 2° to approximately 12°, resulting in increased valgus deviation of the great toe toward the second toe. With this altered position, and with pronation and/or compression by footwear, the clinician can see the development of a callus, an exostosis, and a bursa thickening (all three make up a bunion) on the lateral side of the first metatarsal head. Treatment is directed at controlled foot pronation using an orthotic and motion control footwear with adequate forefoot width. The callus can be trimmed, and icing and other modalities (e.g., ultrasound) can be used to treat the bursitis. If not treated adequately, hallux valgus will continue to progress and often is treated surgically if severe and painful.

Hallux Rigidus

Hallux rigidus is a disabling condition associated with decreased ROM at the first metatarsophalangeal joint accompanied by degenerative changes in the joint. Extension usually is reduced more than flexion, which makes climbing stairs extremely painful. Hallux rigidus is most frequently the result of repeated trauma, but it also can be seen after joint immobilization for a single traumatic episode or infection. The condition progresses, with increasing restriction of joint motion. Radiographic films confirm the hypertrophic degenerative features, such as joint space narrowing, often dorsal osteophytes,

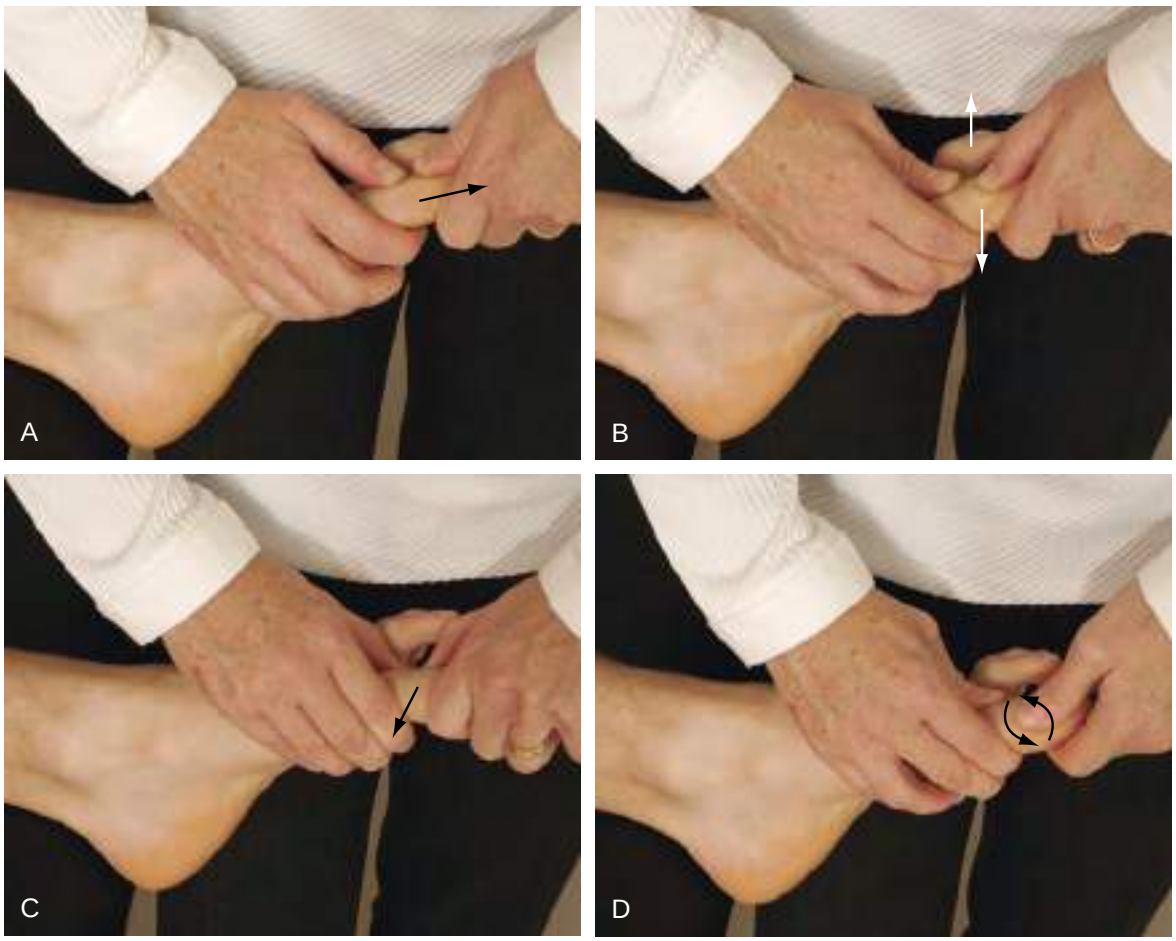

Figure 24-44 Joint play movements at the metatarsophalangeal and interphalangeal joints. **A**, Long-axis extension. **B**, Anteroposterior glide. **C**, Side glide. **D**, Rotation. (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 951, St. Louis, 2014, Saunders.)

TABLE 24-5

Non–Weight-Bearing and Partial Weight-Bearing Exercises That May be Initiated When Patients with First Ray Injuries are Unable to Bear Full Weight

Body Position	Exercise
Long sitting	• Open-chain toe extension active range of motion (AROM) • Open-chain toe flexion AROM
Seated with foot flat on floor	• Open-chain toe extension AROM (lift toes off floor while keeping heel on floor) • Closed-chain toe extension AROM (lift heel off ground while keeping toes on floor) • Closed-chain toe flexion AROM (clawing) • Closed-chain circumduction (lift heel off ground and put weight on lateral forefoot; roll from lateral to medial and then lateral again, making a complete circle around the ball of the foot)

Modified from Sammarco JG: How I manage turf toe, *Phys Sports Med* 16:113-118, 1988.

transverse joint space widening, and subchondral bone sclerosis. In late stages, as the metatarsophalangeal joint stiffens, hyperextension may be noted at the interphalangeal joint. Treatment is similar to that for turf toe.

Turf Toe

"Turf toe" is a sprain of the first metatarsophalangeal joint that typically occurs when the great toe is forced into hyperextension. It is often associated with sports played on artificial turf when a player catches the toe in a seam, but the condition also is common in those in the performing arts, such as ballet. Treatment is aimed at reducing the inflammation, protection, and restoration of normal ROM. Anti-inflammatory and analgesic medications and modalities (e.g., ice, iontophoresis) can be used in the early stages after injury. ROM exercises are used early on, with at least 10° of extension required for walking and stair-climbing. ROM exercises can be performed in a cold whirlpool, or contrast baths may be used during the inflammatory stage.

Passive joint mobilizing techniques can be effective for pain relief, starting with accessory (joint play) movements and moving into physiological movement patterns when accessory movements are pain free (Figure 24-44).[84] Sammarco[85] outlined a non–weight-bearing exercise program for rehabilitation of turf toe that involves stretching and strengthening (Table 24-5); this program is also useful for hallux rigidus. The program is combined with taping of the big toe to prevent hyperextension. If normal ROM cannot be achieved, an orthotic with a rocker bar or a stiff-soled shoe with a rocker bar may be used to allow a pain-free gait. When the individual returns to activity, a properly fitted shoe with a stiffer sole should be used. The shoe can be combined with taping or a stiff insert to prevent hyperextension at the metatarsophalangeal joint. If an orthotic or shoe modification fails to provide relief, surgical consultation is needed. Cheilectomy is the usual procedure because it improves ROM without sacrificing joint stability.

SUMMARY

The rehabilitation of patients with foot, ankle, and lower leg injuries should emphasize a return to functional mobility with early attention to healing tissue. Because the foot is the contact point with the ground, changes here often result in changes further up the kinematic chain. Understanding injuries and rehabilitation at the foot and ankle can help understand injuries throughout the entire lower extremity. Rehabilitation of foot, ankle, and lower extremity injuries is challenging and requires attention to ROM, strength, balance, and functional activities. Finally, attention to sport-specific activities is crucial for full, safe return to play.

CHAPTER 25

Peripheral Nerve Injuries

CAROLINE DRYE TAYLOR, RAFAEL ESCAMILLA, JAMES E. ZACHAZEWSKI*

INTRODUCTION

Peripheral nerve injuries occur infrequently compared with the multitude of other injuries with which the physician, physical therapist, or athletic trainer must contend. Because they are infrequent, they may be overlooked in the process of differential diagnosis. The authors' purpose in writing this chapter is to alert clinicians to a class of injuries that, although infrequent, can have potentially devastating functional implications.

There is increased documentation in the literature regarding the incidence of peripheral nerve injuries, particularly in literature related to surgery, athletic injuries, and trauma. Krivickas and Wilbourn[1] reviewed more than 200 cases and reported that 86% of peripheral nerve injuries in athletics occurred in the upper extremity. More than one third of those injuries were sustained by individuals playing American football, and the most common injury was to the brachial plexus. Takazawa et al.[2] reviewed 9550 injuries treated over a span of 95 years at the clinic of the Japanese Athletic Association. During that period, only 28 cases of peripheral nerve injury were documented. This contrast may be due to the different type of sports or athletic activities in each study and within different cultures. Hirasawa and Sakakida[3] reviewed 18 years of experience with peripheral nerve injuries and reported that only 5.7% (66 of 1167 cases) were associated with athletes. The brachial plexus was involved most often, accounting for 24.2% of injuries (16 of 66). However, this study did not include high-contact sports, such as American football.

Noble et al.[4] reported a prevalence of peripheral nerve injuries of 2.8% in a trauma population of 5777. In this study 83% of the patients were male, and a motor vehicle accident (MVA) was the most common cause of injury (46%). The most frequently injured nerves were the radial nerve in the upper extremity and the common fibular (peroneal) nerve in the lower extremity. A study of war wounds sustained by British soldiers in Iraq and Afghanistan reported that of 261 peripheral nerve injuries sustained by 100 consecutively injured men and women, 63% were caused by explosions. The main nerves injured were the ulnar, common fibular (peroneal), and tibial nerves. Nerve injuries were highly associated (82%) with open wounds.[5]

Peripheral nerves may be vulnerable during surgery as a result of prolonged pressure from patient positioning or retraction of surrounding tissues. A study in 1999 by the American Society of Anesthesiologists evaluated more than 4000 adverse anesthetic outcomes from the files of professional liability insurance companies, and nerve damage was the second most common cause of claims, accounting for 16% of cases.[6,7] Injury to the ulnar nerve occurs in as many as 1 in 200 adult surgical cases and is more common in men than in women.[7] Injury is caused by direct trauma when surgery is performed near the cubital tunnel (e.g., during ulnar collateral ligament reconstruction surgery) or the wrist or from compression of the nerve as a result of poor upper extremity positioning. The likelihood of sciatic nerve injury during total hip arthroplasty (1.3%) increases if there is a preexisting congenital hip dysplasia or dislocation (5.2%) or in cases of revision of prior hip arthroplasties (3.6%).[8]

During normal joint and body movements, the normal nervous system adapts to tensile, shear, and compressive loads. This requires gliding (i.e., excursion) relative to adjacent structures, stretching (by increasing strain), and a capacity to tolerate compression from adjacent or external structures, all the while maintaining its ability to transmit neural impulses.[9] However, when these loads become excessive, axonal transport and intraneural blood supply may decrease, producing peripheral nerve injuries and concomitant signs and symptoms. These are discussed in detail later in this chapter. Various nervous system mobilization techniques have been developed and are also described; and these can be used for both diagnostic purposes and conservative treatment to restore the normal biomechanical function of the nervous system.[10] Mobilizing the nervous system may reduce edema and central sensitization, and the mechanical effects of nerve excursion (i.e., gliding) may gradually result in a normally functioning nervous system.[11]

*The authors, editors, and publisher wish to acknowledge Robert J. Nee for his contributions on this topic in the previous edition.

ETIOLOGY

Injury to a peripheral nerve can occur by means of several mechanisms: stretching, compression (i.e., sustained compression or blunt trauma), friction, inflammation, or laceration. The clinical results of stretching or compression of the nerve vary depending on whether the insult has a rapid onset or is the result of a gradual change. A sudden insult does not allow for any adaptive change in the connective tissue of the nerve and is more likely to cause acute disruption of the nerve's blood supply or connective tissue. Conversely, the nerve can adapt amazingly well to a slow increase in tensile or compressive forces, such as that brought on by a growing osteophyte.[12] A classification of peripheral nerve injuries is presented in Table 25-1.[13–16]

Mechanisms of Peripheral Nerve Injury

- Stretching
- Compression
- Friction
- Inflammation
- Laceration

Compression of the nerve can be caused by external sources or by swelling (e.g., inflammation) with a concomitant increase in pressure in a rigid compartment (e.g., carpal tunnel syndrome [CTS] compressing the median nerve at the wrist or anterior compartment [exertional] syndrome of the leg compressing the deep fibular [peroneal] nerve).[17] A nerve can be directly compressed,

TABLE **25-1**

Classification of Nerve Injuries[13–16]

TYPE	FUNCTION			
Seddon's Classification	**Sunderland's Classification**	**Pathological Basis**	**Possible Causes**	**Prognosis**
Neurapraxia	**Type 1:** • Focal conduction block • Primarily motor function and proprioception are affected • Some sensation and sympathetic function possibly present	• Local myelin injury, primarily larger fibers • Axonal continuity • No Wallerian degeneration	• Electrolyte imbalances • Deformation of myelin sheaths • Ischemia caused by compression or traction	• Recovery within minutes, hours, or days if lesion was caused by anoxia or ionic imbalances • Mechanical compression or stretch may recover in weeks to months
Axonotmesis	**Type 2:** • Loss of nerve conduction at injury site and distally	• Disruption of axonal continuity with Wallerian degeneration • Connective tissue elements of the nerve remain intact	• Compression	• Axonal regeneration required for recovery • The length of time for regeneration will depend on the distance of the injury from the end of the nerve • Good prognosis
	Type 3: • Loss of nerve conduction at injury site and distally	• Loss of axonal continuity and endoneurial tubes • Perineurium and epineurium preserved	• Compression	• Disruption of endoneurial tubes, hemorrhage, and edema, producing scarring • Axonal misdirection possible • Poor prognosis • Surgery possibly required
	Type 4: • Loss of nerve conduction at injury site and distally	• Damage to endoneurium and perineurium • Epineurium remains intact	• Compression	• Intraneural scarring and axonal misdirection • Poor prognosis • Surgery required
Neurotmesis	**Type 5:** • Loss of nerve conduction at injury site and distally	• Severance of entire nerve	• Compression • Traction • Laceration	• Surgical resection and repair only means of recovery; full recovery unlikely • Factors that affect extent of recovery: nerve injured, level at which nerve is damaged, extent of injury, time elapsed since injury, patient's age

Modified from Dumitru D: *Electrodiagnostic medicine,* Philadelphia, 1995, Hanley & Belfus.

such as when the tibial nerve is entrapped and compressed within the tarsal tunnel during running.

In 1973 Upton and McComas[18] theorized that compression at one point along the nerve trunk increased the vulnerability of distal points along the nerve as a result of the effects of the compression. They hypothesized that the proximal compression disrupted axonal transport of vital nutrients and possibly the blood supply to the nerve, and they called this type of lesion a *double crush lesion*. They also noted that nerves with some other type of preexisting physiological disturbance (e.g., diabetic peripheral neuropathy) are more vulnerable to compressive lesions.

Friction over a nerve trunk can cause inflammation and fibrosis of the nerve's connective tissue elements. Fibrosis of the nerve trunk reduces its extensibility. Loss of extensibility at one site along the nerve trunk may cause other portions of the nerve to bear increasing tensile loads when the nerve bed is elongated,[19] leading to a mechanical form of a double crush syndrome.[12]

Injury to tissues adjacent to nerve trunks can cause extensive scarring around the nerve trunk, which may impair the nerve's ability to move relative to its interfacing tissue or may compress the nerve if it is enclosed in a rigid space.[12] This may be one mechanism for nerve injury following radiotherapy in addition to fibrosis of the nerves and adjacent blood vessels. Laceration injuries from trauma and surgery can sever the nerve.

Detailed information on the pathology of nerve injuries can be found in volume 2 of this series, *Scientific Foundations and Principles of Practice in Musculoskeletal Rehabilitation*, Chapter 8.

INJURIES TO THE CERVICAL NERVE ROOTS AND BRACHIAL PLEXUS

Etiology

Brachial plexus injuries are becoming more common as patients are surviving more severe trauma to the head, chest, spine, and shoulder.[20] The peak incidences of brachial plexus injuries are at birth, from obstetrical trauma, and at 20 to 40 years of age, as a result of MVAs or knife or bullet wounds. Up to 10% of all injuries to the peripheral nervous system involve the brachial plexus.[21]

The brachial plexus is vulnerable to injury during surgical procedures, such as scoliosis repair involving the upper ribs,[22] median sternotomy for open heart surgery,[16,23] or shoulder reconstruction. It also may be compromised by positioning during surgical procedures or during procedures such as axillary arteriography, venous cannulation, and administration of regional anesthetic blocks.[7,16] Damage to the brachial plexus is estimated to occur in between 0.2% and 0.6% of all surgeries.[8]

Neoplastic disease also can affect the brachial plexus. Primary brachial plexus tumors are rare; these include schwannomas, neurilemmomas, neurinomas, and neurofibromas. Secondary neoplastic disease of the upper lobe of the lung (Pancoast's or superior sulcus tumors) and breast tissue are the more common causes of brachial plexus lesions. Radiation treatment to the breast and lung may further damage the brachial plexus either by direct fibrosis of the nerves or by damage to the vascular tissue and Schwann cells.[16] Radiation-induced peripheral neuropathy may not be clinically evident for several years.[24]

Brachial plexus injuries are the most common nerve injuries in athletics, although they occur infrequently except in American football; the reported incidence in college football players ranges from 52% to 70%.[25] To obtain a thorough understanding of the epidemiological factors associated with brachial plexus injuries in football, the clinician must consider the mechanism of injury and the player's position, along with other biomechanical and physical factors.

Classically, the following three distinct mechanisms of injury to the brachial plexus and cervical nerve roots have been described in the literature:

- Head and neck lateral flexion with shoulder depression, causing an ipsilateral traction injury to the brachial plexus (a contralateral compression injury to the brachial plexus may also occur) (Figure 25-1).[26–33]
- A direct blow to the supraclavicular region in the area of **Erb's point** (union of C5 and C6 nerve roots located 2 to 3 cm above the clavicle in the posterior triangle of the neck), causing direct compression of the brachial plexus at its most superficial point (Figure 25-2).[26,27,30,34]
- Cervical hyperextension and lateral (side) flexion, causing ipsilateral compression of the nerve roots within the

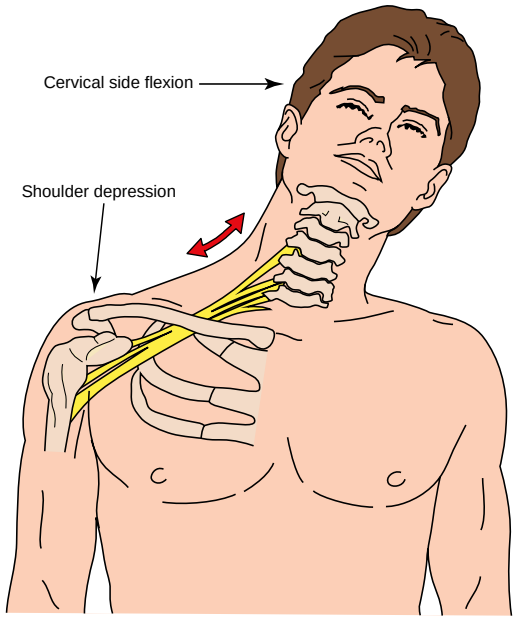

Figure 25-1 The combination of shoulder depression and contralateral cervical side (lateral) flexion can lead to a traction injury to the brachial plexus; this is commonly referred to as a *burner*. (Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 442, Philadelphia, 1996, WB Saunders.)

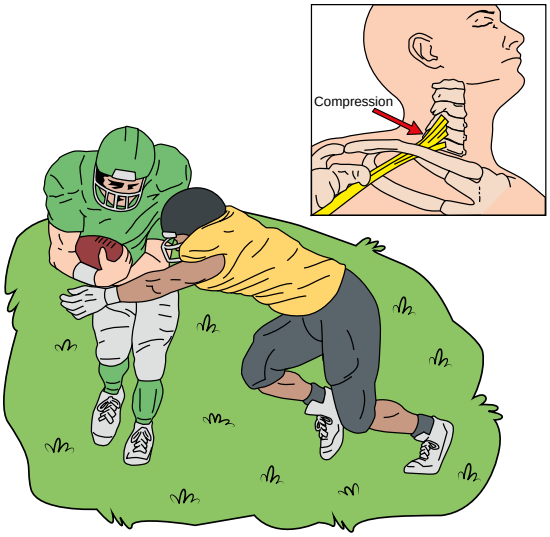

Figure 25-2 A second mechanism for a burner is a direct blow to the base of the neck (Erb's point). This leads to a compression injury to the trunks of the brachial plexus. (Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 443, Philadelphia, 1996, WB Saunders.)

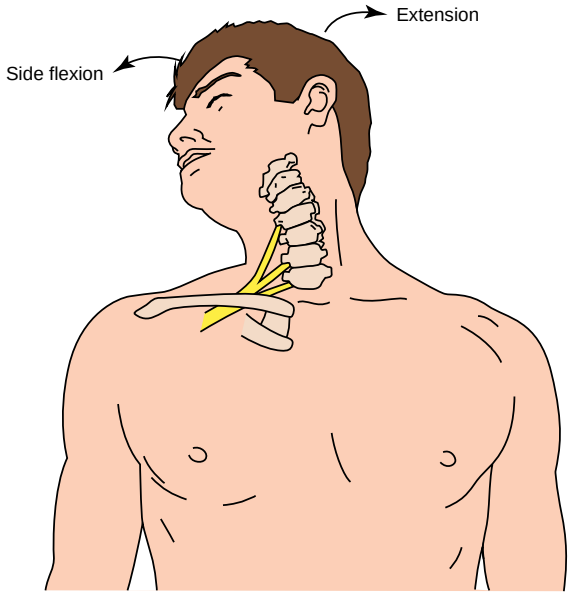

Figure 25-3 A third mechanism of injury in the burner syndrome is cervical extension combined with side (lateral) flexion to the same side. This leads to compression of the cervical nerve roots in the neural foramina. (Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 444, Philadelphia, 1996, WB Saunders.)

foramina (Figure 25-3).[28,34–37] Cumulative trauma from multiple minor compression sprains such as these may lead to chronic inflammation and secondary narrowing of the foramina where nerve roots exit.[35] A relationship between cervical spinal stenosis and brachial plexus injuries has been demonstrated, with injuries caused by the extension and compression mechanism described earlier.[35]

CLINICAL PRESENTATION

Brachial plexus injuries in American football usually are the result of tackling or blocking. Therefore the incidence is highest among defensive players, such as linemen, linebackers, and defensive backs.[38,39] This injury is commonly referred to as a *burner* or *stinger*. The athlete experiences transient weakness of the shoulder musculature accompanied by upper extremity paresthesia. In the acute syndrome, symptoms usually last several seconds to a few minutes and are followed by complete recovery. Neck pain may or may not be present.[32,40]

The injury usually affects the upper trunk of the brachial plexus (i.e., C5-C6 nerve roots).[27–29,41] Immediately after injury, weakness can be found in the biceps, deltoid, supraspinatus, and infraspinatus muscles, which are all muscles that have their innervation by C5-C6 nerve roots. Deep tendon reflexes of the biceps may also be diminished. Symptoms often can be reproduced by cervical extension and lateral (side) flexion toward the involved extremity (compression on the brachial plexus) or lateral (side) flexion away from the involved extremity (tension on the brachial plexus).[33,40] Any restriction of cervical movement or spinal pain should alert the examiner to the possibility of cervical spine injury. True burners rarely involve restricted cervical mobility.[38] Restriction of shoulder range of motion should alert the clinician to the possibility of a clavicular fracture or acromioclavicular separation.

The injury to the nerve usually is considered a neurapraxic lesion, because it recovers almost immediately.[32,40] A thorough neurological examination can help differentiate spinal cord trauma from injury to the nerve root or brachial plexus (Table 25-2). The patient's neurological status should be monitored closely for several days after the injury to determine the level of recovery accurately. Patients with persistent weakness or sensory loss should be referred to a physician for follow-up evaluation for possible axonotmesis or neurotmesis, which are more severe nerve lesions compared with neurapraxia.

Electromyographic (EMG) studies do not differentiate denervation from Wallerian degeneration for 10 to 20 days after injury[33]. Garrick and Webb[31] suggested that EMG studies be performed 6 weeks after injury. Clinically, Speer and Bassett[30] reported that strength deficits at 72 hours after injury equaled those at 4 weeks after injury.

Clinical Note

EMG studies generally are not performed until a minimum of 2 to 3 weeks after injury to allow time for Wallerian degeneration to occur.

Acute management mainly involves resting the extremity. If strength and function return completely in 1 to 2 minutes, returning the athlete to play could be considered.[40] If any neurological deficits persist after this time, the athlete should not be allowed to continue

TABLE 25-2

Neurological Evaluation of Brachial Plexus Injury

Lesion (Root Level)	Motor Findings (Resisted Tests)	Sensory Findings (Light Touch or Pinprick)
C4	Upper trapezius: shoulder elevation	Top of shoulders (acromioclavicular joint)
C5	Supraspinatus and deltoid: shoulder abduction	Lateral upper arm (lower deltoid) and lateral cubital fossa
C6	Biceps: elbow flexion	Lateral forearm, thumb
C7	Triceps: elbow extension	Index and middle fingertips
C8	Extensor pollicis longus: extension of distal phalanx of thumb	Fourth and fifth fingers and hypothenar eminence; medial forearm; medial cubital fossa
T1	Intrinsics of the hand: abduction/adduction of fingers	Medial arm
Suspected spinal cord lesions	Diffuse motor loss, bilateral weakness, lower extremity motor loss	Diffuse paresthesia and numbness, bilateral sensory loss (nondermatomal)

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 444, Philadelphia, 1996, WB Saunders.

participation until full strength, range of motion, and sensation are restored in the cervical spine and extremity. However, the athlete could be susceptible to further injury with a subsequent similar mechanism of injury of a smaller magnitude as a result of enhanced tissue sensitivity. Caution should be exercised in this decision, because athletes may often mask their symptoms because of their desire to play. Historically, Wroble et al.[38] have advocated for the use of ice and various modalities for subjective symptom management (transcutaneous electrical nerve stimulation [TENS], ultrasound), as well as anti-inflammatory medications if pain and tenderness of the cervical spine and shoulder persist. Neck and shoulder strengthening exercises are prescribed to address any residual weakness.[42]

Postural changes (e.g., a depressed shoulder), atrophy of the shoulder muscles, or both may occur.[34] Clearly, more severe neurological losses and the need for longer periods of recuperation indicate that it is less advisable for the athlete to return to play.[38]

Padded neck rolls and shock-absorbing shoulder pads may be of some assistance in preventing recurrent burner injuries in American football players.[20,23] However, they have been evaluated carefully only in controlled laboratory testing and not on the field. Gorden et al.[43] tested a variety of collars and did not find any collars that limited lateral flexion, only hyperextension. An appropriately fitted collar should be worn close to the neck and should restrict cervical extension and lateral flexion (Figure 25-4). Fitted properly, the collar does not restrict cervical

Figure 25-4 Neck rolls often are used to prevent excessive lateral (side) flexion of the cervical spine during tackling in American football**. A,** Properly fit collar and shoulder pads. **B**, Proper fit will assist in preventing excessive lateral flexion and extension of the cervical spine during tackling in American football.

rotation. Often the athlete wears the neck roll too low on the shoulder pads in an effort to be able to move the head and neck and see the football more easily; this renders the neck roll ineffective (Figure 25-5). At no time should straps running from the shoulder pads to the helmet be used to prevent head and neck movement. Use of straps may predispose the cervical spine to excessive axial loading and resultant fracture or fracture-dislocation by preventing movement of the cervical spine. In 1993 the U.S. Military Academy designed augmented shoulder pads that added buffer padding to the neck in an effort to prevent compressive injuries to the brachial plexus.[34] These concepts have now been incorporated into commercially available shoulder pads, resulting in collars and shoulder pad combinations that vary based on the size of the player and position played (Figure 25-6).

Figure 25-5 Position of collar and shoulder pad determine effective protection of cervical spine from injury. Placement too far posterior, either by collar position or shoulder pad fit, will allow too much extension and side (lateral) bending during tackling, which may cause injury.

Cervical nerve root avulsion injuries can occur with more severe injuries. Frequently, more than one nerve root level avulses at the time of injury, with the most common pattern in one study involved the C5-T1 nerve roots.[41] Adjacent roots are always involved if more than one level is avulsed, and associated vascular damage may occur.[20] The patient has complete motor loss in muscles innervated by the affected nerve root levels, and spontaneous recovery does not occur because of a neurotmesis nerve injury. Diagnostic findings may include fractures of the transverse processes on cervical radiographs.[42] Rehabilitation consists of maintaining range of motion in the involved upper extremity and reconstructive surgery to restore as much function as possible.

Acute Brachial Neuropathy

Acute brachial neuropathy is a rare syndrome characterized by acute or subacute intense shoulder pain, accompanied by weakness and wasting of various muscles of the shoulder and proximal arm. It should be considered a possible diagnosis if the patient has no clear trauma or history of overuse. The incidence is higher in males than in females, and patients in their 30s or 70s are affected more frequently.[44] The disorder has no clear pattern of motor nerve or brachial plexus involvement. Denervation may be limited to only one muscle supplied by a peripheral nerve (e.g., a normally innervated infraspinatus muscle with denervation of the supraspinatus muscle). Sensory loss usually is limited. Most reported cases occur in the

Figure 25-6 Shoulder pads and collar combinations used to assist in prevention of injury come in various sizes, shapes, and configurations depending on player position. Smaller pads and collars are used for position players such as defensive backs and receivers, whereas larger pads and collars are used for linemen.

dominant upper extremity.[40,45] The cause of acute brachial neuropathy is unknown.

Management in the acute phase includes rest and analgesics. The patient begins rehabilitation as soon as the pain subsides.[38] The prognosis generally is good, but residual weakness is common for several months or even years after diagnosis.

PERIPHERAL NERVE INJURIES IN THE UPPER QUARTER

Nerve Injuries of the Neck and Upper Limb

- Thoracic outlet syndrome
- Spinal accessory nerve
- Long thoracic nerve
- Axillary nerve
- Suprascapular nerve
- Musculocutaneous nerve
- Radial nerve
- Ulnar nerve
- Median nerve
- Combined lesions

Thoracic Outlet Syndrome

Thoracic outlet syndrome (TOS) is a controversial diagnosis consisting of neural and/or vascular compression in the thoracic outlet. TOS has a variety of clinical manifestations, depending on the site of compression and the neurovascular structures involved, as shown in Figure 25-7. Vascular symptoms are less common than neurogenic symptoms, but underlying vascular insufficiency must be considered. Molina and D'Cunha[46] have documented that, using Doppler ultrasound, 51% of the patients in their study ($n = 148$) with neurogenic TOS were found to have arterial occlusion during TOS testing maneuvers and 8% had compression of the subclavian vein.

Subclavian-axillary vein effort thrombosis (i.e., Paget-Schroetter syndrome), although relatively uncommon, remains the most frequently encountered vascular disorder in young competitive athletes.[46] This condition was previously thought to be from an acute subclavian vein injury with superimposed thrombosis. However, it is now believed to be an acute clinical presentation secondary to a chronic condition characterized by a repetitive mechanical venous injury with exertional activity during arm elevation. The elevated arm increases the likelihood of subclavian vein compression in the costoclavicular space, because this space narrows with arm elevation. Thus, athletes or others involved in overhead activities may have a higher likelihood of subclavian-axillary vein effort thrombosis. Repetitive compression may injure the vein, stimulating localized tissue repair with fibrosis within and around the vein wall. With chronic and repetitive injury, scar tissues ensues. The formation of venous collaterals may limit symptoms for months or years after the original injury. Eventually, turbulent blood flow within the narrowed vein leads to thrombosis formation in the subclavian vein and may also lead to occlusion of the distal axillary vein. When symptoms are finally manifested, they may include arm swelling, cyanotic discoloration, heaviness, pain, and fatigue during or after exertional efforts such as what occurs in sport and exercise.

The most common neurogenic signs of TOS arise from compression of the lower trunk (i.e., C8-T1 nerve roots) of the brachial plexus; these include symptoms such as pain and paresthesias of the medial arm and hand, upper extremity fatigue, and weakness and atrophy of muscles innervated by C8-T1, such as the intrinsic hand muscles.[46]

TOS may occur in patients with excessive shoulder girdle (i.e., scapula and clavicle) depression[47] or overly developed trapezius and neck musculature (e.g., hypertrophy of scalenus anterior and medius) and in those whose work requires repetitive overhead use of the upper extremity or prolonged wear of heavy body armor, such as for combat soldiers. Violinists and violists can develop symptoms from an overly depressed position of the shoulder girdle as they support their instrument on their shoulder. Swimmers may develop symptoms as a result of hypertrophy of the pectoralis minor muscle and thus a decreased coracopectoral space. Tennis, volleyball, and baseball players may develop symptoms owing to either greater muscular development of the dominant arm, increased scapular depression as a result of failure to maintain adequate scapular stabilization with repetitive motions (e.g., fatigue or weakness in the scapular muscles), or repetitive elevation of the upper extremity.[31,48] Prolonged keyboard use and reaching for a computer mouse can also provoke symptoms.

Because the exact diagnosis of TOS is difficult to confirm, symptoms in the upper extremity should always be evaluated carefully to differentiate true TOS from shoulder instabilities, cervical radiculopathies, and other peripheral nerve injuries. Treatment is directed at restoring posture of the spine and scapulae and muscle balance of trunk, shoulder, and shoulder girdle musculature to correct chronic scapular depression[49]; restoring diaphragmatic breathing patterns to reduce recruitment of the scalene muscles; and reducing sensitivity to neurodynamic tests in the upper extremity. Modification of technique or avoidance of some activities may be necessary to prevent recurrence of symptoms.[21,50]

Spinal Accessory Nerve Injury

The spinal accessory nerve is a motor nerve only and contains the spinal portion of cranial nerve XI. This nerve innervates the sternocleidomastoid and trapezius muscles.

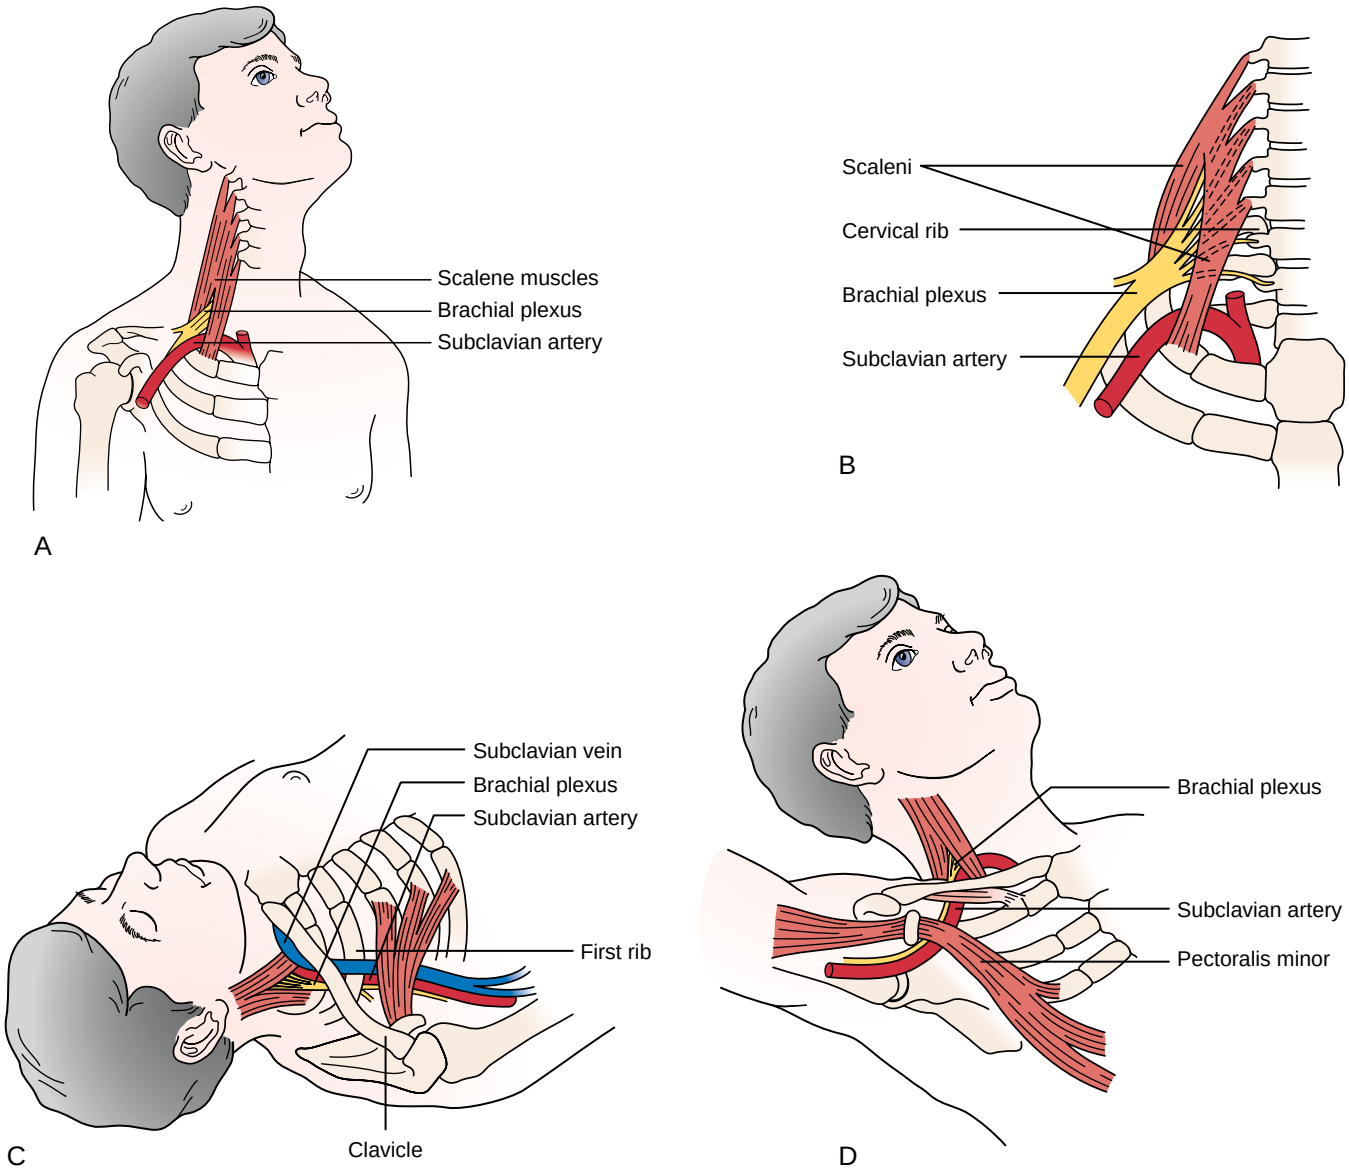

Figure 25-7 Location and causes of thoracic outlet syndrome. **A**, Scalenus anterior syndrome. **B**, Cervical rib syndrome. **C**, Costoclavicular space syndrome. **D**, Hyperabduction syndrome (abduction, extension, and lateral rotation). (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 261, St. Louis, 2014, Saunders/Elsevier.)

It is vulnerable to injury from blunt trauma (e.g., a blow from a hockey stick), radiation, surgical injury,[51] or traction injury.[42] Intracranial tumors can compress the nerve before it exits the jugular foramen. Injury can result in paralysis and atrophy of the trapezius muscle. Weakness usually develops soon after the injury and is accompanied by a persistent ache about the shoulder girdle.[52,53] If the nerve does not recover, scapular stabilizing procedures or transfer of the levator scapulae can be performed surgically. However, the prognosis for full return to athletics or other types of vigorous physical activity is usually poor.[52]

Long Thoracic Nerve Injury (Backpacker's Palsy)

The long thoracic nerve is a motor nerve only that originates from the C5-C7 nerve roots and innervates the serratus anterior muscle, which is essential for scapular stabilization, upward rotation, and protraction. The nerve is vulnerable to blunt trauma as it passes from the brachial plexus across the base of the neck and, more distally, where it lies against the lateral chest wall. For example, during sports, a blow to the ribs underneath an outstretched arm may injure the long thoracic nerve. The nerve may also be entrapped in the scalenus medius or as it runs between

the clavicle and second rib[54] or from a traction injury from carrying heavy backpacks for prolonged periods. A traction injury may also occur with combined head flexion, rotation, and lateral (side) flexion away from the involved side and with extreme shoulder flexion.[55] Paralysis of the serratus anterior has also been reported as an overuse injury in sports such as archery, basketball, overhead throwing, bowling, cycling, golf, rope skipping, weight lifting, and tennis.[52] White and Witten[56] reported one incidence of a stretch injury to the long thoracic nerve in a male ballet dancer from aggressive warm-up stretches. In clinical practice, the onset of symptoms has been observed after sleeping in awkward positions, after a viral illness, and with increased exercise in a plank or push-up position. The presenting complaint is often accompanied by aching or burning around the shoulder or scapula.[52] With long thoracic nerve palsy, an individual would have difficulty elevating the arm as a result of winging of the scapula, where the scapular laterally rotates in a transverse plane (i.e., the medial border moves away from the thorax). A simple test for long thoracic nerve palsy is to lean against the wall with outstretched arms (as in performing a wall push-up), causing winging of the involved scapula to become apparent.

The prognosis is good if the injury is the result of overuse. The injury is treated with rest and exercise to maintain range of motion. Closed injuries have a more guarded prognosis; if the injury was caused by compression, the prognosis depends on the duration and the extent of the compression. Taping the scapula can be used to optimize scapular positioning during activities of daily living (ADLs) and exercise.[57] If strength and endurance do not fully recover with conservative management over 24 months, the scapula may have to be stabilized surgically.[52]

Long thoracic nerve injury and thoracic outlet symptoms can be prevented in children who carry backpacks to school. The American Physical Therapy Association suggests that children carry no more than 15% of their body weight. The backpack should fit properly, and both straps should be used. Hip belts and compressive straps help lessen the strain on the upper body.[58]

Axillary Nerve Injury

The axillary nerve is a mixed sensorimotor nerve formed from the C5 and C6 nerve roots and the posterior cord of the brachial plexus. Its motor function innervates the deltoid and teres minor muscles, and it also provides sensory innervation to the glenohumeral joint and a small area of skin over the lower lateral deltoid. After the nerve courses under the axillary recess of the glenohumeral joint, it exits posteriorly along with the posterior humeral circumflex artery, passes through the quadrilateral space (bound by the teres minor superiorly, the teres major inferiorly, the long head of the triceps medially, and the humeral shaft laterally), and then winds around the surgical neck of the humerus.

The most common mechanism of injury is an acute anterior shoulder dislocation or its reduction.[48,50] Other mechanisms of injury include blunt trauma to the shoulder, fracture of the surgical neck of the humerus, compression by a hematoma, irritation by osteophytes of the glenoid margin, compression from a space-occupying lesion (e.g., ganglion cyst), and compression from muscular hypertrophy (e.g., teres minor, teres major, triceps long head) as the nerve passes through the quadrilateral space. The quadrilateral space can be narrowed with shoulder abduction and lateral (external) rotation with accompanying contraction from the teres minor and teres major, such as during overhead throwing, increasing the risk of nerve compression.[52,59,60] Trauma also may occur during many surgical procedures on the shoulder[8,52,61] and poorly placed intramuscular injections in the deltoid.[7]

If EMG findings show incomplete denervation, the prognosis for recovery generally is good, but a long rest from the provoking activity may be necessary.[59] Fortunately, the supraspinatus and infraspinatus muscles can compensate for some of the loss of abduction and lateral (external) rotation after axillary nerve injury, because these muscles assist in both of these shoulder movements.[52]

Butler[62] proposed a test of the sensitivity of the nerve to mechanical loading based on the geography of the nerve relative to the axes of the shoulder joint (Figure 25-8). This test has not been studied to determine whether it provokes symptoms in the distribution of the axillary nerve.

Suprascapular Nerve Injury

The suprascapular nerve is a mixed sensorimotor nerve formed from the upper trunk of the brachial plexus. Its motor function innervates the supraspinatus and infraspinatus muscles. It also provides sensory branches to the

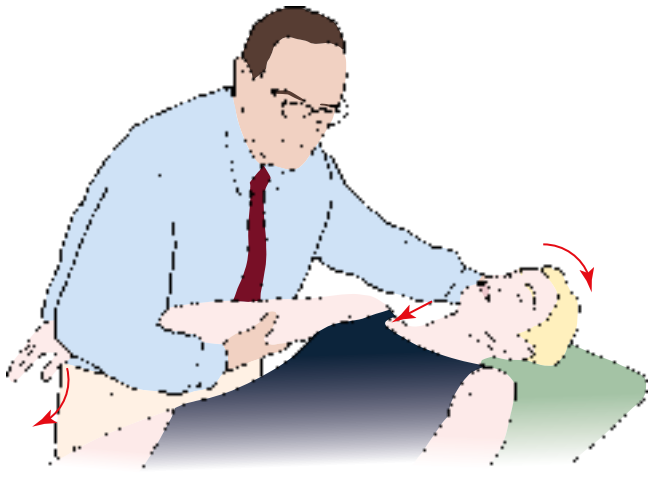

Figure 25-8 Neurodynamic test of the axillary nerve. The test combines medial (internal) rotation of the arm, shoulder girdle depression, and lateral (side) flexion of the cervical spine away from the upper extremity. (Modified from Butler D: *The sensitive nervous system,* p 339, Adelaide, Australia, 2000, Noigroup Publications.)

posterior glenohumeral joint, the acromioclavicular joint, and the subacromial bursa. The five potential sites of trauma along the nerve are outlined in Table 25-3.[52,54,60,63]

The mechanism of injury may be direct trauma, such as a fall on the shoulder or acute dislocation, traction and friction to the nerve as it passes through the suprascapular notch, or compression from a ganglion cyst in the suprascapular notch or the spinoglenoid notch secondary to tears in the shoulder capsule or labrum. The repetitive nature of the overhead throwing motion such as during baseball pitching, the volleyball spike, or the tennis serve can result in superior labrum tears, anterior to posterior in direction (i.e., SLAP lesions), which can lead to the formation of a ganglion cyst. The labral tears occur in part because shoulder lateral (external) rotation during the arm cocking phase of pitching attempts to "peel back" the labrum off the glenoid[64] and via the repetitive force of the long biceps brachii tendon pulling on the posterosuperior labrum as it contracts eccentrically during the arm deceleration phase of pitching to slow down the rapidly extending elbow.[65] These labral tears act as a one-way valve, permitting joint fluid to escape into the ganglion cyst cavity but not allowing the return of the synovial fluid back into the joint.[60] The most common location for labral tears is the superior posterior labrum,[60] which is probably why the most common location for a shoulder ganglion cyst is the spinoglenoid notch. When the ganglion cyst has reached sufficient size to compress the nerve, it leads to isolated denervation of the infraspinatus muscle without pain or other sensory loss.

Rapid stretching of the accompanying suprascapular artery, which travels above the transverse scapular ligament while the suprascapular nerve travels below it, may contribute to ischemic injury of the nerve.[63] Laceration of the nerve during distal clavicle resection has also been reported.[66] Clinically, injury to the nerve has also been seen from prolonged bed rest in left side-lying during a difficult pregnancy with twins.

Volleyball players, swimmers, baseball players, and other individuals who perform repetitive overhead motions are vulnerable to this injury. Suprascapular nerve injury has frequently been reported in baseball pitchers,[52,63,67] owing to the extreme shoulder joint displacements and angular velocities as well as large shoulder joint forces and torques during the arm cocking and arm deceleration phases of pitching or throwing.[63,65,68] These rapid and extreme movements, such as rapid and excessive scapular protraction with glenohumeral horizontal adduction, may, over time, stretch the nerve. A nerve stretched as little as 5% to 10% of its length may result in abnormal function.[60] If the nerve is injured in the suprascapular notch, both motor weakness in the supraspinatus and infraspinatus muscles (resulting in decreased strength in shoulder lateral [external] rotation and possibly abduction) as well as sensory deficits (posterolateral shoulder pain) may result. However, as mentioned previously, if the injury to the nerve is in the spinoglenoid notch, isolated denervation of the infraspinatus muscle is likely with no supraspinatus muscle involvement and no sensory deficits. The atrophy of the infraspinatus muscle may not be easily seen, and a baseball pitcher may have this nerve injury and not even know it. Not limited to baseball, asymptomatic atrophy of the infraspinatus muscle was previously reported in 12 of 96 top-level volleyball players.[69]

The onset of symptoms often is insidious, beginning with a vague shoulder ache and weakness without paresthesia or numbness.[52,63] Visible atrophy and EMG changes may be present without noticeable impairment, even in competitive athletes.[52,67] However, weakness of the supraspinatus and infraspinatus muscles may lead to a loss of functional control of the humeral head and imbalance of force couples around the shoulder, placing other shoulder

TABLE 25-3

Suprascapular Nerve (C4, C5, C6): Potential Sites of Injury[52,54,60,63]

Site	Signs and Symptoms	Mechanism of Injury
• Spinal roots and upper trunk of brachial plexus between fascia of anterior and middle scalenes • Nerve trunk in fascia of subclavius and omohyoid muscles • Suprascapular notch as nerve trunk passes inferior to transverse scapular ligament • Fascial compartment between supraspinatus muscle and base of coracoid process • Spinoglenoid notch as nerve enters infraspinous fossa	• Vague ache/pain in posterolateral shoulder or weakness in shoulder lateral (external) rotation or abduction secondary to weakness in supraspinatus and infraspinatus muscles • Visible atrophy in infraspinatus muscle • Vague ache/pain in posterolateral shoulder or weakness in shoulder lateral (external) rotation or abduction secondary to weakness in supraspinatus and infraspinatus muscles • Selective atrophy of infraspinatus muscle with injury in spinoglenoid notch; asymptomatic	• Direct trauma from fall or dislocation • Insidious or repetitive nerve injury • Anterior ganglion cyst in suprascapular notch (secondary to tears in the shoulder capsule or labrum) compress suprascapular nerve • Posterior ganglion cyst in spinoglenoid notch (secondary to tears in the shoulder capsule or labrum) compress suprascapular nerve

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 448, Philadelphia, 1996, WB Saunders.

structures at risk of impingement, such as the subacromial bursae, supraspinatus muscle, and glenoid labrum. If the nerve lesion fails to recover spontaneously, surgical exploration is indicated to determine whether the nerve is entrapped by ligaments across the suprascapular notch or spinoglenoid notch or whether it is compressed by a lipoma or ganglion cyst.[33,52,60,63,67]

Butler[62] has proposed a test for the sensitivity of the nerve to mechanical loading based on the geography of the nerve relative to the axes of the shoulder joint (Figure 25-9). This test has not been studied to determine whether it provokes symptoms in the distribution of the suprascapular nerve.

Figure 25-9 Neurodynamic test of the suprascapular nerve. The test combines scapular protraction, depression, and rotation of the scapula medially (internally) or laterally (externally). Note that the examiner uses his chest to assist protraction by applying pressure through the shaft of the humerus. (Modified from Butler D: *The sensitive nervous system,* p 339, Adelaide, Australia 2000, Noigroup Publications.)

Musculocutaneous Nerve Injury

The musculocutaneous nerve is a mixed sensorimotor nerve derived from the C5 and C6 nerve roots and occasionally the C7 nerve root. It arises from the lateral cord of the brachial plexus and provides motor innervation to the biceps, brachialis, and coracobrachialis muscles as it runs between these muscles, and it provides sensory innervation to the radial side of the forearm via the lateral antebrachial cutaneous nerve (i.e., lateral cutaneous nerve of the forearm), which is the continuation of the musculocutaneous nerve after it leaves the arm and enters the forearm. Hypertrophy of the biceps, brachialis, or coracobrachialis muscle can cause compression of the nerve. It can be injured during acute anterior shoulder dislocations[52] or closed clavicle fractures,[70] during a fracture to the humerus, or during any surgical procedure involving the anterior aspect of the shoulder.[8,61] Injury to this nerve rarely occurs in isolation because it is a deep and well-protected nerve.

Several cases in the literature involve injuries to the nerve during athletic activities such as rowing, throwing a football, throwing a baseball, or lifting weights.[52,71,72] The loss of function of the long head of the biceps may lead to altered shoulder mechanics and may predispose the patient to other shoulder injuries. This is because the long head of the biceps has multiple roles at the shoulder, including acting as a humeral depressor and controlling lateral (external) and medial (internal) rotation.[54] Butler's test for mechanical loading of the musculocutaneous nerve (Figure 25-10) has not been studied to see whether it has diagnostic significance.[62]

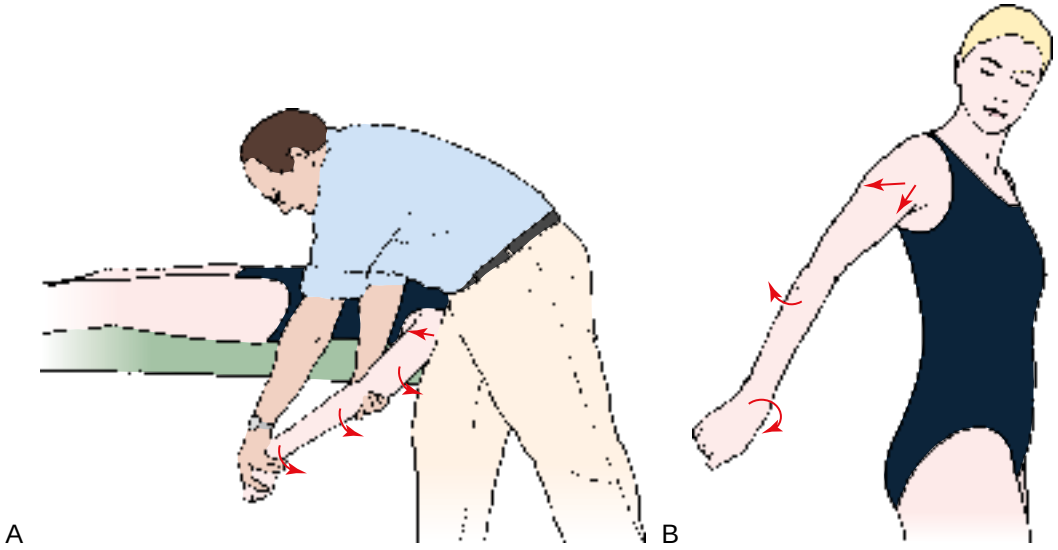

Figure 25-10 Neurodynamic test of the musculocutaneous nerve. **A,** The test combines shoulder girdle depression, elbow extension, shoulder extension, and ulnar deviation of the wrist. **B,** The test may also be performed actively. (Modified from Butler D: *The sensitive nervous system,* pp 336, 338, Adelaide, Australia, 2000, Noigroup Publications.)

Radial Nerve Injury

The radial nerve is a mixed sensorimotor nerve that arises from the posterior cord (C5-T1 nerve roots) of the brachial plexus. It descends posterior to the axillary artery and enters the radial (spiral) groove with the deep brachial artery to pass between the long and medial heads of the triceps and then passes around and down the humerus toward the cubital fossa innervating the triceps brachii, anconeus, brachioradialis, and extensor carpi radialis longus muscles. At the level of the lateral epicondyle of humerus, it divides into deep (motor) and superficial (sensory) branches. The deep motor branch and its direct continuation as the **posterior interosseous nerve** (a C7-C8 motor nerve and a branch of the radial nerve) travels between the two heads of the supinator muscle innervating the supinator as well as the remaining wrist, finger, and thumb extensors in the posterior compartment of the forearm.[73] Trauma, such as radial head dislocation, fracture, or elbow hyperextension, may result in injury to the posterior interosseous nerve as it crosses anteriorly to the elbow.[74]

The superficial sensory branch travels deep to the brachioradialis muscle and enters the dorsal web space (between the first and second digits) of the hand, where it provides cutaneous innervation. This **superficial radial nerve** can be compressed proximally as it runs under the brachioradialis, or it can be compressed at the wrist after a fracture or as a result of a tight watchband or bracelet.[75,76]

The radial nerve is injured in one out of every eight humeral shaft fractures.[7,77] It is vulnerable to compression because of poor positioning against rigid structures during surgery.[7] Proximally, as it passes around the radial grove, it is vulnerable to compression as it passes under the lateral head of the triceps in the upper arm, especially in the presence of a fibrous arch.[14,33,75,78] Strong contraction of the triceps muscle, as may occur during throwing or weight training,[33] can compress the nerve, causing weakness in the wrist and finger extensors.[78] Humeral fracture or penetrating injuries can sever the nerve in the arm.[75,79]

In some individuals, there is a fibrous arch overlying the deep motor branch nerve as it enters the supinator called the **arcade of Frohse**. With repetitive and resisted supination, the arch becomes tense and may compress and injure the nerve, resulting in "drop wrist," which is a classic sign of a radial nerve injury.

Because the **posterior interosseous nerve** winds around the radial head, it is vulnerable to injury during orthopedic procedures at the elbow such as arthroplasty, arthroscopy, fracture repair, and excision of the radial head.[7] Lesions of the posterior interosseus branch in the radial tunnel (i.e., the region from the humeroradial joint past the proximal origin of the supinator muscle; Table 25-4) can mimic the common symptoms of "tennis elbow," or the two conditions may exist simultaneously. In chronic presentations of tennis elbow, the pathophysiological process taking place at the common extensor origin is one of tendon degeneration (i.e., tendinitis initially which progresses to the degenerative condition called tendinosis), rather than the active inflammatory process conveyed by the commonly used term **lateral epicondylitis** (also called lateral epicondylalgia or tennis elbow),[80,81] which consists of persistent lateral elbow pain aggravated by palpation of the lateral epicondyle and activation of the extensor/supinator mass of the forearm (its common extensor tendon is at the lateral epicondyle) through manual resistance (i.e., active wrist extension with concentric muscle action or controlling wrist flexion by eccentric muscle action, such as during the backhand stroke in tennis) or gripping.[80,81]

One difference between radial tunnel syndrome and tennis elbow is in tennis elbow, the pain starts near where the common extensor tendon attaches to the lateral epicondyle, while in **radial tunnel syndrome**, the pain is centered about 2 inches farther down the lateral forearm where the deep branch travels under the supinator muscle. Radial tunnel syndrome also often causes a more aching type of pain or fatigue in the extensor muscles of the forearm. Nerve pressure inside the radial tunnel leads to weakness in the extensor muscles, decreasing wrist stability when grasping and lifting.

Chronic inflammation of the common extensor tendons at the elbow can lead to a reactive synovitis of the annular ligament involving the radial nerve. Fibrosis and local edema from overuse of the tendons may also increase

TABLE **25-4**

Radial Nerve (C5-T1): Potential Sites of Injury in the Radial Tunnel[14,82]

Cause/Site	Signs and Symptoms
Anterior to the radial head (as the nerve enters the radial tunnel, it may be tethered by a fibrous band)	Elbow pain reproduced with active supination and elbow flexion
Blood vessels compressing the nerve as they fan across it in the tunnel	Increased symptoms during exercise
The arcade of Frohse (a fibrous band of the superficial head of the proximal supinator muscle; may cause friction or compression against the nerve)	Weakness of finger and wrist extensors (wrist drop); pain with full passive pronation and wrist flexion and resisted supination
The tendinous margins of the extensor carpi radialis longus and brevis muscles of the wrist (may extend medially and compress the nerve)	Pain with full passive pronation and wrist flexion

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 449, Philadelphia, 1996, WB Saunders.

compression on the nerve as it passes under the extensor carpi radialis brevis muscle.[82] Both conditions usually respond to conservative treatment, which includes anti-inflammatory medication, rest, ice, and muscle stretching and strengthening.[14,33,82] In true radial tunnel syndrome, the most effective treatment usually is surgical decompression of the nerve.[14,82]

Differential diagnosis of lesions to this nerve also must include the possibility of cervical radiculopathy. Gunn and Milbrandt[83] examined the cervical spines of individuals with a history of tennis elbow who had failed to respond to treatment directed at the elbow. All 42 patients in their study had EMG findings "consistent with early radiculopathy or neuropathy of the affected myotomes," and all had increased resistance to passive motion of the C5 and C6 apophyseal joints. Treatment was directed to the cervical spine and included spinal mobilization, traction, various treatment modalities, and isometric exercises. This treatment produced good or satisfactory relief of symptoms in 86% of the patients in an average of 5.25 weeks.

Other authors have explored the relationship between lateral epicondylalgia and cervical dysfunction. A retrospective study of patients with lateral epicondylalgia found that adding treatment of the cervical spine to local interventions at the elbow produced successful outcomes in fewer visits (mean, 5.6; standard deviation [SD], 1.7) compared with management directed only at the elbow (mean, 9.7; SD, 2.4).[84]

It also is important to realize that the relationship between lateral epicondylalgia and cervical spine dysfunction may not be consistent across demographic groups. A prospective study by Waugh et al.[85] revealed that the association between lateral epicondylalgia and cervical joint findings is most likely to be present in women working in repetitive jobs and least likely to occur in men employed in nonrepetitive jobs in whom the onset of lateral elbow symptoms was to the result of a sports-related injury.

Clinical Note

When treating patients with lateral epicondylitis (also called lateral epicondylalgia or tennis elbow), the clinician must be sure to clear the cervical spine, especially in patients who are not responding to treatment at the elbow.

The positive response to treatment of the cervical spine in the aforementioned studies does not necessarily indicate that all the symptoms came from a cervical lesion. It is more likely that treatment directed to the cervical spine removed one component of a double crush lesion, which, in theory, occurs when a proximal lesion along an axon predisposes the axons within the nerve to injury at a more distal site along its course through impaired axoplasmic flow involving both the cervical spine and the radial nerve at the elbow.[86] It may also be that manual therapy treatment of the cervical spine stimulated endogenous descending pain inhibitory systems that result in reduced lateral elbow pain.[80] The interplay of proximal and distal components of nerve irritation, as well as the local effects on the nerve of joint and muscle inflammation, may help explain why the differential diagnosis and treatment of lateral epicondylalgia often are difficult.

Butler[12,62] described this complex interplay between cervical joints and muscle tightness, elbow joint and soft tissue signs, and neural tension tests and neurological findings in the management of a patient with lateral elbow pain. He devised a test known as the **upper limb neurodynamic test 2 (ULNT 2)** with a radial nerve bias, in which mechanical tension is applied to the radial nerve throughout its course. (The text *Orthopedic Physical Assessment* refers to this as the upper limb tension test 3 [ULTT 3].[87]) This test consists of a combination of shoulder depression, elbow extension, shoulder medial (internal) rotation, forearm pronation, wrist flexion and ulnar deviation, and thumb and finger flexion (Figure 25-11). If symptoms have not been provoked by this point in the test, shoulder abduction is performed. Cervical lateral (side) flexion away from the extremity also increases the mechanical load on the brachial plexus,[88] further sensitizing the test. The final forearm position in this test (forearm pronation, wrist flexion and ulnar deviation, and thumb flexion) is a position that is commonly used to test flexibility of the wrist/finger extensor muscles. Pain from muscle stretching in this position can be differentiated from pain from neural structures by the addition of

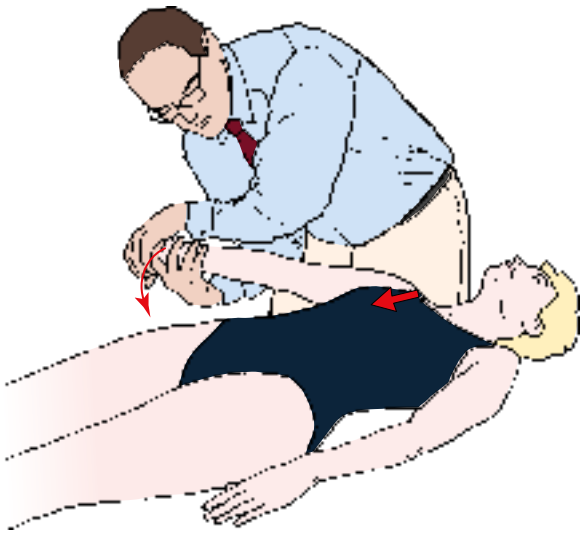

Figure 25-11 The upper limb neurodynamic test 2 (ULNT 2) with a radial nerve bias. The test combines shoulder depression, elbow extension, shoulder medial (internal) rotation, forearm pronation, and wrist and finger flexion. The test is further sensitized with the addition of shoulder depression and abduction and contralateral lateral (side) flexion of the cervical spine. Symptoms are monitored at each position of the test. (Modified from Butler D: *The sensitive nervous system,* p 329, Adelaide, Australia, 2000, Noigroup Publications.)

shoulder abduction or cervical lateral (side) flexion. Both of these maneuvers increase mechanical load through the nerve tract without increasing tension in the extensor muscles.

Yaxley and Jull[89,90] studied the ULNT 2 with a radial nerve bias in 20 subjects with unilateral tennis elbow. Both upper extremities of their subjects had symptoms in the lateral elbow/forearm region, but the symptoms were reported as more intense in the symptomatic elbows/forearms.[90] They observed a statistically significant difference in available range of shoulder abduction in the symptomatic arms of their subjects (12.45° less than the asymptomatic side). They recommended routine inclusion of this test as a part of the differential diagnosis of lateral epicondylalgia. Further support for this recommendation was provided by a prospective case series in which 41% of subjects with lateral epicondylalgia (34 of 83) had their symptoms reproduced during application of the radial bias neurodynamic test.[85]

Clinical Note

The radial nerve biased upper limb neurodynamic test should be used as part of the differential diagnosis process for lateral epicondylalgia.

Ulnar Nerve Injury

The ulnar nerve is a mixed sensorimotor nerve that arises from the medial cord (C8-T1 nerve roots) of the brachial plexus and may also have contributions from the C7 nerve root. It passes down the anteromedial aspect of arm lateral to the brachial artery piercing the medial intermuscular septum as it courses from the anterior to the posterior compartment, passing through the **arcade of Struthers,** a musculofascial band located approximately 8 cm proximal to the medial epicondyle (see Figure 9-22, *C*). It then runs posterior to the medial epicondyle through the cubital tunnel as it enters the forearm, where it passes between two heads of flexor carpi ulnaris under a fascial band called **arcade of Osborne**. It then descends through the forearm between the flexor carpi ulnaris and flexor digitorum profundus muscles, innervating both muscles but only the medial half of the flexor digitorum profundus. It then becomes superficial in the distal part of the medial forearm and passes through **Guyon's tunnel**, formed by the pisiform, hamate, and pisohamate ligament, at the level of the wrist. It then travels superficial to the flexor retinaculum and carpal tunnel as it enters the hand, where it splits into deep (motor) and superficial (sensory) branches. The deep branch innervates most of the intrinsic muscles of the hand including the hypothenar muscles: adductor pollicis, deep portion of flexor pollicis brevis, medial (third and fourth) lumbricals, and dorsal and palmar interossei. The superficial branch supplies the palmaris brevis, skin to the palmar portion of digit 5 (little finger) and the medial half of digit 4 (ring finger), and the distal medial palm. The dorsal branch of ulnar nerve most commonly supplies skin of the medial aspect of dorsum of hand and dorsal aspects of the little finger and medial half of the ring finger. The palmar cutaneous branch of ulnar nerve supplies skin on the proximal medial palm, overlying the medial carpals.

The ulnar nerve is most vulnerable to injury at two sites: the cubital tunnel at the medial elbow and Guyon's tunnel, or canal, at the wrist.[76,91,92] The cubital retinaculum and arcade of Osborne flatten with elbow flexion, decreasing the volume and increasing pressure within and around the **cubital tunnel**, increasing the likelihood that the ulnar nerve will be compressed. Vigorous and repetitive contraction of the flexor carpi ulnaris muscle over time may also compress the nerve. The four major etiological factors for injury of the nerve at the elbow are presented in Table 25-5.

Injury to the ulnar nerve is common in athletes who perform repeated overhead throwing motions, such as baseball pitching, the volleyball spike, the tennis serve,

TABLE **25-5**

Ulnar Nerve (C7-T1): Cubital Tunnel Lesions[91–93]

Cause/Site	Signs and Symptoms

• Traction injuries caused by increased valgus forces:
  ◦ Prior fracture or injury to the growth plate
  ◦ Disruption of the ulnar (medial) collateral ligament (UCL)
• Entrapment under:
  ◦ Thickened arcuate ligament
  ◦ Hypertrophic medial head of triceps, anconeus, or flexor carpi ulnaris muscle
  ◦ Postoperative scar or bony osteophyte formation
• Irregularities in the ulnar groove (cubital tunnel) caused by osteophytes; may prevent sliding of the ulnar nerve
• Subluxation or dislocation of the nerve over the medial epicondyle (usually as a result of laxity of soft tissue restraints) leading to a friction fibrosis
	• Medial elbow pain radiating to the medial forearm
	• Numbness and tingling in the ulnar aspect of the forearm and hand (5th digit and medial 1/2 of 4th digit)
	• Atrophy in intrinsic muscles of hand
	• Claw fingers

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 450, Philadelphia, 1996, WB Saunders.

and the javelin throw. During overhead throwing, a rise in pressure occurs in the ulnar nerve in the cubital tunnel as the elbow is flexed in combination with wrist extension, shoulder abduction, trunk lateral (side) flexion, and valgus loading.[65,94–96] Matsuo and Fleisig[96] reported that abnormal pitching mechanics, such as excessive trunk lateral (side) flexion (approximately 40°) and shoulder abduction (approximately 120°) resulted is approximately twice as much varus torque (approximately 125 N·m) that is needed to resist valgus loading during normal pitching mechanics, which may increase the strain on the ulnar nerve.

Muscle imbalance, such as excessive strength in the extensor-supinator forearm musculature, which generates a valgus torque, compared with the flexor-pronator forearm musculature, which generates a varus torque, may increase valgus loading and strain to the ulnar nerve.[97] Weakness or fatigue in the flexor-pronator forearm musculature may also increase valgus loading and ulnar nerve strain. Therefore, with repetitive throwing, it is important to have adequate strength and endurance in the flexor-pronator musculature of the forearm to help control valgus loading and ulnar nerve strain, as well as proper muscle balance between the flexor-pronator and extensor-supinator musculature of the forearm. Over time, excessive ligamentous laxity of the ulnar (medial) collateral ligament at the elbow may also increase valgus mobility and further increase excessive strain on the ulnar nerve in the cubital tunnel. Surgical removal of an excessive posteromedial olecranon osteophyte, which may occur in overhead throwing sports such as baseball, may result in excessive stretch of both the ulnar collateral ligament and the ulnar nerve because of the loss of valgus restraints.[98,99]

In overhead throwing athletes, the ulnar nerve should be evaluated for subluxation during elbow flexion and valgus loading. Pain over the ulnar nerve, a positive Tinel's sign posterior to the medial epicondyle, a positive elbow flexion test (Figure 25-12), as well as ulnar nerve sensory or motor deficits, all may suggest involvement of the ulnar nerve. Most cases of **cubital tunnel syndrome** have an insidious onset of medial elbow pain radiating down the medial forearm and numbness and tingling in the ulnar aspect of the forearm and hand. Symptoms are aggravated by continued use.[91] Symptoms can occur in computer users working in excessive elbow flexion, violinists or violists practicing for long periods, and laborers who perform repeated elbow flexion/extension on the job. Wright et al.[93] reported that the nerve requires 2 cm (1 inch) of unimpeded movement at the elbow and can experience strain values that diminish the circulation to the nerve. Entrapment or inflammation of the nerve lessens the nerve's ability to tolerate movement or changes in intraneural pressure.

Visible signs of ulnar nerve pathology are "**claw hand**," in which the flexor digitorum profundus and extensor digitorum (extrinsic muscles) both pull on the distal phalanx, and without the control of the intrinsic muscles that attach more proximally, the fingers collapse into the zigzag pattern of metacarpophalangeal hyperextension and proximal interphalangeal and distal interphalangeal flexion. Another visible sign is sunken interosseous spaces in the dorsum of the hand secondary to atrophy of the dorsal interossei muscles. There may also be noticeable atrophy of the hypothenar eminence. Additional signs include an inability to abduct and adduct the fingers or adduct the thumb.

Figure 25-12 The elbow flexion test for ulnar nerve irritation in the cubital tunnel.[100] A positive response is the production of paresthesias along the ulnar border of the forearm and hand. Symptoms should occur in less than 5 seconds but could take several minutes.

Various tests for lesions along the path of the ulnar nerve have been described in the literature. Buehler and Thayer[100] suggested using the elbow flexion test as a clinical test for cubital tunnel syndrome (see Figure 25-12). A positive response to the test consists of reproduction of paresthesias along the ulnar border of the forearm and hand. Butler's upper limb neurodynamic test with an ulnar nerve bias (ULNT 3; Figure 25-13) is similar but increases the tensile stress on the brachial plexus and proximal portion of the ulnar nerve by adding shoulder girdle depression, glenohumeral abduction, and lateral (external) rotation.[62] (This test has been described as the ULTT 3[47,101] or as ULTT 4 in *Orthopedic Physical Assessment*.[87]) Although the test originally was described with the forearm in supination, pronation of the forearm often makes the test more provocative of symptoms. Cervical lateral (side) flexion away from the extremity being tested can also be added.

Responses to Butler's ULNT 3 (ULTT 4 in *Orthopedic Physical Assessment*[87]) have been studied in healthy patients[101–103] and in symptomatic patients.[101] In most healthy subjects, symptoms of tingling or numbness occurred in the medial forearm and hand. Subjects also frequently reported a sensation of pressure at the medial elbow. Some healthy subjects had no

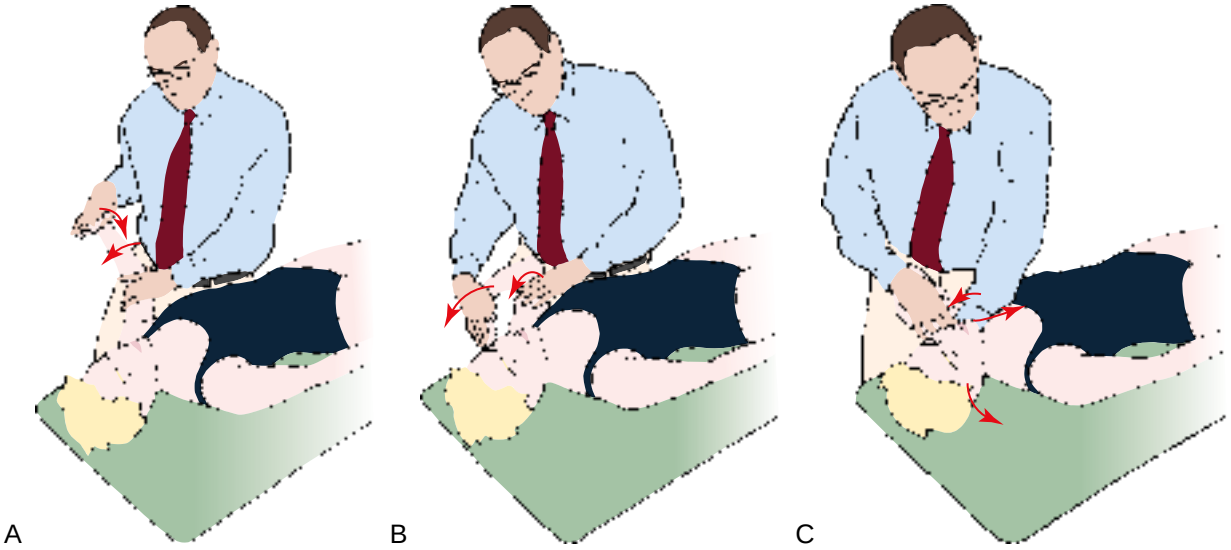

Figure 25-13 The upper limb neurodynamic test 3 (ULNT 3[62]) was designed to place tensile stress on the ulnar nerve. The test consists of wrist and finger extension and forearm pronation **(A)**, elbow flexion and lateral (external) rotation of the arm **(B)**, and shoulder abduction and shoulder girdle depression **(C)**. Contralateral lateral (side) flexion of the cervical spine further sensitizes the test. (Modified from Butler D: *The sensitive nervous system*, p 334, Adelaide, Australia, 2000, Noigroup Publications.)

symptomatic response to the test. In 18 subjects with a variety of upper extremity or cervical spine symptoms, all subjects had some response to the test. They had more frequent reports of medial upper arm pain (44% versus 18% in healthy subjects) and occasional symptoms in the contralateral extremity.

Clinical Note[87]

A positive neurodynamic test is indicated when:
1. The patient's symptoms are reproduced.
2. There is a difference between right and left arms on testing.
3. A sensitivity test (e.g., cervical side flexion) in the ipsilateral quadrant alters the symptoms.
4. Range of motion is restricted by neurological symptoms.

Twenty-five percent of the subjects tested in the patient group had an onset of symptoms before the addition of shoulder abduction, something that never occurred in asymptomatic subjects. When the range of shoulder abduction at the onset of symptoms in the remaining symptomatic arms was compared with that in healthy subjects, the difference was not statistically significant. Clinically, this seems to indicate that provocation of symptoms in the early stages of the ULNT 3 or with the elbow flexion test is a better measure of the presence of abnormality than the degree of abduction available before the onset of symptoms in the ULNT 3. It should be noted that the sequencing of the components of the test affects the onset of symptoms. In a recent study, when the test was performed with wrist and finger extension followed by forearm pronation, elbow flexion, shoulder lateral (external) rotation, scapular depression, and shoulder abduction followed by cervical lateral (side) flexion toward the opposite side, 52% of patients felt symptoms with wrist and finger extension alone.[103]

Treatment for cubital tunnel syndrome consists initially of rest, ice, and anti-inflammatory medications. The patient should also be examined for any problems in the cervical spine or shoulder that may be contributing to the symptoms. Altering the mechanics of throwing may help minimize stress on the elbow in the athlete. Where appropriate, computer keyboard height should be adjusted to place the elbow in less than 90° flexion during prolonged computer use. A soft splint worn at night can help symptoms by preventing prolonged elbow flexion during sleep.

If conservative treatment fails, surgical treatment should be considered. Surgical options include (1) release of the ligament at the cubital tunnel, (2) transposition of the ulnar nerve to the anterior surface of the elbow joint, and (3) removal of the medial epicondyle.[76,91,92] Rettig and Ebben[104] retrospectively reviewed the cases of 20 athletes who underwent anterior subcutaneous transfer of the ulnar nerve. The average length of time between surgery and return to sports was 12.6 weeks (range, 6 to 43 weeks), and 19 of 20 athletes returned to their preinjury level of athletic activity.

Injury to the ulnar nerve at the wrist can cause sensory disturbances in the medial hand and motor weakness in the intrinsic muscles of the hand.[76,105] It is vulnerable during surgical procedures on the triangular fibrocartilage complex (TFCC), ulnar styloid, or carpal tunnel.[7] Compression of the ulnar nerve is a common problem for cyclists because of prolonged pressure on the medial hand and wrist.[42,105,106] Fernald[106] studied the incidence of overuse injuries in elite cyclists and found that 21% had sensory changes in the upper extremities. The abnormality

may result from acute or chronic compression of the ulnar nerve in Guyon's canal (tunnel) as a result of prolonged weight bearing on the hands or a fall. It also can be caused by traction on the nerve produced by the extended wrist position on the handlebars.[45,105] Normally, cyclists bear approximately 45% of their weight on the upper extremities[106]; therefore the combination of compression and vibration from the road increases the likelihood of neurogenic symptoms.

Strategies to prevent irritation to the nerve at the wrist include changing the position of the hands frequently while riding, using padded gloves and handlebars to increase surface area and decrease pressure, using modified handlebars, and adjusting the overall "fit" of the bike to reduce weight bearing on the hands.[105,106]

Median Nerve Injury

The median nerve is a sensorimotor nerve that arises from the medial and lateral cords of the brachial plexus. The lateral root is a continuation of the lateral cord, receiving fibers from C6 and C7, while the medial root is a continuation of the medial cord receiving fibers from C8 and T1. The nerve enters the cubital fossa medial to brachial artery, passes between the two heads of the pronator teres, descends between the flexor digitorum superficialis and flexor digitorum profundus muscles, and travels under the flexor retinaculum as it passes through carpal tunnel to enter the hand.

The motor component of the nerve innervates most of the flexor/pronator muscles in the anterior compartment of the forearm, the muscles in the thenar region of the hand, and the lateral two lumbricals (first and second). The **anterior interosseous nerve** is a C8-T1 motor nerve that branches off the median nerve in the distal part of the cubital fossa as it emerges from between the two heads of the pronator teres and then passes inferiorly on the anterior surface of the interosseous membrane. Along its course, it innervates the lateral half of flexor digitorum profundus, the flexor pollicis longus, and the pronator quadratus muscles. These muscles collectively produce the circular **"okay" sign** as the pads of the thumb and index finger come together via interphalangeal joint flexion of the thumb and distal interphalangeal joint flexion of the index finger along with pronation at the distal radioulnar joint.

The sensory component of the nerve supplies skin of the central and lateral palm (**palmar cutaneous branch**), the palmar surfaces of lateral three and a half fingers and the dorsal surface of lateral three and a half distal phalanges via palmar digital branches, and articular branches supply the elbow, wrist, and carpal joints.

Three common compression syndromes affect this nerve: **pronator teres syndrome (PTS)**, **anterior interosseous nerve syndrome (AINS)**, and **carpal tunnel syndrome (CTS).** Common sites, causes, and signs and symptoms of median nerve compression in proximity to the elbow are listed in Table 25-6.[14] Differential diagnostic characteristics of these syndromes are outlined in Table 25-7.[107]

PTS is often secondary to overuse of the pronator teres muscles, and symptoms worsen with elbow flexion and forearm pronation. PTS symptoms may include pain and reduced mobility in forearm pronation and supination; numbness or tingling in the palm, thumb, index finger, or middle finger; and possible weakness and atrophy in the thenar muscles, which is sometimes referred to as **"ape" hand** because of the flattened thenar eminence that resembles an ape's hand. In more severe injuries, the **"hand of benediction"** may be evident. In this case, when the individual starts with all fingers fully extended and then tries to make a fist, the little finger and ring finger partially

TABLE **25-6**

Median Nerve (C5-T1): Compression in Proximity to the Elbow[14]

Cause/Site	Signs and Symptoms
Swelling from trauma can compress the nerve in the fibro-osseous tunnel created by the ligament of Struthers as it passes between the supracondylar process and the medial epicondyle	Pain with resisted forearm pronation
Abnormal thickness of the bicipital aponeurosis can compress the nerve during resisted elbow flexion or supination	Pain aggravated by resisted elbow flexion and supination
A fibrous band in the superficial head of the pronator teres muscle may compress the nerve where it passes between the superficial and deep heads, or an inflamed pronator teres secondary to overuse (e.g., hammering, repeatedly using a screwdriver, cleaning fish, or performing any activity that requires repetitive use of the pronator teres, such as overhead throwing)	Pain aggravated by resisted forearm pronation and flexion Atrophy in muscles in thenar eminence
The nerve can be compressed under the fibrous arch on the proximal margin of the flexor digitorum superficialis muscle	Pain in the flexor digitorum superficialis with resisted third finger flexion

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 452, Philadelphia, 1996, WB Saunders.

TABLE **25-7**

Differential Diagnostic Characteristics of Carpal Tunnel, Pronator Teres, and Anterior Interosseous Nerve Syndromes

	Paresthesia	Nocturnal Symptoms	Muscle Weakness/ Atrophy	Tinel's Test	Phalen's Test	Direct Compression	Electrodiagnostic Tests
Carpal tunnel syndrome (CTS)	Lateral 3½ digits palmar surface	Yes	Abductor pollicis brevis, opponens pollicis, flexor pollicis brevis	Positive at carpal tunnel	Positive	Positive at carpal tunnel	Diagnostic
Pronator teres syndrome (PTS)	Lateral 3½ digits palmar surface	No	Not a traditional sign but may involve abductor pollicis brevis, opponens pollicis, flexor pollicis brevis, flexor pollicis longus, flexor digitorum profundus (index and middle fingers), pronator quadratus, flexor carpi radialis, palmaris longus	Positive at pronator teres <50%	Negative	Positive at pronator teres, negative at carpal tunnel	Rarely diagnostic
Anterior interosseous nerve syndrome (AINS)	None	No	Flexor pollicis longus, flexor digitorum profundus (index and middle fingers), pronator quadratus	Negative	Negative	Negative	Diagnostic

Modified from Lee MJ, LaStayo PC: Pronator syndrome and other nerve compressions that mimic carpal tunnel syndrome, *J Orthop Sports Phys Ther* 34:601-609, 2004.

flex while the index and middle fingers remain extended. Some PTS symptoms, such as sensory and motor deficits in the hand, may mimic CTS.

CTS symptoms are aggravated by wrist flexion and extension and overuse of the anterior forearm muscles controlling the finger and thumb flexors, because all extrinsic finger and thumb tendons travel with the median nerve through the carpal tunnel. In CTS, more than in PTS, weakness and atrophy of the thenar eminence muscles are observed. A positive Phalen's sign, reverse Phalen's sign, or Tinel's sign over the center of the carpal tunnel may produce tingling and paresthesia in the lateral three and a half fingers, especially the finger pads which have a higher density of sensory receptors compared with other areas of the fingers. In CTS, the palm is usually spared because the palmar branch of the median nerve passes superficial to the flexor retinaculum of the wrist.

If the anterior interosseous nerve is compressed (see Table 25-6), resulting in AINS, it may cause functional weakness in thumb and index finger flexion and weakness in forearm pronation, as well as a weak pinch (i.e., no tip-to-tip pinch). When an individual with anterior interosseous syndrome attempts to make the "okay" sign, a diamond shape forms instead of a circular shape as the pads of the distal phalanx of the thumb and the index finger come together. This is secondary to an inability to flex the interphalangeal joint of the thumb and the distal interphalangeal joint of the index finger. Because the anterior interosseous nerve is primarily a motor nerve, there are typically no sensory symptoms. AINS is rare compared with CTS and pronator syndrome (less than 2%).[107,108]

CTS is by far the most common form of compression of the median nerve (88.2% of median nerve injuries[107,108]). Many activities are considered risk factors, including weight bearing on the hands (with the wrist in end range flexion or extension)[45,105]; repetitive activities such as gripping, typing, throwing, or otherwise engaging in wrist flexion and extension; and the use of vibrating tools. Other physical characteristics linked to a higher incidence of CTS include gender (i.e., more common in females than in males), age, race, and obesity; pregnancy, diabetes, thyroid disease, and connective tissue disorders are also linked to an increased incidence,[109] as is trauma.[110] Splinting in a neutral wrist position may be

necessary to facilitate rest because pressure on the nerve increases with wrist flexion or extension. Compliance with splint use has been linked to the fit and comfort of the splint and the ability to continue to work or to sleep while wearing it.[111] Other adjunct procedures include icing, corticosteroid or lidocaine injection, and resection of the transverse retinacular ligament.[105,110] There is a small risk of nerve injury during surgical release or injection in the carpal tunnel, especially if there is variant anatomy.[7]

The differential diagnosis of median nerve compression syndromes includes ruling out cervical radiculopathies. As with radial and ulnar nerve abnormality, the possibility of a mechanical or physiological double crush lesion must always be considered. Murray-Leslie and Wright[112] reported a positive correlation between the incidence of CTS and a decrease in the size of the anteroposterior measurements of the cervical spinal canal at C5 and C6 and a decrease in cervical disc height when subjects were compared with age-matched controls.

The authors' clinical experience has been that symptoms may be present in the median nerve distribution that appear to be caused by adverse mechanics along the course of the nerve, frequently in the absence of EMG abnormalities. A similar observation led Elvey[88] to develop what is currently considered the first upper limb neurodynamic test (ULNT 1; Figure 25-14). His cadaveric studies demonstrated that the C5-C7 nerve roots moved laterally during shoulder abduction. Elbow extension and wrist extension increased the tension on these structures and on the brachial plexus and median nerve. Other studies have confirmed the motion of the median nerve with shoulder abduction, elbow extension, and wrist extension.[19] The response to the end position of the test in asymptomatic subjects is a deep, sometimes painful stretch over the anterior shoulder, elbow, and lateral forearm.[113] It also provokes a mild to moderate amount of tingling in the thumb, index (2nd digit), and middle (3rd digit) finger.

Butler's variation on the ULNT 1 also stresses the median nerve. It uses the same components of motion as Elvey's test but in a different order.[62] Butler developed the ULNT 2 (ULTT 2 in *Orthopedic Physical Assessment*[87]) (Figure 25-15) to replicate more closely the functional movements that reproduced patients' symptoms. The final position of the test is similar to the backswing of a forehand shot in tennis. The response to this test in healthy subjects is similar to that seen in the ULNT 1.[114,115]

All the upper limb neurodynamic tests described are helpful for determining whether abnormal neurobiomechanics are contributing to persistent symptoms. Treatment can then focus on mobilization or release/decompression of the neural tissues involved. Nerve gliding (sometimes called nerve flossing) has been reported to be an effective technique or home exercise for patients with CTS. Seradge et al.[116] used nerve and tendon gliding exercises as part of a CTS prevention program in a meat packing plant. They reported a 45% decrease in the incidence of CTS in response to their program.[116,117] Lee and LaStayo[107] and Rozmaryn et al.[118] reported that patients with CTS who performed a home program of nerve gliding exercises had a lower rate of subsequent surgery for CTS (43% versus 71.2% in those who did not perform exercises).

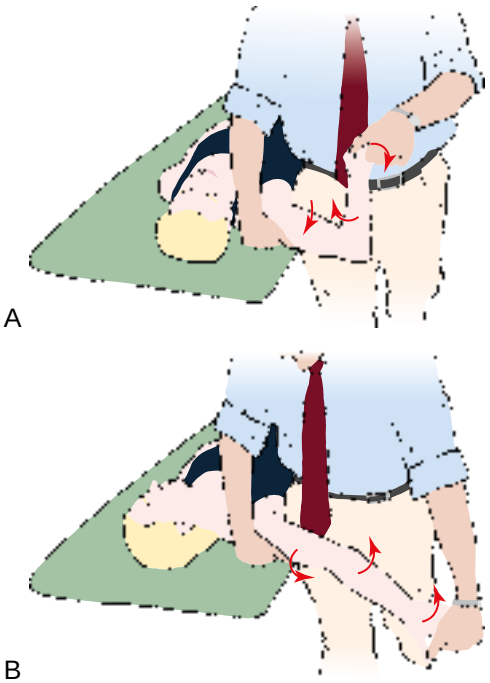

Figure 25-14 The upper limb neurodynamic test 1 (ULNT 1) places tensile stress on the brachial plexus and median nerve throughout its course. The test consists sequentially of shoulder abduction, wrist and finger extension, and forearm supination **(A)** followed by shoulder lateral (external) rotation, elbow extension, and contralateral cervical lateral (side) flexion **(B)**. It is essential to maintain shoulder depression when performing the test movements if one hopes to find a positive test. (Modified from Butler D: *The sensitive nervous system,* p 317, Adelaide, Australia, 2000, Noigroup Publications.)

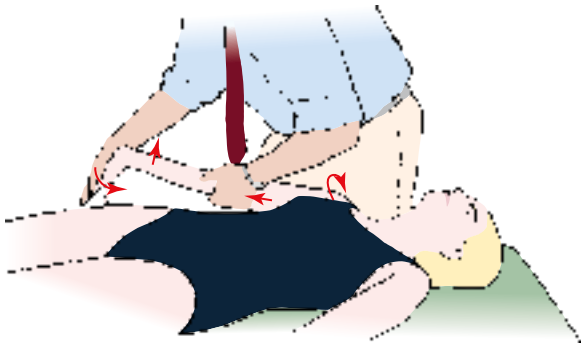

Figure 25-15 The ULNT 2 was developed by Butler[12,62] as an alternative test of the median nerve tract. It consists of shoulder girdle depression, elbow extension, shoulder lateral (external) rotation, supination of the forearm, wrist and finger extension, and shoulder abduction. Contralateral cervical lateral (side) flexion further sensitizes the test. (Modified from Butler D: *The sensitive nervous system,* p 326, Adelaide, Australia, 2000, Noigroup Publications.)

Combined Lesions

Injury to the radial, median, and ulnar nerves can occur as a result of compression in the axilla or upper arm from the misuse of crutches during rehabilitation of lower extremity injuries.[14,76] The median and ulnar nerves are always vulnerable at the wrist during activities requiring weight bearing on extended wrists.[45] The likelihood of combined lesions increases with the magnitude of trauma to the extremity.

Clinical Note

Injury to the peripheral nerves of the upper limb can occur during crutch walking if the crutches are not fitted properly or when the patient is not taught to use them properly.

PERIPHERAL NERVE INJURIES IN THE LOWER QUARTER

Nerve Injuries of the Lumbar Spine and Lower Limb

- Sciatic nerve
- Tibial nerve
- Common fibular (peroneal) nerve
- Femoral nerve
- Obturator nerve

Sciatic Nerve Injury

The sciatic nerve (Table 25-8) is formed by the common fibular (peroneal) and tibial nerves and contains contributions from the L4 to S3 nerve roots of the sacral plexus. It leaves the pelvis through the greater sciatic foramen inferior to the piriformis muscle and deep to the gluteus maximus muscle, but supplies no muscles in the gluteal region. The sciatic nerve then descends along the posterior aspect of thigh, and divides proximal to the knee into the tibial and common fibular (peroneal) nerves. In the thigh, it innervates the adductor magnus (i.e., hamstring portion) and hamstrings (i.e., semimembranosus, semitendinosus, and long head of biceps femoris) by its tibial division. The sciatic nerve also provides articular branches to the hip and knee joints.

The sciatic nerve can be irritated as it passes under or through the piriformis muscle in the buttocks.[119] This is commonly termed **piriformis syndrome**.[120] Pain may be caused by spasm or scarring of the muscle from a muscle strain, trauma, or overuse.[76] Clinically, pain may radiate down the posterior leg with or without dysesthesia[120] with tenderness over the muscle belly. The patient may report pain with prolonged sitting, especially on a hard surface, and resisted hip abduction and lateral (external) rotation. Full passive medial (internal) rotation in flexion and adduction can also compress the nerve under the piriformis muscle.[120] The pain is not usually associated with neurological loss.[76]

TABLE **25-8**

Sciatic Nerve (L4-S3): Areas of Entrapment or Irritation

Cause/Site	Signs and Symptoms
Compression as nerve runs under or through the piriformis in the buttocks	Tenderness over the piriformis muscle belly; pain with resisted hip abduction and lateral (external) rotation; pain with full passive medial (internal) rotation or hip adduction in hip flexion
Entrapment in the fibers of the origin of the hamstrings at the ischial tuberosity	Pain from ischial tuberosity to posterior thigh; neurological and straight-leg raise tests negative; symptoms provoked by stretching, sitting, and running
In association with hamstring tear	Differentiation: • Hamstring tear alone: pain with palpation of muscle, with or without bruising; slump test negative • Sciatic nerve or nerve root involved; slump test positive (see Figure 25-16)

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 454, Philadelphia, 1996, WB Saunders.

The sciatic nerve is also vulnerable during total hip arthroplasty, especially when a posterolateral approach is used. The risk of injury increases if the surgery involves revising a previous hip replacement, if there was underlying congenital hip dysplasia, or if the surgery results in leg lengthening.[8] There is also the risk of nerve injury during hip arthroscopy because of the traction applied to allow for access to the joint.[8,121]

Hamstring syndrome results from entrapment of the sciatic nerve by tight tendinous bands near the lateral origin of the hamstrings at the ischial tuberosity.[119] It often is found in sprinters and hurdlers. Pain is felt at the ischial tuberosity and may radiate down the posterior thigh to the back of the knee.[122] Symptoms are aggravated by sitting, stretching, or running. There may be hamstring weakness, but the results of neurological and straight-leg raise tests usually are negative.[122] Surgical release of the tendinous bands usually is successful in relieving symptoms.[119]

Pain from a torn (2nd or 3rd degree strain) hamstring muscle must be differentiated from irritation of the lumbar nerve roots and the sciatic nerve. The slump sitting test helps differentiate pain arising from neural or muscular structures (Figure 25-16). The test combines full neck and trunk flexion, knee extension, ankle dorsiflexion, and hip flexion in a sitting position.[12,123] It places tensile stress on the neural tissues throughout the spinal canal and the sciatic nerve. Pain from a stretch on the neural tissue can

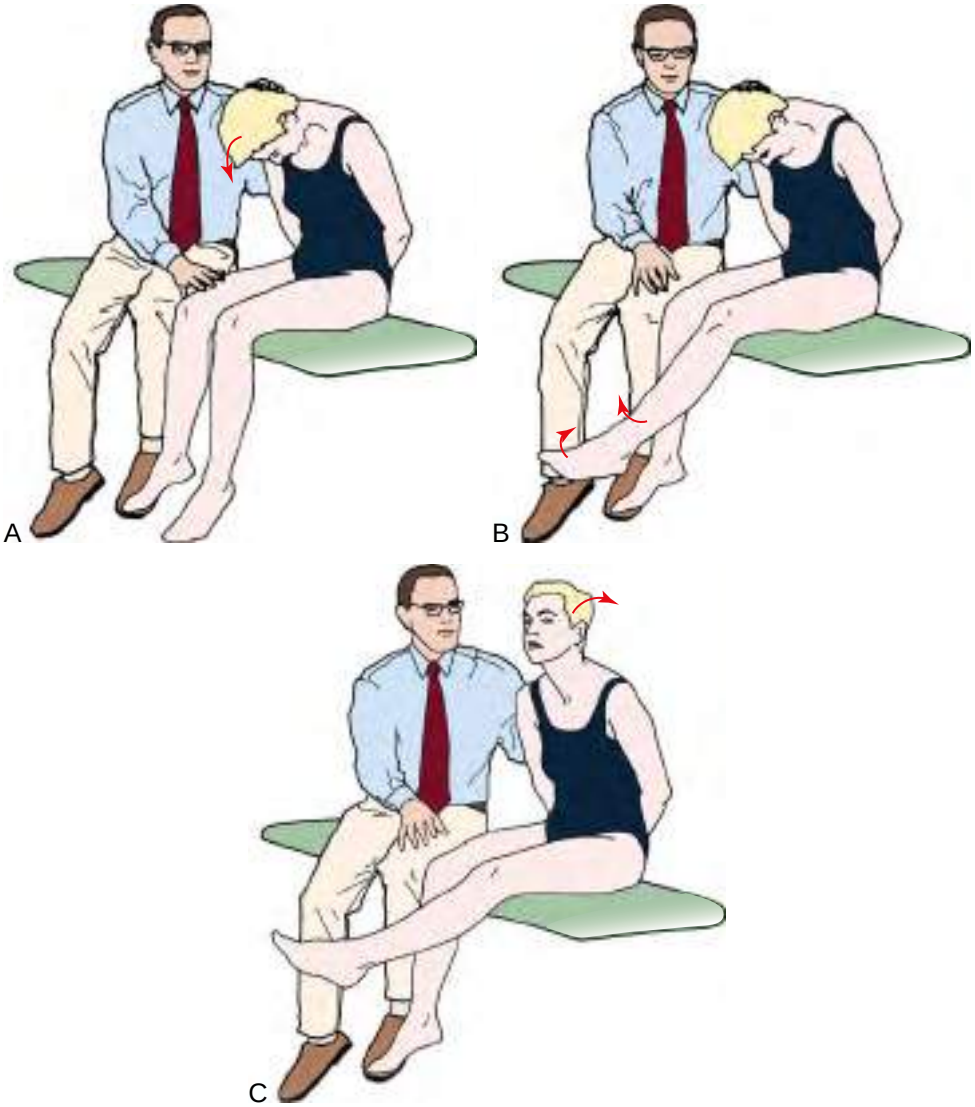

Figure 25-16 The slump test is designed to stress the neural structures in the spinal canal and along the course of the sciatic nerve. The test consists of trunk flexion, neck flexion (**A**), knee extension (**B**), and, as needed, dorsiflexion of the ankle and hip flexion, adduction, or medial (internal) rotation. If knee extension increases or symptoms decrease when the neck flexion component is released (**C**), the test is considered positive. (Modified from Butler D: *The sensitive nervous system,* p 292, Adelaide, Australia, 2000, Noigroup Publications.)

be differentiated from muscular pain from the hamstrings if the leg is maintained in the same degree of knee extension that reproduces the muscle pain and the head and neck are extended. If the pain is decreased, neural structures are implicated, because the muscle length has not been changed, but the tension on the neural tissues has decreased.[124]

Kornberg and Lew[125] demonstrated that use of the slump sitting test as a treatment technique facilitates faster return to play in Australian football players with grade I hamstring tears, indicating that in some cases motion of the sciatic nerve must be impaired as it passes through the muscle either before the tear or from the inflammation and exudate surrounding the nerve after injury. Butler[12,62] advocates early but gentle motion of the muscle and nerve to prevent scarring and adhesion formation between the muscle and nerve.

Clinical Note

With chronic hamstring strains at its insertion, the sciatic nerve should be cleared of any involvement.

Tibial Nerve Injury

The tibial nerve (Table 25-9) is formed from fibers from the L4-S3 nerve roots. It descends vertically through the popliteal space, where it may be vulnerable to compression by trauma to the back of the knee, a **Baker's cyst** (often from chronic knee effusion and concomitant weakening of the posterior capsule), or osteochondroma.[75,76,126] When injured, it can cause paresthesia, pain, and atrophy of the superficial and deep muscles in the posterior compartment of the leg, which includes the gastrocnemius, soleus, plantaris, popliteus,

TABLE **25-9**

Tibial Nerve (L4-S3): Sites of Entrapment or Irritation

Cause/Site	Signs and Symptoms
Popliteal space: • Compression by Baker's cyst • Entrapment in proximal portion of medial gastrocnemius	Posterior knee pain, possibly radiating to calf
Tarsal tunnel: • Space-occupying lesion (e.g., osteophyte, ganglion) • Eversion strain (acute or repetitive)	Pain from medial malleolus to the heel, sole of the foot, and occasionally to the calf Pain worse at night or with walking or running Positive Tinel's test at tarsal tunnel
Medial plantar nerve distal to tarsal tunnel or in hypertrophic abductor muscle of the big toe	Pain and paresthesias in the medial 3½ toes with weight bearing under load or with running
Lateral plantar nerve distal to tarsal tunnel	Pain in the lateral foot and lateral 2 toes; may cause persistent medial heel pain
Interdigital neuromas: • Compression from callus formation under the metatarsal heads • Stretching of nerve under the deep transverse tarsal ligament	Pain and paresthesias at the metatarsal heads that may radiate proximally or to toes Foot drop

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 455, Philadelphia, 1996, WB Saunders.

tibialis posterior, flexor digitorum longus, and flexor hallucis longus muscles. The tibial nerve supplies skin on posterolateral leg via its branch, the **medial sural cutaneous nerve**. The tibial nerve also supplies articular branches to the tibiofemoral joint.[127] The calcaneal cutaneous branches of the tibial and sural nerves supply skin to the heel.

Ekelund[128] reported one case of a female athlete who presented with entrapment of the tibial nerve in the proximal portion of the medial gastrocnemius muscle. Her main complaint was posterior knee pain with training. She had tenderness over the nerve on palpation. Surgical release relieved her symptoms completely.

Entrapment of the tibial nerve in the tarsal tunnel **(tarsal tunnel syndrome)** as it passes through the osseofibrous tunnel between the flexor retinaculum and medial malleolus usually occurs as a result of an alteration in the size or shape of the tunnel owing to fracture, dislocation, trauma, lipoma, tendon sheath cyst, acute or chronic hyperpronation during walking or running, or direct pressure.[76,129,130] The classic symptoms include pain and/or paresthesia at the medial malleolus radiating to the sole of the foot, the heel, and sometimes the calf and worsening of the symptoms at night, with walking or running, with ankle dorsiflexion and eversion, and weakness of toe flexion. Pain or paresthesia is reproduced with Tinel's test over the nerve in the tarsal tunnel.[129]

The tibial nerve splits into medial and lateral plantar nerves in the tarsal tunnel, which innervate (primarily by S2-S3 nerve roots) the four layers of intrinsic muscles in the plantar surface of the foot. It also supplies the skin of the plantar surface of the foot. The **medial plantar nerve** passes distally in the foot between the abductor hallucis and flexor digitorum brevis muscles and divides into motor and sensory branches. Its sensory branch supplies skin of the medial side of the foot and medial portion of the plantar surface of the foot, and the nail beds of medial three and one half digits. Its motor branch innervates the abductor hallucis, flexor digitorum brevis, flexor hallucis brevis, and first lumbrical muscles. Entrapment of the medial plantar nerve usually causes paresthesia or pain in the medial three and one half digits and may also cause weakness or atrophy in the aforementioned intrinsic muscles of the foot.[129,130] The medial plantar nerve can also be entrapped in a hypertrophic or fibrotic abductor hallucis muscle.[76] The repetitive nature of running combined with altered mechanics of the foot and ankle places the nerve at risk for tensile injuries within the tarsal tunnel. Ironically, symptoms may also be provoked by pressure placed on the medial arch by new arch supports.[48] Johnson et al.[131] reported similar problems in a competitive weight lifter owing to the large weight-bearing loads on the foot.

The **lateral plantar nerve** passes laterally in the foot between the quadratus plantae and flexor digitorum brevis muscles and innervates the quadratus plantae and abductor digiti minimi muscles, and then divides into superficial and deep branches. The motor component of the superficial branch innervates the flexor digiti minimi brevis and the fourth plantar and dorsal interossei muscles, while the sensory component supplies skin on the lateral portion of plantar surface of the foot and the skin and nail beds of the lateral one and one half digits. The deep branch (motor only) supplies the first, second, and third plantar and dorsal interossei; the lateral three lumbricals; and the adductor hallucis muscles.

Entrapment of the lateral plantar nerve causes symptoms in the lateral plantar surface of the foot and lateral one and a half digits and may also cause weakness or atrophy in the aforementioned foot intrinsic muscles. Branches of this nerve supply sensation to portions of the medial heel and calcaneus, and the long plantar ligament. Irritation of the calcaneal branch of this nerve is a potential source of persistent heel pain.[129,130]

According to Butler,[12,62] many cases of "plantar fasciitis" may be neurogenic in origin. An important part of the differential diagnosis of neurogenic and fascial pain is the use of tests to detect increased mechanical sensitivity

of the tibial nerve. To differentiate the cause of pain, the foot and ankle are positioned in a pain-provoking position for plantar fasciitis (i.e., dorsiflexion of the foot and toes), and movement of a proximal part of the limb (e.g., straight-leg raise) is superimposed, increasing the tension on the tibial nerve and its branches (Figure 25-17). The plantar fascia is not stressed further by a straight-leg raise. Therefore, if symptoms increase in response to the straight-leg raise, there is likely at least a partial neurogenic origin.[12]

Clinical Note

When differentially diagnosing plantar fasciitis, a straight-leg test while maintaining toe extension (and ankle dorsiflexion) will help indicate whether the tibial nerve is involved.

Interdigital neuromas are most common in the second and third and third and fourth intermetatarsal spaces. One common example is **Morton's neuroma** (also called Morton's metatarsalgia), which most commonly involves the second or third plantar intermetatarsal nerve, which are branches of the medial and lateral plantar nerves. This neuroma most often occurs in runners and dancers because of the repetitive dorsiflexion of the metatarsophalangeal joints. It can also result from wearing high-heel shoes or from trauma, callus formation under the metatarsal heads, or inflammatory conditions. Morton's neuroma is most common in females. The nerve is stretched under the deep transverse metatarsal ligament. Pain and paresthesia are felt at the metatarsal heads and may radiate proximally or into the toes.[130] Treatment usually consists of rest, modification of footwear, corticosteroid injection, or surgical excision of the neuroma. Mobilization of the intermetatarsal joints may help alter the mechanical interface among the nerve, the metatarsal heads, and the transverse ligament.[12]

Figure 25-17 Maximum toe extension and dorsiflexion place tensile stress on the plantar fascia. The position shown is maintained while the lower extremity is raised in a straight-leg raise. If symptoms increase with the addition of the straight-leg raise, neural structures are implicated, because the tension on the plantar fascia has not changed. (Modified from Butler D: *The sensitive nervous system,* p 280, Adelaide, Australia, 2000, Noigroup Publications.)

Common Fibular (Peroneal) Nerve Injury

The **common fibular (peroneal) nerve** (Table 25-10) is formed from fibers from the L4-S2 nerve roots. It divides from the sciatic nerve in the upper part of the popliteal space, where it follows the medial border of the biceps femoris and its tendon. The nerve then passes over the posterior aspect of the head of the fibula and winds around the neck of the fibula deep to fibularis (peroneus) longus, where it divides into deep and superficial fibular (peroneal) nerves.

The **superficial fibular (peroneal) nerve** enters the lateral compartment of the leg, where it innervates the fibularis (peroneal) longus and brevis muscles and supplies sensation to the skin on the distal third of the anterior surface of the leg and the dorsum of the foot, except the web space between the first and second toes. The deep fibular (peroneal) nerve enters the anterior compartment

TABLE **25-10**

Common Fibular (Peroneal) Nerve (L4-S2): Areas of Entrapment or Irritation

Cause/Site	Signs and Symptoms
Traction injury at bifurcation from sciatic nerve	• Acute onset of severe lateral leg pain from hematoma formation within the nerve after ankle fracture or inversion sprain
Fibular head: compression from a blow or entrapment	• Pain and/or paresthesias of the lateral leg and foot • Electromyogram (EMG) may not be positive in entrapment unless symptoms have been provoked by increased activity
Dorsolateral ankle after a sprain	• Lateral foot and ankle pain/paresthesias; possible EMG findings • Positive straight-leg raise test with plantar flexion/inversion of foot and ankle
Dorsolateral ankle: superficial or deep fibular nerve compressed by fascial bands, swelling, or ill-fitting boots or shoes	• Pain and/or paresthesias in the dorsolateral foot and ankle • Symptoms provoked with palpation of the nerve at the site of the lesion • Positive straight-leg raise test with plantar flexion/inversion of foot and ankle • Drop foot • Paresthesias in cleft between first and second toes (deep fibular compression)

Modified from Drye C, Zachazewski JE: Peripheral nerve injuries. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation,* p 457, Philadelphia, 1996, WB Saunders.

of the leg, where it innervates the tibialis anterior, extensor digitorum longus, extensor hallucis longus, and fibularis (peroneus) tertius muscles. The deep fibular (peroneal) nerve then enters the dorsum of foot and innervates the extensor digitorum brevis and extensor hallucis brevis muscles. It supplies sensation to the skin over the web space between the first and second toes.

Because the common fibular (peroneal) nerve borders the popliteal fossa, it is susceptible to compression by a Baker's cyst or osteochondroma, although it is affected less often than the tibial nerve.[127] Because of the nerve's proximity to the fibular head, the nerve is vulnerable to compression injuries from a direct blow to the lateral leg, a lower leg cast, or sustained pressure in proximity of the fibular head (e.g., a race car driver leaning his or her leg against a car door or poor positioning during surgery).[33]

Nobel[132] described two patients who developed a hematoma of the common fibular nerve just distal to the bifurcation from the sciatic nerve after an inversion sprain of the ankle or fracture of the lower leg. He hypothesized that the blood vessels supplying the nerve were ruptured by abrupt longitudinal traction on the nerve. Evacuation of the hematoma relieved the patients' discomfort completely.

Clinical Note

During assessment for ankle sprains, the examiner should clear the common fibular (peroneal) nerve and its branches as part of the differential diagnosis.

McMahon and Craig[133] reported a common fibular (peroneal) nerve injury after a severe varus torque caused disruption of the anterior cruciate ligament (ACL), lateral collateral ligament (LCL), iliotibial band, and biceps tendon. Leach et al.[134] found that in runners, the nerve can be entrapped in musculofascial bands at various points around the fibular head. The main symptoms reported were progressive lateral leg and foot pain and paresthesia and weakness of the ankle evertor and toe extensor muscles. Runners seem to be especially vulnerable to irritation at this site because of repetitive stretching of the nerve during inversion and plantar flexion. One other important observation from this study was the fact that many of the patients had normal neurological findings or EMG studies when examined in the physician's office. However, if the patients returned to the office immediately after a long run, the neurological findings and EMG changes were much more pronounced.

Common fibular (peroneal) nerve injury can be a complication of total knee arthroplasty (Incidence: 0% to 9.5%). The risk of injury increases with a preexisting valgus deformity of more than 10°, in patients with rheumatoid arthritis, and with prolonged tourniquet use.[8]

Common fibular nerve injury should also be considered a probable sequela of grade I to III ankle sprains or fractures.[135] Grade III sprains involve disruption of the lateral ligaments, the deltoid ligament, and the distal anterior talofibular ligament. Nitz et al.[136] reported a high incidence of common fibular and tibial nerve injuries in patients with this type of sprain. Of 36 patients, 31 (86%) had evidence of common fibular (peroneal) nerve injuries and 30 (83%) had tibial nerve injuries; 19 patients in this group also had sensory losses. Of 30 patients with grade II sprains (tearing of lateral ligaments and deltoid ligaments), 5 (17%) had common fibular (peroneal) nerve injuries and three had tibial nerve injuries.

Further evidence of possible neural involvement in ankle inversions sprains was provided by Pahor and Toppenberg.[137] These authors explored responses to the slump test with the foot held in plantar flexion and inversion in 18 subjects who had a history of single or multiple ankle inversion injuries (severity not reported), at least 6 months before neurodynamic testing. Subjects experienced greater reductions in knee extension mobility and more widespread symptoms in the distribution of the common fibular (peroneal) nerve on the involved extremities. Releasing cervical flexion reduced symptoms provoked in the slump test position, confirming a neurogenic contribution to the test response and evidence of increased mechanosensitivity in the common fibular (peroneal) branch of the sciatic tract.

A common site of deep fibular (peroneal) nerve compression is **anterior compartment (exertional) syndrome** of the leg resulting from a contusion, fracture, or severe overexertion, which may compress the deep fibular (peroneal) nerve and impede blood flow in the anterior tibial artery that supplies the anterior leg and the dorsal pedal artery that supplies the foot. Anterior compartment syndrome may compromise deep fibular (peroneal) nerve function, resulting in weakness in the dorsiflexor muscles or, in severe cases, drop foot. It may also cause sensory deficits such as abnormal sensation in first dorsal web space of the foot or produce pain as a result of compression ischemia from decreased blood flow to the leg and foot. A diminished or absent dorsal pedal pulse should alert the clinician to a potential medical emergency. Tissues may be hard on palpation, and passive plantar flexion or active dorsiflexion may evoke pain. Initial muscle damage may occur in 4 to 6 hours and irreversible tissue damage within 18 hours if not treated. An emergency surgical fasciotomy may be needed if conservative treatment (i.e., ice without compression) fails. The greater the pressure, the greater the nerve may be damaged.

Red Flag

If one is assessing for or has a high level of suspicion that an anterior compartment syndrome exists, a diminished or absent dorsalis pedis pulse is an indication of a potential medical emergency.

The superficial fibular (peroneal) nerve can be entrapped as it exits from the deep fascia in the lower leg to cross the dorsolateral ankle.[130] Entrapment of this nerve causes numbness or tingling over the dorsum of the foot. The deep fibular (peroneal) nerve can be injured as it crosses the dorsum of the ankle under the extensor retinaculum, where it is vulnerable to compression from ill-fitting boots or shoes or from swelling or osteophytes after a fracture. It also is vulnerable at this site to traction injuries from repetitive ankle sprains.[33] Both sites of injury are more common in runners.[130]

A modification of the straight-leg raise test can be used to differentiate neurogenic causes from ligament or joint causes of persistent dorsolateral foot and ankle pain.[12] The test is similar to the test described earlier for plantar foot pain. In this case the foot and ankle are held in the pain-provoking position of inversion and plantar flexion, and the entire lower extremity is raised into a straight-leg raise (Figure 25-18). Symptoms caused by nerve abnormality along the common fibular (peroneal) nerve tract increase with this test. Symptoms caused by joint and/or ligament abnormality do not change with this test.

Figure 25-18 The source of lateral ankle pain (i.e., differentiation between a ligament sprain versus nerve irritation) can be differentiated with the following test. The ankle is placed in the pain-provoking position of inversion and plantar flexion. A straight-leg raise is then performed, increasing tensile stresses on the fibular (peroneal) nerve but not on the ankle joint and ligaments. Hip adduction and medial (internal) rotation place further tension on the lumbosacral nerve roots and common fibular (peroneal) nerve. (Modified from Butler D: *The sensitive nervous system,* p 281, Adelaide, Australia, 2000, Noigroup Publications.)

Femoral Nerve Injury

The femoral nerve is formed from the L2-L4 nerve roots of the lumbar plexus.[75] It passes deep to the midpoint of inguinal ligament, lateral to the femoral artery and vein, and divides into motor and cutaneous branches as it runs down the anterior compartment of the thigh, innervating the rectus femoris, vastus lateralis, vastus medialis, vastus intermedius, sartorius, pectineus, and iliacus muscles. It also supplies the skin on the anterior thigh and distal medial thigh by the anterior cutaneous nerve of the thigh, and its articular branches supply the hip and knee joints. The **saphenous nerve** branches off the femoral nerve in the proximal thigh and descends down the thigh and medial leg with the great saphenous vein, supplying the skin on the medial leg and foot.

Different mechanisms can cause injury to the femoral nerve. Compression may occur in the iliac compartment as a result of a hematoma, and this possibility should be considered in any patient who is on anticoagulant therapy or who has hemophilia[76] or a history of trauma to the iliacus muscle. Giuliani et al.[138] reported a case of a healthy 14-year-old who developed a hematoma and femoral nerve injury after minor trauma during gymnastics. The nerve is vulnerable to compression as it passes under the inguinal ligament (Figure 25-19) in athletes or workers who must squat for long periods or wear protective clothing that compress this area. It is also vulnerable to injury during gynecological surgery or with anterior or anterolateral approaches to total hip arthroplasty.[8,76]

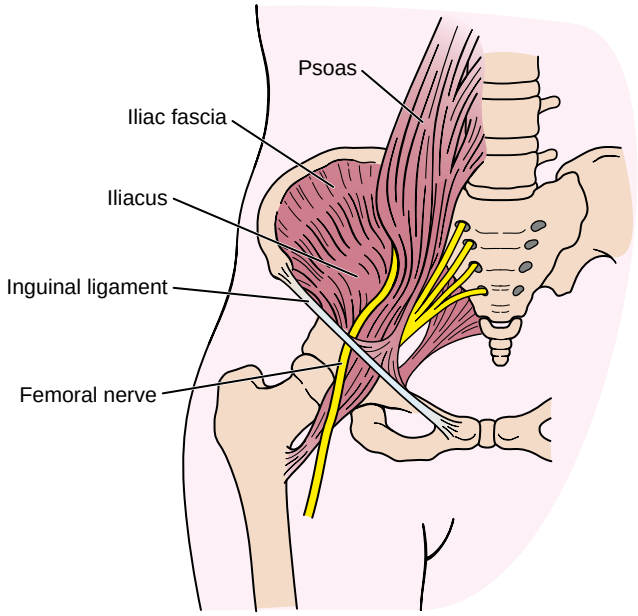

Figure 25-19 Compression of the femoral nerve by an iliacus hematoma. The ballooned right iliacus muscle compresses the femoral nerve against the psoas muscle. (Redrawn from Giuliani G, Poppi M, Acciarri N, Forti A: CT scan and surgical treatment of traumatic iliacus hematoma with femoral neuropathy: case report, *J Trauma* 30:230, 1990.)

Sammarco and Stephens[139] described one case of femoral nerve palsy in a modern dancer. The apparent mechanism of injury was traction from dance positions that required simultaneous hip extension and knee flexion. This position is similar to that used in the prone knee bend test for tension on the femoral nerve and L2-L4 nerve roots (Figure 25-20).[3] Trauma to the groin or proximal anterior thigh regions can also cause injury to the femoral nerve.

Obturator Nerve Injury

The obturator nerve is derived from the L2-L4 nerve roots of the lumbar plexus, travels through the obturator foramen to enter the medial thigh compartment, and then divides into anterior and posterior branches.[75] The anterior branch descends between the adductor longus and adductor brevis muscle and innervates both these muscles as well as the gracilis, and, possibly, the pectineus muscle. The posterior branch descends between adductor brevis and adductor magnus and innervates the obturator externus and the adductor magnus (adductor portion) muscles. The cutaneous branch of the obturator nerve supplies skin on the proximal portion of the medial thigh. Injury can occur from pelvic tumors, obturator hernias, pelvic surgery, or pelvic and proximal femoral fractures.[75]

Butler[12] suggested that entrapment of the obturator nerve may contribute to complaints of persistent groin pain in an athlete with an adductor muscle strain. He suggested modifying the slump sitting test to examine for mechanosensitivity of the obturator nerve by positioning the patient in a sitting position with the leg abducted to the point where groin symptoms are felt. If subsequent alteration of trunk or neck flexion or lateral (side) flexion alters the groin pain, the disorder may have a neurogenic component. Another neurodynamic test used to evaluate the obturator nerve is the slump knee bend test with the involved leg in abduction (Figure 25-21).[62]

Figure 25-20 Prone knee bending is a common test for tension on the femoral nerve and L3 and L4 nerve roots. (Modified from Butler D: *The sensitive nervous system,* p 302, Adelaide, Australia, 2000, Noigroup Publications.)

Figure 25-21 This variation of the slump knee bend test increases tensile loading on the obturator nerve by adding hip abduction. (Modified from Butler D: *The sensitive nervous system,* p 306, Adelaide, Australia, 2000, Noigroup Publications.)

Clinical Note

When assessing for groin strains, the obturator nerve should be cleared for differential diagnosis.

Sensory Nerve Injury

The sensory branches of lower extremity peripheral nerves are vulnerable to entrapment or friction at many points in the lower quarter. Symptoms may include paresthesias, areas of numbness, or pain. A patient in the primary author's practice had compression of the sensory nerves as they passed over the iliac crest to the buttocks after a fall onto the back and buttocks. Palpation of the nerves reproduced the specific sensory complaints that the patient reported.

Meralgia paresthetica is a condition caused by irritation of the **lateral cutaneous nerve of the thigh,** which provides sensation over the anterolateral portion of the thigh.[75] The nerve is formed from the L2 and L3 nerve roots of the lumbar plexus. It is vulnerable to compression or kinking as it passes from the pelvis through the fascia to the thigh or as it passes under the inguinal ligament. It may be compromised by pressure from protective equipment (e.g., a tight belt used to carry tools), from weight belts that are worn too tightly, or by direct trauma.[140] This nerve injury is more common in diabetic, pregnant, and obese patients.[75,76] It also is associated with degeneration of the symphysis pubis in patients older than 40 years of

age, possibly as a result of increased tension on the ilioinguinal ligament.[141]

The sartorial branch of the saphenous nerve (i.e., the medial crural cutaneous nerve) originates at the medial side of the knee and descends alongside the great saphenous vein to supply skin to the medial aspect of the knee and leg.[75,142] It is vulnerable to injury from valgus stresses at the knee and during surgical procedures on the medial knee.[142]

The **saphenous branch** of the femoral nerve can be entrapped in the adductor (Hunter's) canal of the medial thigh (Figure 25-22). The patient may report medial knee pain or paresthesias in the medial lower leg or medial foot. Compression increases during strong muscular contraction, as seen during squats or knee extension exercises.[48] Pendergrass and Moore[143] reported a case of saphenous nerve injury from a direct blow to the thigh by a heavy truck tire. Release of the resulting fibrotic scar was necessary to resolve the patient's symptoms. Butler[12] has devised a modified femoral nerve stretch test to test for adverse mechanosensitivity along the saphenous portion of the femoral nerve (Figure 25-23).

The **sural nerve,** derived from medial and lateral sural cutaneous branches of the tibial and common fibular (peroneal) nerves, respectively, provides cutaneous innervation to the lateral foot[75]; this nerve should be considered a possible source of lateral foot and calf pain. The nerve emerges through a fibrous arcade approximately 16 cm (6.3 inches) proximal to the lateral malleolus (Figure 25-24). Fabre et al.[144] found that entrapment at this site was the source of chronic calf pain in 10 runners who failed to respond to conservative treatment. The sural nerve can be palpated in the lateral side of the foot and in the lateral lower leg proximal to the lateral malleolus.[12] Like the common fibular (peroneal) nerve, it is vulnerable to tensile injury from repetitive inversion sprains of the ankle or compressive injuries from ill-fitting shoes.[12,130]

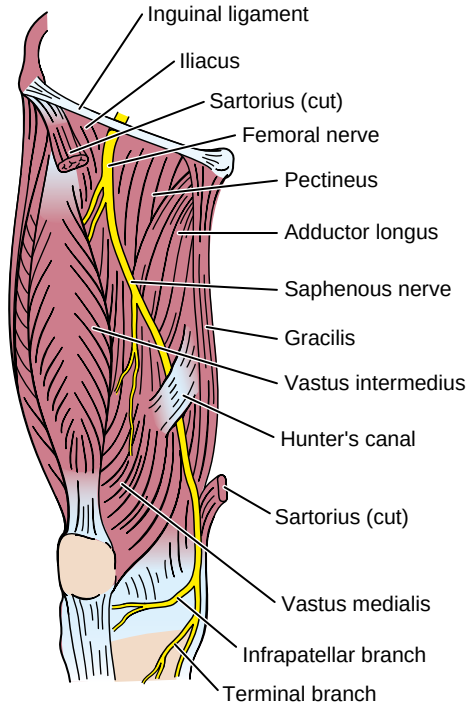

Figure 25-22 The saphenous nerve is vulnerable to entrapment in the adductor (Hunter's) canal of the thigh.

Figure 25-23 Tension can be placed on the saphenous nerve by placing the lower extremity in hip extension, external (lateral) rotation, knee extension, and hip abduction. (Modified from Butler D: *The sensitive nervous system,* p 306, Adelaide, Australia, 2000, Noigroup Publications.)

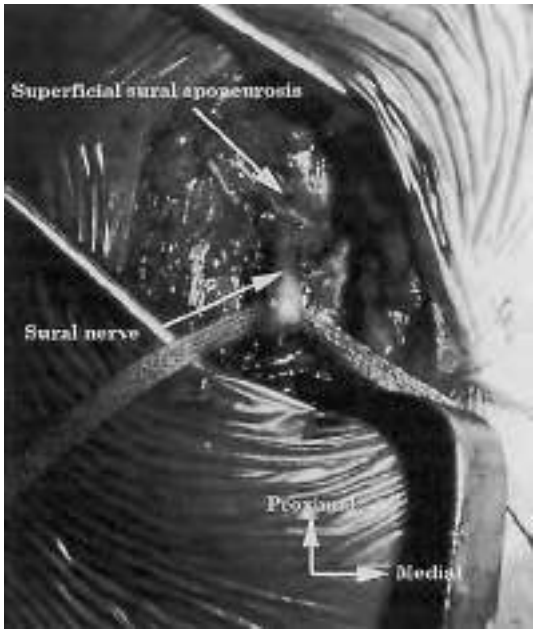

Figure 25-24 The sural nerve can become entrapped in the superficial sural aponeurosis and the fibrous band where the nerve passes through it. (From Fabre T, Montero C, Gaujard E et al: Chronic calf pain in athletes due to sural nerve entrapment, *Am J Sports Med* 28:680, 2000.)

DIFFERENTIAL DIAGNOSIS OF PERIPHERAL NERVE INJURIES

Leffert's advice, "When in doubt, do a history and physical,"[145] is critical in the differential diagnosis of peripheral nerve injuries. The subjective examination must delineate the specific type of symptoms and the area where they are occurring. Paresthesia or sensory losses should be mapped using different sensory devices (e.g., brush, pinwheel, pin, cotton puff) to determine whether the symptoms are in a dermatomal or peripheral nerve distribution.[3] The precipitating injury or predisposing factors from overtraining or biomechanical abnormalities should give clues as to which nerves might have been injured. A nerve injury should always be suspected if an individual experiences sensory changes in addition to weakness or pain.

Important components of objective testing include reflexes, strength, and sensory testing; Tinel's test over the peripheral nerves; and palpation along the course of the nerve (Figure 25-25).[12,62] EMG testing is an important component of the evaluation of peripheral nerve injuries, such as nerve conduction velocity testing and action potential assessment. As mentioned previously, the timing of the examination is crucial. Abnormalities in the **sensory nerve action potentials (SNAPs)** and **combined motor action potentials (CMAPs)** are typically not evident for 7 to 10 days after injury. **Fibrillations** caused by denervation of muscles are not evident for 3 to 5 weeks after injury,[42,145] which makes distinguishing between an axonotmesis and a neurotmesis difficult in the first few days and weeks after an injury. According to Wilbourn,[45] EMG examination is most useful when performed between 3 weeks and 3 to 6 months after injury. In addition to neural conductivity tests, several tests have been described that check for biomechanical sensitivity along nerve trunks. These are useful for identifying the pathomechanics of neural structures and their contribution to symptoms. Butler[12,62] and Shacklock[146] detail the applications and variations of these tests in their texts on mobilization of the nervous system. The tests are thought to be clinically significant when a difference exists in any of the following variables when the symptomatic side is compared with the asymptomatic side:

- available range of motion,
- resistance to motion as perceived by the clinician,
- symptom reproduction, or
- deviation from the established symptomatic responses in normals.

The tests are considered particularly relevant if the exact symptoms of which the patient complains are reproduced during testing.[12,146]

As discussed previously, a compartment (exertional) syndrome may occur when tissue pressures increase within a confined space, compromising circulation and muscle function and possibly injuring the peripheral nerves that traverse the compartment. Expansion of the compartment may be limited by the surrounding fascia or skin or by an external constraint, such as a dressing or cast. The source of increased tissue pressure can be a hematoma that occurs after injury or hypertrophy of the muscles within the compartment, or overexertion.[17] Injury to the nerve can occur as a result of ischemia or direct mechanical compression. Measurement of compartment pressures helps rule out compartment syndromes. Compartment pressures are not elevated in other peripheral nerve entrapment syndromes.[17,136]

Compartment syndromes are commonly traumatic but can be associated with other conditions (Table 25-11).[147,148] Compartment syndromes caused by increased muscular profusion (hypertrophy) are far more common in the lower extremities of athletes but have been reported in the lumbar paraspinals,[149] in the anconeus muscle as a source of lateral elbow pain,[150] in the supraspinatus compartment as

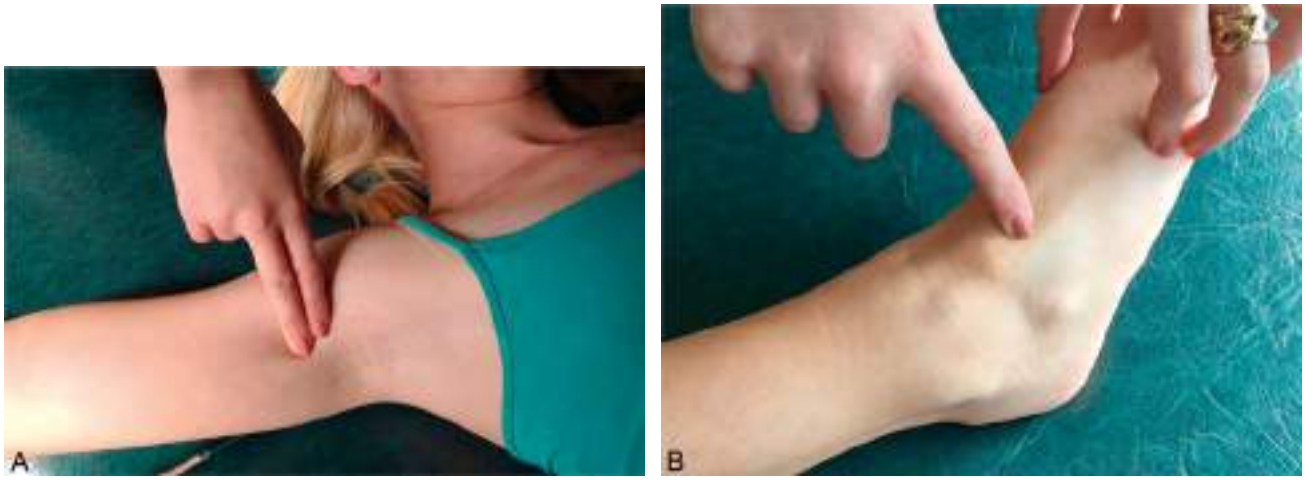

Figure 25-25 Palpation of the nerves is an important part of the examination. Nerves often are tender to the touch at the site of a lesion and palpation may provoke distal pain and paresthesias. **A,** The brachial artery and median and ulnar nerves can be readily palpated in the axilla. **B,** The superficial fibular (peroneal) nerve is visible at the dorsolateral ankle.

TABLE 25-11

Causes of Compartment Syndrome

Type	Cause
Orthopedic	Fractures Fracture surgery
Vascular	Arterial and venous injuries Reperfusion injury Hemorrhage Phlegmasia cerulea dolens
Soft tissue	Crush injury Burns Prolonged limb compression
Iatrogenic	Puncture in patient undergoing anticoagulation therapy Use of pneumatic antishock garment External compression: • Cast, splint or circular dressing • Positioning during surgery or other state of decreased consciousness (e.g., alcohol or drug abuse) Pulsatile irrigation
Occasional	Snakebite Spider bite[149] Overuse of muscles

Modified from Kostler W, Strohm PC, Sudkamp NP: Acute compartment syndrome of the limb, *Injury* 35:1221-1227, 2004.

a source of shoulder pain, and in the 3 forearm compartments and the 10 hand compartments.[151,152] The patient typically reports increased pain and cramping or weakness with increasing activity. Symptoms usually subside when activities stop.[17] If not, surgical decompression is necessary.

MANAGEMENT OF NERVE INJURIES

Management of acute nerve injuries depends on the location and severity of the injury; specific management of several lesions has already been described in this text. Resting the injured part and anti-inflammatory measures (e.g., appropriate medication and icing) may facilitate the initial stages of healing.[14,42,52,92] Corticosteroid or lidocaine injections may be of some use therapeutically and also to confirm the location of the neural lesion.[104]

Butler[12,62] advocated early intervention after injury, beginning with mobilization of the structures surrounding the neural tissue. Gentle mobilization of neural tissues should begin away from the site of the lesion, imparting only gentle movement or tensile loads across the injured nerve. The goal of early mobilization is to prevent scarring between the nerve and the nerve bed or within the connective tissue of the nerve itself as the nerve heals. Care must be taken to avoid tensile loads on a nerve if the patient has acute neurological loss, which suggests the possibility of an axonotmesis or neurotmesis, which are more severe nerve lesions, compared with a mild neurapraxia lesion. If the symptoms are more chronic in nature, all of the neural tension tests described previously can be used in various ways as mobilization techniques. Some variables that may influence the design of nerve mobilization techniques and interventions include:

- the distance from the moving joint to the site of the lesion,
- the position of adjacent joints, and
- whether joint movement stretches or shortens nerve trunks.

Using these variables while applying nerve mobilization has resulted in up to 12.5 mm of nerve gliding in the median, ulnar, tibial, and sciatic nerves.[153] The goal of this type of treatment is to improve the mobility of the nerve relative to adjacent tissues and to stretch the connective tissue elements of the nerve to improve its tolerance to tensile forces (see texts by Butler[12,62] and Shacklock[146] for guidelines on the use of these techniques in treatment).

Factors to Consider When Doing Neurodynamic Mobilization

- Is injury acute or chronic?
- What is the distance from the moving joint(s) to the site of the injury?
- What is the position of adjacent joints?
- Does the movement stretch or shorten the nerve?

Persistent muscular weakness resulting in nerve injury should be addressed with muscular strength training programs (also muscular endurance training where appropriate) to decrease the risk of nerve injury.[31,32,37,40] For example, with injuries to the brachial plexus, the cervical paraspinal and shoulder musculature must be strengthened to help prevent excessive cervical spine flexion and lateral (side) flexion in high-impact sports such as American football.[30,32] We recommend that an athlete in high-risk sports, such as American football, be able to support the body weight at a 45° angle while maintaining the head and neck in the midline neutral position (Figure 25-26). This may be used as a criterion for preseason physicals and for return to sports participation.

Muscle imbalances, weakness, or fatigue of lower or upper extremity musculature can lead to increases in the tensile or compressive stress or strain on neural tissues as they traverse the upper or lower extremity and cross articulations, which can result in a variety of nerve injuries.[17,52,67,92] Communication among the athletic trainer, physical therapist, and weight-training coaches is important to ensure that compensatory techniques during weight training do not promote further muscle imbalances. Specific examples have been provided in previous sections.

If conservative measures fail to restore normal neurological function, surgery may be indicated to decompress,[17,110,134] transpose,[92,104] or repair a segment

Figure 25-26 To prevent injuries to the cervical spine in sports such as football, the athlete should develop adequate cervical strength to support the body weight in a position at a 30° to 45° angle in the supine, prone, and side-lying positions while maintaining the head and neck in the midline.

of the nerve.[152] The optimal time for repair of most closed nerve injuries is about 3 months after the injury.[152] By that time, it is clear whether the nerve will recover spontaneously (neurapraxia) and, in the case of a more severe injury (axonotmesis), whether swelling has had time to decrease. An interdigital neuroma of the foot often is treated successfully with surgical excision.[130] A laceration of a nerve can be surgically repaired immediately.[154] Factors affecting the prognosis of a surgical repair include the violence of the injury to the nerve, the nerve's vascular supply, and any delay in the repair.[79]

PREVENTION OF NERVE INJURIES

By far, the most important part of the management of peripheral nerve injuries is prevention. Protective equipment and splints used to protect or prevent musculoskeletal injuries should be carefully padded to avoid compression over vulnerable nerves such as the lateral femoral cutaneous nerve at the inguinal ligament and the common fibular nerve as it passes around the fibular neck. Careful patient positioning and padding before surgical procedures can prevent many unnecessary intraoperative nerve injuries.

Care must be taken when applying ice over superficial nerves. Bassett et al.[154] reported five cases of cryotherapy-induced nerve injuries. They recommend that ice be applied for no longer than 20 minutes at a time and in a manner that cannot compress a peripheral nerve. Green et al.[155] reported long-term common fibular (peroneal) nerve injury in one patient after icing for only 20 minutes. They hypothesized that the injury, in this case, may have been more severe because of the addition of a compressive wrap over the ice pack and the athlete's ectomorphic body type. They cautioned that the patient should be checked 5 to 10 minutes after the ice is applied for signs of paresthesia or numbness distal to the site of application of the ice and compressive wrap.

SUMMARY

The potential for injury to the nervous system exists with every musculoskeletal injury,[52,125,136] and this possibility should be considered when pain, strength, or sensory deficits fail to resolve in a timely manner. Early recognition of nerve injuries after any trauma helps ensure that the patient receives appropriate acute management, rehabilitation, and advice about continued participation in sports, work, and other activities.

ACKNOWLEDGMENT

The authors wish to thank David Butler, B Phty, GDAMT, M APP SC PT, for generously sharing many of his insights into the intricacies of the nervous system and for stimulating our own clinical practice and research and allowing us to use many drawings from *The Sensitive Nervous System*.[62]

CHAPTER 26

Repetitive Stress Pathology: Bone

ROBERT C. MANSKE, ANDREW PORTER, DANIEL QUILLIN, STUART J. WARDEN, DAVID B. BURR, PETER D. BRUKNER

INTRODUCTION

Repetitive stress pathology in bone manifests clinically in the form of stress reactions and typically as stress fractures. A stress fracture is a common injury that begins with repetitive and excessive stress on the bone and represents the inability of a bone to withstand repetitive bouts of mechanical loading, which results in structural fatigue and resultant signs and symptoms of localized pain and tenderness. This results in acceleration of normal bone remodeling, the production of microfractures (caused by insufficient time for the bone to repair), the creation of a bone stress injury (stress reaction), and eventually a stress fracture.[1] This chapter discusses prevention and treatment options for stress fractures. In doing so it also discusses stress reactions because these can present clinically and are part of a pathology continuum that can progress to stress fracture and in some cases complete bone fracture. To enable the clinician to appreciate the prevention and treatment options for stress fractures, necessary precursory background information is provided on pathophysiology, epidemiology, and risk factors. The chapter concludes by discussing the management of low-risk and high-risk stress fractures.

PATHOPHYSIOLOGY OF STRESS FRACTURES

The proposed pathophysiology for stress fractures is presented in Figure 26-1. A major role of the skeleton is to provide internal support to enable the force of gravity to be countered. In fulfilling this role, bones are exposed to repetitive bouts of mechanical loading. When a bone is mechanically loaded, it experiences internal strain. **Strain** refers to the change in length per unit length of a bone; it is a unitless value, but because it is very small for bone, it often is expressed in terms of *microstrain* (με). One thousand microstrain is equivalent to 0.1% of deformation or in other words a deformation of 0.1 mm for a 10-cm (3.9-inch) long bone. Bone strains typically range from 400 to 1500 με during usual activities of daily living, although activities that involve high-impact loads result in higher bone strains and strain rates.[2] The **strain rate** is how fast the strain is introduced; together with the absolute strain magnitude, it has important implications for the risk of stress fractures.

Complete bone fractures typically are caused by single loads that generate strains on the order of 10,000 με; therefore the safety factor between usual and failure strains is large. However, strains below this level are capable of causing damage when introduced repetitively. As with other structural materials, a natural phenomenon associated with repetitive strain in bone is the generation of damage (often called **microdamage**) (Figure 26-2).[3–5] In most instances this damage is of little consequence because bone is different from nonbiological materials and is capable of self-repair through targeted remodeling.[6] **Remodeling** is the removal of damaged bone by osteoclastic cells and its subsequent replacement with new bone by osteoblastic cells. Bone is capable of adapting to its mechanical environment by means of this mechanism. However, under certain conditions, imbalances can develop between the generation of damaged bone and its removal. The subsequent accumulation of damage is the start of a pathological continuum that can result clinically in stress reactions, stress fractures, and ultimately complete bone fractures (see Figure 26-1).[3,7,8]

The magnitude and rate of introduction of an applied load influence whether damage is generated by strain. Damage is a threshold-related phenomenon, which means that strain magnitudes above a certain level cause damage.[9] With increasing strain, damage increases.[10] The rate at which the strain is introduced influences damage formation. Strains introduced over shorter periods result in significantly greater damage formation.[11] The interaction between the strain magnitude and the strain rate ultimately reduces the number of loading cycles a bone can withstand before fatigue failure. Clinically this means that any activities that increase the magnitude or rate (or both) of

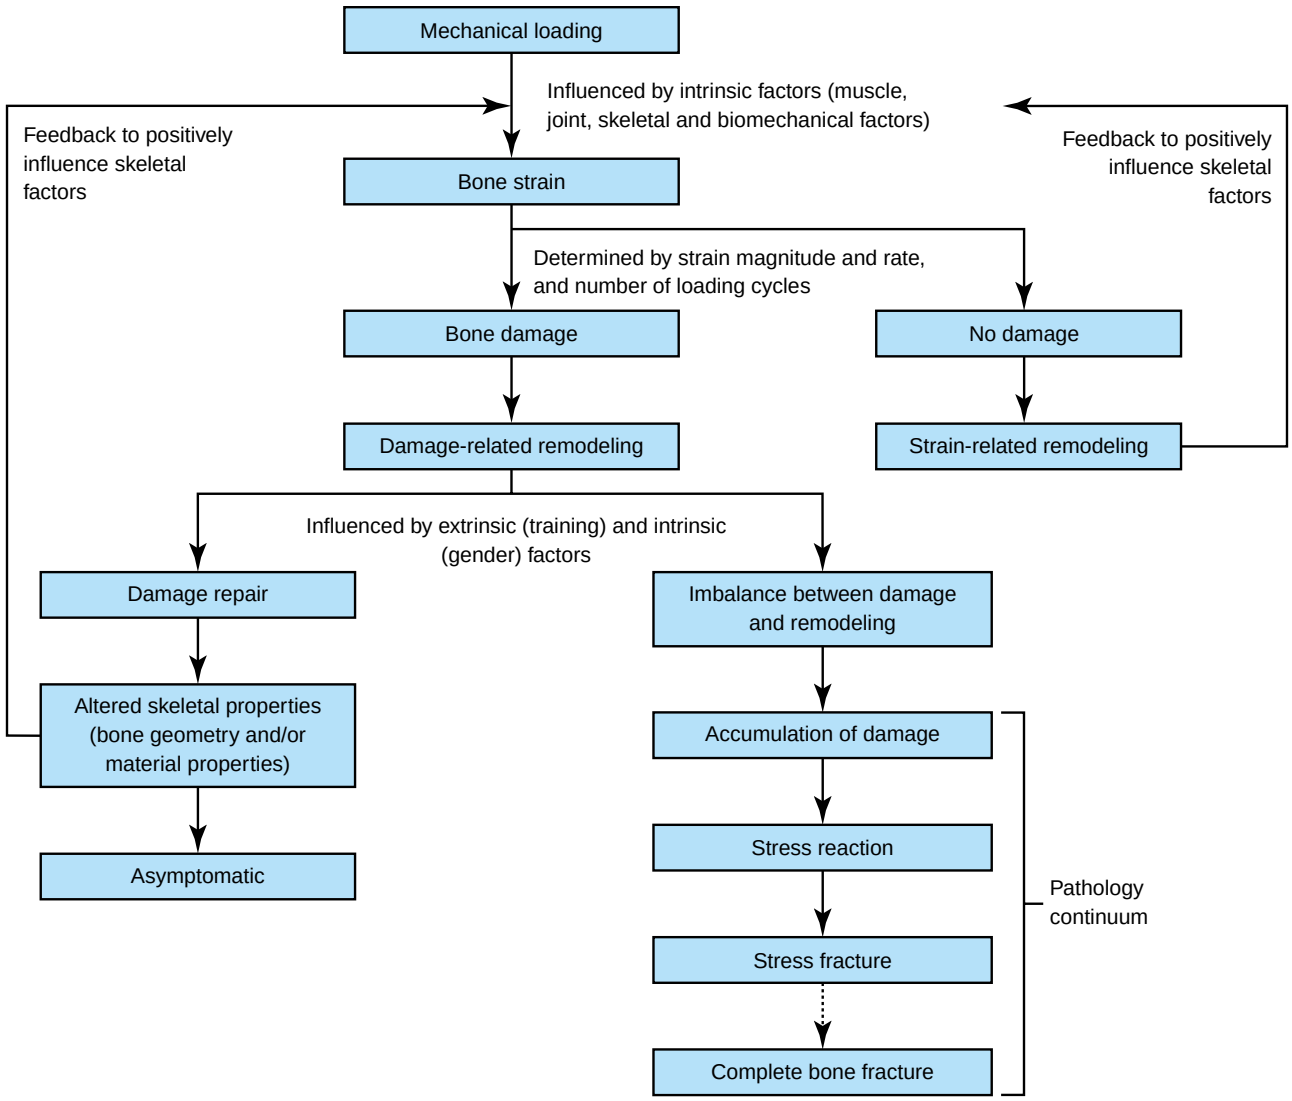

Figure 26-1 Pathophysiology of stress fractures.

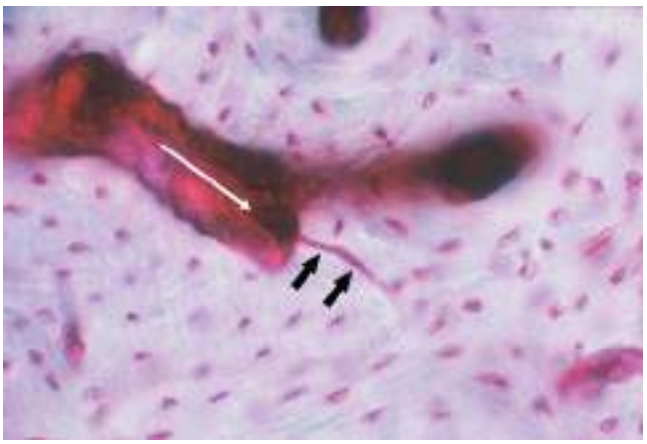

Figure 26-2 Bone microdamage viewed microscopically. The *black arrows* indicate a microcrack, and the *white arrow* indicates a resorption space associated with the targeted remodeling of the microcrack.

bone loading may contribute to damage formation, with subsequent progression to a stress fracture. These activities typically involve some form of impact loading in which high loads are introduced over short periods. Similarly damage accumulation and stress fracture may result from pure cyclic overloading.[12] This occurs when remodeling is given insufficient time to repair damage, and additional loading cycles cause damage to accumulate. Therefore factors that increase the number of loading cycles also may contribute to the development of a stress fracture.

EPIDEMIOLOGY OF STRESS FRACTURES

Because the pathophysiology of stress fractures involves repetitive mechanical loading, it is not surprising that they occur predominantly in athletes and military recruits. In both of these populations, stress fractures appear to be a

common overuse injury; however, the precise incidence is difficult to ascertain.[13] Retrospective studies have found that 8.3% to 52% of runners have had a history of stress fracture,[14,15] and the incidence in a 12-month prospective study of track and field athletes was 21.1%.[16,17] Expressed as a percentage of all injuries, stress fractures have been reported to account for 0.7% to 20% of all injuries sustained by athletic populations.[13,17] Prospective data in recruits undergoing basic training indicate a stress fracture incidence rate of 3.3% to 8.5% in the U.S. military[18–21] and 3.6% to 28.9% in the Israeli military.[22,23]

Stress fractures are site specific, which means that they occur at sites exposed to repetitive mechanical loading. Given their association with mechanical loading, stress fractures predominantly occur at weight-bearing sites, and the most common sites are the tibia, metatarsals, and fibula.[24] The exact location depends on the way the skeleton is loaded; different activities result in different loading patterns in different bones. For example, power athletes (sprinters) load the bones of their feet relatively more than endurance athletes (distance runners).[25] Consequently the former are at greater risk of tarsal and metatarsal stress fractures.[17]

Although stress fractures predominantly occur at weight-bearing sites, they also occur in response to repetitive loading at non–weight-bearing sites. Rowers repetitively load the rib cage during the drive phase of the rowing stroke.[26] Consequently they are at greater risk of generating rib stress fractures.[27] Because stress fractures can occur at both weight-bearing and non–weight-bearing sites, they can occur in virtually any bone in the body (Table 26-1).[8] They therefore need to be considered in the differential diagnosis of all presenting injuries.

The most common locations for stress fractures are the tibia (23.6%), tarsal navicular (17.6%), metatarsal (16.2%), fibula (15.5%), femur (6.6%), pelvis (1.6%), and spine (0.6%).[1,24,28] Much less common are upper extremity stress fractures that occur in athletes who are involved in throwing sports or those with overhead motions.[29]

RISK FACTORS FOR STRESS FRACTURES

An understanding of the risk factors that contribute to stress fractures is necessary to prevent them and also to develop appropriate management strategies when they occur. As with most overuse conditions, the development of a stress fracture is likely due to a range of factors, with the relative contribution of each factor varying among individuals. These factors can be grouped into two categories: extrinsic and intrinsic factors (Table 26-2).

TABLE **26-1**

Sites of Stress Fractures and Commonly Associated Activities

Skeletal Site	Stress Fracture Site	Commonly Associated Sport or Activity
Scapula	Coracoid process	Trapshooting
	Body	Running with handheld weights
Humerus	Diaphysis	Throwing, racquet sports
Ulna	Diaphysis	Racquet sports (especially tennis), gymnastics, volleyball, weight lifting
	Olecranon	Throwing/pitching
Ribs	First rib	Throwing/pitching
	Second to tenth ribs	Rowing, kayaking, golfing
Lumbar spine	Pars interarticularis	Gymnastics, ballet, cricket fast bowling, volleyball, springboard diving
Pelvis	Pubic ramus	Distance running, ballet
Femur	Neck	Distance running, jumping, ballet
	Diaphysis	Distance running
Patella		Running, hurdling
Tibia	Plateau	Running
	Diaphysis	Running, ballet
	Medial malleolus	Basketball, running
Fibula		Running, aerobics, race walking, ballet
Talus	Lateral process	Pole vaulting
Navicular		Sprinting, middle-distance running, hurdling, long/triple jump, football
Metatarsals	General	Running, ballet, marching
	Base of the second metatarsal	Ballet
	Fifth metatarsal	Tennis, ballet
Sesamoid bones of the foot		Running, ballet, basketball, skating

TABLE **26-2**

Extrinsic and Intrinsic Risk Factors for Stress Fractures

Type of Risk Factor	Subcategories
Extrinsic factors	• Type of activity or sport • Training program factors • Equipment factors • Environmental factors
Intrinsic factors	• Skeletal factors • Muscle factors • Joint factors • Biomechanical factors • Physical fitness factors • Nutritional factors • Gender factors

Extrinsic Risk Factors

Extrinsic risk factors are factors in the environment or external to the individual that influence the likelihood of an injury occurring. In terms of stress fractures, these include the type of activity or sport, training factors, equipment factors, and environmental factors.

Type of Activity or Sport

The type of activity or sport in which an individual participates is a risk factor for the generation of stress fractures. As mentioned, the pathophysiology of stress fractures involves mechanical loading. Because most sports involve some form of mechanical loading, participation in a sport by itself raises the risk of stress fracture. This is reflected in the high incidence of stress fractures in athletes compared with sedentary controls. However, individuals in different sports are at varying risk of developing a stress fracture based on the sport or sports in which they participate.[30] Different sports expose the skeleton to different loads. Damage generation in bone and its progression to stress fracture depends on both the magnitude and the rate of introduction of an applied load. Individuals who participate in sports that involve high-magnitude loads that are introduced over short periods have a greater risk of developing a stress fracture. These sports, which typically involve some form of ground impact, include jogging, running, or sprinting.

Another contributing factor to stress fracture generation is the number of loading cycles to which the skeleton is exposed. Individuals who participate in sports that involve high numbers of load repetitions are at greater risk. Such sports include rowing, throwing, and long-distance running. Because different sports load different parts of the skeleton, the sport in which individuals participate influences their susceptibility to a stress fracture at particular skeletal sites (see Table 26-1). It is important that clinicians remember this association of different sports with different stress fracture locations when presented with an athlete who participates in a particular sport.

Training Factors

Training program factors appear to be critical in the development of stress fractures. Depending on the characteristics of the loading stimulus, bone loading can cause damage generation. Damage serves as a stimulus that activates bone remodeling, a sequential process involving cellular activation, bone resorption, and finally bone formation. The remodeling response ensures relative homeostasis between damage formation and its repair and maintains the mechanical competence of the skeleton. It also enables a bone to adapt over time to its mechanical environment so that it can meet increasing levels of loading. Modification of a training routine can disturb this homeostasis.

Remodeling normally removes damage approximately as fast as it occurs. However, remodeling is time dependent. The remodeling time required to reach a new equilibrium after a disturbance is about one remodeling period, or approximately 3 to 4 months.[31,32] If insufficient time is allowed for adaptation to a change in the training routine, additional damage may occur. Although a remodeling reserve exists that allows increased activation of remodeling units in response to increases in damage formation, an increase in the number of active remodeling units removes bone temporarily, reducing bone mass and potentially increasing the chance for damage initiation when loading is continued. This feedforward occurs because resorption precedes formation in the remodeling process, and an increase in the number of currently active remodeling units is associated with an increase in bone porosity. This reduces the elastic modulus of the bone, which in turn increases strain and subsequently the rate of damage formation. The accumulation of damage may progress into a stress fracture. Therefore from a biological perspective, an alteration in the local mechanical environment of a bone through a change in the training routine has the potential to contribute to the development of stress fractures.

Remodeling Time

- Normal remodeling takes up to 3 to 4 months to replace damaged bone
- Damage may accumulate or enlarge if loading exceeds the rate at which bone is replaced

Changes in a training routine that may contribute to the development of stress fractures include any changes that alter the magnitude or rate of bone strain at a particular site, such as a change in training intensity. Increasing training intensity (e.g., increasing speed) may increase the magnitude or rate of bone strain at a particular site. Similarly, a change in training, such as an increase in the number or duration of training sessions, may also contribute to stress fracture generation. This increases the number of bone loading cycles, a factor that reduces bone

fatigue life. These training changes may disturb the balance between damage formation and remodeling. Surveys showed that up to 86% of injured athletes could identify some change in their training before they developed a stress fracture.[30,33] However, it has not been established how many athletes do not develop a stress fracture after a change in their training program. This is important because athletes frequently alter the characteristics of their training program without pathological consequences.

Equipment Factors

Equipment factors can influence the risk of stress fractures by altering the loading environment of the skeleton, whether by increasing bone strain or by redistributing strain so that it occurs at less accustomed locations in a bone. The most commonly implicated pieces of equipment in stress fracture development are shoes and inserts (insoles and orthotics). Located at the foot-ground interface, shoes and inserts act as filters that theoretically attenuate ground impact forces. In addition, they have the potential to influence the motion of the foot and ankle and the subsequent mechanics proximally in the kinetic chain. Through these two mechanisms, shoes and inserts may influence bone strain and subsequently affect the risk of stress fracture. Gardner et al.[34] found that military recruits who started training in shoes of advanced age (an indicator of possible reduced shock absorptive capacity) were at greater risk of developing a stress fracture. (Because most studies of the role of shoes and inserts in stress fracture risk have involved intervention trials, their role is discussed further in the section, Prevention and Management Options for Stress Fractures.)

Rowers provide further evidence of the role of equipment factors in the risk of stress fracture. In the early 1990s the incidence of rib stress fractures appeared to increase among rowers.[35] This coincided with the introduction of a new blade shape for the oar; the blade was changed from narrow and long to broader, shorter, and more rectangular. These changes made the oar easier to handle, gave it greater stability in the water, and prevented backwatering at the shaft end.[36] In addition, the oar shaft was converted from wood to carbon fiber. This made the oar stiffer, allowing the force developed by the rower to be transmitted more efficiently to the blade. These changes in construction made for a more efficient rowing stroke. However, they also resulted in the generation of a greater force at the handle when the same load was applied. This increased the magnitude of loading, theoretically exposing the ribs to higher levels of strain and potentiating the development of stress fractures.[27] Therefore, equipment and changes in equipment may contribute to the risk of stress fractures.

Environmental Factors

The primary environmental factor in the etiology of stress fractures is the training surface, which has long been considered a contributor to the development of these fractures.[37] Running on cambered or uneven surfaces may accentuate biomechanical problems, and running on less compliant surfaces can increase impact forces and the subsequent magnitude and rate of bone loading.[38,39] Confirming the influence of training surface compliance on bone loading, Milgrom et al.[40] showed that running on a treadmill resulted in significantly lower tibial bone strain than running over ground. Although this suggests that running on softer, more compliant surfaces may reduce the risk of stress fracture, the issue may be influenced by muscle fatigue. Running on compliant surfaces (i.e., sand, dirt, gravel) requires a greater expenditure of energy and may hasten muscle fatigue.[41] This has the potential to influence bone loading (see the Muscle Factors section).

Although the training surface anecdotally has been associated with stress fractures, large epidemiological studies of running injuries have failed to show an association between injuries and training surface or terrain after controlling for weekly running distance.[42,43] However, this may be related to difficulty in quantifying running surface parameters accurately and to sampling bias.[41] One investigation of stress fractures in female military recruits found an increase in the incidence of stress fractures when training was changed from a usual flat, predictable terrain to a hilly, rocky terrain.[44]

Intrinsic Risk Factors

Extrinsic risk factors are critical to the development of stress fractures because some form of loading must be placed on a bone to generate damage and enable the stress to cause pathology. However, stress fracture development also is influenced by the body's ability to respond to applied loads. **Intrinsic risk factors** are characteristics within individuals themselves and the way their bodies respond to mechanical loading and the damage it may generate. The contribution of intrinsic risk factors is indicated by the fact that not all individuals exposed to an equivalent loading regimen develop a stress fracture. Intrinsic risk factors include skeletal, muscle, joint, biomechanical, physical fitness, nutritional, and gender factors.

Skeletal Factors

The contribution of skeletal factors to the risk of stress fracture has been well established. Seminal work by Carter and Hayes[45,46] demonstrated that a bone's ability to withstand repetitive low-magnitude loads depends on how much bone is present (mass) and the distribution of this bone (structure). Warden et al.[47] demonstrated that skeletal fatigue resistance significantly correlates with measures of both bone mass and structure. Although these findings have gained variable clinical support from numerous cross-sectional studies,[14,18,48–52] statistically more powerful prospective studies have confirmed that susceptibility to stress fractures is directly related to skeletal properties.[16,19,20]

Specifically, Bennell et al.[16] showed that female athletes who sustained a tibial stress fracture had lower generalized (whole body) bone mineral content and localized (tibial and fibular) bone mineral density than those who did not sustain a stress fracture. Meanwhile, Beck et al.[19] found that tibial stress fractures occur in individuals with smaller cross-sectional areas, section moduli, and widths. These structural properties are important because they reflect the ability of a bone to resist bending.

Muscle Factors

An intimate mechanical relationship exists between muscle and bone. Therefore muscles have the potential to influence bone loading and consequently may have a role in the etiology of stress fractures. Some suggest that stress fractures are initiated by excessive repetitive muscular forces,[53] but the consensus is that muscle is protective against rather than a cause of stress fractures.[54–57]

During impact loading, muscle is believed to serve as an active shock absorber, helping to attenuate loads as they are transmitted proximally along the kinetic chain. When muscles are dysfunctional (i.e., weakened, fatigued, or altered in their activation patterns), their ability to absorb loads becomes compromised, potentially leading to increased loading on the skeleton. Laboratory-based studies show that muscle fatigue causes an increase in both the magnitude and rate of bone strain.[58–61] Further support for a protective role for muscle in the development of stress fractures comes from prospective clinical studies, which have demonstrated that susceptibility to stress fractures is directly related to muscle factors (as indicated by measures of thigh and calf girth).[16,18,62]

Joint Factors

Joints and their associated structures (e.g., capsules, ligaments, and menisci) are important mediators in the transmission of applied loads; consequently, joint factors may contribute to the risk of stress fractures. During impact loading, joints typically are in an open-packed position and move through a certain range of motion. This arrangement is primarily to protect articular cartilage from excessive axial loads; however, it also functions to propagate forces away from the skeleton and to nonarticular structures (i.e., muscle). The best example of this is in the lower extremity, where knee and ankle flexion during landing from a jump are believed to reduce the magnitude of skeletal loading and thus protect against the development of stress fractures.[63,64] When joint motion is restricted, the consequence may be an increased magnitude of bone strain and an altered rate of bone loading.[65] Given the role of these load characteristics in microdamage formation, joint restriction may potentiate the formation of a stress fracture. Hughes[66] found a decrease in ankle dorsiflexion to be associated with the development of stress fractures, although subsequent research has failed to validate this finding.[16,67]

Biomechanical Factors

Muscle, joint, and bone factors by themselves may contribute to the intrinsic risk of stress fractures, but the way these factors work together as a functional unit also is important. Biomechanics are believed to influence the risk of stress fracture by influencing the magnitude, rate, and distribution of loads applied to the skeleton. However, establishing the relationship between individual biomechanical features and the risk of stress fractures is very difficult. Two primary reasons account for this: (1) assessment of dynamic biomechanical features typically requires complicated measurement tools that frequently are not readily available and that are time-consuming to use, and (2) a prospective study of risk factors for stress fractures requires the study of large numbers of individuals over long periods to generate sufficient statistical power. Consequently, few prospective studies have been done on the influence of specific biomechanical features on the risk of stress fractures.

According to the available literature, biomechanical factors that may predispose individuals to stress fracture are a high degree of external rotation of the hip,[68–70] leg length discrepancy,[16,71] and pes planus[33,67] and pes cavus.[28,72–74] Of these, the structure of the foot (pes planus or pes cavus) has received the most attention. A foot with a high longitudinal arch (pes cavus) is more rigid and has a reduced shock-absorbing capacity; this may allow more force to be transmitted proximally. A more flexible type of foot (pes planus) may attenuate more force, allowing less to be propagated proximally. This hypothesis is supported by the findings of Simkin et al.[74] who demonstrated that the foot arch structure influenced the location of stress fractures. Femoral and tibial stress fractures were more common in subjects with high-arched feet, whereas metatarsal stress fractures were more common in low-arched feet.

However, studies investigating the role of these foot types frequently assess the foot statically or when it is in a nonfunctional position. Clinically, what appears to be more important is the amount and duration of foot motion during dynamic loading. Static measurements do not necessarily correlate with the dynamic situation.[75] Prolonged pronation or hyperpronation during loading may lead to excessive torsion on the tibia, whereas limited pronation may reduce force attenuation by the foot and result in its subsequent proximal propagation.[41]

Lower Limb and Repetitive Stress

- The amount and duration of foot motion, rather than the type of foot (i.e., high arch or low arch), are most important in the development of repetitive stress injuries
- Leg length discrepancy plays a role in stress fractures

Although the structure of the foot has received the most attention, leg length discrepancy provides the most

conclusive evidence for a biomechanical risk factor for stress fractures. A leg length discrepancy has been postulated as a risk factor for stress fracture because of its effect on skeletal alignment and loading symmetries. In their prospective study, Bennell et al.[16] found that a difference in leg length of more than 0.5 cm (0.2 inch) was more common in women who developed stress fractures than in those who did not. Stress fractures in these individuals occurred with equal frequency in the shorter and longer limbs; however, they were more likely to occur in the dominant limb.

Physical Fitness Factors

Physical fitness appears to be a predictor of the risk of stress fracture.[76] Studies in the military consistently have shown significant associations between low aerobic fitness levels and a higher risk of stress fracture during basic training.[77,78] Milgrom et al.[23] demonstrated in three prospective epidemiological studies that military recruits who played ball sports regularly for at least 2 years before basic training had less than half the risk of developing a stress fracture than recruits who did not play ball sports. Similarly, Lappe et al.[21] demonstrated that a history of regular exercise in military recruits was protective against stress fracture and that a longer history of exercise further reduced the relative risk. The reason for these differences has not been established; however, physical activity may cause beneficial changes in other intrinsic risk factors, such as skeletal, muscle, and joint factors. Although the risk factor of poor physical conditioning does not seem to apply to athletes because stress fractures often occur in well-conditioned individuals who have been training for years,[41] maintaining physical fitness after diagnosis of a stress fracture may be important for future risk.

Nutritional Factors

Four nutritional or dietary factors have been linked with stress fractures. The first relates to the dietary intake of calcium. Calcium deficiencies may contribute to the development of stress fractures by influencing bone density and remodeling. However, calcium appears to be important primarily during growth, when calcium intake influences bone accrual,[79] and after menopause, when calcium supplementation can reduce bone turnover and loss.[80,81] Lappe et al.[82] in a study of female Navy recruits showed reduction in stress fractures in those consuming 2000 mg of calcium and 800 International Units of vitamin D daily either as a supplement or through intake of dairy products.

The second dietary factor linked to the risk of stress fractures involves dietary behaviors and eating patterns. Stress fractures have been found to be more likely to occur in individuals who restrict caloric intake, avoid high-fat dairy foods, consume low-calorie products, have a self-reported history of an eating disorder, and have a lower percentage of ideal body weight.[83] In a cross-sectional study of young adult female track and field athletes, those with a history of stress fractures scored significantly higher on the **Eating Attitudes Test (EAT)-40** (a validated test relating to dieting, bulimia, and food preoccupation) and were more likely to engage in restrictive eating patterns and dieting.[14] Whether this association of stress fractures with dietary behaviors and eating patterns is causal or is due to some other factor is not clear.[41]

Third, lower levels of 25-hydroxyvitamin D may place men at risk for development of stress fractures. A study found that Finnish male military recruits who developed stress fractures were more likely to have lower levels of 25-hydroxyvitamin D.[84]

Lastly, a study of female military recruits demonstrated an increased risk of stress fracture with a history of smoking, exercising less than 3 times per week, and consuming more than 10 alcoholic drinks per week before the start of basic training.[20]

Stress Fractures are More Likely to Occur in Individuals Who:

- Restrict calorie intake
- Avoid high-fat dairy foods
- Consume low-calorie products
- Have a self-reported history of an eating disorder
- Have a lower percentage of ideal body weight
- Have a history of smoking
- Drink more than 10 alcoholic drinks per week

Gender Factors

Gender factors appear to contribute to susceptibility to stress fractures, and females are at greater risk.[41,76,85] A number of military studies have shown that women performing the same prescribed physical activities as men incur stress fractures at incidences 2 to 10 times higher than those for men.[77,86–89] This gender difference is not as evident in sports participation populations; studies in male and female athletes show either no difference or only a slightly increased risk for women.[15,17,30] However, the latter studies are somewhat limited because they were not able to control for differences in the amount or intensity of activity between genders.

The cause of the apparent higher incidence of stress fractures in females is not known. A possible cause may relate to gender-specific differences in endocrine factors. Physically active females have a higher prevalence of menstrual disturbances compared with the general female population.[90,91] Menstrual disturbance is a risk factor for stress fracture; the relative risk for stress fracture in amenorrheic female athletes is 2 to 4 times greater than in their eumenorrheic counterparts.[90] The mechanism by which endocrine disturbances in female athletes potentiate the development of stress fractures is not clear; however, they may alter the repair response to microdamage. Amenorrhea is associated

with a reduction in bone turnover, particularly bone formation,[92,93] and a reduction in bone formation reduces the bones' ability to repair loading-induced microdamage. The net result is microdamage accumulation and potential progression to stress fracture.

CLINICAL DIAGNOSIS OF STRESS FRACTURES

Stress fractures typically present with a history consistent with an overuse injury—the gradual onset of activity-related pain. Because they occur along a continuum of pathology, signs and symptoms may vary, depending on the point along the continuum at which the patient presents. The stage along the continuum can be assigned clinically (Table 26-3).[94–96] An astute clinician can diagnose the pathology at the stress reaction stage. However, some patients may not present until the pathology has progressed to a stress fracture, in which the bony cortices have actually been disrupted. The earlier in the continuum a diagnosis is made, the more likely it is that the pathology will respond quickly and favorably to treatment. Conversely, a delay in diagnosis potentially increases morbidity, which may influence the individual's long-term participation in the chosen activity. Therefore a certain level of suspicion must be maintained at all times in appropriately presenting patients to ensure prompt diagnosis.

A didactic history is the first step in the diagnosis of a stress fracture. In many cases individuals with stress fractures have a consistent, predictable history that typically centers around pain. At the start of the pathology continuum, pain usually is described as a mild ache that occurs after a specific amount of exercise. Because this initial pain typically subsides soon after exercise is completed and it is not present during rest, it often is ignored at first.

TABLE **26-3**

Clinical and Radiographic Staging and Grading of Repetitive Stress Injuries to Bone

	STAGE OR GRADE				
	0	1	2	3	4
Pathology	None (normal remodeling)	Mild stress reaction	Moderate stress reaction	Severe stress reaction	Stress fracture
Signs and symptoms	Asymptomatic Can perform normal activity without symptoms	Local pain toward end of activity No resting pain	Local pain earlier during activity Tender on palpation	Significant pain during activity that does not abate after cessation of activity	Pain with everyday activities, at rest, and/or night pain
Radiography	Normal	Normal	Normal	Possible visible sclerosis and/or periosteal bone formation	Possible visible fracture line
Bone scintigraphy	Normal	Poorly defined area of increased uptake	More intense uptake but still poorly defined	Sharply marginated area of focal or fusiform increased activity	More intense, transcortical, localized uptake
CT	Normal	Normal	Normal	Focal cortical lucency, periosteal new bone, cortical bridging or focal stenosis	Visible cortical defect
MRI	Normal	Positive STIR image	Positive STIR and T_2 image	Positive T_1 and T_2 images but without definite cortical defect	Positive T_1 and T_2 images with definite cortical fracture line
Time course for recovery					

CT, computed tomography; *MRI*, magnetic resonance imaging; *STIR*, short T1 inversion recovery.

However, with continued exercise and progression of the pathology, the pain may become more severe or occur at an earlier stage, or both. It also may persist for longer periods after exercise is finished, and it may manifest during activities that involve lower levels of bone loading, such as walking. Ultimately, the pain can result in exercise restriction or the need to stop training completely. At this more advanced stage, the associated inflammatory response to the injury may occasionally contribute to resting and night pain.

On physical examination, the most obvious feature of a stress fracture is localized bony tenderness. This obviously is easier to establish in bones that are relatively superficial, and it may be absent with stress fractures in deep-seated bones, such as those in the shaft or neck of the femur. It is important to be precise in the palpation of the affected areas, particularly in regions such as the foot, where a number of bones and joints are located in a relatively small area. Because stress fractures are associated with an inflammatory reaction, localized redness, swelling, and warmth occasionally may be seen. In longer-standing conditions, periosteal thickening and callus formation may be felt.

The application of percussion, a vibrating tuning fork, or ultrasound have all been suggested as potential clinical tools for diagnosing stress fractures, but the sensitivity of each of these methods has been found to be low, and each is associated with high rates of false-negative findings.[97–99] In addition, a single leg hop test that produces severe localized pain in lower extremities has been reported as a method to help diagnose, although no recent literature supports this idea.[1] A fulcrum test can be used to assess for stress fractures of the femoral shaft. The patient will have pain at the fracture site when the clinician applies a bending force (e.g., over the exam table) to the distal femur.[100] A similar maneuver may be applied to any long bone although there is no supporting literature.

Besides obtaining a history of the pain and its relation to exercise, the clinician must determine whether any of the previously discussed risk factors is present. This is crucial because a history of a stress fracture is a significant risk factor for subsequent stress fractures.[101] By establishing potential risk factors during healing and intervening, it may be possible to influence future susceptibility. With all stress fractures involving the lower limb, a full biomechanical examination must be performed. Any evidence of leg length discrepancy, malalignment, muscle imbalance, weakness, or lack of flexibility or control should be noted.

A training or activity history also is essential. The clinician should note any recent changes in the patient's activity level, such as an increased amount or intensity of training, as well as any changes in surface, equipment, or technique; this information may need to be obtained from the patient's coach or trainer. A full dietary history should be taken, and particular attention should be paid to the possible presence of eating disorders. A menstrual history should be taken with female patients, including the age of menarche and subsequent menstrual status. A history of previous similar injury or any other musculoskeletal injury should be obtained.

It is essential to obtain a brief history of the patient's general health, medications, and personal habits to ensure that none of these include factors that may influence bone health.

Factors to Consider in Assessing for Stress Fracture

- Pain
- Localized bone tenderness
- Level of activity and any changes to activity level
- Risk factors
- Leg length discrepancy (lower limb)
- Muscle imbalance
- Lack of flexibility
- Lack of movement control
- Dietary history
- Menstrual history (in females)
- History of stress fractures
- General health

DIAGNOSTIC IMAGING OF STRESS FRACTURES

Given its sensitivity in the diagnosis of stress fracture, clinical examination is sufficient in many cases. However, imaging can play an important supplementary role when the diagnosis is uncertain or when more specific knowledge is desired. A number of imaging techniques can be used for this purpose, but those most commonly used are radiography, bone scintigraphy, computed tomography (CT), and magnetic resonance imaging (MRI).

Radiography

Plain radiography (x-ray) typically is the most accessible imaging tool; however, it is the least useful for confirming a stress fracture because of its poor sensitivity. Although radiography primarily images the skeletal system and is useful for frank bone fractures, it is inherently planar in nature and has relatively low spatial resolution. These features do not allow radiography to detect the small defects associated with stress fractures; therefore radiography is associated with a high incidence of false-negative findings.[102]

X-rays may be able to demonstrate a stress fracture at later stages in the pathological process. Healing of a stress fracture typically involves initial resorption and subsequent formation of bone at the injured site, as well as callus formation periosteally. This may make the stress fracture site visible on radiography; the classic radiographic abnormalities are new periosteal bone formation, a visible area of sclerosis, the presence of callus, or a visible fracture line (Figure 26-3). These features, which typically are seen no earlier than 2 to 3 weeks after the onset of symptoms, are indicators of the reparative process. If any of these

Figure 26-3 Radiographic appearance of a tibial stress fracture. The white arrow indicates a visible fracture line. Note the presence of new periosteal bone formation (callus).

radiographic signs are present, the diagnosis of stress fracture can be confirmed. However, in many cases of stress fracture, obvious radiographic abnormalities are not seen at any stage. Consequently, radiography is not considered a particularly useful tool for confirming a stress fracture. That being said, plain radiography is the best imaging modality to begin with.

Bone Scintigraphy

If plain radiography shows a stress fracture, further investigations may still be required. However, with high clinical suspicion of a stress fracture but a negative radiograph, bone scintigraphy is a frequent mode of investigation. Because of its nearly 100% sensitivity in the detection of stress fractures and its ability to indicate changes as early as 48 to 72 hours after the onset of symptoms, scintigraphy is frequently used.

Bone scintigraphy often is performed in the form of a triple-phase bone scan. This involves intravenous injection of a radiopharmaceutical marker, commonly a ^{99m}Tc-phosphate analogue. Three phases of marker uptake subsequently are assessed to determine the differential uptake of the marker. The initial phase (blood flow and angiogram phase) consists of serial images that are obtained during injection of the marker. This phase is used to demonstrate perfusion of the marker within the circulatory system, indicating areas of hyperperfusion. The second phase (blood pool phase) is imaged within 5 to 10 minutes after injection of the marker; this phase is used to indicate the extent of the extracellular fluid volume, thereby demonstrating areas of tissue hyperemia. The final phase (delayed phase) consists of images taken 2 to 4 hours after injection of the marker. By this time, urinary excretion of the marker has reduced the amount of marker present in soft tissues. The delayed phase therefore demonstrates uptake only in the osseous structures.

Because the delayed scan demonstrates uptake only in osseous structures, a conventional single-phase bone scan may be used to diagnose a stress fracture. On these and the delayed phase of the triple-phase bone scans, a stress fracture is characterized by a sharply marginated or fusiform area of increased local uptake involving one cortex or occasionally extending the width of the bone (Figure 26-4).[103] Based on the intensity of this uptake, the stage in the pathology continuum can be estimated (see Table 26-3)[103–105]; however, the grading systems for bone scintigraphy are not widely accepted.

Although bone scintigraphy has virtually 100% sensitivity, it is not without limitations. False-positive findings can occur, because other nontraumatic lesions (e.g., tumors, infections, and bone infarctions) can also cause localized increased uptake of the marker.[102,106] Therefore, bone scintigraphy lacks specificity.[107] Specificity can be increased somewhat by using a triple-phase rather than a single-phase bone scan because the former allows differentiation between soft tissue and osseous pathology.

A stress injury to bone is identified by localized increased uptake of the radiopharmaceutical marker in all three phases of the scan.[108,109] This is not the case with other bony abnormalities (e.g., periostitis), which are only positive on delayed images,[109,110] or with soft tissue injuries, which are positive only in the blood flow and blood pool phases.[111] Even with this approach, the specificity of bone scintigraphy is limited because it does not allow direct visualization of the fracture itself, and precisely

Figure 26-4 Bone scintigraphy (scintigram) of a tibial stress fracture. The stress fracture is revealed by the fusiform area of increased uptake of the radiopharmaceutical marker.

locating the site, especially in the foot, can be difficult. This may be important for management considerations. An additional limitation for the use of bone scintigraphy is the level of ionizing radiation associated with the test.

Computed Tomography

CT can be useful for diagnosing the more advanced stages on the pathology continuum (i.e., stress fractures); it has a high specificity because of its ability to image bone with good spatial resolution. However, it does not appear particularly useful for diagnosing stress reactions in which a cortical defect does not exist. In addition, the role of CT is mainly limited to differentiating causes of increased uptake on bone scan that may mimic stress fracture. These include osteoid osteoma, osteomyelitis with a Brodie's abscess, and other malignancies.[111] A stress fracture on CT is identified by a combination of a visible cortical defect, focal cortical lucency, periosteal new bone, and cortical bridging (Figure 26-5).[112–114] Although CT is used primarily in differential diagnosis, it can also be useful in cases in which plain radiography is normal, the isotope bone scan shows increased uptake, and demonstration of a fracture line may affect treatment.[85,111] Such a scenario occurs with stress fractures of the navicular[112,115] and longitudinal stress fractures of the tibia and femur.[116,117]

Magnetic Resonance Imaging

Of all the imaging techniques for stress fractures, MRI has emerged as the premier technique. Although MRI does not image cortical bone as well as CT and its sensitivity is comparable to that of bone scintigraphy, it has surpassed these techniques in the detection of stress fractures because it has much greater specificity as a result of its wide contrast resolution and high spatial resolution.[107,118,119] In addition, the patient is not exposed to radiation. MRI is able to image osseous tissues and provides simultaneous excellent representation of soft tissues and associated processes, thereby providing greater diagnostic information than can be obtained from other imaging techniques. This includes depiction of the extent and orientation of a stress fracture, factors that may influence management.[120]

MRI can be performed on a wide array of equipment and using a variety of pulse sequences. The best equipment for imaging stress fractures is that which provides the optimum contrast and spatial resolution. In terms of sequences, those most commonly used are T_1- and T_2-weighted images and fat-suppression techniques, such as short T_1 inversion recovery (STIR) and T_2 fat saturation views. Specific MRI characteristics of stress fractures, which depend on the sequence used, include (1) a fracture line that appears on all sequences as a very low signal medullary band contiguous with the cortex; (2) surrounding marrow hemorrhage and edema, seen as low signal intensity on T_1-weighted images and as high signal on T_2-weighted and STIR images; and (3) periosteal edema and hemorrhage, which appear as high signal intensity on T_2-weighted and STIR images and low signal intensity on T_1-weighted images (Figure 26-6).[121] The stage in the pathology continuum can be estimated based on the findings with each sequence (see Table 26-3).

MRI can image bone edema and can be used to depict a bone stress reaction. This is considered a precursor to a stress fracture, and it shows on MRI as an area of altered intensity signal (increased signal on T_2-weighted and STIR images, decreased signal on T_1-weighted images) without the presence of a fracture line. However, the finding of stress reactions on MRI in asymptomatic individuals does not appear to be of clinical significance.[122] Stress reactions are common in individuals who take part in intensive physical activity, and they commonly heal or remain asymptomatic, even if

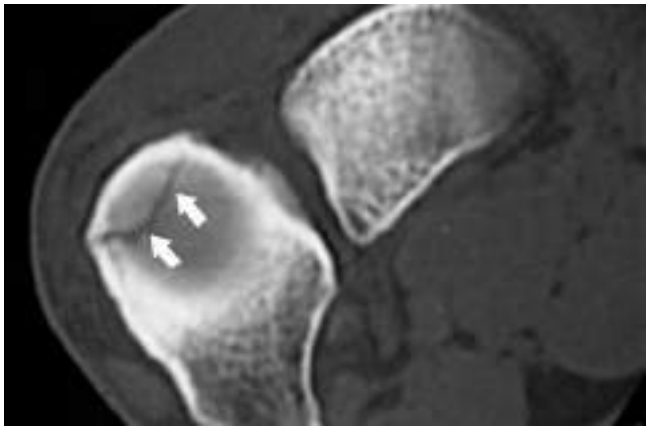

Figure 26-5 CT (tomogram) of a navicular stress fracture. The arrows indicate a visible cortical defect.

Figure 26-6 MRI scan of a femoral neck stress fracture. The arrow indicates a region of altered signal intensity.

the intensive physical activity continues.[120,122] Therefore the use of MRI to detect areas of stress reactions in asymptomatic individuals does not appear to be warranted.

False-negative MRI findings in the assessment of stress fractures do occur; however, they typically are due to reader error, suboptimum choice of imaging planes and sequences, inhomogeneities in fat suppression, and partial volume effects.[118,123] For this reason, MRI operators and readers experienced in the imaging of stress fractures are critical to an accurate diagnosis.

PREVENTION AND MANAGEMENT OPTIONS FOR STRESS FRACTURES

Prevention

Despite the clinical significance of stress fractures, currently only limited prevention strategies are available.[124] The primary reason for this is the apparent multifactorial etiology of the condition. Stress fractures appear to occur in different people as a result of different factors. Consequently there is no single factor that can be modified to prevent stress fractures. However, because stress fractures result from the accumulation of loading-induced damage, preventive strategies typically focus on controlling the strain experienced by the skeleton. By reducing the magnitude and rate of strain within a bone and the absolute number of loading cycles, the amount of damage and the consequent risk for stress fracture may be positively influenced.

It seems reasonably safe to assume that modification of training schedules is a good way to start reducing the incidence of stress fractures. Decreasing either the intensity or volume of training may benefit the system by allowing much needed recovery time between activity bouts.

Orthotic inserts, such as those that cushion a supinated foot, may be helpful in preventing lower limb stress fractures. Shock-absorbing shoe inserts have been proven to be effective in reducing the occurrence of lower extremity stress injury in military recruits.[125]

Consuming 2000 mg of calcium and 800 International Units of vitamin D daily either as a supplement or through intake of dairy products will help decrease the chance of stress fractures as well.[82]

Management Options

As with prevention, few established intervention techniques exist for treating a stress fracture.[124] The major goal for clinicians in managing acute musculoskeletal injuries is to return the individual to the preinjury level of function, ideally in the shortest time possible and without compromising healing at the tissue level. One method of accomplishing this is to accelerate the rate of tissue repair. Unfortunately, limited interventions are capable of achieving this. The current, accepted alternative is to facilitate rehabilitation and return the patient to activity while ensuring that tissue healing is not overtly compromised.[126] The following sections discuss different options in the prevention and management of stress fractures and when available the scientific evidence behind their use.

Exercise

Exercise has important roles in both the prevention and treatment of stress fractures through its effects on intrinsic risk factors, including skeletal, muscle, and joint factors. Because the risk of stress fractures is directly influenced by bone factors, it has been hypothesized that modification of these properties through an exercise program may be a means of preventing stress fractures.[19,22,23,47,127]

Although an exercise program that incorporates mechanical loading can lead to skeletal fatigue, it also can act as a potent anabolic stimulus.[128] Bone is inherently mechanosensitive and responds and adapts to its mechanical environment. Warden et al.[47] demonstrated that bone structural changes induced by a mechanical loading program cause an exponential increase in fatigue resistance; this occurs as new bone formation in response to loading at biomechanically relevant sites. This enables a bone to better resist applied loads, which subsequently reduces the magnitude of strain the bone experiences.

An exercise program that incorporates mechanical loading may be used to positively modify skeletal risk factors in sedentary individuals before a training program is started (such as in military recruits). However, those who design exercise programs to influence the risk of stress fractures must keep in mind that although repetitive mechanical loading can act as a potent anabolic stimulus, it also can lead to skeletal fatigue. Therefore exercise programs need to be designed to induce the desired changes in bone structure without inflicting harm in the form of generated damage and its accumulation. One method of achieving this is to ensure that the duration of exercise (and therefore the number of loading cycles to which a bone is exposed) is restricted. Further details on designing an exercise program to enhance bone structure and strength can be found in reviews by Turner and Robling[129,130] and Warden et al.[128]

Although an exercise program may positively influence skeletal risk factors for stress fractures in sedentary individuals, its potential to reduce the risk of stress fractures in athletes is debatable. Studies consistently have demonstrated that athletes have increased bone mass and size compared with controls.[25,131–133] The ability of an exercise program to further modify bone material and structural properties in these individuals is questionable. However, an exercise program in athletes can be used to modify muscle and joint risk factors. Athletes should be regularly screened for muscle activation patterns, strength, and endurance. Preventive muscle strengthening and endurance exercises should be prescribed to individuals who have had a stress fracture.

The use of exercise as a possible prevention strategy for stress fractures has previously been hypothesized[19,22,23,127] and has initial clinical support.[21–23,134] Milgrom et al.[23] demonstrated in three prospective epidemiological studies that military recruits who played ball sports regularly for at least 2 years before basic training had less than half the risk of developing a stress fracture than recruits who did not play ball sports. Similarly, Lappe et al.[21] demonstrated that a history of regular exercise in military recruits was protective against stress fracture and that a longer history of exercise further reduced the relative risk.

Shoes and Inserts

Shoes and inserts (i.e., orthotics and insoles) have been suggested as potential means of modifying the risk of stress fractures during weight-bearing activities. Located at the foot-ground interface, shoes and inserts act as filters that theoretically attenuate ground impact forces. In addition, they have the potential to influence the motion of the foot and ankle and the subsequent mechanics proximally in the kinetic chain. Through these two mechanisms, shoes and inserts may lower bone strain, which may reduce the risk of stress fractures.

The evidence on the ability of shoes and inserts to prevent stress fractures is contradictory, and most of these data are generated in military studies. Initial studies failed to find any benefit in preventing stress fractures from placing a shock-absorbing insole in a standard military boot.[34,135] A more recent prospective, randomized controlled trial demonstrated a statistically significant difference in the incidence of stress fractures between recruits who trained with custom orthoses and those who trained without such devices; the incidence was double among nonusers of the orthoses.[68] However, this finding was not confirmed in a subsequent study by the same research group, who found no significant differences between recruits wearing either soft or semirigid prefabricated or custom orthoses.[136] Combining the findings of four trials, a Cochrane review suggested that the use of shock-absorbing insoles may prevent stress fractures of the lower extremities.[124]

For shoes, the evidence is similarly contradictory. Although recruits who trained in a modified basketball shoe had a lower incidence of metatarsal stress fractures compared with those who trained in a standard infantry boot, no differences were seen in the incidence of tibial or femoral stress fractures.[137] No differences were also noted in the total number of stress fractures between the two groups. In contrast, Gardner et al.[34] found that the shock absorption provided by shoes may be important in preventing stress fractures. This was indicated by the fact that the risk of stress fracture increased when military training was started with a shoe of advanced age.

If shoes and inserts potentially are able to influence bone strain and therefore the risk of stress fracture, the question remains as to how to apply this information to individual patients. Shoes and inserts reportedly are used to prevent stress fractures by improving cushioning (i.e., reducing bone strain) and aligning the skeleton (i.e., changing mechanics). Although these mechanisms seem logical, supportive scientific evidence is lacking. In one study, when soft or semirigid orthoses were worn with running shoes, neither significantly influenced tibial peak strain or strain rates during running.[138] Similarly, studies have been unable to find significant differences between shoes of differing shock absorptive capacity in tibial peak strain or strain rates during running.[139–141]

In terms of the ability of shoes and inserts to influence skeletal alignment, studies using bone pin markers have shown that the differences in bone movements between barefoot and shod running are small and unsystematic (mean effects were less than 2) compared with differences between subjects (up to 10).[142,143] Similarly, inserts do not appear to alter rear foot and tibial joint coupling substantially during running.[144,145] What can be gathered from this is that bone strains and skeletal kinematics during running appear to be unique to each individual, and shoe and insert modifications do not seem to be able to change them substantially.

Because shoes and inserts do not appear to be able to reduce bone strain or change skeletal mechanics substantially, other mechanisms need to be considered to guide their clinical prescription. A growing concept is the effect of shoes and inserts on muscle activity.[146,147] Muscle activity in the leg is tuned in response to impact force characteristics.[148,149] This activity is influenced by running in shoes of differing material characteristics.[150,151] Whether this tuning affects the risk of stress fracture has not been established; however, with shoe and insert prescription, the paramount issue appears to be comfort. This is important both for adherence and for potential benefit. If a shoe or insert is not comfortable, it will not be used, and any potential benefit will not be gained. Also, the comfort of inserts has been found to influence the kinematics, kinetics, and muscle activity in the lower extremity during running.[152] Therefore from a practical perspective, shoes and inserts should be chosen based on their comfort to the individual. Typically this is a shoe or insert that is appropriate for the individual's foot structure and mechanics.

Pneumatic Leg Braces

Pneumatic leg braces are frequently used in the management of stress fractures, primarily stress fractures of the tibial diaphysis.[153–160] The most commonly used brace is the Aircast leg brace (Aircast Corp., Summit, NJ) (Figure 26-7). Although pneumatic leg braces are not believed to influence the rate of tissue healing directly, they appear to function as stress sharing devices that help redistribute and attenuate ground impact forces. This, combined with the application of pressure to the injured limb, appears to help reduce the pain associated with stress fractures and

Figure 26-7 Aircast leg brace. (From Magee DJ, Zachazewski JE, Quillen WS, editors: *Scientific foundations and principles of practice in musculoskeletal rehabilitation,* p 612, St Louis, 2007, WB Saunders.)

allows an earlier return to function, apparently without detriment to the healing tissues.

Preliminary evidence indicates the efficacy of pneumatic leg braces in the management of stress fractures.[154–157,159,160] The most convincing evidence was provided by Swenson et al.[159] In a randomized, prospective study of 18 competitive and recreational athletes, they found that use of the Aircast allowed earlier return to light and full activity after a tibial diaphyseal stress fracture. Furthermore, they noted that athletes who used the brace became pain free at a median of 14±6 days after initiation of treatment, compared with 45±9 days in athletes who did not use the brace. A subsequent study attempted to replicate this finding in a military population.[153] However, this study suffered severely from a large dropout rate (35%) and an inappropriate study design, which compromised the researchers' ability to detect a significant difference between groups. Supporting the use of pneumatic air braces, a Cochrane review indicated a likely benefit of such braces for a faster return to sports.[124]

A Cochrane review pooling data from three small studies suggested that patients with a tibial stress fracture who used a pneumatic brace (e.g., a stirrup leg brace) showed a significant reduction in time to recommencing full activity; however, more evidence is needed because the information is based on a small number of subjects.[125]

Training Program Design

If stress fractures are to be prevented, training programs need to be designed with consideration given to their effects on the skeleton. Although individuals need to progress their training or activity programs to induce adaptation in desired systems and improve performance, this can have adverse effects on the skeleton. Changes in training or activity, intensity, duration, frequency, type, surface, technique, and equipment all can affect the generation of damage and its accumulation in bone. A training or activity program that introduces multiple, simultaneous changes in training may lead to the development of a stress fracture. For example, military studies have shown that those who experience a significant change in a training program (e.g., recruits with no history of physical activity before starting intense infantry training) are at greater risk of a stress fracture.[22,24] Therefore changes in a training or activity program should be made progressively, and limited variables should be changed at a given time.

In addition, the use of cyclical training methods should be explored, particularly in those prone to stress fractures as indicated by a past history of such injuries. Cyclical training may involve the introduction of rest periods into a training program or the replacement of high bone-loading activities, such as running, with low bone-loading activities, such as cycling, swimming, or water running. This may involve a monthly regimen of 3 weeks of high-load activities and 1 week of no load or low-load activities. Such a program has been shown to reduce the incidence of stress fracture in military populations.[161]

Training and Activity Programs and Stress Reduction

- Changes should be progressive
- Variables should be limited
- Time should be allowed between changes
- Cyclic training methods with rest periods should be used
- Both high-load and low-load activities should be included

Pharmacological Intervention

Bisphosphonates

Bisphosphonates cause osteoclast apoptosis[162] and are traditionally prescribed to prevent the loss of bone associated with aging. However, bisphosphonates also have been suggested as a means of preventing stress fractures.[163] Osteoclasts participate in targeted remodeling by resorbing bone to remove areas of damage.[164] Although this removal of damage is important, an increase in the number and activity of osteoclasts augments damage formation by increasing bone porosity. This feedforward reduces the elastic modulus of the bone, which in turn increases strain and subsequently the rate of damage formation. Therefore short-term suppression of bone turnover with bisphosphonates may prevent the initial loss of bone during the remodeling response to damage and may prevent progression to stress fracture.[163] However, evidence

for this hypothesis is scarce, and the only currently available clinical trial demonstrated that one bisphosphonate (i.e., risedronate) did not influence the incidence of stress fractures in military recruits.[22]

Nonsteroidal Anti-inflammatory Drugs

Nonsteroidal anti-inflammatory drugs (NSAIDs) frequently are used as adjunct therapies in the treatment of stress fractures,[165,166] in which the basic tenet for their use is to treat symptoms related to inflammation (i.e., pain). Although these drugs are effective pain relievers, their role during the repair of stress fractures has been questioned.[167–169] Pain is an important indicator of the pathology in stress fractures, one that is used not only for diagnosis but also to determine the progression of treatment and the patient's eventual return to full activity. Inhibiting this pain may mask possible progression of symptoms and the pathology.

In addition to masking symptoms, NSAIDs also may delay tissue-level healing at the stress fracture site.[168,169] NSAIDs exert their predominant effects by inhibiting cyclooxygenase (COX) enzyme activity. The COX isozymes catalyze the rate-limiting step in the formation of prostaglandins (PGs) from arachidonic acid. PGs synthesized after injury participate in inflammation by causing vasodilation and increasing local vascular permeability.[170] Although limiting this response may appear advantageous, the PGs synthesized after injury are crucial to the repair of injured bone. PGs affect bone formation and resorption, which are mediated through the proliferation and differentiation of osteoblasts and the regulation of osteoclast differentiation.[171] In animal models, removal of these effects through NSAID inhibition of the COX enzymes appears to be detrimental to the repair process.[172–175] Although animal studies have limited translation to the clinical setting, NSAIDs should be used sparingly in the management of stress fractures because of their ability to mask symptoms and their potential to influence the rate of tissue-level healing.

Modalities

Therapeutic Ultrasound

Therapeutic ultrasound therapy may represent a unique treatment for stress fractures in that it may accelerate tissue-level repair to facilitate recovery and allow earlier return to activity. Although systematic reviews and meta-analyses repeatedly have concluded that the evidence is insufficient to support current clinical applications of ultrasound,[176–179] research has shown that ultrasound can have clinically significant beneficial effects on injured bone.[180] These benefits were generated using low-intensity (less than $0.1\,W/cm^2$) pulsed ultrasound (LIPUS), a dose alternative to that traditionally used in sports medicine.[181]

LIPUS has developed into an established intervention for bone injuries (for a complete review, see Rubin et al.[182] and Warden et al.[183,184]). In brief, during fresh fracture repair in three well-designed, randomized controlled trials, LIPUS was shown to accelerate the rate of fresh tibial, radial, and scaphoid fracture repair by 30% to 38%.[185–187] When the results of the 158 fractures investigated were pooled, a weighted average effect size was calculated at 6.41.[188] This converts into a mean difference in healing time of 64 days between the active- and inactive-ultrasound treated groups. In addition to its beneficial effects on fresh fractures, LIPUS has been shown to facilitate healing in fractures with delayed union or nonunion.[189–192] It has been found to stimulate union in 91% of fractures showing delayed union and in 86% of fractures showing nonunion.[190] These fractures covered a range of skeletal sites.

The effect of LIPUS on traditional bone fractures is of interest in the treatment of stress fractures because the latter are believed to heal in stages comparable to those of traditional bone fractures. Previous trials of the effect of LIPUS on fracture repair have shown efficacy for healing of small, undisplaced fractures. This suggests that LIPUS may have beneficial effects on stress fracture repair, a hypothesis that has variable support from preliminary case reports and one clinical trial.[157,193,194]

In seven posteromedial cortex stress fractures of the tibia, introduction of LIPUS enabled continuation of activity and return to competition within 4 weeks.[193] In one tarsal navicular stress fracture, LIPUS reportedly stimulated bony union and allowed return to competition within 5 weeks.[193] In contrast to these case reports, the one available randomized clinical trial (RCT) showed LIPUS to have no effect on tibial stress fracture repair, as assessed by the total number of symptomatic days.[194] Because RCTs are the highest level of evidence, this finding would indicate that LIPUS is not actually beneficial to stress fracture repair. However, the trial was statistically underpowered and could detect only a 36% (20-day) difference in healing time between groups. In contrast to this limited evidence in the treatment of acute stress fractures, LIPUS has been shown to be effective in stress fractures showing delayed union and nonunion; it was found to stimulate union in 98% and 94% of cases, respectively.[190] These findings suggest that LIPUS may have beneficial effects on stress fracture repair; however, this needs to be established through appropriately designed clinical trials.

Electromagnetic Fields

Electromagnetic fields have been considered as a modality that may facilitate stress fracture repair. The use of electromagnetic fields to aid bone healing arose from the discovery that bone tissue generates an internal electrical field when it is deformed by mechanical forces.[195,196] In physiological moist bone, these mechanoelectrical potentials (known as *stress-generated streaming potentials*) are believed to result from the mechanically induced movement of charged particles throughout bone channels.[197]

These streaming potentials are considered to be biologically important, potentially representing an intermediate signal by which bone cells sense functional demands. Therefore it has been hypothesized that the application of electrical fields may be able to stimulate osteogenesis by stimulating the natural endogenous streaming potentials in bone.[198]

Although a rationale exists for the use of electromagnetic fields on damaged bone, strong supportive evidence is lacking. Numerous observational studies have suggested a beneficial role of electromagnetic fields during fracture repair; however, few controlled studies have been performed. The controlled studies that have been performed suggest that electromagnetic fields may be primarily beneficial to fractures that show delayed union or nonunion.[199] Electromagnetic fields do not appear to be beneficial to acute fracture repair processes; however, preliminary evidence has demonstrated that electromagnetic fields may be safely applied to healing stress fractures,[200] although this does not imply efficacy.

Nutrition

Calcium and vitamin D supplementation may help in prevention of stress fractures. A 20% lower incidence of stress fractures compared with a placebo group was seen in female recruits who took a daily calcium supplement (2000 mg) and vitamin D supplement (800 International Units).[82]

MANAGEMENT OF STRESS REACTIONS AND LOW-RISK STRESS FRACTURES

The management of a stress fracture depends on its risk for healing complications.[201] Most stress fractures represent relatively straightforward management problems. These stress fractures are uncomplicated and typically respond to relative rest from the aggravating activity and removal or modification of risk factors.

The major goal for clinicians in managing low-risk stress fractures is to return the patient to the preinjury level of function, ideally in the shortest time possible and without compromising tissue-level healing. To accomplish this, graduated loading programs are commonly used, with pain as the directive variable. Most clinicians agree that pain is a useful guide in assessing the progress of an injury toward healing, particularly stress fractures. In the management of low-risk stress fractures, the objective is to facilitate function while keeping pain below the patient's pain threshold. Because pain is the directive variable, pharmacological manipulation of pain using analgesics or NSAIDs is not advisable. These agents may be used in the initial stages if a patient has resting, night, or severe pain, but they should be withdrawn as soon as possible because they can mask pain and may allow too rapid a progression through a graduated loading program.

A **graduated loading program** is used in the management of low-risk stress fractures to apply controlled loading and to facilitate return to full function in a timely fashion. Although mechanical loading is central to the development of a stress fracture, its complete removal is not necessary or advised during recovery. Bone is mechanosensitive, and removal of all mechanical loading has a negative influence on the skeletal risk factors for stress fractures. In addition, the removal of loading may delay healing, because osteoblasts respond to mechanical loading by increasing necessary reparative bone formation. Therefore the recovery needs of the injured tissue and patient are best met in low-risk stress fractures by a balance of rest from aggravating activities and the performance of appropriate loading. Appropriate loading is defined as loading that does not provoke a patient's signs or symptoms at a rating higher than 2 on a 0 to 10 scale (where 0 is no pain and 10 is the most severe pain the person has ever experienced), either during the activity or after it is completed. Using this definition, individuals can be progressed through a graduated loading program.

Box 26-1 presents an example of a graduated loading program for commonly occurring posteromedial tibial stress fractures. This program consists of a preentry stage and five loading stages. Stage 0, the preentry stage, is the stage in which the patient experiences pain during walking and in normal activities of daily living. During this stage, some patients may require gait aids to facilitate a natural gait pattern; however, these should be removed as soon as possible. Once the patient is completely pain free for 3 consecutive days, the individual can begin stage 1 of the loading program. Stage 1 involves 30-minute exercise sessions of walking and jogging. There are 2 consecutive days of loading, followed by 1 day of rest. On the rest day, the patient should not perform any weight-bearing exercise, including prolonged walking. In stage 2, loading is progressed to solely jogging, which is performed every second day at increasing durations. Jogging duration is further progressed in stage 3 and is performed for 4 days in 1 week. The last two stages incorporate individualized running and activity until return to full activity is achieved.

In each stage of the graduated loading program, successful completion of each level is determined by pain. During each loading session, the patient must stop exercising if the individual experiences pain that he or she would rate higher than 2 on the 0 to 10 scale. If this occurs, the patient must return to the previous loading level for the remainder of the session. If pain rated higher than 2 is still experienced, the patient must stop the loading session. The amount of pain the patient experiences in the last loading session determines the level at which the person will exercise in the next session. If the patient successfully completes a loading session with pain rated below 2 on the 0 to 10 scale and did not experience any pain after completion of loading, the individual can progress to the next level in that stage. When the patient has successfully

BOX 26-1

Graduated Loading Program

Stage 0	**Preentry to graduated loading program**
	Pain during walking in normal activities of daily living
Stage 1	**Walk and jog stage (2 days loading, 1 day rest)**
Level A	Walk 30 min
B	Walk 9 min and jog 1 min (×3)
C	Rest
D	Walk 8 min and jog 2 min (×3)
E	Walk 7 min and jog 3 min (×3)
F	Rest
G	Walk 6 min and jog 4 min (×3)
H	Walk 5 min and jog 5 min (×3)
I	Rest
J	Walk 4 min and jog 6 min (×3)
K	Walk 3 min and jog 7 min (×3)
L	Rest
M	Walk 2 min and jog 8 min (×3)
N	Walk 1 min and jog 9 min (×3)
O	Rest
Stage 2	**Jogging every second day**
Level A	Jog 12 min
B	Rest
C	Jog 15 min
D	Rest
E	Jog 15 min
F	Rest
G	Jog 17 min
H	Rest
I	Jog 17 min
J	Rest
K	Jog 20 min
L	Rest
M	Jog 20 min
Stage 3	**Jogging (4 loading days in 1 week)**
Level A	Jog 25 min
B	Rest
C	Jog 25 min
D	Rest
E	Jog 30 min
F	Jog 30 min
G	Rest
Stage 4	**Individualized running (5 loading days in 1 week)**
Level A	Running
B	Running
C	Rest
D	Running
E	Running
F	Rest
G	Running
Stage 5	**Return to activity (individualized)**

completed each level, he or she can progress to the next stage. However, if the patient is unable to successfully complete a loading session because of pain but can train at the previous loading level for the remainder of the session, then at the next session the patient should reattempt the loading session that could not be completed because of pain. If the patient was unable to successfully complete a loading session because of pain and could not train at the previous loading level because of pain, then at the next loading session the patient should train at the last level he or she successfully attempted.

Using a graduated loading program that is strictly guided by pain to manage low-risk stress fractures, the patient and clinician can facilitate recovery while being relatively confident the pathology is not progressing. Of course, this requires the full understanding of the patient regarding the appropriate progression through the program and adherence to the set pain levels. Patients with lower grade injuries (i.e., stress reactions) may be able to progress more quickly through a graduated loading program, and the total duration of their program may be reduced from that shown in Box 26-1. Program duration should be based on the expected time course for recovery, which in turn depends on the stage of pathology in which the patient presents. Therefore all patients should perform individualized programs.

To further facilitate functional recovery of posteromedial tibial stress fractures, a pneumatic leg brace may be prescribed for wear during waking hours, including during a graduated loading program. In addition, LIPUS may be used to try to accelerate the rate of tissue-level repair. At all times during recovery, patients can maintain fitness by cycling, water running, or working out on exercise machines. In addition, individual risk factors for stress fractures identified during the examination need to be addressed as early as possible during management. The high

rate of recurrence of stress fractures is an indication that risk factors are an often neglected component in management programs.

Complete recovery from a stress fracture has occurred when a patient completes the graduated loading program, has no local tenderness, and is able to perform the precipitating activity without pain.[8] This can be achieved with most stress fractures within 6 to 8 weeks of clinical presentation.[8] In most cases attempting to monitor healing radiologically is not useful; the radiological appearance of healing stress fractures can be deceptive, because the fracture still is visible well after clinical healing has occurred.[85,202]

Stress Fractures and Diagnostic Imaging

- Radiographs and bone scans should not be used to monitor the progress of fracture healing because imaging signs of healing lag well behind actual clinical healing.

MANAGEMENT OF *"HIGH-RISK"* STRESS FRACTURES

Most stress fractures heal without complication and have a low risk of complications. However, certain stress fractures present diagnostic and treatment challenges. These include stress fractures that are prone to delayed union or nonunion and/or are at high risk for progression to complete fracture. Specific sites for these stress fractures are the neck of the femur, anterior cortex of the tibia, medial malleolus, talus, navicular, fifth metatarsal, and great toe sesamoids. Stress fractures at these sites require specific management (Table 26-4).

TABLE **26-4**

Common Management Approaches for High-Risk Stress Fractures

Stress Fracture Site	Management
Femoral neck	Initially bed rest and non–weight-bearing crutches, then gradual weight bearing for undisplaced fractures; surgical fixation for displaced fractures
Anterior cortex of the tibia	Rest, non–weight-bearing cast immobilization or surgical intervention (intramedullary rod fixation)
Medial malleolus	Non–weight-bearing cast immobilization for 6 weeks or surgical intervention
Talus (lateral process)	Non–weight-bearing cast immobilization for 6 weeks
Navicular	Non–weight-bearing cast immobilization for 6 weeks
Base of the fifth metatarsal	Cast immobilization or percutaneous screw fixation
Great toe sesamoids	Non–weight-bearing for 4 weeks or surgical intervention

Neck of the Femur

Femoral neck stress fractures are relatively uncommon in athletes (fewer than 5% of all stress fractures),[203] but they can have serious consequences. This stress fracture should be considered in the differential diagnosis when an individual, especially an athlete, presents with a history of gradual or acute-onset anterior hip, groin, or knee pain that is aggravated by exercise.[204–206] The physical examination may also reveal pain and restriction at the end of passive hip range of motion.[205–207] However, early diagnosis can be difficult because these signs are nonspecific; therefore a high level of clinical suspicion is required at all times. Early diagnosis is very important for successful management because delay is not conducive to a good prognosis.[203,208]

Femoral neck stress fractures typically are classified into three categories: *tension*, *compression*, and *displaced*.[209] Tension femoral neck stress fractures occur on the superior margin of the femoral neck and are radiographically visible as a cortical discontinuity. This type occurs predominantly in older patients, commonly in association with bone disease (osteoporosis), although it has been reported in active younger patients.[210] Tension stress fractures are at increased risk of progression to complete fracture because they are unstable; therefore management may involve operative stabilization.[206]

Compression femoral neck stress fractures occur on the inferior femoral neck and are characterized radiologically by a periosteal reaction, or callus formation, without evidence of a fracture line.[206] This type typically occurs in younger athletes and has a lower risk of fracture displacement because it is more stable. The typical intervention for these stress fractures and frequently for tension femoral neck stress fractures is conservative, involving rest initially, until passive hip movement is pain free, followed by non-weight bearing on crutches until radiographic evidence of healing is seen.[201] Weight-bearing exercise is resumed gradually and built up to the patient's preinjury level over 6 to 8 weeks.

Displaced femoral neck stress fractures occur with progression of a stress fracture and subsequent displacement of the fractured bones. Displaced stress fractures carry the risk of avascular necrosis of the femoral head and should be treated promptly through surgical fixation.[211,212]

Types of Femoral Neck Stress Fractures

- Tension
- Compression
- Displaced

Anterior Cortex of the Tibia

Most tibial stress fractures occur along the posteromedial aspect of the bone and respond to rest and a gradual return to weight-bearing activity. Less often, stress fractures occur along the anterior tibial cortex; these are a particular concern because they are prone to nonunion and possible progression to complete fracture.[155,213] Nonunion of these stress fractures is demonstrated radiographically by a discontinuity of the anterior part of the cortex (the so-called dreaded black line), which suggests bony resorption at the fracture site (Figure 26-8). At this time, the patient may have been symptomatic for some months, but frequently the symptoms are minimal and the individual has been able to continue activity.[201] This can result in progression to an acute transverse fracture because of the affected tibial mechanics.[214]

The treatment of stress fractures of the anterior cortex of the tibia is aggressive, involving rest, immobilization in a non–weight-bearing cast, or early surgery (insertion of an intramedullary rod).[201,215,216] Each of these methods requires a prolonged recovery period, and return to full activity takes 6 to 12 months.[216,217] An alternative approach may be to use a pneumatic leg brace with an anterior pad for activities of daily living and for free walking once the patient is pain free.[154] However, this approach still requires a lengthy recovery period (7 to 11 months in the reported cases). Other simultaneously introduced interventions may include application of electromagnetic fields and LIPUS therapy.[155,216]

Medial Malleolus

Stress fractures of the medial malleolus occur in distance runners and jumpers (e.g., basketball players and gymnasts).[218–220] These individuals typically present with chronic or acute pain over the medial malleolus, sometimes with an associated ankle effusion.[220,221] On imaging, the stress fractures are identified by focal increased uptake on bone scintigraphy.[218] When observed on radiography, CT, or MRI, the fracture line often is vertical from the tibial plafond and medial malleolus but may arch obliquely from the distal tibial metaphysis.[201,222] Because these stress fractures can develop into a nonunion and progress to complete fracture,[218,219,223] specific management is required.

Several authors have recommended that patients with a visible fracture line on radiography, CT, or MRI undergo open reduction and internal fixation, particularly if they are elite athletes.[219,220] Postoperative management is early range of motion exercises with protected weight bearing.[222] Fractures that are positive on bone scan and negative on more specific forms of imaging (i.e., radiography, CT, and MRI) can be treated with immobilization in a pneumatic brace.[201,220] Whether a conservative or surgical approach is taken, the usual recovery time after the initiation of treatment is 6 to 8 weeks,[220] although it may be extended in some cases (up to 5 months).[221] During recovery, any identifiable risk factors that cause stress overloading of the medial ankle should be addressed.

Figure 26-8 Multiple nonunited stress fractures of the anterior cortex of the tibia, as evidenced by the multiple "dreaded black lines" (*arrows*).

Talus

Stress fractures of the talus are relatively rare; however, they can occur in multiple locations, the most frequent site being the lateral body of the talus and its lateral process.[224–228] Stress fractures at this site can extend into the subtalar joint and are prone to nonunion.[111] They present with signs and symptoms of severe sinus tarsi syndrome and a gradual onset of lateral ankle pain[225] and demonstrate a characteristic appearance of localized increased uptake of marker on bone scintigraphy. CT and MRI can be useful for imaging the fracture line directly and can aid diagnosis.[225,228] The recommended treatment is immobilization in a non–weight-bearing cast for 4 to 6 weeks if the fracture is diagnosed early.[201,225] Excision of the lateral process of the talus through the fracture line is recommended for long-standing, symptomatic fractures.[201]

Navicular

Stress fractures of the tarsal navicular bone are common, especially among runners, jumpers, hurdlers, and basketball players.[115,229,230] The onset of symptoms usually is insidious, with patients having increased foot pain after sprinting, jumping, or running. These fractures often are poorly recognized, possibly because the patient's symptoms are vague, particularly in the early stages of injury.[231,232] The pain typically radiates along the medial longitudinal arch or along the dorsum of the foot. Symptoms abate rapidly with rest but recur when the patient resumes activity. Examination reveals tenderness over the proximodorsal aspect of the navicular, the so-called **"N spot"** (Figure 26-9),[233] and imaging frequently demonstrates the injury (see Figure 26-5).[112]

Figure 26-9 Palpation for a navicular stress fracture at the so-called "N spot".

Correct diagnosis and definitive treatment are important in patients with navicular stress fractures because delay in diagnosis can result in prolonged disability. Navicular stress fractures treated with rest and a gradual return to activity have a high incidence of delayed union and nonunion.[115] The recommended treatment for navicular stress fractures is immobilization in a non–weight-bearing cast for at least 6 weeks.[115,233] Even complete navicular stress fractures have been shown to heal with this regimen. After 6 weeks, the patient's cast is removed and healing is assessed by palpation on the "N spot". Radiographs or bone scans should not be used to monitor progress of the fracture because imaging signs of healing lag well behind clinical healing. A 6-week rehabilitation program consisting of joint mobilization, muscle strengthening, and gradual return to activity can begin when the patient has no pain on palpation of the "N spot".[115,233]

Fifth Metatarsal

Stress fractures of the metatarsals most often occur in the second and third metatarsals. A less common yet important variant is a diaphyseal stress fracture of the fifth metatarsal. This type of stress fracture occurs in the proximal 1.5 cm (0.6 inch) of the diaphysis and sometimes is mistaken for a Jones fracture.[234–236] The term *Jones fracture* should be reserved for an acute fracture of the fifth metatarsal, at the level of the articular facet between the fourth and fifth metatarsals, that does not extend distally.[237] Diaphyseal stress fractures of the fifth metatarsal commonly present with localized pain and tenderness near the base of the metatarsal, and dorsal swelling is seen in this area. Diagnosis is important because these fractures have a high potential for delayed union, nonunion, and refracture.[234,238]

The treatment of fifth metatarsal diaphyseal stress fractures depends on their classification. Torg et al.[239] described three subtypes of diaphyseal stress fractures: type I is the acute or early form, type II is characterized by delayed union, and type III involves nonunion. A type I stress fracture is an early stress fracture with periosteal reaction that represents healing of an incomplete fracture. Radiography confirms the fracture and shows no medullary sclerosis. This subtype has a good prognosis with immobilization in a nonwalking, short leg cast for 6 weeks,[201,235] after which healing is assessed clinically and radiographically. Patients can then gradually resume activity. An alternative management option is to use intramedullary screw fixation; however, the time to union using this technique is identical to that with conservative management.[240]

Type II and type III stress fractures frequently present as an apparent acute fracture, but when questioned, the patient describes a variable history of pain at the fracture site with activity. Radiography shows a fracture line and, depending on the duration of symptoms, may show medullary sclerosis or established nonunion with complete intramedullary obliteration. These subtypes may heal with prolonged cast immobilization (i.e., 3 to 6 months); however, surgical treatment produces more rapid and predictable healing.[241] Intramedullary screw fixation is advocated for type II and type III diaphyseal stress fractures, and bone grafting is variably used for type III stress fractures.[235,240,241] Patients typically return to activity 6 weeks (screw fixation) or 12 weeks (bone grafting) after surgery.[201,222]

Great Toe Sesamoid

The sesamoids of the great toe are embedded in the flexor hallucis brevis and receive fibrous insertions from abductor and adductor brevis muscles. They function to increase the mechanical advantage of the flexor hallucis brevis, assist with weight bearing under the first metatarsal, and elevate the metatarsal head off the ground. As such, they are exposed to repetitive loads and are prone to stress fracture in weight-bearing individuals, especially athletes. Stress fractures most often occur in the tibial sesamoid because it receives most of the weight transmitted by the first metatarsal.[242]

Sesamoid stress fractures typically present as forefoot pain during loading that increases with dorsiflexion of the great toe and decreases with rest. Palpation is used to determine the presence of localized sesamoid pain. Because these symptoms also are consistent with sesamoiditis, the diagnosis often is delayed. Similarly, the diagnosis can be influenced by the presence of a bipartite or multipartite sesamoid, which frequently is present in normal, asymptomatic individuals.[243] Any delay in the diagnosis of sesamoid stress fractures can be problematic, because prolonged morbidity and progression to nonunion are relatively common. The initial management of sesamoid stress fractures is conservative, with non–weight-bearing for 4 weeks. Given the important functional role of the sesamoids, surgical removal should be considered only if conservative management fails.

UNUSUAL STRESS FRACTURES

Scapula

Scapular stress fractures are rare but have been reported in the literature involving the acromial base, the coracoid process, and body of the scapula.[244–247] These injuries, in most cases, occurred following an unusually large increase in activity resulting in repetitive low-to-moderate levels of stress creating the injury. All result in localized painful areas of the scapula.

Humerus

Unlike its lower limb counterpart, the upper limb is relatively shielded from repetitive weight-bearing stress. Despite this, it is well known that the upper arm, including the distal and middle humerus, is prone to injury due to repetitive overhead activity. In skeletally mature patients, humeral shaft fractures can occur owing to generalized and rotational shaft stress.[248] Several papers have reported stress reactions which, if left untreated, can lead to complete stress fractures.[249–252] These humeral injuries can be seen due to the large amount of rotational stress seen during athletic endeavors such as serving in tennis and throwing in baseball, softball, or the javelin.[253] These forces create substantial stress to be placed upon the middle and distal humerus that result in spiral fractures.[254–256] Unfortunately, these injuries may be difficult to diagnose early as they may be characterized as pain in the arm or elbow.[250] If in the elbow, the pain may be initially overlooked as the athlete tries to play though the pain. However, if caught early when symptoms have lasted no more than 2 to 3 weeks, the athlete should be able to rehabilitate and resume play more quickly.

Olecranon

Due to stress similar to those during valgus extension overload, the elbow can incur a transverse or oblique olecranon stress fracture.[257] Throwing can create valgus stress or tensile stress from attachment of the triceps. If triceps tensile traction forces and extension are the primary stress, a transverse type stress fracture occurs. However, when increased valgus stress occurs with extension forces, as is seen in throwing, the injury pattern is that of an oblique stress fracture.[257]

Ribs

Ribs are an uncommon site for stress fractures but have been seen in athletes who use large upper body muscle forces to perform their activity such as rowers and throwers in track and field.[53,258] These injuries have also been seen in golfers.[259] Ribs that may have a stress fracture include the first rib (anterolaterally), the second to fourth ribs (posteromedially), and fourth to ninth ribs (posterolaterally and laterally).[53,258]

SUMMARY

Repetitive stress injuries to bone present along a pathology continuum ranging from stress reactions to complete bone fractures. For this reason, signs and symptoms often vary, depending upon the stage in which a patient presents. Similarly, recovery times also vary. Typically, the earlier an individual is diagnosed, the better and quicker is the response to management. Therefore a certain level of suspicion needs to be maintained at all times in appropriately presenting patients. The diagnosis typically is made clinically by a history consistent with an overuse injury and is confirmed radiographically. In confirmed cases of a repetitive stress injury to bone, management is determined by the risk for healing complications. Low-risk stress injures represent relatively straightforward management problems and typically respond to relative rest from the aggravating activity and removal or modification of risk factors. High-risk stress fractures, on the other hand, are prone to complication and require specific management.

CHAPTER 27

Repetitive Stress Pathology: Soft Tissue

NANCY N. BYL, MARY F. BARBE, CAROLYN BYL DOLAN, GRANT GLASS*

INTRODUCTION

The purpose of this chapter is to integrate the basic science of injury, repair, and recovery with patients who have suffered from acute and chronic work-related musculoskeletal trauma related to repetitive overuse in work-related activities. Research findings based on animal and human models can explain the rise in the workplace incidence and prevalence of repetitive strain injuries. The local cellular responses to ongoing repetitive forces are clearly outlined. Peripheralization of the injury is not uncommon when excessive repetitive forces continue too long. Central consequences of overuse, including chronic pain and movement dysfunction (e.g., focal hand dystonia [FHd]), are highlighted, based on laboratory and clinical science research. An etiological model of FHd based on lack of homeostatic plasticity and aberrant learning is proposed as one foundation for effective intervention. The chapter concludes by outlining a comprehensive management strategy for the rehabilitation of patients with occupational hand cramps.

EPIDEMIOLOGY AND MANAGEMENT OF WORK-RELATED MUSCULOSKELETAL DISORDERS OF THE HAND AND WRIST

The Problem

Work-related musculoskeletal disorders (WRMSDs), referred to as work-related repetitive stress (overuse) injuries, have accounted for a significant proportion of work injuries and workers' compensation claims in Western industrialized nations since the late 1980s. The extent to which work is a causal factor in the development of such disorders is still the subject of much controversy. However, recent epidemiological studies have greatly improved methods of distinguishing between the contributions of workplace and nonworkplace risk factors in the development and severity of WRMSDs. The evidence is clear that both workplace and nonworkplace factors can cause or exacerbate WRMSDs, and the key to controlling the impact of such disorders in the workplace is prevention.

Although there is still much to learn about the underlying pathophysiology of work-related repetitive strain disorders, epidemiological research provides information about the scope of the problem and likely causal factors that are being studied in the laboratory and among clinical populations. This section reviews the recent epidemiological literature on WRMSDs of the hand and wrist, with an emphasis on the most prevalent peripheral nerve and musculotendinous disorders.

Definition

Work-Related Musculoskeletal Disorders

The U.S. Department of Labor defines WRMSDs, also known as ergonomic injuries, as injuries or disorders of the muscles, nerves, tendons, joints, cartilage, and spinal discs associated with exposure to risk factors in the workplace. WRMSDs include sprains, strains, tears, edema, fractures, compression, malalignment, disc herniation, and excessive, repetitive movements that challenge the musculoskeletal, connective, or neural tissue reactions (e.g., carpal tunnel syndrome [CTS]) as a result of stressful lifting, bending, climbing, crawling, reaching, twisting, pushing, pulling, poor postural alignment, psychological stress, overexertion, or repetition.[1,2] WRMSDs do not include disorders caused by slips, trips, falls, motor vehicle accidents, or other traumatic injuries.[2] Musculoskeletal disorders (MSDs) also do not generally include Raynaud's phenomenon (although Raynaud's symptoms associated with hand–arm vibration syndrome is a type of WRMSD), tarsal tunnel syndrome, or herniated spinal discs. These types of cases may be related to work stress, but the National Center for Chronic

*The authors, editors, and publisher wish to acknowledge Ann Barr for her contributions on this topic in the previous edition.

Diseases considers them separately from musculoskeletal work-related disorders.[1]

Work-Related Musculoskeletal Disorders

Work-related musculoskeletal disorders (WRMSDs) are injuries or disorders of the following:
- Muscles
- Fascia
- Nerves
- Tendons
- Joints
- Cartilage
- Spinal discs

Events or exposures that lead to WRMSDs include the following:
- Bodily reaction/bending
- Climbing
- Crawling
- Reaching
- Twisting
- Lifting
- Pulling
- Poor postural alignment
- Overexertion
- Repetition

WRMSDs include disorders of musculoskeletal, connective, or neural tissues:
- Sprains, strains, tears
- Hurt back
- Pain
- Edema
- Inflammation
- Soreness
- Compression (e.g., carpal tunnel syndrome, neural tension of the brachial plexus or sciatic nerve)
- Hernia
- Musculoskeletal system or connective tissue diseases/disorders
- Biomechanical malalignment
- Psychological stress/anxiety

WRMSDs *do not* include the following:
- Disorders caused by slips, trips, falls, motor vehicle accidents
- Injuries from equipment failures
- Raynaud's phenomenon
- Tarsal tunnel syndrome
- Specific herniated spinal discs

Risk Factors for Work-Related Musculoskeletal Disorders

Certain risk factors are associated with the development or exacerbation of MSDs in the workplace. These risk factors include one or more conditions of physical, biomechanical, environmental, specific job tasks, and/or psychosocial stress in the workplace. In addition, certain worker characteristics, such as obesity, genetics, poor nutrition/hydration, metabolic disease, personality, cumulative exposure, and coping mechanisms, may predispose individuals to MSDs.

Physical and Biomechanical Risk Factors. The primary physical or biomechanical risk factors that contribute to the onset or exacerbation of WRMSDs include the performance of highly repetitive motions and forceful motion.[3–7] The assumption of fixed postures for long periods (particularly when postures place joints in the extremes of physiological range of motion [ROM]), the presence of vibration (e.g., during the operation of handheld power tools), interaction with cold temperatures, or altitude extremes can also increase the risk of repetitive strain injuries.[8–11] There is considerable evidence that the interaction of physical risk factors, such as the combination of high repetition and high force during repetitive power grips or repetitive forceful pinching, disproportionately increases the risk of peripheral neuropathy and musculotendinous disorders of the upper limb.[3–7,12,13] Risks for WRMSDs can also be exacerbated by other medical problems, economic issues, and psychosocial stresses at work and at home, as described in the accompanying textbox.

Risk Factors Contributing to Work-Related Musculoskeletal Disorders

Physical and Biomechanical Risk Factors
- Repetitive movements
- Forceful movements
- Repetitive high-force tasks > either independently
- Fixed postures
- Non-neutral, awkward, or extreme positions
- Vibration
- Cold temperature
- Extreme altitudes

Psychosocial Risk Factors
- High work stress or demands
- Low job security
- Poor job satisfaction
- Low decision control
- Poor workplace social support
- Contentious relationships with supervisors
- Low pay with minimal benefits

Individual Predisposing Risk Factors
- Genetics
- Co-morbid medical conditions
- Physical inactivity
- Physical and psychosocial coping behaviors
- Personality
- Obesity
- Aging
- Female gender
- Life goals and family responsibilities

Psychosocial Risk Factors. Psychosocial risk factors in the workplace, such as job content and demands, job control, and social support, can increase the risk for MSDs.[1,9] Examples of psychosocial factors in the workplace include low worker control over workflow and organization (e.g., assembly line

work),[11] contentious relationships with co-workers and supervisors, low decision-making authority, time pressure, low pay and minimal benefits, and excessive employee performance evaluation by management, to name a few.

Individual Predisposing Factors. Nonworkplace factors also can contribute to the development and exacerbation of WRMSDs.[8,14] It is vital that health care providers not only explore such possibilities with workers but also arrange for treatment. These individual predisposing factors not only include physical and psychosocial risk factors (e.g., long hours of practice and performance to maintain a job related skill) but high levels of stress in the home (e.g., partner relationships, adequacy of income, stability of housing, physical, social, educational and psychological challenges of children). Genetics as well as past or current medical conditions also may be co-morbid risk factors for WRMSDs.[9,15,16] Examples include past traumatic injury to the affected body part (e.g., a fracture or sprain), difficulties with digestion, abnormal sleep patterns, obesity, physical inactivity, and systemic diseases (e.g., rheumatoid arthritis, cardiovascular dysfunction, metabolic disorders, diabetes mellitus, celiac disease). Epidemiological studies have linked upper extremity WRMSDs with occupational physical activities involving repetitive arm motions and other risk factors (including force, duration, and female gender).[8,17,18] Advanced age may increase the impact of other risk factors on the severity of MSDs,[19–21] and obesity has been reported to predict the onset of MSDs.[18,22,23]

WRMSDs, therefore, have complex multifactorial causes that contribute to the persistent controversy surrounding governmental regulation of these disorders. Consequently, private industry in the United States addresses these disorders on a voluntary basis, using industry-specific guidelines provided by the Occupational Safety and Health Administration (OSHA) (www.osha.gov).

Clinical Point

When treating patients with WRMSDs, health care providers must bear in mind the complexity of causal factors and attempt to identify and address multifactorial aggravating factors in a comprehensive, holistic approach that emphasizes patient education.

U.S. Department of Labor Survey of Health Statistics

WRMSDs, also known as repetitive strain injuries (RSIs) and work-related overuse injuries, are the most reported types of occupational illnesses. Musculoskeletal conditions, in general, are the second greatest cause of disability globally and have increased 45% worldwide, according to the 2010 Global Burden of Disease Study.[24] WRMSDs are now considered a leading cause of long-term pain and physical disability worldwide,[24–27] with diagnoses including tendinopathies, nerve compression syndromes, and muscular and joint disorders.[28–31]

According to the U.S. Bureau of Labor Statistics reports titled "Nonfatal Occupational Injuries and Illnesses Requiring Days away from Work 2012" and "Workplace Injury and Illness Summary 2012,"[21,32] WRMSDs account for 34% of lost workday injuries and illnesses in the United States and cost on the order of $100 billion annually. The median days away from work—a key measure of severity of injuries and illnesses—was 9 days. Injuries and illnesses resulting from repetitive motion involving microtasks resulted in a median of 23 days away from work to recuperate. Private sector incidence rate for days-away-from-work cases decreased from 105 per 10,000 full-time workers in 2011 to 102 in 2012. Yet, despite this overall decrease, four occupational groups had increases in their incidence rates in 2012: computer and mathematical occupations, community and social service occupations, personal care and service occupations, and transportation and material moving occupations. Seven occupations had rates greater than 375 cases per 10,000 full-time workers: transit and intercity bus drivers; police and sheriff's patrol officers; correctional officers and jailers; firefighters; nursing assistants; laborers and freight, stock, and material movers; and emergency medical technicians and paramedics. Laborers and freight, stock, and material movers had the highest number of days-away-from-work cases in 2012 with 63,690 cases and an incidence rate of 391 (up from 367 in 2011).[21] Overexertion and bodily reaction was the leading event or exposure. Furthermore, because age is a risk factor and the average age of the American and international workforce is rapidly increasing as a result of economic realities, more WRMSDs cases are predicted.[33–35]

Scope of Workplace Musculoskeletal Disorders in U.S. Industry

- WRMSDs accounted for 34% of all injury and illnesses in 2012
- Injuries and illnesses resulting from repetitive motion involving microtasks resulted in a median of 23 days away from work to recuperate
- Overexertion and bodily reaction was the leading event or exposure, with 408,760 cases

Epidemiological Evidence of Work-Related Repetitive Overuse Injuries of the Forearm, Wrist, and Hand

Several comprehensive reviews of the literature concerning WRMSDs have been completed since 1997. A seminal review undertaken by the National Institute for Occupational Safety and Health (NIOSH) included more than 600 epidemiological studies, dating from the 1970s to the mid-1990s, concerning WRMSDs of the neck, upper extremity, and low back.[8] The National Research Council (NRC) and the Institute of Medicine conducted a second, more exclusive review of the WRMSD literature.[36] The NRC review included studies from the late 1970s to the late 1990s that examined tissue pathophysiology; mechanical, organizational,

and psychosocial risk factors; and clinical interventions for WRMSDs of the upper extremity and low back. The panel reviewed 42 studies of physical risk factors and 28 studies of psychosocial risk factors. The overall conclusions of both the NIOSH and NRC reviews were that there is evidence supporting associations between workplace physical risk factors and elbow, hand, and wrist WRMSDs and that key risk factors included repetition, force, vibration, gender, age, and others listed earlier. Both reviews identified gaps in the literature in the hope of guiding future research. In subsequent years, investigators began to address some of these issues. Table 27-1 presents a recent update of the epidemiological literature concerning CTS and forearm, hand, and wrist musculoskeletal disorders.

Cumulative Effects of Small Amplitude Forces

MSDs often result from physical demands placed on the musculoskeletal system and peripheral nerves in the workplace.[8,31,36,45] Although acute trauma may be a factor in some cases of MSDs, many WRMSDs are the result of cumulative effects of smaller amplitude forces that occur with overtraining, overexertion, repetitive movements and activities, forceful actions, and prolonged static positioning.[46] The risk for developing lateral epicondylitis (i.e., tennis elbow), for example, is higher with time spent in forearm pronation when combined with increased time in general or increased time spent performing forceful exertions (see Table 27-1).[4] Older age (i.e., 35 to 65 years) is also associated with increased risk for developing lateral epicondylitis[4] (see Table 27-1), perhaps as a consequence of cumulative tissue changes and/or reduced healing as a result of aging. That said, a study examining computer workers found that younger employees were more likely to report hand and wrist symptoms than older workers and postulated that this might have been because the younger employees might have increased hours of computer use as a result of job hierarchy, increased time using computers that was unrelated to work, inappropriate working conditions, first employment, and/or increased awareness of condition, making them more likely to report symptoms (see Table 27-1).[17]

Interaction of Force and Repetition on Tissue Endurance

A recent systematic review of the WRMSD epidemiology literature examined studies that tested for an interaction between two key risk factors: repetition and force (see Table 27-1).[3] Evidence of interaction was found in 10 of 12 epidemiological studies. A consistent pattern of interaction was observed across a number of disorders, including CTS, tendinitis, epicondylitis, and hand pain, with low-force tasks demonstrating a small or modest increase in MSD risk with increased repetition, whereas an escalation in MSD risk was consistently exhibited with high-force tasks, especially when combined with increased repetition.[3] The authors of that review provided a theoretical basis for the interaction between force and repetition, suggesting that this interaction pattern would be anticipated if musculoskeletal tissues incurred damage as the result of fatigue failure of the tissues with prolonged performance of occupational-related tasks. With fatigue failure, high-force tasks could withstand fewer cycles before failure, but as force was decreased, many more cycles could be tolerated. In addition, there often exists an "endurance limit" below which tissues can be repeatedly loaded without failing (or, at least, tolerate a very large number of repetitions before experiencing failure).[3] This same idea was upheld in a number of other epidemiological studies (see Table 27-1). For example, the risk for arm and wrist tendinosis and epicondylitis increased with increased time spent in forearm pronation performing forceful manual tasks, such as power grip[4] and percentage of time spent in heavy pinch.[6] Recent epidemiological studies clearly showed that the risk for developing CTS was greater with increased repetition, with increased hand force (e.g., high pinch force and power grip), and when performing jobs with forceful hand exertions combined with high repetition.[5,7] Other studies also reported increased prevalence of osteoarthritis in fingers and the thumb in dentists and teachers as a consequence of continued hand joint overloading.[43,44]

Contributions of Posture and Gender

Prolonged static positioning[46] and non-neutral body postures have been identified as key risk factors for WRMSDs.[47] A large cross-sectional study of 2652 subjects (761 males and 1891 females) found that wrist angular velocity was the most consistent physical exposure factor associated with a diagnosis of medial epicondylitis (i.e., golfer's elbow) and CTS and that jobs with high use of wrist flexion were associated with lateral epicondylitis (see Table 27-1).[11] A meta-analysis also showed an increased risk for CTS with increasing hours of exposure to wrist deviation, extension, or flexion.[10] However, a recent prospective study of 2472 employees found no association between wrist posture and risk for developing CTS (finding instead that forceful hand exertion, with or without repetition, was a key factor for incident CTS).[5] Most studies agreed that female gender was a key risk factor associated with development of or a diagnosis of a WRMSD.[6,11] Associated disorders included wrist tendinosis, epicondylitis, CTS, and hand osteoarthritis.

Psychosocial Factors

The 2001 NRC study also examined the importance of psychosocial factors and determined that job content and demands, job control, and social support could increase the risk for MSDs.[1,9] More specifically, psychosocial factors in the workplace included low worker control over workflow and organization (e.g., assembly line work), contentious relationships with co-workers and supervisors, low decision-making authority, time pressure, low pay, minimal benefits, and excessive employee performance evaluation by management. Recent epidemiological studies, such as those shown in Tables 27-1, 27-2 and 27-3, have confirmed that workplace factors, such as low job control,

Selected Recent Epidemiological Studies on Work-Related Musculoskeletal Disorders of the Forearm, Wrist, and Hand—cont'd

Authors (Country)	Sample	Study Design	Findings	Conclusions
Ding et al., 2010; Solovieva et al., 2005 (Finland)[43,44]	295 dentists and 248 teachers All females, ages 45-63 years, of same socioeconomic level	Cross-sectional study of females in Dental Association and Finnish Teachers' Trade Union First study: investigated association of extensive hand use with radiographic hand joint OA in workers from two occupations with different hand loads[43] Second study: investigated relationship of pinch grip strength with radiographic hand OA and hand joint pain[44]	DIP joints most frequently involved Prevalence of OA in finger and DIP joints in teachers > dentists, especially ring and little OA in right-hand thumb and index and middle fingers in dentists > teachers[43] Symptomatic hand OA (radiological and pain findings) = ↑ risk of low pinch grip strength in both hands, adjusting for age, BMI, hand size, occupation, and hand-loading leisure-time activity[44]	Hand function, specifically continuing hand joint overload, is related to severity of hand OA Finger OA in middle-aged women is highly prevalent, often polyarticular and occupation specific
Harris-Adamson et al., 2014 (USA)[5]	A pooled study cohort from five research groups of 2474 workers (without CTS or possible poly neuropathy at enrollment) employed in hand-intensive work	Longitudinal: followed up to 6.5 years (51,023 person-years) Questionnaires administered to participants at enrollment and during follow-up sessions (work history, demographics, medical history, musculoskeletal symptoms) Individual workplace exposure measures of dominant hand were collected for each task and included force, repetition, duty cycle, and posture Electrodiagnostic studies	7.2% incidence rate of CTS during follow-up period Forceful exertions = those requiring ≥9 N pinch force or ≥45 N of power grip force or a Borg CR-10 ≥ 2 Biomechanical risk factors associated with ↑ risk of developing CTS include time-weighted average peak hand force, forceful hand exertion repetition rate, and % time of forceful hand exertion Total repetition rate, % time any hand exertion, % time finger pinch or power grip, and wrist posture measures were *not* associated with ↑ CTS risk	Measures of exposure of forceful hand exertion were associated with incident CTS after controlling for important covariates ↑ risk of CTS with ↑ forceful hand exertion repetition rate and ↑ time in forceful hand exertion

Authors (Country)	Sample	Study Design	Findings	Conclusions
You et al., 2014 (USA, Netherlands, United Kingdom studies included)[10]	Meta-analysis that identified six cross-sectional and three case-control design studies that relied on self-report or observer's estimates for wrist posture assessment Occupations included ski industry, industrial plant, electronic assembly, pork processing, and grocery store workers	Inclusion: Search terms: work related, carpal tunnel syndrome, wrist posture, and epidemiology Relative risk of individual studies pooled to evaluate overall risk of wrist posture on CTS Exclusion: office workers because of ↑ risk	The pooled RR of work-related CTS ↑ with increasing hours of exposure to wrist deviation or extension or flexion (RR = 2.01 [1.66-2.43])	Prolonged exposure to non-neutral wrist postures is associated with a twofold increased risk for CTS, compared with low hours of exposure to non-neutral wrist postures

Animal Models of Upper Extremity Work-Related Musculoskeletal Disorders

Authors	Model	Tissue and Functional Changes
Food Retrieval Task (retrieval of a small 45-mg food pellet from a tube within a portal located at shoulder height)		
Elliott et al.[50] Barbe et al.[51] Coq et al.[52]	Young adult rats (2.5 mo of age at onset) LRNF food retrieval task up to 12 wk 3.3 reaches/min, <5% of maximum voluntary grasp force	*Median nerve:* ↑ macrophages and TNF-α in week 12; no neural fibrosis *Forearm flexor muscle/tendons:* No changes *Forearm bones:* No changes *Serum:* Low ↑ MIP2 and MIP3 in weeks 6-8, with LRNF < HRNF *Spinal cord:* ↑ substance P in week 8, and NK-1R in weeks 8-12 in cervical spinal cord segments *Behavior:* No changes in reach rate or task duration; 1.6× ↑ in arm movement reversals in week 8; transient ↓ grip strength week 6
Abdelmagid et al.[53] Al-Shatti et al.[54] Barbe et al.[55] Barbe et al.[51] Barr et al.[56] Clark et al.[57] Coq et al.[52,58] Elliott et al.[59]	Young adult rats (2.5 mo of age at onset) High-repetition, negligible-force (HRNF) food retrieval task up to 12 wk 5 reaches/min, <5% of maximum voluntary grasp force	*Median nerve:* Transient ↑ IL-1α, IL-1β, TNF-α, IL-6 in week 5; ↑ macrophages weeks 8-12; fibrosis by week 12 with 9% ↓ NCV *Forearm flexor muscle and tendons:* Low ↑ IL-1α, IL-1β, IL-10, TNF-α in week 8, with HRNF > LRNF *Forearm bones:* Low ↑ osteoclasts in weeks 4-8, adaptation visible by week 12 *Serum:* Low ↑ IL-1α, MIP2, MIP3, and TNF-α in weeks 6-8, with HRNF > LRNF. *Spinal cord and brain:* ↑ substance P and NK-1R in weeks 6-10 in cervical spinal cord segments; degraded sensorimotor cortical maps *Behavior:* Cyclical task duration, % success after week 3; 2× ↑ arm movement reversals in week 8; ↓ grip strength after 4 wk, with HRNF declines > LRNF and < HRHF (see below)
Handle Pulling Task (reach, grasp, and isometric pull on a stationary handle/lever bar)		
Barbe et al.[13]	Young adult rats (2.5 mo of age at onset) LRLF handle pulling task for 12 wk 2 reaches/min, 15% of maximum voluntary grasp force	*Median nerve:* No changes *Forearm flexor muscle and tendons:* ↓ HSP72 in tendon week 12 = adaptation *Forearm bones and cartilage:* No changes *Serum:* No changes *Spinal cord:* No changes in substance P *Behavior:* Slight ↑ mechanosensitivity
Elliott et al.[60] Barbe et al.[13] Kietrys et al.[61]	Young adult rats (2.5 mo of age at onset) LRHF/MRHF handle pulling task for 12 wk 2 reaches/min, 60% of maximum voluntary grasp force	*Median nerve:* ↑ macrophages, neural fibrosis with 15% ↓ NCV by week 12 *Forearm flexor muscle and tendons:* ↑ macrophages weeks 6-12; transient ↑ IL-1β after training only *Forearm bones and cartilage:* ↑ IL-1α, IL-1β, IL-10, TNF-α by week 12 but < HRHF; ↑ osteoclasts and ↑ osteoblasts = no change in bone volume density *Serum:* Transient ↑ TNF-α in week 6; ↑ MIP3a in weeks 6-12 *Spinal cord:* ↑ substance P and NK-1 in weeks 6-12 *Behavior:* ↓ voluntary reach force and reflexive grip strength in weeks 9-12, ↓ task participation by week 12, ↑ mechanosensitivity (allodynia) in weeks 6-12
Barbe et al.[13,62] Gao et al.[63] Kietrys et al.[64] Xin et al.[65]	Young adult rats (2.5 mo at onset) HRLF handle pulling task for up to 24 wk 5 reaches/min, 15% of maximum voluntary grasp force	*Median nerve:* ↑ TNF-α, macrophages, and neural fibrosis in week 12 *Forearm flexor muscle and tendons:* Transient ↑ TNF-α and IL-1β after training, resolution by week 18; ↓ HSP72 by week 12 = adaptation; ↑ TGF- β 1 and CTGF with tissue fibrosis by week 24 *Forearm bones and cartilage:* ↑ osteoblasts and bone volume density = bone adaptation by week 12; no cartilage changes *Serum:* ↑ MIP2 in week 6; cyclical ↑ TNF-α after training and again week 24; ↑ TGF- β1 in week 18 and CTGF in week 24 with tissue fibrosis *Spinal cord:* ↑ substance P by week 12, with HRLF < LRHF and HRHF *Behavior:* ↑ mechanosensitivity (allodynia) in week 12; progressive ↓ grip strength especially after week 21

high mental workload, and fast workplace, increased the odds for developing WRMSDs and severe regional musculoskeletal pain.[17,38,48,49] Individual contributing factors include fear avoidance of physical activity, low educational status, low work experience, and presence of other chronic disease.[38,48,49]

Suggested Workplace Strategies

Future workplace strategies should focus on developing the means to avoid overexposure to risk factors, such as high repetition, high force, and prolonged static postures in non-neutral joint positions. One means might be to incorporate more training and engineering interventions that reduce sustained non-neutral wrist postures.[10] Good general health should also be promoted, because it has been shown to decrease some of these risks,[4] whereas the presence of chronic disease increases the risk of developing musculoskeletal pain as a consequence of work. Findings of several workplace and individual psychosocial risk factors indicated that multi-intervention strategies were required to both prevent and treat WRMSDs.

EVIDENCE-BASED REVIEW OF PATHOPHYSIOLOGY OF ACTIVITY-RELATED NEURAL AND MUSCULOSKELETAL DISORDERS

The Problem

Musculoskeletal disorders related to overuse have been associated with a number of changes in neural, muscular, fascial, tendinous, and bony tissues. The following sections review the processes of inflammation and wound healing and factors that affect those processes. Then, current evidence for neural, muscular, and tendinous pathophysiological changes in the development of overuse injuries is presented, as well as possible mechanisms for those changes. A conceptual model for changes in tissue tolerance, with continued tissue loading, that affect inflammation and healing also is presented. This is followed by recommendations for intervention timing as well as for integrating concepts of wellness, physical activity, nutrition, biomechanics, and neural adaptation for effective management of early MSDs.

Review of Wound Healing and Its Relationship to Overuse Injuries

With repetitive forces over time, injuries develop in the local tissues. *Wound healing* is the process by which tissues attempt to restore normal tissue architecture and function after an injury in an effort to restore homeostasis. A complex series of molecular, vascular, and cellular responses are initiated the moment a tissue is injured. Wound healing involves three distinct phases, which develop in an orderly but overlapping manner: hemostasis/acute inflammation, proliferation/fibroplasia, and remodeling/maturation (Figure 27-1).[84,85]

Unfortunately, many factors affect wound healing. For example, if the injury or initiating stimulus is repetitive or chronic, the tissues have little chance to complete the healing process, and either chronic inflammation or fibrosis can result. In these cases, chronic or cyclic release of a

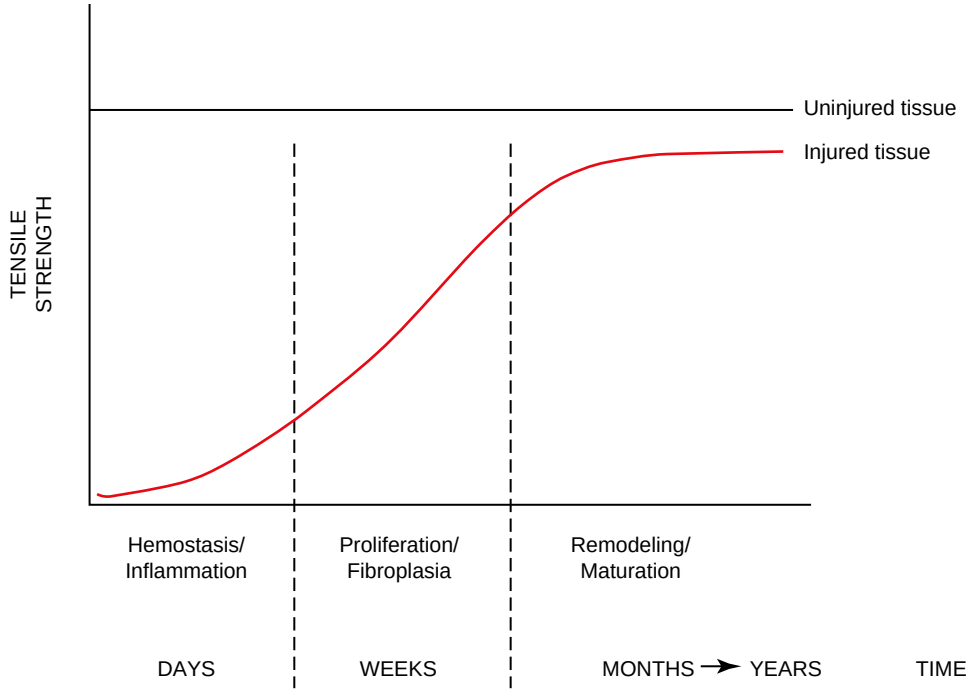

Figure 27-1 Wound healing response in tendons. (From Lin TW, Cardenas L, Soslowsky LJ: Biomechanics of tendon injury and repair, *J Biomech* 37:866, 2004.)

variety of inflammatory or fibrogenic biochemical mediators can perpetuate the inflammatory response or cause excessive proliferation and fibroplasia.[62,63] Some of the inflammatory mediators are cytotoxic at high levels, such as the cytokine tumor necrosis factor-alpha (TNF-α), and can further worsen cellular damage at the injury site. The patient's overall health also must be considered in wound healing. Many metabolic disorders, such as diabetes, can directly affect the success of wound healing, and these disorders therefore must be considered co-morbidities when a treatment plan is designed.[4,48,86]

Acute Inflammatory and Vascular Response

Hemostasis (clotting) and acute inflammation are the tissue's initial responses to acute injury or infection. The hemostasis response causes the wound to be closed by clotting, which occurs through platelet activation. The acute inflammatory response is characterized by infiltration of immune cells and fluid exudate into the affected tissues; it typically lasts 24 to 48 hours and usually is complete in 2 weeks (Figure 27-2). This vascular and immune response is characterized by the cardinal signs of inflammation, which are redness (rubor), swelling (tumor), heat (color), and pain (dolor). The pain (dolor) associated with inflammation usually results from increased pressure on nerves caused by edema. Biochemical mediators, such as histamine, prostaglandin, bradykinin, serotonin, and cytokines (including tumor necrosis factor-alpha [TNF-α] and interleukin-1 [IL-1]), which are released by mast cells, infiltrating immune cells, and injured tissue cells, play crucial roles in the process of vasodilation (Table 27-4; see Figure 27-2).[87–90]

Acute Inflammation

- Vascular reaction
- Cellular reaction (infiltration of platelets, neutrophils, macrophages, and/or lymphocytes)
- Muscle spasm

Cellular Reaction. The migration of cells into the interstitial space is a process called *chemotaxis*. The type of cells that infiltrate depends on the type of stimulus (i.e., injury, infectious, or allergic) and the specific molecules and inflammatory mediators released by the injured cells and tissues. Critical players in this reaction are platelets, mast cells, and leukocytes (including neutrophils and macrophages; see Figure 27-2).

Platelets are anuclear, cytoplasmic fragments derived from megakaryocytes and are the first repair components to appear when a wound is created.[91,92] Their primary function is to initiate the coagulation cascade and form the fibrin plug that fills the tissue gap, a process called *hemostasis*. Platelets release a variety of growth factors and cytokines upon contact with collagen and other extracellular matrix components. For example, they release platelet-derived growth factor (PDGF), which initiates the healing cascade by being chemotactic to neutrophils and monocytes and inducing fibroblast proliferation. Platelets also release transforming growth factor-beta (TGF-β) and proinflammatory cytokines, such as IL-1, IL-6, and TNF-α. These proteins are key mediators of inflammation as well as tissue healing through their ability to induce collagen and fibronectin production by fibroblasts.[91,92]

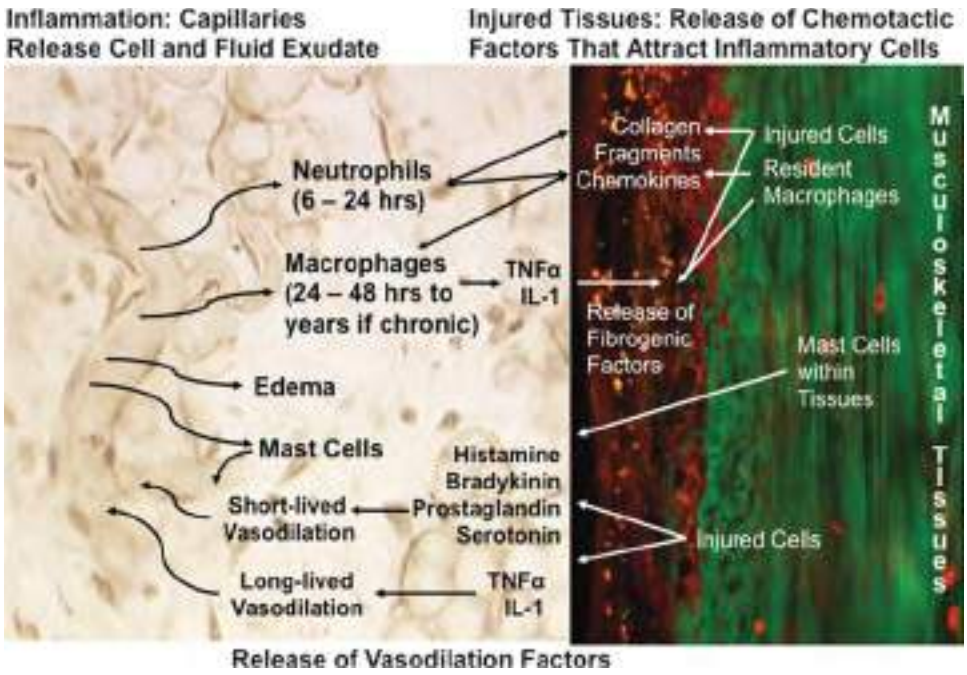

Figure 27-2 Sequence of events in acute inflammation in response to a mechanical injury stimulus. Mechanical injury can damage vascular and musculoskeletal tissues and lead to the mobilization of leukocytes, neutrophils, and macrophages by circulatory distribution and/or by chemotaxis induced by the presence of collagen fragments and other factors at the injury site. Even when the vasculature is spared mechanical injury, the release of inflammatory mediators from tissue mast cells and injured cells release factors (e.g., histamine and bradykinin) that cause vasodilation and leukocyte mobilization. Ideally, acute inflammation resolves, and injured tissue heals either completely or with the formation of a fibrous scar. The latter can occur as a result of release of fibrogenic factors from injured cells, macrophages, or fibroblasts after activation by proinflammatory cytokines, such as tumor necrosis factor-alpha (TNF-α) and interleukin-1 (IL-1). (Modified from Barr AE, Barbe MF: Inflammation reduces physiological tissue tolerance in the development of work-related musculoskeletal disorders, *J Electromyogr Kinesiol* 14:79, 2004.)

TABLE **27-4**

Peptides, Neurotransmitters, and Nerve-Related Proteins Involved in Wound Healing

Analyte	Role in Wound Healing
Bradykinin	An endogenous vasodilator nonapeptide kinin; a very powerful vasodilator that increases capillary permeability; stimulates nociceptors (pain receptors)
Growth-associated protein 43 (GAP43)	High levels in neuronal growth cones during axonal regeneration; a crucial component of an effective peripheral nerve regenerative response
Glutamate	An excitatory neurotransmitter; a key metabolite in cellular metabolism
Kallidin	A decapeptide vasodilator produced by the kallikrein-mediated enzymatic cleavage of kininogen
Nitric oxide (NO)	A free radical; endothelium-derived relaxing factor; an important cellular signaling molecule functioning in vasodilation and neurotransmission
Nerve growth factor receptor P75	Promotes growth cone and neurite formation, elongation, and arborization in regenerating nerve axons
Neuropeptide Y (NPY)	Released from nerves; plays a role in controlling vascular tone, more specifically for thermoregulation
Serotonin (5-HT)	A monoamine neurotransmitter; biochemically derived from tryptophan; a key mediator in the physiology of vascular function, as well as mood
Substance P	Upregulates endothelial cell receptors that promote leukocyte adhesion and migration; chemotactic for neutrophils and macrophages; fibrogenic properties, specifically stimulates the production of collagen by fibroblasts and tenocytes

Neutrophils are the first leukocytes to be chemotactically drawn to the wound site.[84] They typically appear within 1 hour after the wound occurs and peak between 24 and 48 hours after an injury. Neutrophil infiltration can be associated with secondary tissue damage in overloaded muscles because neutrophils release lytic enzymes and produce superoxide free radicals.[93,94] These free radicals, which are antimicrobial, break down injured cells and tissues by disrupting cell membranes, denaturing proteins, and disrupting cell chromosomes. Although neutrophils are short lived, they produce proteinases for debridement and proinflammatory cytokines (e.g., TNF-α) that perpetuate the inflammatory response by attracting macrophages.

In contrast to neutrophils, macrophages are a heterogeneous group of long-lived cells with a myriad of functions.[84,95] Macrophages derive from circulating monocytes, which convert into ameboid, phagocytic cells known as *macrophages* as they invade injured cells and tissues. These cells are voraciously phagocytic and can live for months or years migrating into and out of tissues. They break down necrosed muscle, dead neutrophils, and cell debris through the release of proteolytic enzymes (e.g., collagenase and elastase). Type 1 macrophages (M1) release numerous potentially cytotoxic compounds, including reactive oxygen species and nitric oxide (NO) that can contribute directly to further tissue injury (i.e., secondary tissue injury).[95] Furthermore, activated macrophages secrete proinflammatory cytokines, which act as key mediators of inflammation. In contrast, type 2 macrophages (M2) perform wound-healing functions through their secretion of growth factors (e.g., TGF-β) that stimulate the proliferation of many cell types, leading to tissue repair and healing.[84,95,96] M2 macrophages also secrete anti-inflammatory cytokines (e.g., IL-10) that downregulate the production of proinflammatory mediators and thus promotion of wound healing.[95]

Restorative Repair versus Chronic Inflammation and Fibrosis

Healing and Repair. The process of wound healing is an effort to restore normal tissue function and architecture after injury. Essentially, three primary outcomes are possible with tissue injury: (1) complete resolution with total restoration of normal tissue structure; (2) repair with scar formation of varying degrees, depending on the level of injury; and (3) chronic inflammation. *Complete restoration* is the regeneration or re-creation of the tissue to a state in which it may even be in a better form or condition than before the injury. *Repair* is the process of mending tissue after decay or damage. The mended area may not be complete but may consist of a collagenous scar that fills the damaged tissue region. Substantial tissue injury may also occur in tissues after prolonged edema. The edematous tissue, injury site, or tissue gap then fills with exudate, immune cells, and fibroblasts before converting to fibrotic connective tissue, which is later remodeled, albeit slowly.[84,97] In the case of tendons, a fibrotic scar often fills the tissue gap.[98–100] Although remodeling of the scar area occurs, tendons may never return to normal structural or biomechanical properties, even after long periods of recovery.[84,100]

Phases of Wound Healing

Repair Phase

- Infiltration of immune cells to clear debris
- Fibroplasia (increased fibroblast proliferation and matrix production)
- Angiogenesis (increased migration and proliferation of endothelial cells)
- Reepithelialization of skin or mucous membrane
- Scar formation

Remodeling Phase

- Remodeling and maturation of tissue toward normal, preinjury structure
  - Collagen conversion: type III (first to be deposited) converted to type I
  - Realignment of fibroblasts in wound
  - Increased mobility of collagen

The repair phase begins once the wound site has been cleared of debris, a process that should occur during the acute inflammatory phase of wound healing (Figure 27-3). The repair phase consists of a proliferation/fibroplasia phase and a remodeling/maturation phase (see Figure 27-1). The proliferative phase is characterized by the migration of fibroblasts into the injury site, which proliferate to fill in the wound site. This phase is also called the granulation tissue formation phase, because microscopically the wound site appears to be filled with many small immune cells and proliferating fibroblasts. The primary function of fibroblasts is to produce new intracellular and extracellular matrix, such as collagen type III.

The remodeling/maturation phase of repair and healing is characterized by collagen conversion, wound contraction, and scar formation.[84] Collagen type III gradually converts to collagen type I, the collagen becomes cross-linked, and fibroblasts realign along the axis of force through the tissue.[84,97] Unfortunately, some tissues, such as tendons, may not recover fully to their original structure and strength because of poor vascularization, insufficient recovery in the damage site (see Figure 27-3), persistent inflammation, or excessive fibrosis/scar formation.

Chronic Inflammation and Fibrosis. Instead of resolving, an acute inflammatory response may be prolonged chronically. Chronic inflammation can be considered an interruption of the normal healing progression and can last for months or years. It is associated with certain conditions that prolong the inflammatory response because of chronic exposure to the initiating stimulus, insufficient repair (see Figure 27-3) or because of a smoldering subacute inflammation or infection. Chronic inflammation

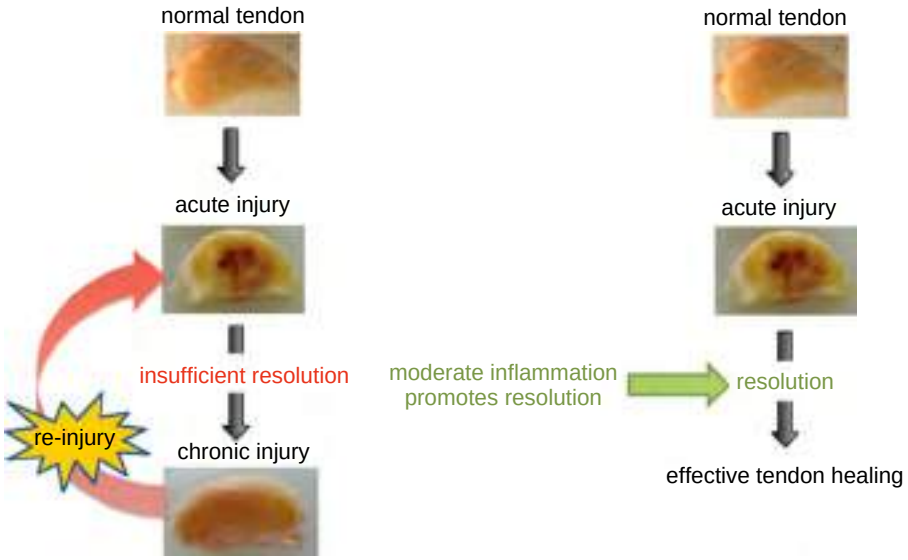

Figure 27-3 Tendon injury schematic to propose the relationship between inflammation and resolution in the development of tendon injury. **A**, In early-stage injury, inflammation triggers a tendon resolution response, which appears to be transient and reduces with age and time after injury. During the later stages of healing (i.e., chronic injury), it is proposed that insufficient or dysregulated resolution allows low-level inflammation to persist, increasing the propensity for fibrotic healing and reinjury. **B**, To improve the healing response of tendons, a potential therapeutic strategy is to moderate inflammation while simultaneously enhancing the tendon's resolution response. (From Dakin SG, Dudhia J, Smith RK: Resolving an inflammatory concept: the importance of inflammation and resolution in tendinopathy, *Vet Immunol Immunopathol* 158:121-127, 2014.)

is characterized by the prolonged presence of large numbers of mast cells and macrophages in and around the tissues, which contribute to secondary tissue damage through their prolonged phagocytic activity and release of cytotoxic free radicals (see Figure 27-2). Chronic production of inflammatory mediators, such as IL-1 and TNF-α, by macrophages or cells that are injured, irritated, or apoptotic can perpetuate the inflammatory cycle, because these molecules are chemotactic for additional immune cells. Some cytokines released by injured cells and macrophages are fibrogenic mediators, such as connective tissue growth factor (CTGF) and TGF-β. As shown in Figure 27-2, overproduction or chronic production of fibrogenic mediators can lead to excessive fibroblast proliferation and matrix deposition at the wound site, a process called *fibrosis*.[13,62,63,101–104] Several studies support the hypothesis that chronic inflammation generally precedes fibrosis.[62,63] These inflammatory and fibrogenic mediators can enter the bloodstream, circulate, and stimulate systemic inflammatory effects, widespread secondary tissue damage, and widespread fibrosis in healthy tissues.[13,62,63]

Chronic Inflammation

- Perpetuation of inflammatory response
  - Continued presence and activity of macrophages in wound site
  - Continued production of inflammatory mediators by cells in wound site
- Fibrosis
- Either or both of these two components may become widespread or systemic

Factors That Affect Wound Healing. Many diverse factors affect wound healing, including ischemia, scar formation, malnutrition, infection, and stress. Circulating cytokines (discussed previously) can induce bone formation, degradation of cartilage and other connective tissues, and recruitment of leukocytes into widespread tissues areas. As mentioned earlier, invading neutrophils and macrophages lead to secondary tissue damage through phagocytosis, free radical damage, and tissue and protein catabolism. These cells often invade not only the injury site but also nearby healthy tissue and degrade that tissue as well. The overall health of the tissues and of the individual are also key factors in the end success of wound healing.[86]

Other factors in the success of wound healing are neurogenic in origin and arise from a family of biochemical mediators known as *neuropeptides*. Neuropeptides are secreted by autonomic efferent, nociceptive afferent fibers and perivascular terminals of noradrenergic and cholinergic fibers. They have been shown to play a role in all phases of the healing response. Table 27-4 summarizes the primary effects of several neuropeptides as well as several nerve growth factors involved in during wound healing.

Changes in Tissue Tolerance with Continued Tissue Loading

Overexertion is an initiating and a propagating injury stimulus in WRMSDs and overuse injuries. The authors have speculated that the mechanisms leading to tissue repair are prevented by the continued cycle of tissue trauma in repetitive motion injury.[13,105,106] Although cumulative loading of viscoelastic tissues in the short term may increase the likelihood that applied loads will result

in tissue injury, it becomes an overexertion event that initiates a cyclical and perhaps persistent inflammatory response. Phagocytic cell infiltration, an increase in the number of free radicals, and induction of inflammatory cytokines by persistent injury and inflammation can lead to tissue degeneration, such as tissue necrosis, pathological tissue reorganization, and subsequent biomechanical failure. Repeated bouts of injury, inflammation, and fibrosis eventually contribute to decreasing tissue tolerance over time, such that lower levels of exertion lead to tissue damage, which further reduces tissue tolerance and functional performance. Figure 27-4 presents a schematic of this dose-dependent decline in tissue tolerance and functional declines. Figure 27-5 shows how these combined tissue responses can combine into a vicious cycle.

Such decreasing tissue tolerance may explain why analyses of human tissue that is collected at the time of surgical repair, such as the flexor tendon synovium in CTS and the extensor carpi radialis brevis tendon in lateral epicondylitis, do not reveal acute inflammatory indicators but instead show tissue degeneration, fibrosis, and/or necrosis.[90,101,102,107–109] The authors postulate that the time of surgery for sensorimotor dysfunction is long after the acute inflammation has resolved.

The authors agree that designating soft tissue injuries as noninflammatory provides important information to clinicians trying to find effective treatments for patients seen late in the process of injury. However, some clinicians disagree that the early pathomechanical initiator of these conditions is noninflammatory. The mere presence of fibrotic tissues and anti-inflammatory mediators in the tissues of patients with overuse injuries strongly suggests earlier proinflammatory episodes. What is clear is that full restorative repair can be complicated, as can best time points in which to intervene (see Figure 27-5). Healthy nutrition, good hydration to improve oxygen delivery, progressive physical activities to accommodate anatomic impairments, manual techniques to release scar tissue, posture and strengthening exercise to improve alignment with gravity, and sensory and motor retraining may be needed to restore maximum function.

Evidence of Peripheral and Central Neural Changes in the Development of Overuse Injuries

Nerve damage can be caused in numerous ways. Typical modes of injury include compression, overstretching, contusion, and frank tears. Compression and overstretching are the most common types of nerve damage associated with repetitive motion.[57,60,66,67,110–113] However, several other modes of nerve injury are not exclusive to overuse injuries; these include crush, immunological causes

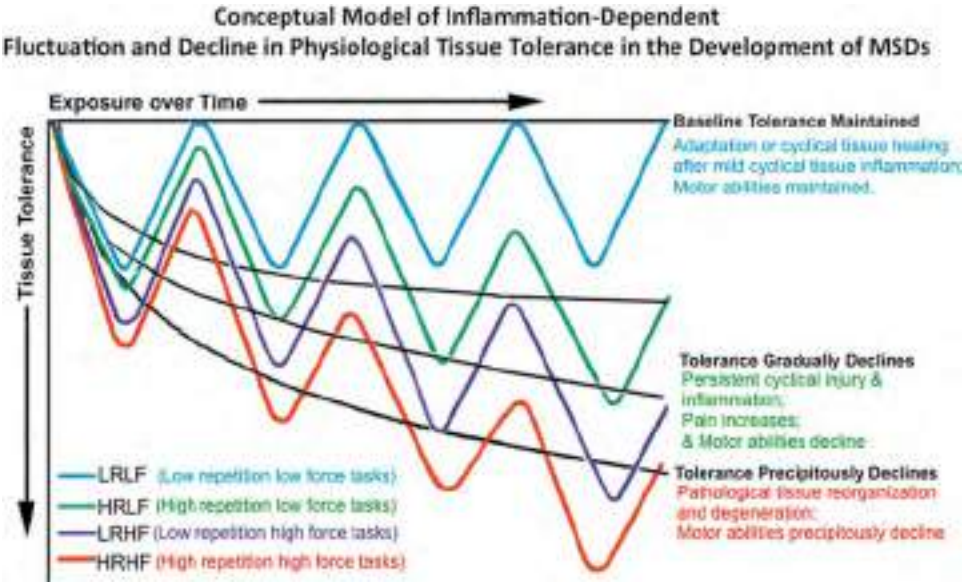

Figure 27-4 Conceptual model of the hypothesized long-term effects of repeated tissue inflammation on tissue tolerance and underlying mechanisms of tissue responses. This model is consistent with the overexertion theory of the development of work-related musculoskeletal disorders. If tissue exposure levels stay below a critical threshold, inflammation either does not occur or resolves (indicated by the episodic fluctuations of tissue tolerance) and adaptive remodeling to the task occurs (indicated by the return to baseline tissue tolerance of the upper low-repetition, low-force [LRLF] curve between the inflammatory episodes). When tissue exposure exceeds a critical threshold, incomplete healing results (indicated by the lower three lines). Exposure-dependent declines in tissue tolerance lead to persistent injury and inflammation, followed by tissue disorganization, degeneration, or cell death. Depending on the degree of exertion, this decline in tissue tolerance may be gradual (as in the high-repetition, low-force [HRLF] group) or precipitous (as in the high-repetition, high-force [HRHF] group). In addition to the overall decline in tissue tolerance, inflammatory episodes result in transient periods of even lower tissue tolerance, resulting in the fluctuations in tissue tolerance shown. Modification of the tissue exposure level during these transient tissue tolerance episodes may have an important impact on the maximization of tissue tolerance. Furthermore, motor function declines with increasing task demands. (Modified from Barr AE, Barbe MF: Inflammation reduces physiological tissue tolerance in the development of work-related musculoskeletal disorders, *J Electromyogr Kinesiol* 14:83, 2004.)

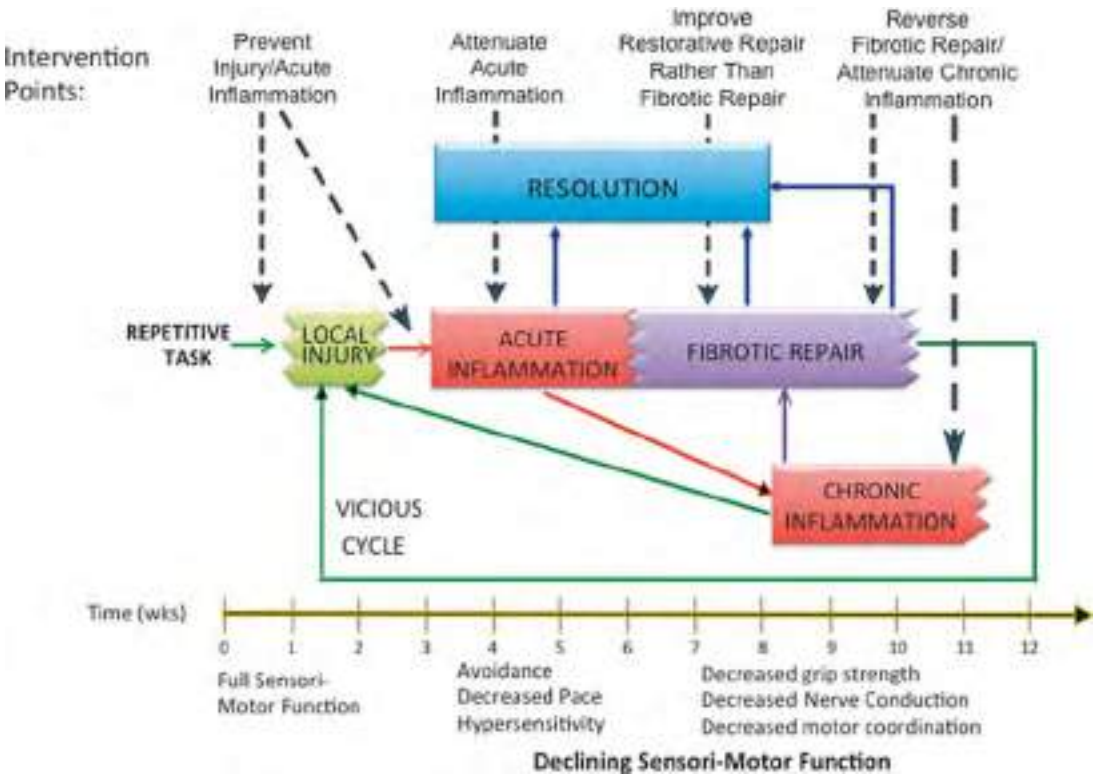

Figure 27-5 Steps in the inflammation-mediated development of work-related musculoskeletal disorders. The timeline at the bottom of the figure relates these inflammatory events to observations of behavioral indicators in a rat model. The three possible exposure-dependent outcomes in this schematic are indicated as follows: (1) acute inflammation followed by resolution and restoration of normal tissue; (2) acute inflammation, which may resolve or may lead to fibrotic repair; and (3) acute inflammation followed by chronic systemic inflammation, with or without fibrotic repair, and initiation of a vicious cycle of further injury and inflammation. At the very bottom of the figure, the physical sign (sensory and/or motor behavior degradation) that reflects underlying pathophysiology is indicated. (Modified from Barr AE, Barbe MF: Inflammation reduces physiological tissue tolerance in the development of work-related musculoskeletal disorders, *J Electromyogr Kinesiol* 14:82, 2004.)

(creating a chronic autoimmune response in the nerve), chronic constriction injury, and vascular disease.[111] Each of these types of injuries can be a compounding factor in a patient with overuse injuries.[39,110–112,114,115]

Clinical, Histological, and Biochemical Signs of Nerve Injury

Clinical signs of nerve damage include acute pain, chronic pain, loss of sensation and discrimination, declines in nerve conduction velocity (NCV), and motor dysfunction. Examples of motor dysfunction include weakness, atrophy, and paralysis of a muscle. Abnormal sensations, such as hyperalgesia (hypersensitivity) and mechanical allodynia (non-noxious pain), may also develop.

Clinical Signs of Nerve Damage

- Acute pain
- Chronic pain state
- Loss of sensation and discrimination
- Reduced nerve conduction velocity
- Numbness and tingling
- Motor dysfunction (weakness, atrophy, or paralysis)

Mechanical disruption of axons and myelin leads to histological signs of nerve damage, such as myelin degradation, Schwann cell necrosis, and axon degeneration. Macrophage infiltration also occurs as a result of disruption of the blood–nerve barrier or injury-induced chemotaxis, or both. The macrophages then add to the loss of Schwann cells and axons by phagocytosing even partly injured cells in an effort to debride the injury site and stimulate repair. Each of these histological changes contributes to the decline in nerve conduction by disrupting the flow of current that would occur after loss of the Schwann cell's myelin sheath or by interfering with axoplasmic flow that would occur after disruption of the axons. Nerve compression, edema, and chronic inflammation also lead to the development of fibrotic tissue in extraneural and intraneural tissues,[57,60,66,67,110] which further contributes to nerve compression if the fibrosed area lies within a constrained space, such as the carpal tunnel.

Biochemical signs of peripheral nerve damage include increased production and release of a variety of mediators of pain, inflammation, and vasodilation by Schwann cells, infiltrating macrophages and mast cells, and the nerve terminal itself.[54,116–119] IL-1, TNF-α, and IL-6 are increased after nerve injury and contribute to further inflammation

by recruiting macrophages intraneurally. These same cytokines can enhance pain by sensitizing nociceptors through the activation of the neuron or by lowering the threshold for firing in the larger nerve trunk or surrounding tissues. Increased intraneural levels of cytokines also contribute to hyperalgesia and mechanical allodynia.[60] Schwann cells also produce bradykinin, which results in vasodilation, and the nerve terminals produce substance P, vasoactive intestinal peptide (VIP), and calcitonin gene-reactive protein (CGRP), which contribute to immune cell infiltration of intraneural and other tissues and further sensitization of the nociceptors.[13,50,60,120–124]

Peripheral Nerve Trauma Associated with Repetitive Tasks

In WRMSDs, the primary causes of peripheral nerve trauma are overstretching, increased intracarpal pressure with compression of nerves during flexion or extension or fingertip loading, and overstretching of neuronal tissues during excursion.[5,10,57,60,66,67,110–113,125,126]

The authors' laboratory has investigated the pathophysiology of repetitive motion injuries of the upper limb caused by voluntary high-repetition tasks with or without force using an innovative, operant, rat model of voluntary repetitive and forceful reaching and grasping in order to answer fundamental questions about the effects of such tasks on musculoskeletal tissues. A force training apparatus was designed in which rats can perform at a range of reach rates and force levels. This model has been used to determine the effects on sensorimotor behavior and the pathophysiological outcomes of forelimb tissues that occurred in rats performing tasks at variable force and repetition rates. Some tasks were voluntary low or negligible force tasks (<5%-15% of maximum grip strength) performed at low frequency reach rates (low repetition low force [LRLF] or low repetition negligible force [LRNF]; 2 reaches/min). Others were voluntary low or negligible force tasks performed at high frequency reach rates (high repetitions low force [HRLF] or high repetition negligible force [HRNF]; 8 reaches/min). The remaining two tasks were high force tasks (60% of maximum grip strength) that were performed at either low reach rates (low repetition high force [LRHF]) or high reach rates (high repetition high force [HRHF]). The specific details of these tasks are described and depicted in Barbe et al.[13]

Using this model, the authors examined the median nerve for decreased NCV, a common test used in humans to identify nerve injury. By 10 weeks of an HRNF task, a 9% decrease was seen in NCV, which showed that nerve injury accumulated and led to a clinically relevant loss of function.[57] The decrease in the NCV was even greater (15%) in rats performing the LRHF task for 12 weeks,[60] and was 16% in rats performing the HRHF task for 12 weeks,[13,70] supportive of an exposure response relationship between task exposure level and loss of nerve function. These declines are comparable to the criteria for abnormal median nerve conduction (equivalent to 9% and 24% slowing of NCV) in human studies[127] and a study in primates by Sommerich et al.[80] (see Table 27-3). Additional findings in the rat overuse injury model included increased myelin degradation and perineural fibrosis in the median nerve after the performance of the HRLF, LRHF, or HRHF tasks for 9 to 12 weeks, but not after performance of the LRNF or LRLF tasks.[13,50,57,60,67,70] Such maladaptive fibrosis in the connective tissue "container" surrounding nerves is thought to be one cause of reduced nerve function,[116,128] as well as reduced physical strength in affected tissues, such as reduced grip strength if forearm muscles and tendons have undergone fibrosis.[63,129] Last, increased M1-type macrophages and proinflammatory cytokines (IL-1α, IL-1β, TNF-α, and IL-6) in the median nerve were observed with repetitive task performance.[54,60,66] These changes are indicative of a nerve inflammatory process, termed *neuritis*,[116,130] which is often associated with increased pain behaviors. These findings and others are summarized in Table 27-3.

Central Nervous System Neuroplasticity Associated with Chronic Pain and Inflammation

Neuroplasticity is a persistent anatomical change occurring in a neuron, recruitment of different neurons, recruitment of new synaptic connections, or development of new neurons (e.g., neurogenesis in the hippocampus) as a result of repeated activity across neural connections. It occurs during development, during regeneration, and within the mature nervous system. Neuroplasticity can occur at any level of the peripheral and central nervous systems, including the spinal cord. Several mechanisms are possible for neuroplasticity. Two of these mechanisms are summarized in Figure 27-6.[131] The different mechanisms increase the efficacy of a synapse, unmask or enhance previously ineffective sites, produce changes in neuronal morphology, prune unused neuronal processes, or create electrophysiological changes in the neuron.

Peripheral nerve injury results in an increased release of excitatory neurotransmitters and neuropeptides (e.g., substance P, glutamate, and CGRP) both peripherally from nociceptor terminals and centrally in a dorsal spinal nerve root or in the dorsal nucleus at the level of the medulla.[132–137] The central release activates postsynaptic receptors for these neurotransmitters, which trigger the release of protein kinases, NO, or both (see Figure 27-6). The molecules then activate intracellular cascades in the postsynaptic neuron. Chronic or repetitive activation of these cascades results in the upregulation of genes, leading to increased production of neuropeptides, hormones, and enzymes, as well as additional receptors. If additional receptors for neurotransmitters/neuropeptides are inserted into the postsynaptic cell membrane, the postsynaptic neuron's ability to bind these molecules is enhanced, which creates a hyperexcitable neuron. Also, as shown in Figure 27-6, NO is a retrograde messenger that can cross cell membranes to the presynaptic cell. It can increase the release of neurotransmitters from

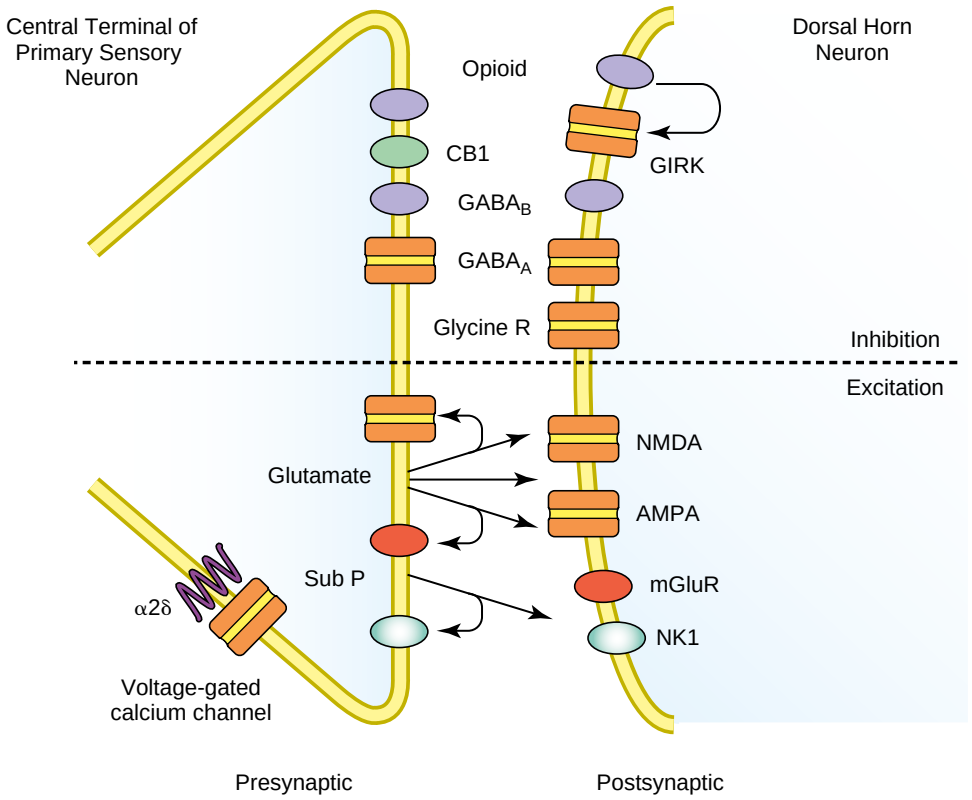

Figure 27-6 Transmission between primary sensory and dorsal horn neurons in the spinal cord is subject to several presynaptic and postsynaptic excitatory and inhibitory influences. *CB1*, cannabinoid receptor type 1; *GABA*, gamma-aminobutyric acid; *Glycine R*, Glycine receptor; *Sub P*, substance P; *GIRK*, G protein-coupled inwardly rectifying potassium channels; *NMDA*, N-methyl-D-aspartate receptor; *AMPA*, α-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid receptor; *mGluR*, metabotropic glutamate receptor; *NK1*, neurokinin receptor 1; *α2δ*, alpha2delta channel. (Modified from Siegel GJ, Albers RW, Brady ST, Price DL: *Basic neurochemistry: molecular, cellular and medical aspects*, ed 7, p 932, Amsterdam, 2006, Elsevier.)

the presynaptic neuron, which can also lead to hyperexcitability of this synapse.

Chronic pain appears to change the efficacy of a synapse by increasing the release of neuromodulators or neurotransmitters from nociceptor terminals or by increasing the number of synaptic vesicles in the nociceptor terminal.[134,138] Chronic pain also has been reported to alter the enzymatic degradation or reuptake of the neurotransmitter or increase the insertion of receptors into the postsynaptic membrane. Nociceptor hyperexcitability, therefore, may play a role in the pathogenesis of abnormal sensations after peripheral nerve injury. The clinical significance of such neuroplasticity is hyperalgesia, hypersensitivity, and sensory dysfunction.

Abnormal Pain Characteristics

- *Allodynia:* Pain is induced by a normally non-noxious stimulus.
- *Hyperalgesia:* A painful stimulus evokes pain of a greater than normal intensity.
- *Chronic pain:* Pain is of long duration; decreased nociceptor threshold (hyperalgesia).
- *Hypersensitivity:* The autonomic nervous system is operating in a "fight or flight" mode; sensory receptors and nociceptors are overly excitable.

Hypersensitivity and Spinal Cord Neuroplasticity Associated with Repetitive Tasks

The previously discussed studies prompted us to use our model to test sensory function (see Table 27-3). This was done by observing paw withdrawal in response to palmar stimulation using graded von Frey monofilaments. Von Frey monofilaments are calibrated fibers used to test mechanical sensitivity with the application of stimulation to the plantar aspect of the paws. A positive response is defined as immediate withdrawal of the paw from the stimulus and frequently includes licking or shaking of the paw. We observed an exposure–response decrease in the paw withdrawal threshold at 12 weeks in the HRLF, LRHF, and HRHF groups, a change indicative of mechanical allodynia (hypersensitivity to touch).[13,60] Aged HRLF rats showed even greater levels of mechanical allodynia, supporting the contribution of aging to increased regional pain symptoms.[66] The time frame for development of the pain behaviors as well as other behavioral changes, such as motor declines, is indicated in Figure 27-5.

The authors also examined the spinal cord for changes in response to peripheral inflammation induced by each of the four task groups. Dorsal horns in cervical spinal cord segments showed increased substance P and its receptor, neurokinin-1 receptor (NK-1R), as well as increased

inflammatory cytokine expression (IL-1β and TNF-α) after 12 weeks of performance of the HRLF, LRHF, or HRHF tasks.[13,50,59,60] The HRHF task induced the highest expression of each substance, showing an exposure-dependent spinal cord response. Evidence for involvement of the spinal cord in the pathology associated with peripheral nerve compression injuries and pain has been demonstrated previously.[123,139] Substance P and inflammatory cytokines play central roles in nociceptor signaling in the spinal cord and in central sensitization changes that are associated with pain behaviors.[123,139] Thus, although the spinal cord is not undergoing direct task-induced injury in this model, these findings indicate that repetitive forceful tasks can induce central neural responses associated with pain behaviors.

Peripheral neuroplasticity also has been observed in conjunction with overuse injuries. Increased innervation and increased levels of neurochemicals (e.g., substance P, glutamate, NK-1R, and CGRP) have been observed in patients with chronic tendinopathy in forearm tendons, as summarized in Table 27-5.[87,140–143] Similarly, using the rat model, we found increased levels of substance P in flexor forelimb tendons by 3 weeks in the HRHF rats, with additional increases by 12 weeks, changes that correlated with sensorimotor declines in the forearm (see Table 27-3).[69] These human and animal findings suggest that increased neuronal innervation, as well as increased release of neurochemicals from activated nociceptor terminals into peripheral tendon tissues, is linked to painful tendinopathies. These data combined suggest that central and peripheral neuroplasticity may be an underlying cause of some of the motor changes observed in patients with painful tendinopathies.

Evidence of Musculoskeletal Injury and Inflammation in the Development of Overuse Injuries

Musculoskeletal injuries caused by repetitive and/or forceful tasks are the result of repeated overstretching, overloading, deformation, compression, friction, or ischemia.[113,152–154] As forces and consequent stress on affected tissues increase, tissues may be deformed enough to reach their "elastic" limit, where the material may start to exhibit an inability to return to its original configuration. This would, at some point, be likely to produce muscle or tendon microtears or disruption,[155–157] mechanical injury of membranes and intracellular structures, bone microscopic damage (e.g., increased resorption spaces and microcracks, which are small linear or elliptical cracks between osteons[158–160]; cartilage tidemark changes, microcracks and subchondral resorptive lesions[161–163]), or diffuse tissue damage when tissues are exposed to additional high-force loading cycles.[3,13] The

ECRB, Extensor carpi radialis brevis; *CTS,* carpal tunnel syndrome; *PGE_2,* prostaglandin E_2; *IL-6,* interlukin-6, both a proinflammatory and an anti-inflammatory cytokine; *VEGF,* vascular endothelial growth factor; *MMP-2,* matrix metalloproteinase, a collagenase; *CGRP,* calcitonin gene-reactive protein; *NADH,* nicotine-adenine-dinucleotide reductase; *Pi,* inorganic phosphate, a byproduct of adenosine 5′-triphosphate hydrolysis, released during muscle contraction crossbridge cycle, accumulation during exercise causes a decrement in force production capability; *WRMSDs,* work-related musculoskeletal disorders; *IL-1,* interleukin 1, a proinflammatory cytokine; *TNF-α,* tumor necrosis factor-alpha, a proinflammatory cytokine; *CRP,* C-reactive protein, a nonspecific inflammatory marker; *HAVS,* hand arm vibration syndrome; *sICAM-1,* soluble intercellular adhesion molecule-1; *IL-18,* interlukin-18, also known as interferon-gamma inducing factor, produced by macrophages and other cells; *PMN,* polymorphonuclear cells; *sIL-1RII,* soluble intercellular adhesion molecule 1, facilitates leukocyte adhesion and migration across endothelium and therefore is a biomarker of inflammation; *HDL,* high-density lipoprotein.

*Visfatin is an adipocytokine produced predominantly by human visceral adipose tissue that exerts insulin-mimetic actions through insulin receptors.

authors hypothesize that these injuries first lead to acute inflammatory responses (Figure 27-7). If injury and acute inflammation occur repeatedly, as might be the case with a moderate- to high-demand repetitive task in which the injury cycle overshoots healing, then chronic inflammation, fibrosis, and perhaps even tissue breakdown (disorganization and degeneration) result.

Animal Studies

A number of animal studies have related exercise loading of tendons to early inflammatory changes, as summarized in Table 27-3. In the authors' model of upper extremity overuse injuries in the rat, adaptive-type changes were observed in flexor digitorum muscles and tendons of 12-week HRLF and LRLF rats. These changes included resolution of the inflammatory response and decreased expression of a stress protein, heat shock protein 72 (HSP72).[13,50,64,69] These findings match those from chronic stretch-shortening contractions studies, in which skeletal muscle adaptation can occur if the muscle is able to compensate to the increased demands of an activity.[164–166] In the distal radius and ulna of the reach limbs, signs of bone formation (including increased osteoblasts and radial trabecular bone volume) were observed in 12-week HRLF and LRHF rats.[13] These findings suggest that the bones were adapting positively to the prolonged loading at LRHF and HRLF levels. These results match findings from other laboratories using involuntary animal loading models showing that bone loaded below the fatigue threshold underwent bone formation.[167–169] These musculoskeletal findings combined suggest that prolonged activity at low-force parameters activates a variety of metabolic and adaptive changes that allow tissues to handle the potentially damaging changes occurring with the tasks more efficiently.

In contrast, continued performance of the HRHF task, and partially the HRLF task, negatively affected flexor digitorum muscles and tendons (see Table 27-3). The greatest inflammatory responses, highest levels of a cell/tissue stress protein (HSP72), and muscle and tendon microdamage were observed in 12-week HRHF rats.[13,60,69] The persistent increases of inflammatory cytokines and macrophages indicate that these tissues were unable to accommodate to this task.[153,170,171] The increased HSP72 in muscles and tendons is consistent with recent findings in

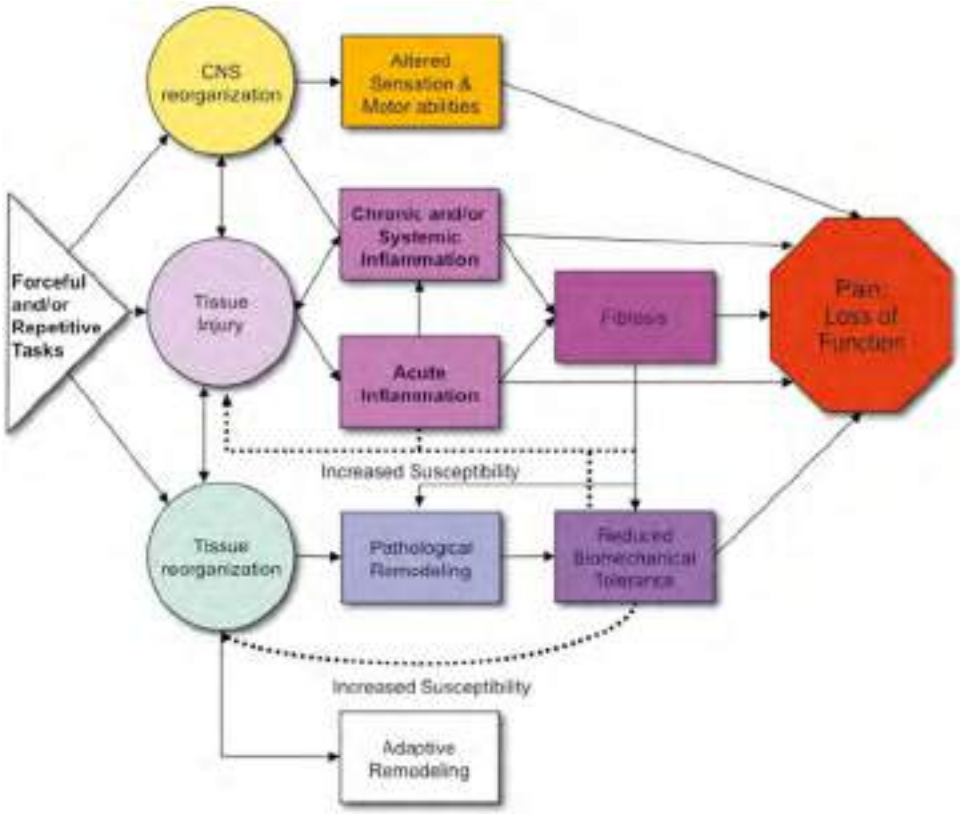

Figure 27-7 Schematic diagram showing three primary pathways hypothesized to lead to work-related musculoskeletal disorders (or adaptive remodeling) caused by repetitive and/or forceful hand-intensive tasks. Interrelationships between components of these pathways are indicated, which illustrates the pathomechanical complexity that may contribute to pain and loss of function. (Modified from Barbe MF, Barr AE: Inflammation and the pathophysiology of work-related musculoskeletal disorders, *Brain Behav Immun* 20:423-429, 2006.)

human subjects by Sjogaard et al.[172] showing that repetitive stressful work increased inducible HSP72 in muscles. Increased fibrogenic proteins (e.g., TGF-β1 and CTGF) and histopathological evidence of fibrosis were also significant in forearm muscles and tendons of 12-week HRHF rats.[53,67,69,71] Fibrogenic changes were prevented in this model if treated early in their development with anti-inflammatory drugs,[53] showing that earlier inflammatory processes are contributing to later developing fibrotic responses. These findings combined indicate that tissue adaptation processes were not keeping pace with tissue injury. Furthermore, fibrotic tissue changes, evident as increased collagen matrix (also known as fascia) within and surrounding muscles, tendons and nerves,[60,66,67,69,71] may distort dynamic biomechanical properties and increase tissue strain even further as a result of adherence to adjacent structures, as postulated by Driscoll and Blyum.[129]

Continued performance of the HRHF task for 12 weeks also negatively affected forearm bones. Increased inflammatory cytokines, increased osteoclasts, decreased trabecular bone volume, thinning of the cortex (i.e., the outer shell) of the bone in the mid-diaphyseal region, and articular cartilage damage was observed in 12-week HRHF rats (see Table 27-3). These changes were indicative of bone and cartilage catabolism and damage as a consequence of this high-demand task. Bone responds to loading along a continuum ranging from anabolism to catabolism, depending on the magnitude, frequency, and duration of loading.[173–178] Repetitive loading conditions, such as in studies of rats running on treadmills, performing repetitive jumping, and repetitively reaching at high-force loads, also showed that increasing the intensity of weight-bearing or muscle-loading exercise/activities might be associated with diminishing returns in bone morphology, such as declines in bone volume and quality.[72,176,179,180]

Results of other animal models of upper extremity MSDs are also presented in Table 27-3, with similar outcomes. For example, Nakama et al.[83,103,181] found evidence of tendon injury after cyclical loading of the flexor digitorum muscle for 13 weeks at a repetition rate of 2 hours per day, 3 days per week. They observed microscopic microtears in the tendons at their epicondylar attachment to the humerus and increased fibrogenic proteins in the tendon, indicative of repetitive strain–induced tendinopathy.[83,103,181] Carpenter et al.[81] and Soslowsky et al.[82] developed a rat model of running-induced rotator cuff tendinopathy. They found evidence of inflammation and fibrosis (i.e., hypercellularity and tendon thickening) after 4 weeks of running. These tissue changes persisted through 16 weeks. They also found that biomechanical tissue tolerance decreased in the tendons of experimental animals compared with controls.

Human Findings

Human studies examining tendons and tenosynovial biopsies from patients with chronic tendinopathies (e.g., epicondylitis, epicondylalgia, tendinosis, CTS) found evidence of increased levels of injury markers, neurochemicals, inflammatory mediators, angiogenic growth factors, fiber and matrix disorganization, fibrogenic proteins, and fibrosis (see Table 27-5).[87,90,101,109,140,141,143–145,182–184] Furthermore, a study by Hirata et al.[109] showed that the levels of metalloproteinases (MMPs), which are enzymes involved in collagen degradation, correlated with pain severity with tendon synovial fibrosis increasing over time in these patients. It should be noted that not all of the tendon studies in Table 27-5 found each of these tissue changes. Because only a limited amount of tissue could be collected during a biopsy, the number of questions that could be pursued was limited in human studies. Even so, these studies showed that repetitive tasks often lead to fibrotic and degenerative tendon changes and that these changes often are accompanied by localized increases in neurochemicals and their receptors, as well as pain.

Studies also have been performed on muscle tissue biopsied from patients with long-term chronic overuse syndromes (see examples in Table 27-5). These studies showed evidence of muscle tissue changes, including both myopathic changes such as inflammation, muscle fiber necrosis, and cell metabolic changes consistent with injury, denervation, and/or ischemic loss of muscle fibers.[87,185–189] Moreno-Torres et al.[146] examined volunteer instrumentalists with nonspecific pain in finger extensor musculature and observed increased acidic inorganic phosphate biochemical spectral peaks using phosphorous magnetic resonance spectroscopy (P-MRS) in hand extrinsic extensor muscles in instrumentalists with pain versus controls. This is interesting because inorganic phosphate is a byproduct of adenosine 5′-triphosphate hydrolysis and is released during the muscle contraction cross-bridge cycle. Its accumulation causes a decrement in force production capability and would be associated with muscle fatigue.

Serum markers of injury and inflammatory processes have been found in patients with overuse injuries (see Table 27-5). The biomarker malondialdehyde, an indicator of cell stress and therefore injury, has been identified in patients with CTS[144] and in subjects with hand–arm vibration syndrome.[149] Serum from subjects with hand–arm vibration syndrome has increased inflammatory markers, including increased polymorphonuclear cells and levels of soluble intercellular adhesion molecule-1 (*sICAM-1*), a soluble and circulating form of ICAM-1 present on endothelial cells that helps facilitate leukocyte adhesion and migration across endothelium.[148,149]

In patients treated in an outpatient physical therapy clinic for diagnoses related to severe overuse injuries, Carp et al.[190] detected proinflammatory cytokines in serum. The patients were classified into three groups according to symptom severity, as measured by the Upper Body Musculoskeletal Assessment tool (UBMA): mild (UBMA score 51-75; $n=9$), moderate (UBMA score 76-100; $n=9$), and severe (UBMA score >100; $n=9$). A control group consisting of unaffected individuals with an UBMA score below 50 ($n=9$) was used for comparison. The serum results showed significant increases in all proinflammatory cytokines in patients with severe overuse injuries, as well as increases in IL-6 in patients with moderate and mild overuse injuries. Because inclusion in this study required a duration of symptoms no longer than 12 weeks, these findings support the presence of an early inflammatory process in the development of overuse injuries. Another study examining serum from patients seeking medical advice for specific and nonspecific MSDs, mainly lateral epicondylitis and rotator cuff tendinitis, found increased soluble intercellular adhesion molecule 1 (sIL-1RII), a receptor that facilitates leukocyte adhesion and migration across endothelium and is thus a biomarker of inflammation.[191] However, several other inflammatory cytokines were not increased above control subject levels in this same study, and serum levels of IL-18, a member of the IL-1 superfamily, were actually decreased in the MSD cases.[191]

The differences in findings in the aforementioned studies highlight one of the challenges involved in studying workers is the difficulty determining the causality between tissue and behavioral responses. Timing is key. If serum or tissues are examined early in the injury process, injury and/or inflammatory markers are likely to be detected. However, if serum or tissues are examined at the time of surgery, presumably, the initiating injury stimulus is long since passed and the condition of the tissues has been substantially altered from the preinjury state. This means one is likely to detect wound healing or fibrogenic markers instead of inflammatory markers.

Summary

By examining the findings of human and animal studies done on severe overuse injuries, the authors have developed a proposed mechanism of pathophysiological and behavioral changes associated with these injuries.[192] First, repetitive activity leads to injury of cells and tissues (see Figure 27-7). This injury activates the acute inflammatory response: infiltration of immune cells into the injury site and increased production of cytokines by these immune cells and by injured cells and tissues. The acute inflammatory response then activates mechanisms of cell proliferation and matrix production related to wound healing. Unfortunately, the continued cycle of tissue trauma by continued performance of the repetitive task halts the process of tissue repair at this point.[105] Instead, a chronic inflammatory response (with associated secondary tissue damage) is stimulated, along with an excessive fibrogenic response. This postulated mechanism is supported by the many studies, both human

and animal, that have found evidence of tendon tissue thickening and fibrosis, nerve and muscle fibrosis, and tissue disorganization and necrosis. Behavior changes related to tissue damage, pain, or both would be clearly apparent at this point as a result of nerve damage, and sensory losses may also be present as a consequence of the nerve damage. Finally, a systemic response is stimulated, apparently by the release of cytokines into the bloodstream from the injured tissues and immune cells still present in the tissues. The circulating cytokines may stimulate several global responses, including widespread stimulation of macrophages and cell proliferation at local and distant tissue sites. The presence of chronic pain and central neuroplasticity stimulates a variety of sensorimotor behavioral consequences that are discussed in detail in the next section.

EVIDENCE-BASED REVIEW OF CENTRAL CONSEQUENCES OF CHRONIC REPETITIVE OVERUSE INJURIES OF THE UPPER LIMB: FOCAL HAND DYSTONIA

The Problem

As reported at the beginning of this chapter, stressful, repetitive use of the upper limb in work or sports can lead to acute pain and loss of function. Rest, anti-inflammatory medications, change in biomechanics, and good ergonomics usually are effective intervention strategies. Unfortunately, some RSIs become chronic. Degenerative changes may be documented in tendons, joints, muscles, and fascia that may limit mobility, compress peripheral nerves, compromise vascular tissues, and lead to chronic pain. However, in some cases, abnormal, involuntary end range twisting postures develop when a person tries to perform a well-learned task. This movement dysfunction is referred to as *occupational hand cramps*.[193] Usually the movements are painless, but in some cases, muscle cramping can be painful.

Dystonia can be general, involving the entire body; focal, involving one body part; segmental, involving multiple adjacent body parts; or task specific, such as golfer's yip (a jerking movement when hitting the ball—usually putting; lack of a smooth stroke) or musician's dystonia or cramp. Focal dystonia involving the hand may be referred to as *hand cramps* or by task specificity (e.g., keyboarder's cramp, writer's cramp). Focal dystonia tends to be primary in adults (e.g., underlying genetic, neurophysiological or sensorimotor integrative dysfunction), whereas in children the problem is more commonly secondary (e.g., cerebral palsy with injury to the basal ganglia).[194,195] The etiology and impact of dystonia are unique in children compared with adults. In children the onset of serious movement dysfunction such as dystonia can significantly disrupt development, independence, and acquisition of motor, sensory, cognitive, and social skills.[196] This section of the chapter focuses on hand dystonia in adults; however, the information may be applicable to other types of focal dystonias (e.g., cervical, spinal, and leg dystonias).

It is difficult to report the incidence and prevalence of focal dystonia because there are so many different types and different body parts affected. The genetic contribution to focal dystonia in adults has not been widely investigated. Approximately 23% to 30% of those with focal dystonia have a relative with the disorder.[197,198] The incidence of RSIs in performing artists varies from 44% to 84%, with pain, weakness, numbness, or tingling being the most common complaints.[199–201] Approximately 12% of musicians have to take time off work, with nearly 50% returning to performance while still having pain.[200,201] Although the type of dystonia may vary by the instrument played, approximately 1% of professional musicians are affected.[198,202] This is in contrast to the general population, where the prevalence of FHd is estimated as 29.5 per 100,000 in the United States and 61 per 100,000 in Japan.[203,204] In a recent systematic review and meta-analysis including 15 studies (12 service-based and 3 population-based studies), researchers calculated an overall prevalence of primary dystonia as 16.32 per 100,000, with the prevalence higher in the population-based studies than in the service-based studies. The researchers suggested this was probably an underestimate.[205]

Cervical dystonia (i.e., torticollis) is the most common form of adult-onset dystonia. The prevalence of cervical torticollis ranges from 20 to 4100 cases per million. The incidence is estimated at 8 to 12 cases per million person-years.[206]

Etiology of Hand Dystonia (FHd)

Dystonia is a product of genetic factors interacting with physical, psychosocial, and environmental modifiers.[207] When this problem was initially reported in talented musicians, some health care professionals were of the opinion that FHd was a psychological disorder. Today, the etiology of FHd is still considered idiopathic, with a growing body of knowledge supporting a multifactorial etiology for most cases of hand dystonia (Figure 27-8).

Genetics

The risk for FHd can be higher than in age-matched controls if an individual has a familial gene for dystonia.[197,198] A variety of genes are known to cause generalized dystonia, but only a few genes are identified for different types of focal dystonia. For example, the *DYT1* gene has been identified in Ashkenazi Jewish families.[208–211] Not all individuals who carry this gene (genotype) develop clinical dystonia (phenotype).[212,213] The gene is noted to have "low penetrance."[208–211] The clinical phenotype is most likely to develop when multiple aggravating factors are present (e.g., perseverative behavior, phobia, anatomical impairments, stress, traumatic injury, excessive repetition).[208–211] Many genetic studies are currently under way,

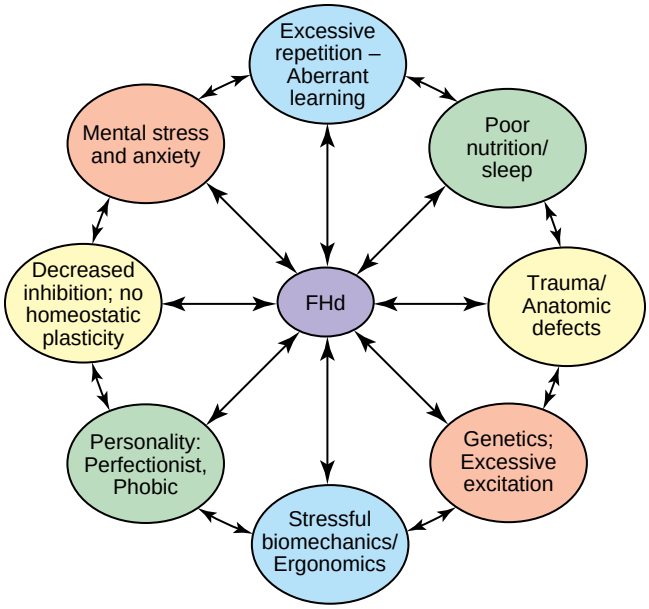

Figure 27-8 The etiology of focal hand dystonia is multifactorial. Multiple risk factors are needed to provide sufficient aggravation to lead to the clinical expression of focal hand dystonia.

and in the future, it is expected that new genes will be identified for both general and focal dystonia.

Musculoskeletal Risk Factors

Individuals performing fast, forceful, accurate, repetitive movements (e.g., typing or programming on a computer, playing a musical instrument, writing, screwing nails) are at risk for developing WRMSDs, including occupational hand cramps.[214] The most common factor contributing to injuries in musicians appears to be excessive practice or performance-related activities.[200,201,215] The musician most likely to develop FHd is the one who is extremely perfectionist, perseverative, persistent, goal oriented, and often phobic.[202]

Researchers report anatomical and musculoskeletal limitations are common in individuals with FHd (e.g., decreased ROM,[216] anatomical variations,[78,217] abnormal kinematics,[218] and excessive use of force[219]). Some clinical researchers report increased neural tension and ulnar nerve subluxation.[220,221]

Some clinical scientists argue that FHd can develop as a consequence of a traumatic injury (e.g., complicated or simple fracture, peripheral nerve entrapment, anatomical restrictions in soft tissue).[222,223] Although the debate about trauma as a cause of hand dystonia has not been resolved, there is some consensus that individuals who develop FHd after trauma to the upper limb are usually at risk for developing dystonia before the injury,[220] with the trauma simply serving as the "last straw."

Neurophysiological Impairments

Impairments in reciprocal and surround inhibition, sensory processing, sensory integration, and maladaptive plasticity are common neurophysiological risk factors for developing occupational hand cramps.[207,224] The imbalance between inhibition and excitation involves the basal ganglia, spinal cord, brain stem, and cortex.[225–228] Inadequate inhibition complemented by lower-than-normal gamma-aminobutyric acid (GABA) levels in the sensorimotor area appear to contribute to excessive plasticity and corticospinal excitability.[229] In addition to inadequate inhibition, impaired neurophysiological processing has been reported in many different areas of the brain. These impairments range from dysfunction in the primary motor cortex,[230–235] degradation in the sensory thalamus,[236,237] disruption in cortical sensory activation, somatosensory representation and spatial perception,[238,239] abnormal gating of somatosensory inputs,[240] abnormal presynaptic synchronization of movement, abnormal muscle spindle afferent firing,[241–243] excessive tendencies to form associations between sensory inputs and motor outputs,[242,244] uncoupling of movements in the primary motor and sensory areas,[245] abnormalities in gray matter,[246] impaired somatosensory function, and difficulty with sensorimotor integration.[247–255] In addition, Siebner et al.[256] reported altered blood flow responses in the premotor areas, putamen, thalamus, and cerebellum (e.g., after repetitive transmagnetic stimulation [rTMS], there was a greater decrease of regional cerebral blood flow (rCBF) in the lateral and medial premotor areas, putamen, and thalamus but a general increased responsiveness of the cerebellum).[256,257]

Neuroplasticity and FHd Etiology

Aberrant Learning. Our hands allow us to perform delicate, complex, individuated, fine motor movements.[258–265] Skilled, well-practiced hand movements represent an interaction of many factors, including orderly, somatotopic, highly differentiated representations of the hand in the thalamus, basal ganglia, and cortex (Figure 27-9).[263,264] Normal primates have a precise somatosensory representation of the hand characterized

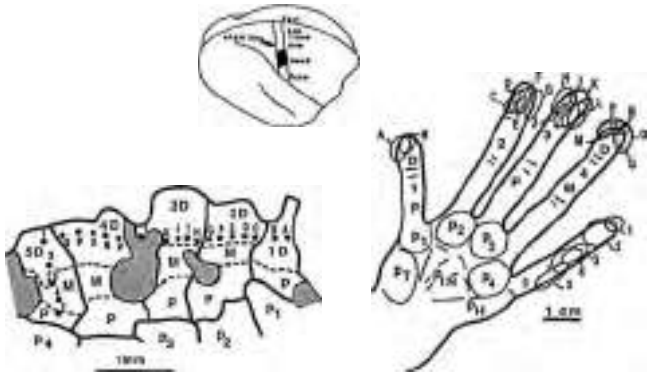

Figure 27-9 Representative normal somatosensory map of the hand with small receptive fields. The digits are organized from distal to proximal. (From Byl NN, Merzenich MM, Cheung S et al: A primate model for studying focal dystonia and repetitive strain injury: effects on the primary somatosensory cortex, *Phys Ther* 77:273, 1997.)

with one receptive field per electrode penetration, small receptive fields (8 μm^2) unique to each digit, orderly sequencing of digits from inferior to superior, and orderly representation of the segments from proximal to distal. There is a distinct differentiation of the digits at 100 to 600 µm, and an area of hand representation of 3.2 to 5.1 mm^2 (see Figure 27-9).[266] With positive learning-based training, the area of representation increases in size, but the receptive fields decrease in size with increased specificity and density.[267–281]

Positive changes in neural adaptive behaviors can be achieved by maturation or by training under conditions of rewarded, spaced, fun, learning-based, goal-directed, task-specific progressive mental and physical practice matched to the interests of the individual.[267–283] Musicians, for example, practice complex fine motor skills to perfect performance (i.e., efficiency, quality, accuracy, control, complexity of decision making, or complexity of movements).[284,285] This practice is associated with improved topographical representation of the hand.[286,287] Thus, it may not be surprising that FHd is reported in musicians.[288–292] Furthermore, well-learned tasks have their own topographical representations beyond the anatomical limb performing the task.[287]

However, our nervous system has inherent, finite limits in adaptation (e.g., physiological time constants, inhibition, integration time).[234] Genetics, trauma, poor biomechanics, excessive neuronal excitation, poor inhibition, environmental deprivation, drug use, phobias, negative feedback, chronic stress, perseveration, perfectionism, chronic pain, and/or *forceful, rapid, repetitive, near-simultaneous, stereotypical movements* can lead to degradation of the topographical representations of the digits[76,77] (Figure 27-10) and changes in timing, amplitude, and spatial characteristics of neuronal processing.[207,293] If rapid inputs occur within the inhibitory or integration period of stimulus processing, new inputs are not registered as temporally distinct[75–77,232,293–296] or with stimulated skin surfaces forming a unified rather than a unique spatial and temporal representation in the cerebral cortices, brain stem, and spinal cord.[294] Specificity of digital representation is critical to the maintenance of the normal sensory

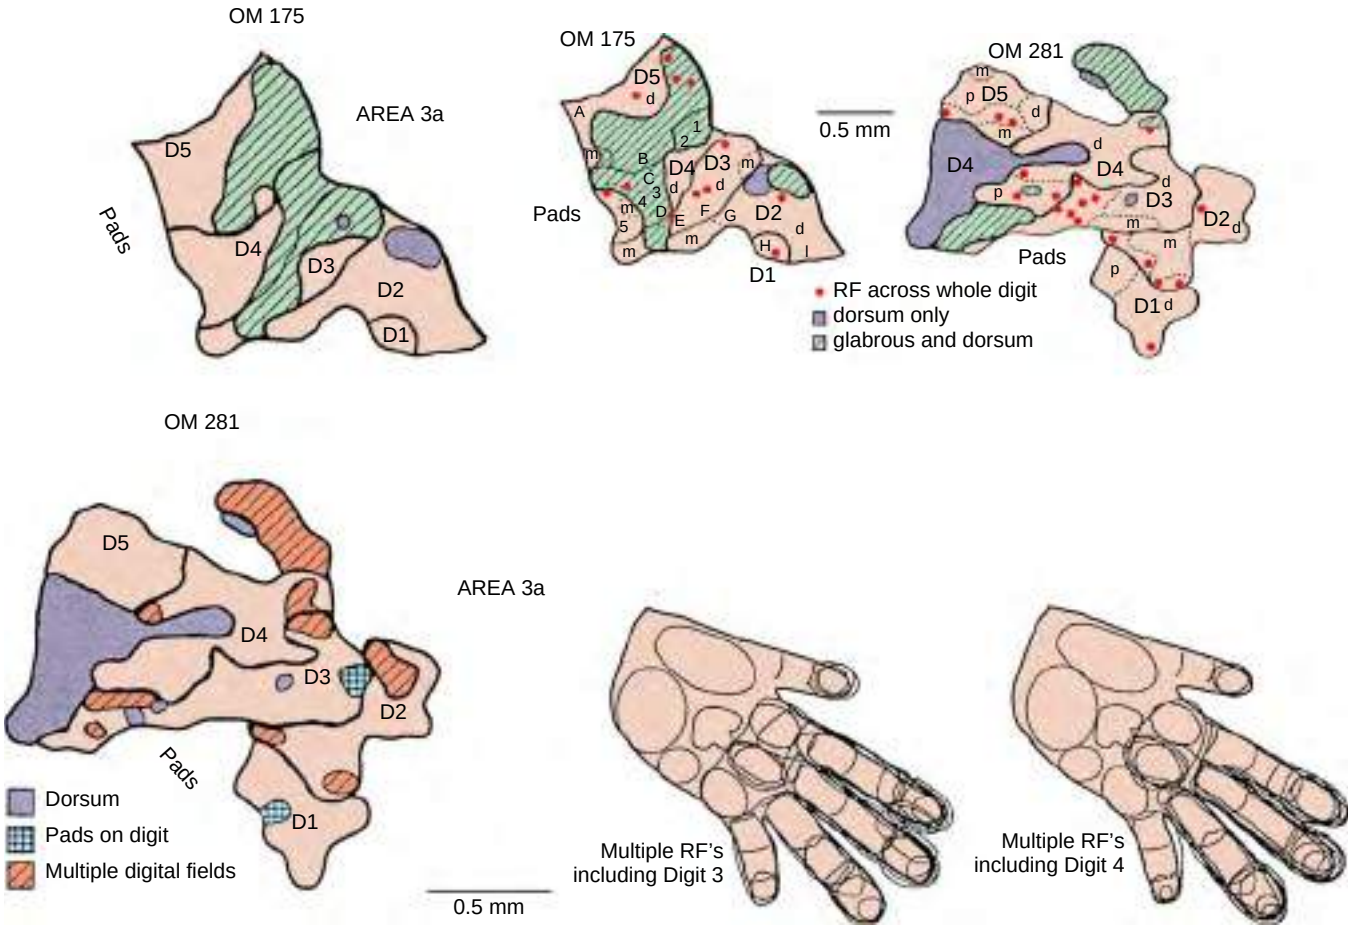

Figure 27-10 Abnormal somatosensory map of the hand after excessive repetitive training. Large receptive fields overlap adjacent digits, adjacent segments, and dorsal and glabrous surfaces. *RF*, receptive fields. (From Byl NN, Merzenich MM, Cheung S et al: A primate genesis model of focal dystonia and repetitive strain injury. I. Learning-induced dedifferentiation of the representation of the hand in the primary somatosensory cortex in adult monkeys, *Neurology* 47:513-515, 1996.)

organization, sensorimotor feedback, and fine motor control.[297,298] These aberrant topographical mappings of somatosensory inputs and motor outputs have been associated with abnormal, involuntary, dystonic motor movements of the hand.[75–77,297,299,300]

With this information, a paradigm shift was developing in the understanding of the etiology of FHd. Based on primate studies of repetitive hand use, Blake et al.[75,296] and Byl et al.[76,77] proposed the "sensorimotor learning hypothesis": repetitive use, near-simultaneous firing, coupling of multiple sensory signals, and voluntary coactivation of flexor and extensor muscles could lead to degradation of the cortical sensory and motor representations of the hand.

In a series of animal research studies based on a repetitive training paradigm, four of six primates developed movement dysfunction consistent with focal dystonia. These primates worked intensively on a daily basis to open and close a hand-piece to release food pellets (e.g., performing 1000 to 2000 repetitions/hour, 2 to 3 hours/day for 1 to 6 months). The two primates who did not develop dystonia trained slowly and casually (closing/opening the hand-piece for 10 minutes and then taking a break, performing fewer than 1000 repetitions in 2 to 3 hours). In addition, these two primates placed the hand on the hand-piece and leaned backward to close the device, minimizing rapid, repetitive, stereotypical, and coincident movements and maintaining normal topographical representation.[76,77]

Both the trained and untrained hands of all the primates were dissected by an anatomist blinded to dystonia status. There were no signs of acute inflammation in any of the animals.[78,291] Interestingly, the monkey who developed the earliest sign of FHd (i.e., hyperextension of D4 after 4 weeks of training) had a congenital defect of the flexor superficialis and flexor profundus tendons on the fourth digit on the trained side and the third finger on the untrained side. The size of the receptive fields of D4 on the trained side were enlarged, overlapping adjacent fingers and dorsal and palmar surfaces. On the untrained side, there were no signs of movement dysfunction even though the receptive fields of D3 were larger than normal. However, the receptive fields on the untrained side did not overlap across adjacent digits or dorsal and glabrous surfaces.[78,291]

On the basis of the sensorimotor hypothesis, Sanger and Merzenich[301] proposed an integrated, multisystem computational model to explain the origin of FHd. If the sensorimotor loop gain and the neural circuitry connecting the deep cortical nuclei, basal ganglia, and thalamus are unstable, a focal or a general dystonia could develop (e.g., depending on the extent of the imbalance across multiple sensory and motor systems).[253,294] The computational model could explain why symptoms (1) develop in otherwise healthy individuals who perform highly attended, repetitive movements; (2) evolve variably in time; (3) appear only during the performance of a target-specific task (i.e., dystonic movements); (4) persist even when the task is no longer performed repetitively; (5) decrease but are not remediated with dopamine-depleting drugs or botulinum toxin; and (6) are associated with abnormalities in somatosensory, sensorimotor, and motor representations of the dystonic limb.

Lack of Homeostatic Plasticity. In the past 10 years, research has provided convincing evidence about excessive brain plasticity in patients with FHd. In a variety of clinical studies, exceptional adaptability of the central nervous system has been reported in patients with focal dystonia.[249,256,302–307] Quartarone and his team hypothesized the degradation in motor control seen in patients with focal dystonia was a consequence of excessive plasticity.[249,256,302,305,306] In other words, there is a lack of homeostatic, associative plasticity in the brain in patients with task-specific dystonia. The brain fails to stop adapting when the most efficient neural firing pattern is achieved. This hypothesis is consistent with the hyperactivity measured in the basal ganglia[249] and the somatosensory, sensorimotor, and motor cortices.[256,302,305,306] This hypothesis is also consistent with recent findings of abnormal synaptic plasticity[308] and defective cerebellar control of plasticity[309] in patients with focal dystonia. Compared with age-matched controls, patients with dystonia have increased neuronal excitation and decreased inhibition with easy modification of the cortical silent period in the premotor and motor cortices following rTMS or anodal and cathodal transcutaneous direct current stimulation (tDCS). These findings suggest the nervous system does not have the usual adaptive mechanisms to limit allowable levels of synaptic potentiation.[302,306]

An Interactive Systems Model

Given the incidence of FHd in musicians, Altenmuller et al.[310] proposed the systems model for understanding the etiology of FHd. This model integrates the task specificity as well as the strength of sensory information to modify the motor dysfunction (i.e., sensory trick). If the sensory stimulus is encoded as a signal vector of a high dimension, then a part of its component directly represents the sensory stimulus while the remaining components describe the context. This etiological model for focal dystonia accounts for the task specificity and the context of the movement dysfunction,[193] while also being consistent with the aberrant topography of the digits,[75–77,267,286,294,296] the lack of homeostatic plasticity,[304,305] and the imbalance of excitation and inhibition.[207] This model explains why weakening dystonic muscles with botulinum toxin does not "cure" FHd.[311] This model also provides a foundation for supporting rehabilitative strategies directed toward stopping the abnormal movements, engaging motivation and commitment to improve biomechanics, reducing unnecessary stressful repetition and creating task-specific, progressive sensory and motor retraining to restore normal motor and somatosensory representations.

History, Clinical Assessment, and Diagnosis of Focal Hand Dystonia

The diagnosis of FHd is made by a careful history and clinical examination.[312–315] Although there may be some common findings among patients with FHd, there are also differences that may be important relative to treatment planning.[316–318] There are no laboratory tests to confirm the diagnosis. The history is begun by inquiring about a genetic workup. The clinician should inquire whether any other family members have dystonia or other types of movement disorders (e.g., Parkinson's disease, essential tremor, neural hyperexcitability [e.g., sensitivity to loud noises], attention-deficit disorders, premature birth, Alzheimer's disease) as well as information about results of imaging and electromyography (EMG).[312]

The clinician should review past or recent traumas to the hand. If there was an injury to the hand, the clinician should determine whether the trauma (1) had a strong temporal-anatomical relationship to the onset of FHd; (2) was severe enough to cause persistent local symptoms and lead to late medical attention; (3) was the same site as the initial anatomical manifestation of the movement disorder; (4) was within days or up to 12 months of the onset of the movement dysfunction; and (5) occurred to the hand or upper limb with preexisting contractures and limitations of passive movement.[222,223] It is essential that the clinician check about levels of stress, periods of intensive repetitive hand use, job instability, application of a new technique, a change in equipment, increased time on task to improve quality of performance, quantity of work expected, or intensity of time involved in performance.[223,319]

The clinician should inquire about the initial onset of signs and symptoms relative to overuse: inflammation, swelling, pain, fatigue, tendinitis, or neuropathy.[319] Some patients report no previous injury, but rather an insidious onset of weakness, incoordination, or involuntary movements when performing a specific task, such as playing the guitar. Still others report a tremor or jerkiness when performing similar tasks, such as typing on the keyboard or playing the piano. The clinician should inquire about stress[217] and assess personality characteristics (e.g., intense, high achiever, perfectionist, impatient, phobic) depression, and emotional stability.[202,320,321]

The clinical examination should include the administration of standardized tests and measurements (Table 27-6).[322–330] A magnetic resonance imaging (MRI) scan may be ordered by the physician to rule out specific brain pathology; however, functional imaging techniques (fMRI, rTMS, repetitive direct current stimulation [rDCS], motor evoked response [MEP], sensory evoked response [SEP]) used in clinical research are not considered a standard part of a FHd examination.[76,77,286,294] The physician may order EMG studies if signs of a peripheral neuropathy are present.[265,292]

TABLE **27-6**

Summary of Clinical Testing Procedures for Examination of Focal Hand Dystonia and Clinical Studies

Measurement Tool	Dependent Variable	Scoring System	Directions	Reliability	Equipment
Graphesthesia (modified subtest of Sensory Integration Praxis Test [SIPT])	Sensory performance	2 = Correct 1 = Partially correct 0 = Incorrect % error calculated	Tip of a paper clip was used to draw designs on subject's fingers while the subject's eyes were closed Subject recreated design with pen with eyes open Two designs per finger pad	Inter-rater = 0.95 Test–retest: $r = 0.91$ (Ayres[331])	Paper clip and design sheet
Kinesthesia (subtest of SIPT)	Sensory performance	Average error (distance from target) in mm	Subject's hand was moved to target and back to start position; subject attempted to relocate digit, eyes were closed Five trials per hand	Inter-rater = 0.95 Test-retest: $r = 0.90$ (Ayres,[331] Byl et al.[251])	Target sheet and ruler
Byl-Cheney-Boczai (BCB) test for stereognosis	Sensory performance	2 = Correct 1 = Partially correct 0 = Incorrect % error calculated	Subject's finger was drawn across the shape twice, eyes were closed Subject attempted to pick correct shape 10 trials for second and fourth finger pads	Inter-rater/intrarater = 0.995 (ICC) Correlation of $r = 0.60$ between BCB test (Byl et al.[332]) and Purdue Test Lafayette Instruments	20 designs and test sheet of designs

UE, Upper extremity; *LE,* lower extremity.

*Muscle groups tested: hip flexors and extensors, knee flexors and extensors, ankle dorsiflexors, elbow flexors, shoulder flexors, wrist extensors, lumbricals, grip and pinch (three-jaw chuck and key grip) strength.

Although patients frequently report "weakness," on the clinical musculoskeletal examination, strength is usually normal unless there are clear signs of peripheral nerve compression at the thoracic outlet, cubital tunnel, or carpal tunnel.[265,292,303] However, there may be an imbalance in strength between the extrinsic and intrinsic muscles, with extrinsic muscles exceptionally strong from overuse and the intrinsic muscles disproportionately weak, potentially from limited use.[336] Poor posture (i.e., forward head and shoulders) and poor postural righting

are commonly noted.[336] Hypermobility of the interphalangeal and metacarpophalangeal joints in flexion and extension and excessive ulnar deviation of the wrist may be noted. In addition, limitations in finger spread, forearm rotation, and/or shoulder lateral (external) rotation are also commonly measured.[216,284]

The neurological examination is usually considered normal (e.g., reflexes, coordination, gait, light touch, sharp dull). If hyporeflexia or hyperreflexia are noted, then further diagnostic testing may be needed to rule out a peripheral neuropathy or central neural dysfunction. On the other hand, cases of hyperactive dystonia have been reported, primarily in children who have both spasticity and dystonia.[196] Most commonly, the involuntary movements occur primarily when the patient voluntarily performs a target task or a similar task and are usually not present at rest or with sleep.

There may be positive signs of neural tension when the brachial plexus is placed on a stretch for the median or ulnar nerve.[303] In patients with FHd, especially musicians, it is not uncommon to palpate a subluxing ulnar nerve at the elbow.[220,221] If a patient is experiencing pain, ask the patient to rate the pain on a visual analog scale of 1 to 10.[326] Some patients with FHd report a sense of dullness or numbness in the pads of the fingers when they are placed on the target surface. Patients with FHd frequently perform poorly on tasks demanding cortical sensory discrimination, such as stereognosis, graphesthesia, and proprioception.[307–309] It is important to objectively evaluate all motor and sensory skills to establish a foundation for validating change.

The objective validation of FHd is to observe the involuntary movements when the patient is asked to perform the target task. With permission, the patient should be video recorded while performing the target task. Videos can serve as a reference for measuring preintervention and postintervention performance. Traditional dystonia scales should be used to rate the involuntary movements (i.e., quality and severity).[328,329] The Arm Dystonia Scale or the arm component of the Unified Dystonia Rating Scale (UDRS), the Global Dystonia Rating Scale (GDS), or the Fahn Marsden Dystonia Rating Scale (FMDRS) can be used for these ratings (Table 27-7).[302,306,328,329] Some clinicians may have access to motion analysis to more objectively document timing and force abnormalities.[304,327] The Disabilities of the Arm, Shoulder and Hand (DASH) Outcome Measure and Quick DASH are available as applications to the iPad or the iPhone and can be administered to assess general functional limitations in the hand/arm (Institute for Work and Health).[337] It can be helpful to administer a general functional measure (e.g., CAFÉ 40)[330] to document the impact of the hand dystonia on activities of daily living (ADLs) and community participation. The patient should be asked to demonstrate what he or she does to try to control the involuntary movements (i.e., sensory tricks). Based on the underlying neurophysiological findings relative to etiology, is important to examine both the involved and uninvolved limbs.

TABLE **27-7**

Dystonia Scales: Grading Severity of Involuntary Dystonia Movements

Dystonia Scales: Arm/Hand	Area Evaluated	Ordinal Scores
Global Dystonia Rating Scale (GDS)	10 body areas: 1 = Eyes and face 2 = Lower face 3 = Jaw and tongue 4 = Larynx 5 = Neck 6 = Shoulder and proximal arm 7 = Distal arm and hand, including elbow 8 = Pelvis and upper leg 9 = Distal leg and foot 10 = Trunk	Rated on a scale of 0-10: 0 = No dystonia 1 = Minimal dystonia 5 = Moderate dystonia 10 = Most severe dystonia
Unified Dystonia Rating Scale (UDRS)	Rated on an ordinal scale 10 areas of body rated for severity Rating also required for duration	Shoulder and proximal arm (right and left), distal arm and hand (right and left) Score 0-4: 0 = None 1 = Mild; movement <25% of normal 2 = Moderate; movements 25%-50% of range possible 3 = Severe; movements 50%-75% of possible range 4 = Extreme; movements <75% of possible

TABLE 27-7

Dystonia Scales: Grading Severity of Involuntary Dystonia Movements—cont'd

Dystonia Scales: Arm/Hand	Area Evaluated	Ordinal Scores
Fahn Marsden Dystonia Rating Scale (FMDRS) (product of symptom frequency and severity)	9 areas of the body evaluated: eyes, mouth, speech, swallowing, neck, trunk, right and left arms, and right and left legs Two clinical rated subscales: movement subscale based on patient examination and disability subscale based on patient's report of disability in activities of daily living (7 areas, including speech, writing, feeding, eating, hygiene, dressing, and walking) The score for eyes, mouth, and neck is multiplied by 0.5 before being entered into the calculation; total movement FMDRS subscore is the sum of the product of provoking, severity, and weighting factors; total maximal score is 120. Training for administration is recommended	Movement scale: 0 = No dystonia present 1 = Slight dystonia; clinically insignificant 2 = Mild: obvious dystonia, but not disabling 3 = Moderate: able to grasp with some manual function 4 = Severe: no useful grasp Disability rated on an ordinal scale of 5 but walking rated on a 7-point scale Provoking factors: 0 = No dystonia at rest or with action 1 = Dystonia only with particular action 2 = Dystonia with many actions 3 = Dystonia on action of distant part of body or intermittently at rest 4 = Dystonia present at rest

Data from www.mdvu.org/library/ratingscales/dystonia/.

Biofeedback can be used to allow the examiner and the patient to observe the onset of involuntary co-contractions of agonists and antagonists, firing patterns, and the ability to turn off a muscle once excited. One characteristic of dystonia is an on/off pattern of muscle firing when the patient recruits a dystonic muscle and tries to hold consistently against resistance. Neural firing can also be "heard" when an EMG injection needle electrode is placed into an overexcited dystonic muscle. EMG monitoring is used to select the muscles to inject with botulinum toxin and monitor an immediate, early quieting after the injection.[311]

The diagnosis of FHd is based on a careful history and clinical examination to try to "rule in" the diagnosis and minimize false-positive and false-negative diagnoses (Figures 27-11 and 27-12).[338] The history

Factors to "Rule in" Diagnosis Focal Hand Dystonia (FHd)

Factors	Yes = 1	No = 0	Comment
1. Normal neurological exam except involuntary movement at target task			
2. Involuntary movement when performing target task			
3. Type A personality (e.g., perfectionist, possibly phobic)			
4. Sensory trick			
5. Under stress, history of high levels of repetitive practice			
6. Abnormal cortical sensory discrimination (e.g., graphesthesia, stereognosis)			
7. Decreased finger spread			
8. Normal magnetic resonance imaging (MRI)			
9. Family history of dystonia or Jewish descent			
Maximum total score	9		

Figure 27-11 Focal hand dystonia is a clinical diagnosis. The diagnosis is ruled in based on the history of onset, signs and symptoms, family history of movement disorders, genetic history, history of high stress, excessive practice or increased work, the presence of involuntary movements when performing a specific well-learned task, the benefit of sensory tricks to temporarily control the involuntary contractions, normal neurological examination, and normal magnetic resonance imaging scans. *Graphesthesia,* ability to recognize writing on skin by sensation of touch; *stereognosis,* the ability to perceive the form of solid objects by touch.

"Ruling in" the Diagnosis of
Focal Hand Dystonia (FHd): Example

Score	Has FHd	Does not have FHd	
9	25	5	30
<9	4	26	30
	29	31	

False positive 4/29 (13.8%) **False negative** 5/30 (16.7%)

Sensitivity 25/29 = 86% **Specificity** 26/31 = 84%

Likelihood ratio +(LR+)
LR+ = 0.86/0.167 = 5.15

Likelihood ratio −(LR−)
LR− = 0.14/0.84 = 0.17

Figure 27-12 When the clinical criteria are met to rule in the diagnosis of focal hand dystonia (FHd), the objective is to minimize false-positive diagnoses (diagnosed with the disorder when it is not the diagnosis) and false-negative diagnoses (cleared of the diagnosis when the patient does have the disorder). The criteria should lead to a diagnosis that is both sensitive and specific. Here is an example of using the criteria in Figure 27-11 to determine false-positive results, false-negative results, sensitivity, and specificity.

and clinical examination should conclude with a list of impairments and functional limitations that need to be addressed in treatment. Many of these impairments and functional limitations will be consistent across patients with FHd, but it is important to identify impairments that may be unique to each individual patient (Table 27-8).

The prognosis for recovery depends on a variety of factors. These factors range from personal goals, objectives, and commitment to personal and vocational opportunities, access to health care specialists, and community resources for retraining (Table 27-9). The most important factor in recovery is patient motivation and commitment to retraining. The second most important factor is patient access to resources to establish a guided recovery program.

TABLE **27-8**

Impairments and Limitations Common in Patients with Focal Hand Dystonia

Anatomic and Neurophysiological Impairments	Functional Limitations
Decrease in range of motion • Finger spread • Forearm pronation/supination • Shoulder external rotation	• Inability to place forearm in full pronation on a keyboard (e.g., playing piano, typing) • Difficulty holding a stringed instrument in full supination (e.g., violin or viola) • Difficulty opening hand on keyboard
Excessive range of motion • Excessive extension of interphalangeal (IP) joints • Excessive extension of the metacarpophalangeal (MP) joints • Excessive wrist ulnar deviation	• Difficulty maintaining stability of the digits on the keyboard • Difficulty controlling coordinated digital movements within an octave • Difficulty writing and typing
Imbalance of strength • Strong extrinsic wrist and finger flexors • Weak intrinsic muscles (interossei and lumbricals)	• Cannot place hand in neutral (e.g., assumes a claw-like position) • Difficult to perform coordinated, controlled fine motor movements
Abnormal sensory processing • Decreased accuracy of spatial/temporal sensory processing • Excessive sensory excitability	• Errors in fine motor movements • Inadequate regulation of velocity and movement force • Disruption of sound quality
Abnormal preparation for movement • Poor sensory gating • Poor motor preparation • Excessive motor firing	• Finger contact with objects produces involuntary, quick, and jerky movements • Quality and efficiency of fine motor control compromised
Lack of inhibition • Involuntary simultaneous contraction of agonists and antagonists • Inability to turn off unwanted firing	• Sensory inputs lead to jerky, quick, forceful, poorly graded movements • Unwanted notes and keys are depressed
Lack of homeostatic plasticity • Hypersensitivity of synaptic connections • Autonomic fight/flight responses (and sometimes hyper-reflexia) • Rapid, high-amplitude response • Difficulty turning off neuronal activation • Prolonged muscle firing	• Light touch leads to reflexive, exaggerated protective motor responses (high-force and amplitude) • Light touch may be painful • Repetitive movements do not get faster despite practice • Difficult to control common digital movements for writing and typing

TABLE 27-9

Prognosis for Successful Management of Focal Hand Dystonia

Positive Factors	Negative Factors
Expects to get better; motivated to retraining	Feels discouraged about recovery
Positive health and wellness (aerobic exercise, good hydration, good nutrition, adequate sleep)	Has not invested in regular health and wellness program
Not perseverative or phobic but still a perfectionist	Perseverative, perfectionist, phobic
Supportive family; supportive work environment with financial stability	Does not have supportive family, supportive employer, or financial stability
Able to stop abnormal movements (even though needs sensory tricks or modification of surface or position)	Unable to stop abnormal movements
Integrates diaphragmatic breathing; worked through neural tension	Breathes with scalenes; has neural tension and subluxing ulnar nerve and/or carpal tunnel syndrome
Has no numbness or tingling	Has numbness, tingling sensory loss
Has normal reflexes	Has hypoactive or hyperactive reflexes
Has normal range of motion	Has hypermobile metacarpophalangeal (MP) or interphalangeal joints but restricted finger spread
Has good strength of intrinsic hand muscles	Has weakness of intrinsic hand muscles
Manages stress, anxiety, and depression well	Is unusually stressed, tense, and anxious
Has a good coach for task performance (e.g., music teacher)	Does not have a coach for task-specific training
Can take time off from performing task	Financially needs to continue to work at job that creates the dystonia
Sets time for retraining	Cannot find time or retraining; too busy working
Is willing and able to change biomechanics and techniques for performance	Is unable or unwilling to modify biomechanics of upper extremity
Experiences improved sensory discrimination	Has chronic neuropathic pain; neural sensitivity and poor sensory discrimination continues
Is committed to learning something new	Is completely engrained in habitual activities
Progresses practice difficulty; takes frequent breaks	Is unable to space practice; continues with intense practice despite short practice periods
Combines mental imagery and practice with physical practice	Has difficulty performing mental imagery; dependent on excessive physical practice

MANAGEMENT OF WORK-RELATED MUSCULOSKELETAL DISORDERS

Worksite Management

For U.S. employers, the Occupational Safety and Health Administration (OSHA) continued to develop industry-specific and task-specific ergonomic guidelines for voluntary use.[339] Thus far, guidelines have been established for foundries,[340] nursing homes,[341] shipyards,[342] manual materials handling,[343] poultry processing,[344] grocery stores,[345] apparel and footware industries,[346] furniture manufacturing industries,[347] telecommunications industry,[348] farming,[349] baggage handling for the airline industry,[350] construction industries,[351] and more. All of these guidelines embrace the same basic program components of prevention and management, which are set forth, for example, in the OSHA guidelines for nursing homes[341]:

1. *Management support:* Clearly developed program goals, clearly identified program responsibilities for participants, adequate provision of resources, and oversight to ensure the success of the program.
2. *Employee involvement:* Early employee reporting of problems; also, employees provide insight (i.e., suggestions and evaluation) into work design issues and solutions and share responsibility for program development and implementation.
3. *Problem identification:* Systematic procedures using various sources of information, such as OSHA injury and illness logs, data from workers' compensation claims, and surveillance and workplace analysis.
4. *Solution implementation:* Typically involves changes to eliminate or reduce workplace hazards, problematic work practices, or both.
5. *Injury management:* Emphasis on early detection and intervention.
6. *Training of employees and managers:* Training on the risks and detection of MSDs and the procedures required to respond to an MSD incident.
7. *Regular program evaluation:* Determination of quantifiable measures, such as number and severity of MSDs.

The success of such workplace MSD management programs relies on clear communication between workers,

managers, and health care providers. Such communication requires an atmosphere of cooperation and mutual trust among all stakeholders. One benefit of establishing such a program is that it often alleviates the impact of psychosocial risk factors by providing employees with an opportunity to contribute directly as members of a cohesive MSD management team.

Essential Components: Workplace Management Program for Musculoskeletal Disorders

- Management support
- Employee involvement
- Problem identification
- Solution implementation
- Injury management
- Training of employees and managers
- Regular program evaluation

Clinical Management

The biopsychosocial model of clinical management has been clearly demonstrated to be the most successful approach to the management of activity-related MSDs. In this model, the interactions of physical impairments, personal psychological factors, and psychosocial factors are recognized and targeted for prevention as well as treatment in a holistic approach to care.[352] Biopsychosocial management programs have several advantages, including the following:

1. Emphasizing prevention and education regarding excessive overuse
2. Addressing the importance of a safe, supportive environment in the workplace
3. Emphasizing the importance of using a multidisciplinary health care team to address the multiple causal factors of activity-related MSDs
4. Illustrating the need for clear communication and cooperation between health care providers, injured workers, and various stakeholders in the workplace
5. Showing that clear communication is greatly enhanced by trained case managers who oversee all aspects of health care and workplace management
6. Demonstrating that effective health care interventions for activity-related MSDs do not necessarily result in a cure but rather lead to long-term worker- and workplace-focused management through effective problem solving by the entire MSD management team

Essential Components of a Clinical Management Program for Musculoskeletal Disorders

- Education and prevention
- Holistic approach to care with focus on physical impairments and personal and workplace psychosocial factors
- Multidisciplinary health care team
- Communication and cooperation between health care providers, injured workers, and the workplace
- Trained case managers
- Long-term worker- and workplace-focused management

Summary

MSDs account for 34% of lost workday injuries and illnesses in the United States in 2012. The median days away from work—a key measure of severity of injuries and illnesses—was 9 days. Injuries and illnesses resulting from repetitive motion involving microtasks resulted in a median of 23 days away from work to recuperate and increased further in 2012 in four occupational groups: computer and mathematical occupations, community and social service occupations, personal care and service occupations, and transportation and material moving occupations. These disorders have a major effect on workers' compensation costs, absenteeism, and loss of productivity.

Strong epidemiological evidence indicates that risk factors for the development of work-related MSDs of the upper limb include the performance of hand-intensive tasks in a manner that is highly repetitive or forceful (or both) in awkward or sustained postures, with or without vibration and cold temperatures. Psychosocial stress also increases the risk of WRMSDs of the upper limb. Individual predisposing factors that contribute to the risk of upper limb WRMSDs include past or present comorbid medical conditions, female gender, obesity, poor biomechanics, and advanced age.

It is beyond the scope of this chapter to describe in detail MSD clinical management programs for patients with acute MSD injuries. However, several recent examples in the literature can guide the reader.[353–355] The remaining part of this chapter outlines the comprehensive intervention program needed for patients with chronic musculoskeletal disorders that are associated with persistent pain and FHd.

MANAGEMENT OF CHRONIC WORK-RELATED MUSCULOSKELETAL DISORDERS: FOCAL HAND DYSTONIA

General Management

Simultaneous with workplace management, education, ergonomics, facilitation of healing, and clinical problem solving, patients with chronic MSDs must work with a team and engage in a comprehensive rehabilitation program. Rehabilitation must focus on general health and wellness (i.e., exercise, lifestyle modification, improved biomechanics, nutrition) and specific retraining to maximize neural adaptation. The prognosis for functional recovery is affected by a variety of intrinsic and extrinsic factors (see Table 27-9).

The patient and his or her family are critical members of the rehabilitation team. The patient must expect to get better and be willing to invest time and effort in the recovery process. The health care providers on the team include the physician, therapists, psychologist, and nutritionist. Teachers and community movement trainers can support the health care team. The physician should be a specialist in neurology, musculoskeletal disorders, pain management, and/or movement disorders. The physician should be familiar with prescribing systemic drugs as needed for pain, muscle spasm, anxiety, depression, and sleep, as well as with injecting botulinum toxin if needed to decrease muscle cramping. Ideally, the physician should have experience working with a team of nutritionists, physical therapists, occupational therapists, and psychologists experienced in the management of chronic pain, stress, and anxiety. A "coach" (e.g., a music teacher, sports coach, a biomechanist) may be able to suggest new ways to perform job-related tasks without further injury. In addition, relaxation techniques, massage, mindfulness training, meditation, acupuncture, acupressure, and imagery for self-healing along with classes or individual sessions involving movement training (e.g., yoga, tai chi, Ji Gong, Alexander Technique, Feldenkrais Method, Pilates, Nia, tae kwon do, dance) can also be beneficial. The remainder of this chapter describes activities for health and wellness, principles of neural adaptation, and physical and occupational therapy strategies for retraining.

Positive Health Behaviors

Our population is aging. Aging is associated with brain atrophy, memory problems, depression, decreased physical activity, and degenerative disease.[356] In fact, the World Health Organization reports physical inactivity as a primary health problem today.[357] This is the case despite the objectives established in 1979 for *Healthy People 2000*.[358] In fact, physical inactivity is the fourth leading cause of global mortality and is the main cause of approximately 21% to 25% of breast and colon cancer cases, 27% of diabetes cases, and 30% of ischemic heart disease cases. Physically active people have lower rates of coronary heart disease, high blood pressure, stroke, diabetes, colon cancer, and depression. Active people also have a lower risk of falling and hip or vertebral fractures. Young people need a minimum of 60 minutes of intense exercise a week, but those 18 to 65 years and older should have 150 minutes of moderate exercise and 75 minutes of vigorous activity each week.[359]

Longitudinal studies confirm moderate and aerobic exercise complemented with positive lifestyle behaviors is needed to facilitate healthy aging and maintain flexibility, strength, endurance, coordination, posture, balance, and cardiopulmonary function, as well as reduce risks for diabetes, arthritis, and cancer.[360–362] Furthermore, a combination of intense aerobic exercise and cognitive motor training not only may decrease brain atrophy and maintain memory and motor skills but also may potentially be neuroprotective against neurodegenerative disease.[359,363]

Ideally, individuals should walk or ride a bike instead of driving. It is better to walk up or down the stairs instead of taking an elevator. Patients should be encouraged to take daily walks while talking, observing, and learning something new (e.g., noting new activities in the neighborhood and greeting people along the way).

Aerobic exercise should be performed four to five times a week, 30 to 40 minutes per session. In these sessions, each individual should warm up and cool down for 3 to 5 minutes and keep the heart rate at 70% to 80% of maximum ([220 − age] × 80%) for approximately 20 to 30 minutes. Patients can chose to run, bike, swim, dance, or practice routines for a sport (e.g., plyometric activities, ball activities, balance). It is important to experience moderate exertion (rated at least 3 out of 10) with associated perspiration and an increase in breathing rate.[364]

All of us, young and old, should participate in learning activities for brain fitness. Focused learning activities drive selective changes in cortical cell differentiation and specialized representations. These changes not only include the expansion of cortical areas of representations, the reduction in the size of receptive fields, and the narrowed columnar spread but also improve co-selection of complementary inputs, increase excitable neurons, enhance salience and specificity of feedback, increase myelination, strengthen synapses between coincident inputs, shorten integration time, and increase complexity of dendritic branching.[266,365–374] The neural adaptation is associated with the emergence of more efficient, accurate, and differentiated behaviors.[268–278,280–283,375]

Learning activities range from simply learning something new each day (e.g., reading, doing crossword puzzles, playing Scrabble, identifying and spelling words, playing card games) to participating in specific, progressive perceptual motor, cognitive, and motor learning activities (e.g., playing games like Wii [wii.com] or Xbox Kinect [www.xbox.com/US/kinect]) or engaging in learning-based exercises from Posit Science (positscience.com) or Lumocity (lumocity.com).[363,364,374,376] In addition to general physical and brain exercises, individuals with FHd must emphasize specific sensory, sensorimotor, motor, and perceptual motor training activities to restore brain topography and function.[363]

Training activities need to take place in a positive environment, with the patient expecting to improve and motivated to engage in attended, goal-directed behavioral activities. The patient must understand the neurophysiology of dystonia and the challenge of inhibiting the involuntary, disruptive movements. The principles of neural retraining (e.g., sensory, sensorimotor, and motor retraining) can be applied across a variety of types of movement dysfunction and pain.

Translation of Principles of Neuroplasticity to Behavioral Training[374]

- "Use it or lose it"
- Remap and improve it; learn something new daily
- Have adequate, repetitive, variable, and progressive repetitions
- Make training intense with learning rather than stress as the focus (2-4 hours/day spread across the day, 4-5 days/week)
- Attend and be focused in practice activities
- Vary training sequences
- Progress difficulty of the tasks
- Be specific (e.g., task training, patient preferences, inspirational, motivational)
- Make learning fun (e.g., laugh, include elements of surprise)
- Spread practice over time (i.e., 8-12 weeks or more)
- Make training salient to each individual
- Make training age and task relevant
- Reinforce learning with feedback/accuracy
- Transfer common learning skills to new tasks
- Strengthen learning with predictable and unpredictable interference

Interestingly, neural learning is significantly affected by sleep. New synaptic networks (engrams) can be refreshed, and poor connections can be erased with not only variation in inputs but also metabolic state, emotions, natural endorphins, and sleep.[377–382] Thus, when retraining, one cannot overlook the importance of making sure patients have enough sleep. Sleep is essential for the nervous system to consolidate learning and recover from stressful life events. Although the number of hours of sleep may vary from individual to individual, everyone needs a comfortable period of deep (rapid eye movement [REM]) sleep. When individuals are stressed, anxious, or depressed, REM sleep may be limited not only by the time in bed but by the amount of worry during sleep.

Although there is no magic to achieve an ideal night of sleep, some behaviors can be helpful. Dinner should occur early, with time to move around and relax before going to bed. Sometimes a warm shower can help relax the muscles before going to sleep. Taking time to review the positive aspects as well as the challenging aspects of the day can be helpful to relax the mind. Thinking ahead to plan for the next day may also help encourage more relaxing sleep.

Current research reports new information about the negative effects of sleep deprivation. Although some individuals claim not to need a lot of sleep, the evidence suggests that a minimum amount of sleep is essential for positive health, learning, and memory.[380–382] On the other hand, sleeping to justify isolation and lack of productivity is not healthy. Further details of the positive and negative effects of sleep are beyond the scope of this chapter.

Nutrition and Healing: Patients with RSI

"Food should be our medicine and our medicine should be our food."
—Hippocrates

The words of Hippocrates have poignant wisdom for every patient with neuromusculoskeletal disorders, including those suffering from RSIs. The purpose of this section is to elaborate on the importance of recovery and how to set the stage for recovery to occur. The authors summarized current nutritional research with findings integrated into management strategies to reduce tissue sensitivity to repetitive force and to maximize and support recovery of patients with chronic musculoskeletal, work-related overuse injuries.

Nutrition affects all of our body systems, including but not limited to, the cardiovascular, neurological, muscular, skeletal, endocrine, pulmonary, dermatological, reproductive, genitourinary, and gastrointestinal (GI) systems. No system operates in isolation. The effects of inflammation from mechanical disruption or physiological processes will produce a response in all systems, albeit with different symptomatology.[13] As a consequence, a multifactorial, or multisystem, intervention strategy is needed to treat patients with overuse disorders. Nutrition fuels all of our body systems, positively or negatively affecting all physiological processes across the spectrum of healing and recovery from overuse injuries. Lack of proper nutrition can lead to chronic inflammatory processes, compromised healing, limited recovery, and reduced potential for rehabilitation.

Impact of Nutrition on Physiological Systems Affecting Healing

Nutritional factors affect the health and injury recovery of the joint, muscle, tendon, and bone. Park et al.[383] reported a link between vitamin D deficiencies in patients with early inflammatory arthritis. Kim et al.[384] reported antioxidants decreased cell death in human rotator cuff tenofibroblasts. Food components, like resveratrol, whey protein, chlorogenic acid, omega-3 fatty acids, and cherry extract, have been linked to increased muscle strength, decreased oxidative stress after exercise, decreased protein cross-linking, and decreased inflammatory markers.[385–388] Tendon healing can be enhanced by nutritional components such as vitamin C[389] and aloe vera.[390] In rat studies, fructose-rich diets have been associated with a metabolic syndrome that may impair bone growth via decreasing osteogenic potentiation.[391] Unfortunately, even medications, intended to improve recovery, may impair musculoskeletal recovery. For example, animal research studies reported nonsteroidal anti-inflammatory drugs (NSAIDs) decreased the biomechanical strength of repaired rat rotator cuff tendons (11 to 20 days after surgery).[392] Statin drugs, common in the treatment of high cholesterol, may produce an imbalance and microdamage of the extracellular matrix of tendons.[393]

The neurological system is also affected by nutritional components. In an obese mouse model, Tucsek et al.[394] reported that a high-fat diet exacerbated systemic inflammation in mice. In addition, there was a disruption in the blood–brain barrier resulting in neuroinflammation and oxidative stress in the hippocampus.[394] In mice,

Baumgarner et al.[395] reported that a high-fat diet produced peripheral cytokines in adipose tissue and the spleen, as well as measurable neuroinflammation and cognitive deficits. In quail embryo, Chen et al.[396] reported gestational diabetes in pregnancy as a result of high glucose and impaired nerve differentiation on the dorsal root ganglion and the developing limb buds. Using a mouse model for asthma, Ramalho et al.[397] reported increased substance P involved in neurogenic inflammation in high fat–induced obesity. Guo et al.[398] reported that older adults who added artificial sweeteners to their coffee or tea had a higher risk of depression than older adults who did not use artificial sweeteners.[398] The **Wahls Protocol**, a new treatment approach for progressive multiple sclerosis (MS), includes nutritional recommendations to assist stabilization, if not reversal, of the disease process, especially in relation to fatigue.[399]

Researchers have also demonstrated that nutrition can directly affect the endocrine system. Diet-induced obesity in rodents results in hepatic inflammation.[400] Interestingly, this inflammation is improved with resveratrol, a whole food nutrient.[400] Increased neutrophils in the mouse liver can be stimulated by high-fructose ingestion.[401] In a longitudinal clinical study, poor glycemic control increased inflammatory markers (insulin-like growth factor [IGF]-1).[402] Additionally, diet had a strong link to insulin sensitivity,[402] a critical physiological hormone that directs many pathways, including inflammation. Both Kanazawa et al.[402] and Young et al.[403] demonstrated that improved glycemic control with dietary factors improved insulin sensitivity and decreased inflammatory markers.

The cardiovascular system is also influenced by nutritional components. Liu et al.[404] evaluated the response of myocardial infarction markers in rats after ingestion of a Chinese herbal formula. Significant improvements in proinflammatory cytokines (TNF, IL-6, IL-1) were found after consuming this Chinese herbal formula.[404] Omega-3 polyunsaturated fatty acid (omega-3 PUFA) supplementation decreased inflammatory cytokines for patients with cardiomyopathy secondary to Chagas disease.[405] Jansen[406] reported that a multinutritional diet had beneficial effects on vascular health in a rat model for atherosclerosis. Supplemental chicken collagen hydrolysate may improve circulation in patients with mild hypertension.[407] A patient's risk of stroke is higher with consumption of sugar-sweetened soda.[408] Proper hydration appears to decrease the risk of a future stroke.[409–412] Ruth et al.[413] reported that a high-fat (60% saturated fat) and low-carbohydrate diet was associated with improvements in blood lipid and systemic inflammation, indicating improved cardiovascular health.

Nutrition has influences on the pulmonary system. For example, a poor dietary inflammatory index has been linked to patients with asthma.[414] Shi et al.[415] reported human consumption of monosodium glutamate (MSG) was positively associated with snoring and a high probability of sleep-disordered breathing (SDB) even if individuals were not overweight. Diet-induced obesity in mice has also been linked to peribronchial inflammation.[397]

There is also a relationship between the GI system and the neurological system, also known as the gut–brains axis. Shulman et al.[416] investigated the relationship between gut permeability and symptoms of life interference and psychological distress symptoms. In this clinical study, GI permeability was assessed using a urinary sucrose and lactulose ratio. In addition, information was collected on ADLs, work, psychological distress, and symptoms. They reported that within the population with irritable bowel syndrome (IBS), there was a distinct group with increased GI permeability who also had dysfunction in daily activities, psychological distress, and IBS symptoms.[416] Dickerson et al.[417] reported that patients with recent-onset psychosis and those with multiepisode schizophrenia have significantly increased levels of immune response to the gluten protein, gliadin, compared with control subjects. This sensitivity to the gluten protein has been associated with acute mania and bipolar disorders, without associated celiac disease (a digestive and autoimmune disorder).[418,419] A randomized, placebo-controlled clinical trial demonstrated that probiotic supplementation (multistrain bacterium) improved a common somatic symptom of bowel difficulty associated with schizophrenia but produced no significant changes in psychiatric symptoms.[420]

There is also evidence that GI health can affect inflammatory disorders. Giardina et al.[421] reported that probiotics of the lactic acid bacteria strain improved inflammatory events associated with oxalate-degrading activity in the intestines in human subjects (e.g., Lactobacillis plantarum, Lactobacillus acidophilus, Bifidobacterium breve, and Bifidobacterium longum). In a randomized, double-blind, placebo-controlled clinical study of patients with rheumatoid arthritis, a significant decrease in disease activity score and a decrease in inflammatory cytokines (e.g., TNF-α, IL-6, IL-10) was reported with probiotic intervention.[422]

These cited research articles are a representative collection to illustrate the association of nutritional components and systemic responses. Many more studies have been published and are worthy of further independent exploration in the fields of cardiology, nutrition, orthopedics, functional medicine, and many others. It will be important for clinicians to keep abreast of nutrition research in the treatment of their patients.

Nutritional Recommendations for the Management of Patient's with Repetitive Strain Injuries

> *"If we could give every individual the right amount of nourishment and exercise, not too little and not too much, we would have found the safest way to health."* —Hippocrates

There is an increasing amount of research associating nutritional factors and their effects on inflammation and healing throughout the body. However, the unanswered question is, what specific nutritional strategies should be

integrated with lifestyle changes, stress management, and exercise to decrease inflammation and facilitate healing, remodeling, and recovery from RSIs?[423–426]

One strategy described in the literature is intermittent fasting. *Intermittent fasting* is defined as extending the interval between meals. In particular, intermittent fasting may have a positive effect on inflammation and recovery in the male population. For example, in one study of intermittent fasting following an experimentally induced brain injury in mice, there was a decrease in infarct volume in the mice that were fasted compared with those that ate ad libitum.[427] In another study with neonatal pigs, muscle protein synthesis increased more with intermittent eating versus continuous feeding.[428] In aging men, mood, depression, and nutritional status improved in those who were fasting with calorie restriction.[429] Bahammam et al.[430,431] explored the safety of a fasting strategy in men who followed intermittent fasting during Ramadan, a Muslim annual religious observance. No ill effects were reported. Intermittent calorie restriction has also been used as an effective dietary treatment for drug-resistant epilepsy.[432]

Attenuation of proinflammatory cytokines has been reported following intermittent fasting by healthy subjects.[433] Recent literature reviews concluded that dietary restriction or intermittent fasting could support peripheral nerve health by attenuation of peripheral demyelination, promotion of neurogenesis, and positive health of the peripheral nerve.[434] Thus, calorie restriction or intermittent fasting could be safely tried in males during regeneration and recovery of nerve function following a peripheral neuropathy.

Although intermittent fasting can have positive results for men, one must be cautious to implement this strategy in the female population. Females have a monthly ovulatory cycle that is very sensitive to external stress. Consequently, it is not recommended for females to fast daily without proper monitoring. Month-long fasting for females, as in Ramadan, may adversely affect the reproductive system in irreparable ways. Thus, rather than intermittent fasting, females could implement a narrowed eating window strategy. This might include narrowing the eating window during the hours of 9 AM and 7 PM (10 hours), allowing a natural fasting between 7 PM and 9 AM (14 hours). This fasting would occur more naturally during sleeping hours. Another nutritional management tool involves specific avoidance of inflammatory foods and specific inclusion of anti-inflammatory and nutrient-rich whole foods in the diet.

Based on a review of the literature, there are foods that have been associated with inflammation or inhibition of healing and that should be avoided (Table 27-10). There are also food items that incorporate the nutrients that support health and anti-inflammation (Table 27-11). Dr. Terry Wahls carried out clinical studies integrating the Wahls Protocol with patients with progressive MS. She confirmed not only the safety of a whole foods–type diet but also the benefits of this type of dieting on neuromuscular function. An important component of the Wahls Protocol diet is the specific exclusion of processed and inflammatory foods and the specific inclusion of nutrient-dense whole foods.[399] The diet not only was safe but was associated with improvement in neuromuscular function.[399]

In summary, a patient recovering from an RSI may improve healing by eating whole foods with high nutrient value. Patients should try to *remove* processed foods (i.e., refined grains, refined sugar, refined vegetable oils, alcohol) and non–nutrient-rich foods (i.e., grains, especially those containing gluten; most dairy; and legumes). The patient should try to *replace* non–nutrient-rich foods with whole organic produce, especially colorful leafy

TABLE **27-10**

Nutritional Foods Exacerbating Inflammation

Dietary Limitations/ Avoidance	Foods in Which Found
Carbohydrates[396,435–438]	Candies, desserts, flour-derived baked or processed foods, pastas, cereals, granola, fruit juice, beans/legumes, dried fruits (especially if sweetened), anything with added sugars
Fructose[391,401,439]	Agave syrup, honey, dates, raisins, dried fruit, molasses, green grapes, canned fruit in syrup, fruit juice
Aspartame[440]	Nutrasweet, Equal, a potential additive in sweet-tasting "sugar-free" foods
Ethanol[441]	Beer, wine, spirits, mixed adult beverages
Monosodium glutamate (MSG)[442,443]	May be present in an ingredient list as "flavoring," processed packaged foods, restaurant foods
Gliadin (gluten protein)[417,444]	Wheat, oats, barley (anything containing gluten)
Statins[393]	Consult physician about short-term hold of medication during healing of RSI
NSAIDs[392]	Consult physician about short-term hold of medication during healing of RSI, although NSAIDs can protect against cartilage and bone resorption occurring with RSI[70,445]
Trans fats[445]	Vegetable and seed oils (canola, rape seed, soybean, safflower, partially hydrogenated fat/oil)

The foods referenced here can be found on the government website http://ndb.nal.usda.gov/.

RSI, Repetitive strain injury; *NSAIDs,* nonsteroidal anti-inflammatory drugs.

TABLE 27-11

Nutritional Components Supporting Healing and/or Anti-Inflammatory Mechanisms

Beneficial Dietary Component	Food in Which Found
Probiotics[421,422,445,446]	Naturally fermented vegetables and dairy (pickles, sauerkraut, kimchi, yogurt, kefir)
Prebiotics[446]	Resistant starch (potato, plantain, inulin)
Leucine-rich diet[447]	Eggs, spirulina, cheese, beef, pork
Olive oil[448,449]	100% pure olive oil
Aloe vera[450]	Aloe vera (juice or capsules)
Gelatin/collagen[450,451]	Pure gelatin or collagen hydrolysate, bone broth
Chinese herbal formula (sini tang)[404]	Recommend consultation with herbalist
Antioxidants[384,452–456]	Anthocyanins (blue, red, and purple berries; cherries; purple grapes; red cabbage), betalains (beets, cactus)
Biotin[457]	Green leafy vegetables, liver
Bovine colostrum[458]	Bovine colostrum
Brazil nuts[459]	Brazil nuts
Green coffee bean extract (chlorogenic acid)[388]	Green coffee bean extract, prunes
Resveratrol[385,400,460–463]	Purple grapes, bilberries, blueberries
Curcumin (turmeric)[464–466]	Turmeric
Docosahexenoic acid (DHA)[405,467–477]	Oily fish (salmon, tuna, sardines, mackerel, and trout)
Cocoa[478,479]	100% chocolate
Glycosaminoglycans (glucosamine)[480,481]	Glucosamine/chondroitin sulfate supplements
Vitamin D[383,482]	Liver, grass-fed dairy, fermented cod liver oil, fish, portabella mushrooms, egg yolk
Spirulina[478,483]	Spirulina, raw or dried
Lean red meat[484]	Lean red meat; beef, wild game
Vitamin C[389,396,485]	Citrus, peppers, kale
Whey protein (if diabetic)[486]	Whey protein powder
Vitamin E[485]	Nuts (almonds, hazelnuts, pine nuts), nut oils
Yeast hydrolysate[487]	Yeast extract

The foods referenced here can be found on the government website http://ndb.nal.usda.gov/.

vegetables and fruits and berries; grass-fed grass-finished organic meats, including organ meats; wild-caught fish; and plenty of healthy fats, such as coconut oil, grass-fed and clarified butter, lard, and unheated olive oil. These nutritional habits should be maintained for 30 to 90 days to *recover* health and see results. These habits of specific avoidance and specific inclusion should be maintained for a lifetime of positive health and healing.

These eating strategies may be daunting to remember for the patient with an RSI. A simple pneumonic can provide some guidance. The *"Triple R" Strategy* (*remove, replace, recover*) can be used as a reminder (Table 27-12). This principle is easily applied in all areas of recovery for the patient with an RSI.

Principles for Recovery from Repetitive Stress Injuries

- Remove the aberrant or inflammatory movement
- Replace it with normal and healthy movement/posture
- Restore function

TABLE 27-12

"Triple R" Strategy for Nutritional Recovery from Repetitive Stress Disorder

Triple R Strategy	Nutritional Recovery from Repetitive Strain Injury
Remove	Remove refined grains, refined sugars, refined vegetable oils, and processed foods/drinks
Replace	Replace processed foods with whole organic produce, wild-caught fish, grass-fed grass-finished beef, organic meats, healthy fats, and water
Restore	Maintain healthy eating for a minimum of 30 days to restore health and a lifetime for continued health

There is no single nutritional recipe for perfect health that works for every patient with an RSI. There is, however, always a balance and a period of personal and individual trial and error. Should the patient be unable to eat a whole foods diet within these guidelines, demonstrate a lack of progress, or need further help, supplementation should be considered. If needed, further collaboration with functional medicine professionals, specially trained dietitians or nutritionists, and physicians may be warranted.

Clinicians, such as physical therapists, should check with their governing state board and local national chapters to be sure they are in compliance with their state's regulations regarding the scope of practice and making nutritional recommendations along with physical activities to help patients to restore normal healthy pain-free movements, independence, and quality of life.

"The natural healing force within each of us is the greatest force in getting well." —Hippocrates

Clinicians, such as physical therapists, have the opportunity and foundation of knowledge to work with every patient on many levels, with the ultimate goal of facilitating positive health, quality movement, independent function, and prevention of injury or disability. Recent research evidence indicates that physical therapists should help guide the patient to establish a healthy lifestyle to maximize health and restore maximum function after an injury or disease. This lifestyle should include adequate amounts of recovery time, moderate and appropriate exercise, restful sleep, hydration, stress management, and healthy nutrition.

Specific Management Strategies for Patients with Focal Hand Dystonia

Goals for Rehabilitation

Each patient must be treated individually. The patient and the family need to agree on the goals. These goals should be focused on managing the movement dysfunction by reducing risk factors, managing the pain, retraining the brain, and successfully returning to functional activities, work, and quality of life.

Patient Goals for Retraining for Focal Hand Dystonia

- Learn as much as possible about the risk factors, the etiology, and the different approaches to remediate FHd
- Become your own best therapist
- Negotiate a compatible work schedule
- Recruit support of family and friends
- Think positively about recovery
- Maintain self-confidence and self-esteem
- Create a positive environment for learning
- Maximize state of health and wellness
- Stop abnormal movements
- Quiet excessive excitation of muscles
- Restore normal sensory processing
- Restore graded, smooth fine motor movements
- Redifferentiate the sensory, sensorimotor, and motor representations of the hand in cortical and subcortical brain networks
- Relearn how to perform the target task(s)
- Return to preferred work

Medical Management

Successful retraining strategies for FHd are multifactorial. A successful program begins with a good *medical management plan*. The physician will usually assume the responsibility for medications, transmagnetic or direct cutaneous stimulation, and referrals for counseling, surgery, or deep brain stimulation (DBS), as well as referrals for rehabilitation.[292,312,488] It is important for the physician to assess the need for counseling and possibly medications for anxiety, depression, and even more severe psychopathology.[319–321,488,489] It is important that each patient be able to concentrate on retraining.

The most common medical treatment for patients with FHd is the injection of botulinum toxin to reduce the intensity of the dystonic cramping by interfering with neural signals to the muscle.[311,490–492] Baclofen may be helpful when spasticity is present along with dystonia.[493]

Immobilization is another medical management strategy that was initiated in Italy.[494] Based on the possibility that FHd is a consequence of overuse and a change in cortical organization,[75–77,296] immobilization of the hand would discourage use of the hand, decrease the repetition of the abnormal movements, and potentially quiet the overexcitation of the muscles. This could serve as treatment or quiet the neural activity in preparation for retraining. In initial trials this strategy was applied to a small patient group with early-onset dystonia. The hand was immobilized in a cast for 10 days, and decreased dystonia was reported when the cast was removed.[494,495]

Some patients with FHd have clear and objective signs of peripheral nerve compression of the ulnar or the median nerve. These patients may be referred for surgical decompression (e.g., repositioning the ulnar nerve at the elbow).[220,221] Surgical modifications of anatomical variations are sometimes performed.[78,216,217,284]

Repetitive transcranial magnetic stimulation (rTMS) and *transcranial direct current stimulation (tDCS)* are noninvasive techniques used to induce change in corticospinal excitability.[496–498] In the case of FHd, the objective of repetitive stimulation is to improve corticospinal inhibition during stimulation[498] with lasting effects for a short period of time after stimulation.[496,497] For tDCS, depending on the orientation of the cells and the current, cortical membrane potentials may be hyperpolarized or depolarized by a low-voltage current (mV). Although rTMS covers a treatment target area of about 25 mm, tDCS can cover approximately 2500 mm^2. It can

be difficult to be specific with the coils of the TMS. The intensity and the spread of tDCS can be controlled by the size of the electrode (e.g., a smaller electrode would provide more intense coverage in a smaller area).[496] DBS is another possible medical management strategy. However, this surgical procedure is reserved mostly for patients with generalized dystonia. If a focal dystonia is severe and disabling (e.g., cervical dystonia more than hand dystonia), DBS may be considered.[499]

Effectiveness of Medical Management. Generally, medical intervention strategies are effective in terms of management but not in terms of a cure. Botulinum toxin can quiet and weaken overactive muscles.[500–503] The challenge is to inject the correct muscles with the appropriate dose of medication. Unfortunately, the effect is temporary, lasting approximately 3 months. Then another injection is needed. Botulinum toxin does not have a direct effect on remapping the brain; however, the injections may make it easier for patients to participate in retraining. Some patients can become less responsive to the injections with time, resulting in the injections no longer being effective. In general, patients seem to tolerate the botulinum toxin for a long period.[311] In some cases, the patient can develop excessive weakness that does not return to normal when the botulinum toxin wears off.

The initial studies of immobilization with casting were associated with reduction in the severity of the dystonia for patients with early-onset hand dystonia.[494,504,505] A randomized trial was designed to replicate the benefits of immobilization in patients with more established hand dystonia. This trial was terminated early because some patients experienced increased dystonic movements while confined in a cast.

There is some evidence that rTMS, transcutaneous nerve stimulation (tCNS), or computer–brain interface biofeedback can assist inhibition, modify aberrant cortical topography and neurophysiological processing, and improve functional performance. These studies tend to be small pre/post test trials without random assignment, and the amount of repetitive stimulation is short.[496–498,506] In one study, after 1 hour of stimulation to the first dorsal interossei and the abductor pollicis brevis muscles, patients with hand dystonia and control subjects practiced grip-lift handwriting and cyclic drawing tasks. After 1 hour of nonassociative stimulation, the topographical map was reduced in size for both muscles, the center of the digital fields moved farther apart, and there was less movement variability during drawing. In another study, rTMS was administered to age-matched controls and patients with FHd. The effects were measured in terms of blood flow, which lasted approximately 1 hour after stimulation. In patients with FHd compared with age-matched controls, there was a greater decrease of rCBF in lateral and medial premotor areas in the putamen and thalamus, including the stimulated premotor cortex and a larger increase in cerebellar rCBF. This suggests that one session of rTMS can change synaptic activity, with the greatest responsiveness occurring in the premotor cortex.[257,498] Kimberley et al.[507] and Priori et al.[496] also reported positive changes in cortical responsiveness and topography with rTMS. In addition, anodal tDCS has been associated with decreased cortical excitability.[497]

At this time, treatment of focal dystonia with rTMS, tDCS, and neurobiofeedback with an implanted brain electrode are considered experimental and are not covered by insurance as a medically necessary treatment for FHd. Scientists are still trying to understand how patients with FHd respond differently to rTMS stimulation compared with control subjects.[508] More information is also needed about the intensity and the frequency of the stimulation and how to make the effects longer lasting. On the other hand, minimal risks are associated with this approach to intervention. In the future it is anticipated that physical therapists will have the opportunity to integrate rTMS, tDCS, and/or neurobiofeedback with learning-based training strategies.

Evidence-Based Rehabilitation Strategies for Focal Hand Dystonia

Some patients with hand dystonia chose to change their instrument and even learned to play one handed in order to continue to perform the target task.[509] This is considered a compensatory strategy. However, the neurophysiological evidence regarding aberrant learning, lack of homeostatic plasticity, decreased inhibition, degraded topography, excessive excitation (i.e., magnitude and amplitude of neuronal firing), and poor sensorimotor integration must be translated to rehabilitation strategies that target redifferentiation of cortical and subcortical representations of the hand. This is consistent with the sensorimotor, computational, homeostatic plasticity, and systems etiological hypotheses. Pathological connections must be uncoupled, unwanted movements need to be inhibited, and selective normal movements must be practiced to engage time-relevant, sequenced cognitive, sensory, and motor neuronal networks to restore voluntary movements.

A variety of retraining paradigms have been tried for patients with FHd (Table 27-13).[292,312] These strategies must be supplemented with positive expectations, aerobic exercise, and healthy lifestyle behaviors.[506,510] The retraining paradigms range from kinematic and biomechanical modifications,[511] general strengthening exercises, fatigue training, flexibility training, joint and soft tissue mobilization, neural mobilization/gliding, acupressure, trigger point therapy, dry needling, craniosacral therapy to learning-based training (e.g., biofeedback,[506,510,512] mirror imagery,[513–516] graded motor imagery,[517–521] sensory discrimination training,[522] braille reading,[523–525] fatigue therapy,[519] sensory motor retuning [constraint-induced movement therapy, (CIMT)],[526–534] learning-based sensory motor training,[535–537] cognitive and perceptual motor training,[44,370–373,529] motor retraining,[538–540] performance coaching,[541] hypnosis,[542] or a combination of these strategies[543]).

TABLE **27-13**

Summary of Different Intervention Strategies for Focal Hand Dystonia

Intervention	Strategy
Electrical stimulation	• Stimulation to assist in voluntary contraction of desired muscles (agonists) • Stimulation of forceful repetitive contractions to fatigue muscles • Stimulation of agonists to facilitate strengthening of desired muscles • Stimulation at sensory level to quiet the antagonist or hyperexcitable muscles • Deep brain stimulation • Transcutaneous direct cranial stimulation
Biofeedback	• Quiet overexcited muscles • Inhibit firing of conflicting antagonists • Balance activation and inhibition for stability and mobility • Correct abnormal movements by providing error, visual, or auditory feedback (e.g., feedback from a writing device) • Provide "force reaction information" or kinematic data to improve biomechanics • Guide desired movements with use of a laser pointer and stop abnormal movements or stabilize movements
Exercise	• General moderate flexibility and strengthening exercises • Aerobic exercise • Posture and balance exercises • Strengthening to balance mobility and stability (e.g., intrinsic muscles and extrinsic muscles) • Kinematic training • Fatigue training
Coaching	• Music lessons with exceptional teacher • Guided training and practice, similar to that for competitive sports • Ergonomic modifications at work • Analysis of safe, functional biomechanics needed to perform the target task • Physical training to improve efficiency, effectiveness, endurance, and skill • Anxiety and stress management
Manual techniques	• Joint mobilization • Traction • Soft tissue mobilization • Neural mobilization, nerve gliding • Immobilization with casting • Rocking, vibration
Behavioral retraining	• Sensory retuning (sensory and motor training with splinting following guidelines for constraint induced therapy) • Sensory discrimination training (sensitivity training) • Braille reading • Perceptual motor and cognitive training • Imagery (mental, mirror, graded motor) and virtual reality • Learning-based sensorimotor training
Other holistic strategies	• Movement strategies (Pilates, yoga, Alexander, Ji Gong, tai chi) • Dry needling • Acupressure/acupuncture • Transmagnetic stimulation • Hypnosis • Craniosacral therapy

Biofeedback. Biofeedback can provide auditory, visual, or sensory feedback (e.g., force data) about muscle firing patterns and force dimensions. Patients can concentrate on activating or inhibiting muscle activation or changing the force of the muscle contraction. Error feedback can be used as a method of improving quality of movement. This has been used most frequently with patients having writer's cramp. Patients are directed to use the feedback to decrease the grip force on the pen or the writing pressure.[218,219] Biofeedback is usually combined with other task-specific training techniques such as changing the strategy of gripping the pen[512,544–548] or practicing fine motor movements to improve writing fluency and speed.[248]

Imagery. Mirror imagery, guided mental imagery, and guided imagery for self-healing are helpful strategies to begin retraining, particularly when it is not possible to

stop the abnormal movements.[513–516] With imagery, patients can try to quiet overexcitation and enhance inhibition. In addition, patients can integrate mental practice instead of physical practice. Imagery can be associated with changes in brain organization.[513]

Sensory Training (Braille). Sensory stimulation can functionally reorganize the brain.[259] This occurs not only after injury[267] but with heavy hand use like in musicians[250,251] and braille readers.[525] However, cortical de-differentiation is reported in patients with FHd[294] and animals trained intensively until the development of involuntary, uncontrolled hand movements when performing the target task.[75,296,299,300] Improved cortical differentiation is reported in multifinger braille readers.[525] Thus, teaching patients to read braille[523,524] and perform other sensory discrimination activities[522,535,536] has been recommended as a method of driving the reorganization needed to restore motor control in patients with FHd.

Constraint-Induced Movement Therapy (CIMT): Sensory Motor Retuning. CIMT is based on the concept of "forced use" of the paretic upper extremity.[526] It was designed to counter "learned nonuse" most specifically for a patient after stroke and later applied to patients with other movement dysfunction like cerebral palsy and dystonia. CIMT is concentrated and intensive (6 to 8 hours a day over 2 weeks). In CIMT, the unaffected limb is placed in a mitt or a cast for 90% of waking hours to make it difficult to use in daily activities.[527,528,535] Patient-preferred tasks are identified. Then constraint of the unaffected arm/hand is combined with repetitive task-oriented training of the paretic upper extremity for 6 or more hours each day. Derivatives of CIMT have been tried, incorporating shorter periods of training over longer intervention periods, and different variations of progressive and alternating splint immobilization of the digits have been tried for musicians with FHd.[530–534]

Learning-Based Sensorimotor Training (LBSMT). Learning-based sensorimotor training is based on the theoretical constructs of learning and neural adaptation integrated with health and wellness, positive expectations, mental practice, mental imagery, and good biomechanics.[535–537,549] The goal of LBSMT is to match patient needs, preferences, and sensory and motor findings with progressive learning-based target-specific retraining to restore normal topography of the hand, recover target specific function, achieve quality of life, and return to work.

LBSMT training is comprehensive (Table 27-14). This training must be practiced at home as well as in supervised settings where clinicians and coaches can provide guidance concerning progression of activities. Retraining requires time, patient motivation, attention, and progressive learning. Although the training progresses through phases, the early phases will continue to require practice and integration even when behavioral training has progressed to task-specific practice and return to work. Given the neurophysiological challenges of excessive excitation and decreased inhibition, patients must be mindful to minimize the risk factors.

The phases of behavioral retraining in LBSMT are described in Table 27-14. These phases are overlapping with the soft, not rigid boundaries of each phase. The first two phases require modifying lifestyle behaviors to establish a positive foundation of health and wellness.

TABLE **27-14**

Summary of Interactive Phases for Learning-Based Sensorimotor Training

Phase	Description
Phase I: positive health and positive expectations	Expect to get better. Engage in wellness activities and exercise (aerobic, posture, balance, strength, coordination, flexibility). Maintain hydration, good nutrition, and quality sleep. Manage stress and anxiety. Be sure to balance work and play.
Phase II: quieting the nervous system	Stop abnormal movements. Engage in relaxation activities to help quiet the overexcitation of the nervous system. Quiet neural hypersensitivity and pain by rocking, stroking, swinging, swaddling, massage, vibration, and soothing music.
Phase III: sensory discrimination training	Improve accuracy of tactile, auditory, visual, and proprioceptive processing. Think sensory and let sensation of objects open the hand. Strengthen sensory inputs by putting rough surfaces on the instrument to minimize force. Compare and match objects through touch not vision. Locate different stimuli drawn on the skin. Duplicate drawings made on the skin. Have taste and smell contests with flowers, wine, and food. Listen to someone delivering sounds behind you in different locations and point to the location. See Figures 27-13 and 27-14.
Phase IV: imagery and sensorimotor training	Use mental imagery to remind yourself of how it felt to perform the task normally. Mentally practice performing all aspects of the task. Put the unaffected hand in front of mirror and carefully watch the mirror image (looks like affected hand). While positioned with the mirror, perform simple movements and manipulate objects. Try to transfer the mirror image to your affected hand (see Figure 27-15). You can work by yourself or have someone place his or her hands on your hands to help provide more sensory input. You may also improve the sensibility of the hand and motor control by using low-level neuromuscular stimulation on the palm or the dorsum of the hand periodically during the day when you are training.

(Continued)

TABLE **27-14**

Summary of Interactive Phases for Learning-Based Sensorimotor Training—cont'd

Phase	Description
Phase V: improve biomechanics and kinematics	Work on integrating normal biomechanics into functional hand use (e.g., keep hand in round comfortable position; especially keep the thumb and index finger round and soft when holding an instrument to play). When dropping the hand on a surface or an instrument, be on your finger pads (middle of finger pad for D2, D3, D4 and lateral surface of pads of D1 and D5). Let the contact surface open the hand. Avoid hyperextension of the interphalangeal joints. Move from the elbow or shoulder and simply drop the hand on a surface. Try to use the aerobic muscles of the hand (e.g., intrinsic hand muscles of lumbricales and interossei and forearm rotators instead of the extrinsic, glycogenic muscles (wrist and finger extensors and flexors). Depress the keys on the piano or computer keyboard or the string on an instrument by moving from the metacarpal phalangeal joint. Practice removing the pressure from the keys by stopping the pressure down rather than lifting up with the extensors. Rather than reaching with excessive finger extension and abduction, rotate the forearm with a fulcrum on the little finger and drop the thumb on the desired key. Then rotate the forearm with the thumb as a fulcrum to drop the little finger down. When doing coordinated movements, let all fingers rest down rather than holding some up; however, put only the necessary pressure on the desired movements. Get a coach to help improve biomechanics of performing with good ergonomics at the target task performance
Phase VI: graded motor training	Practice smooth, graded, nonjerky movements at common daily tasks that balance stability with mobility. Move hand lightly on a moving surface (see Figure 22-16). Find activities that create large slow movements around the shoulder, elbow, and wrist (e.g., yoga, tai chi, Feldenkrais). Gently let different surfaces spread the fingers out (e.g., smooth, rough, powdery, cold, warm surfaces). Make large sweeping brushing or sweeping rhythmical movements of the whole arm. Do large finger painting or try large smooth strokes for water painting with large brushes and large strokes. Practice making designs in shaving cream (see Figure 22-17). Hold a light ball and watch it as you take it to the right, the left, and high and low in front. Purchase a calligraphy board and practice large caligraphy letters that disappear in minutes. Let hand drop on a scale and try to estimate different weights. Then try to pick up objects without increasing the weight on the scale (see Guided Motor Imagery[519]).
Phase VII: task-specific training	Begin process of practicing small parts of the target task in unusual positions and then usual positions. Progress task complexity and difficulty. Use feedback to improve performance (e.g., error feedback, reward feedback, auditory feedback, electrical biofeedback about specific muscle recruitment regarding time to activation and time to turn off muscle firing; see Figure 22-18). Try to improve inhibition (e.g., turning off unwanted contractions). It is essential to spread the practice over time.
Phase VIII: return to work	Return to work (e.g., preferably part-time progressing to full-time). Even when back to work, maintain activities in phases I, II, and III. Schedule more breaks. Learn to manage new stresses related to work. Incorporate mental imagery and practice to supplement physical practice for the job.

Note: Patients may be working in multiple phases simultaneously. This is interactive training not isolated training

Phases III and IV focus on improving sensory discrimination and somatosensory representations while using imagery to practice the target task without creating abnormal movements. Phases V through VIII focus on motor learning, target task practice, and return to work. Lifestyle changes, health and wellness, and behavioral activities initiated in the early phases not only must continue to be practiced throughout the rehabilitation process but must be continued indefinitely. Ideally, retraining progresses without flaring involuntary movements. Figures 27-13 through 27-18 give examples of some of the sensorimotor training strategies. These sensory motor learning-based techniques are frequently complemented with specific coaching from a therapist, teacher, or coach to improve biomechanics and voluntary motor control.[535–537,541,549]

A variety of other general training techniques have been tried with patients with FHd. These strategies range from fatigue therapy for hyperactive muscles (i.e., repetitively, voluntarily performing a maximum contraction of a muscle

Figure 27-13 Example of sensory discrimination training to improve graphesthesia. Letters, numbers, and designs are written on the skin of the involved hand and digits when the patient with dystonia has the eyes closed; the patient then has to reproduce the stimulus on the exact surface or on a piece of paper.

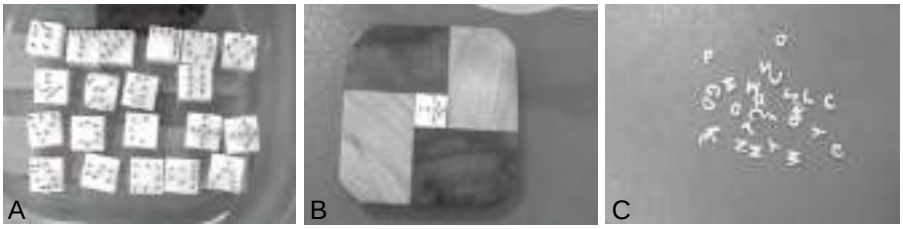

Figure 27-14 Examples of retraining skills at stereognosis. **A**, The Byl-Cheney-Boczai (BCB) test is a test used to evaluate accuracy of stereognosis. Cubes with specific stimuli have been created. **B**, The cube is placed in a holder. The patient has the eyes closed, and the examiner takes the finger across the stimulus twice. Then the cube is covered, and the patient looks at a sheet with all of the different shapes on the cube and tries to identify the correct design. **C**, Alphabet soup letters can be placed on a surface. With the eyes closed, the patient palpates one letter and tries to identify it.

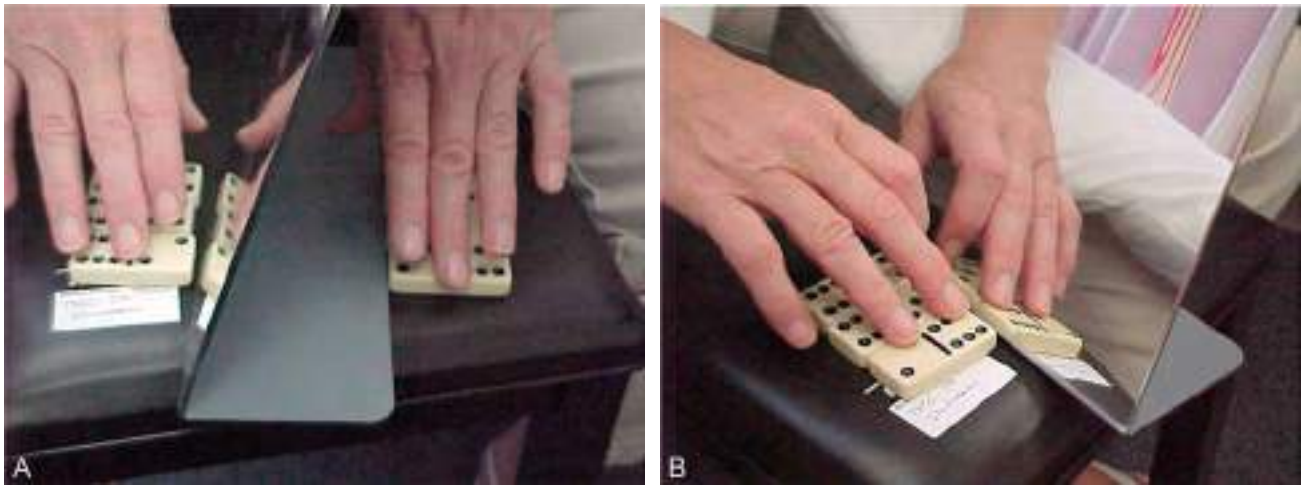

Figure 27-15 A mirror can be used in sensory and perceptual motor learning activities to reinforce normal movement. **A**, The affected hand is put behind the mirror, and the unaffected hand is placed in front of the mirror. The mirror image of the unaffected hand looks like the affected hand. **B**, Watching the mirror image, the patient attempts to manipulate some dominoes placed on both sides of the mirror.

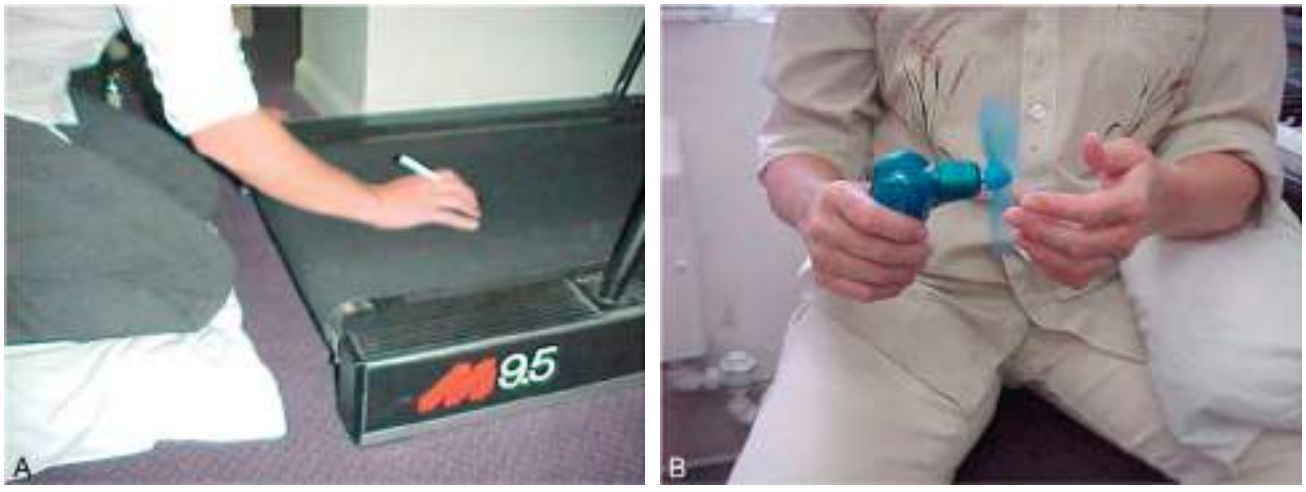

Figure 27-16 Grading movement can be difficult for patients with neural hypersensitivity. When the agonists and antagonists contract simultaneously, performing fine motor tasks is difficult. Creating situations in which a patient has to maintain light contact on a moving object without interfering with the movement of the object can be challenging. **A**, Here a patient is trying to decrease excessive downward pressure and move smoothly by writing while on a moving treadmill. **B**, A patient is trying to lightly touch the plastic fan blades without stopping the blade movement.

until exertion)[526] to general strengthening, flexibility, movement training, and fine motor dexterous skill training.[538] In addition, holistic approaches such as acupressure, acupuncture, dry needling, craniosacral therapy, and hypnosis have also been described, but no specific trials have been reported on using these strategies in isolation with patients with FHd.

Clinical Evidence-Based Research on the Effectiveness of Rehabilitation Strategies for Focal Hand Dystonia

Single-case studies, pre/post test study designs, crossover designs, and small prospective controlled experimental studies have been carried out to evaluate the effectiveness of rehabilitation strategies to enable recovery of task-specific

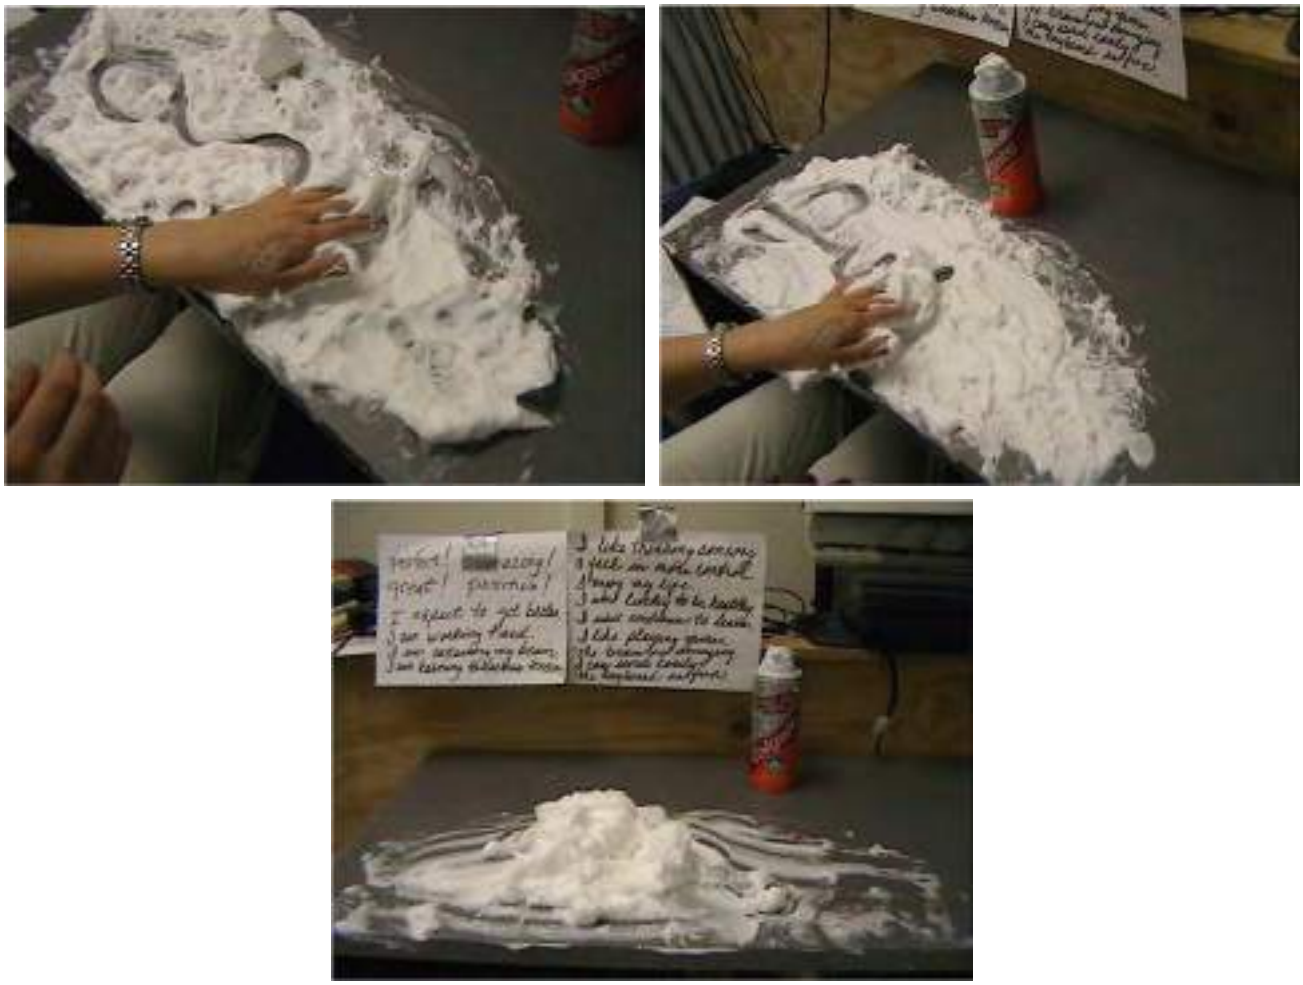

Figure 27-17 When retraining motor skills, increasing or changing sensory inputs may be helpful. In this example, the patient has writer's cramp. She puts shaving cream on a table or a counter and spreads out the shaving cream. First she just practices large movements and then finally practices writing letters and then sentences.

Figure 27-18 Facilitating the functional position of the hand with a palmar pad along with a biofeedback machine with electrodes over the intrinsic muscles helps the patient shape the hand as she begins to retrain her ability to type on a computer keyboard.

function of patients with FHd. Unfortunately, there are no large randomized clinical trials, systematic reviews, or meta-analyses to confirm the efficacy of the results. To date, no intervention strategies have been predicted to be 100% effective to restore normal motor control for patients with FHd. However, there are individuals who describe complete recovery. The strongest measures of validity for learning-based behavioral training are based on the neuroscience evidence of central nervous system plasticity.

Biofeedback: Writer's Cramp. Several controlled studies assessed the effectiveness of biofeedback training for patients with writer's cramp. Patients with writer's cramp heavily grip the pen and push down when writing. The objective was to improve writing frequency and fluency by training patients to reduce grip force and writing pressure, use a modified grip, practice writing,[546,550] and/or combine the strategies.[218,219,544] The research studies confirm that patients can effectively use force biofeedback to reduce grip force and writing pressure.[544,545] The research also confirmed that patients could reduce pen gripping and writing force by using a modified grip and writing practice.[546,547] When combined across studies, the mean effect sizes for improving task performance varied from 2.2 for reducing writing pressure, 2.2 for increasing writing frequency, and 4.52 for improving writing time. The reduction in force could be further enhanced by combining an ergonomic grip with writing practice.[544,545] The improvement in writing could be maintained up to 6 months after training. Interestingly, improvement in fluency and speed of writing was not necessarily specifically correlated with decreased gripping or writing force.[547,548]

In patients with simple and complex writer's cramp, it was assumed that excessive grip force was used in all activities, not just writing.[218,248,548] In a recent well-controlled study by Schneider et al.,[219] the grip force with writing and the dynamic force used when lifting a box were compared between patients with writer's cramp and matched healthy controls. Although the grip force and writing force were significantly greater for patients with writer's cramp, there were no significant differences between the forces used to lift boxes containing different weights.[219] This study raises question about the underlying general state of hyperexcitation with inadequate inhibition in patients with FHd. However, the preservation of the normalcy of the lifting force could also reflect the difference between performing a simple hand task (lifting a box) versus performing precise motor movements.[219]

Imagery. Controlled, randomized trials provide evidence that graded motor imagery can significantly reduce the severity of pathological pain.[517,518,520] Graded motor imagery can also significantly reduce pain associated with an amputation.[522,551] There are no studies confirming graded motor imagery alone significantly improved motor control in patients with FHd. The same is true for mirror imagery. Research using mirror imagery confirms the recruitment of the neurons in the superior parietal lobe during internal representation using a mirror.[514] There is also evidence that mirror training significantly improves function of the upper limb after stroke[515,516] and after amputation in patients with phantom limb pain.[551] Although mirror training is integrated into a variety of learning-based training strategies, no randomized, controlled trials based on mirror training alone were located to confirm effectiveness of restoring voluntary motor control in the case of FHd.

Sensory Training (Braille). In a small pre/post test study, Zeuner et al.[523] provided evidence supporting the benefit of braille reading for patients with writer's cramp. With 10 subjects practicing braille reading daily for 8 weeks, there was a significant improvement in tactile spatial acuity of writing and a decrease in severity of dystonia as measured by the *Fahn dystonia rating scale*. Half of the subjects continued to practice braille reading for up to a year with continued improvement in writing.[524] The patients continued to show improvement and felt their writing was better; however, none achieved full recovery. Sterr et al.[369,525] reported sensory perception changes with braille reading.

CIMT: Sensory Motor Retuning. There is class 1 evidence supporting the efficacy of the original form of CIMT for improving arm–hand activities, the amount of (self-reported) arm–hand use, and the integration of arm–hand movements into functional activities after stroke.[527–530] In general, CIMT improves motor ability and functional use of the affected limb compared with no active therapy or with conventional or dose-matched physical rehabilitation.[526] There is also positive evidence supporting the benefit of this strategy for musicians with dystonia.[531–533] This strategy was found to be more effective with guitarists than with pianists.[532] Sensory motor retuning can also reduce pain in patients with regional pain syndrome.[534] It is important to note that sensory motor retuning, when used for patients with dystonia, integrates a splint for constraint with selective immobilization and release of individual digits instead of a cast.[531–533] The mean effect size of the small studies on sensory motor retuning and reading braille was 1.1 both for improved motor control at the target task and improved fine motor control.

Learning-Based Sensorimotor Training. McKenzie et al.[300] and Byl et al.[336,535–537,549] carried out a series of small clinical studies to gather evidence to confirm the presence of sensorimotor impairments in patients with FHd and to study the effectiveness of LBSMT (i.e., clinical function and cortical remapping). In this series of studies, there was consistency in the eligibility characteristics of the subjects and the LBSMT intervention. The subjects in these clinical studies included controls and patients with FHd (e.g., 20 to 60 years of age, all working in occupations demanding repetitive hand use). The patients with FHd had been diagnosed for at least 6 months and were receiving care from the University of California, San Francisco (UCSF) Peter Ostwald Health Program for Performing Artists or the UCSF Physical Therapy Faculty Practice. Each subject demonstrated (1) observable involuntary twisting movements of the digits and wrist when performing the target or similar task, (2) normal reflexes, and (3) no evidence of objective peripheral neuropathy or central nervous system pathology. None of the subjects had received any injected or systemic drugs to control the dystonia for more than 6 months.

The first two studies were descriptive, with 10 patients with FHd and 10 controls in experiment I and 17 patients with FHd and 15 controls in experiment II. In experiment III (pre/post test design), 12 subjects with FHd received LBSMT twice a week for 3 hours each day for 6 weeks. Gains in performance by patients with FHd were compared with those in 30 controls. Pre/post test experiments IV to VI were intervention studies with one FHd musician with a matched control in experiment IV, 3 FHd cases in experiment V, and 13 subjects (18 hands) with FHd in experiment VI.

All subjects were evaluated at baseline and immediately after treatment by blinded, trained evaluators administering standardized tests (Table 27-15). The outcome variables from the standardized tests[254] were summed into seven dependent variables: (l) physical musculoskeletal performance (i.e., selected ROM, strength, neural tension); (2) sensory discrimination (i.e., graphesthesia, localization, kinesthesia, stereognosis); (3) fine motor efficiency (i.e., Purdue Test time), fine motor skill (i.e., line tracing accuracy and time), and digital reaction time (i.e., averaged across the five digits for each hand); (4) motor control at the target task; (5) posture and balance; (6) functional independence; and (7) pain. In addition, imaging studies were included to understand neurophysiological correlates of clinical performance.

Magnetoencephalography was performed by trained staff in the UCSF Center for Bioimaging and the Department of Radiology.[336] The test–retest value for the magnetic source image (MSI) was high (>0.9).[368] A 37-channel biomagnetometer (Magnes II 4D Neuroimaging, 1.5 fT, San Diego, CA) placed in a magnetically shielded room with two circular sensors (14.4 cm) was used to create a MSI of l cm^2 for 30 milliseconds at 17 to 20 pounds per square inch (PSI) with a pseudorandom interstimulus hold force designed to indent the skin 400 µm. Each digit on each hand was stimulated on the distal pad, the middle segment, and the proximal segment. In addition, a similar stimulus was delivered to each side of the upper lip.

Normal *cutaneous somatosensory evoked field (SEF)* responses were characterized by a peak amplitude at a latency between 30 and 70 msec, subject to a signal-to-noise ratio greater than 4 and goodness of fit (model/data) greater than 0.95, with a minimal confidence volume less than 3000 mm.[336] The dependent variables recorded for each SEF response included latency (in milliseconds); root mean square (rms) amplitude across sensory channels (fT); ratio of amplitude to latency; location of the digits on the *x*-, *y*-, and *z*-axes (in centimeters); spread between digits; order of the digits on the *z*-axis; and volume of the hand representation ($4/3\pi$ times the radius of the spread on the *x*-, *y*-, and *z*-axes).

The results of these studies are summarized in Table 27-15. Descriptively, on both the affected and unaffected arms, subjects with FHd had significantly different neuromusculoskeletal and neurophysiological findings compared with age-matched controls. Clinically, those with dystonic FHd not only had difficulty performing the target task but also had greater problems with balance, postural alignment, finger spread, fine motor control, and sensory discrimination. Compared with controls, the location of the digits on the *x*-axis and the *y*-axis were significantly different in FHd subjects and the digits tended to be clumped in one location rather than sequenced. The ratio of SEF amplitude to latency was higher for FHd subjects compared with controls (Figure 27-19), and the volume of the hand representation was significantly larger on the hemisphere of the unaffected hand compared with the affected dystonic limb. The ratio of the amplitude to latency was positively correlated with the severity of dystonia (i.e., the more severe the dystonia, the higher the ratio). There was a negative correlation between the severity of the dystonia and both fine motor skills and motor control on the target task (i.e., the more severe the dystonia, the greater the compromise of motor skills). A low ratio of amplitude to latency was associated with the worst performance (Figure 27-20). Training was associated with improved amplitude of the somatosensory evoked responses and the sequencing of the digits (Figures 27-21 and 27-22). No changes were reported in the repeated imaging measurements of control subjects.

Attendance at supervised training sessions averaged 85%. No adverse events occurred with training. After LBSMT, subjects significantly improved in clinical performance. In experiment III, significant gains were achieved in motor control, neural tension, and sensory processing but not in strength or ROM. The effect sizes ranged from a mean of 0.72 for motor control to 0.96 for neural tension to 1.03 for sensory processing. In experiment IV, the clinical gains were significant for fine motor control (effect size 0.72), task-specific control (effect size 2.42), and functional independence (effect size 0.38). Posttest musculoskeletal measurements and accuracy of sensory processing were similar to the performance levels of the controls. All but two subjects returned to their previous work. None of the subjects gained 100% of fine motor control of the hand. In the case series in experiment V, the patients with hand dystonia improved the spread of the area of representation on the unaffected side along with improved order of digit and amplitude of magnetic evoked responses for patients with FHd. In experiment VI, subjects performing memory training in addition to supervised LBSMT achieved a higher score on task-specific performance after training (improving from 78.1% to 90%) than subjects performing supervised LBSMT alone (improving from 63.5% to 82%). When followed up 6 months after LBSMT, the subjects maintaining posttreatment skills were those who were partially to fully compliant with home practice.

One-Hand Compensation. The compensatory strategy of playing with one good hand is not uncommon among musicians with focal dystonia, congenital defects, weakness, trauma, or stroke.[509] These adaptations usually

TABLE **27-15**

Summary of Clinical Research Findings on Learning-Based Sensorimotor Training

Parameter	Findings
I. Descriptive Differences: Patients with Focal Hand Dystonia (FHd) and Controls	
A. Neuromusculoskeletal differences (experiment I)[300]	**1.** In experiment I, subjects with FHd (10) performed significantly worse than healthy controls (10) when using either the affected or unaffected side on musculoskeletal tasks, balance activities, postural alignment, fine motor control, and sensory discrimination. **2.** Subjects with severe dystonia demonstrated the following: • Greater restrictions on musculoskeletal skills and target specific motor control • Reduced accuracy in sensory discrimination but faster performance than those with mild dystonia • Better sensory discrimination accuracy on the unaffected side compared with subjects with mild dystonia
B. Somatosensory evoked field (SEF) responses (experiment I and experiment IV)[254,300]	In experiment I (10 subjects and matched controls): **1.** No significant differences were seen between the mean SEF response latency and the mean amplitude for FHd subjects and reference controls. **2.** The locations of the digits on the *x*- (bilateral) and *y*-axes (affected) were significantly different ($p < 0.0001$, respectively), and the ratio of SEF mean amplitude to latency was higher for FHd subjects compared with controls ($p < 0.05$) (see Figure 27-19). **3.** On the unaffected side, the volume of the hand representation was significantly larger for FHd subjects than for controls ($p < 0.05$). **4.** The ratio of SEF amplitude plotted by response latency was significantly lower in the early phase (<100 msec) for the FHd subjects than for controls. **5.** The amplitude was similar for the control subjects and the FHd subjects for the unaffected digits on the affected limb and the digits on the unaffected limb. **6.** There was a bimodal distribution of the mean SEF amplitude plotted by mean latency on the affected side (mean latency ranging from 30-60 msec and the mean amplitude ranging from 20-119 fT). **7.** There was a negative linear trend of amplitude by latency for the digits on the unaffected side for FHd subjects and all of the controls (as the latency increased, the amplitude decreased). **8.** The field evoked firing patterns for controls and those with dystonia (mild and severe) were similar when measured on an unaffected part (i.e., the lip). **9.** Integrating amplitude by latency on the affected limb, those with severe dystonia had a significantly higher amplitude than those with mild dystonia (see Figure 27-20). **10.** Subjects with severe dystonia had a short latency and a high amplitude, and those with mild dystonia had a long latency and a low amplitude (see Figure 27-20). **11.** Bilaterally, the volume of the representation of the hand for those with mild dystonia was larger than the volume for subjects with severe dystonia. **12.** The amplitude of the functional magnetic resonance imaging in the basal ganglia was greater for FHd patients during a motor task than for controls across multiple tasks. **13.** Cortical activity in M1 is greater in patients with FHd than in controls. **14.** Cortical activity in the primary motor cortex (PMC) and the supplementary motor area (SMA) is significantly reduced in patients with FHd when performing a manual task with affected hand. **15.** There is hyperactivity in M2 and hypoactivity in PMC/SMA in patients with FHd compared with controls. In experiment IV (case-controlled study of a healthy musician and a musician with dystonia): **1.** The magnetic field evoked responses in the primary somatosensory cortex of the musician with dystonia had a disorganized pattern of firing with a short latency, excessive amplitude, but decreased density compared with the musician without dystonia (see Figure 27-19). **2.** The location of the digits on the *x*-, *y*-, and *z*-axes were different, with sequential organization compromised in the musician with dystonia compared with the control musician.

TABLE **27-15**

Summary of Clinical Research Findings on Learning-Based Sensorimotor Training—cont'd

Parameter	Findings
C. Correlation of magnetoencephalography (MEG) and clinical performance parameters (experiment II)[336]	In experiment II (17 subjects with FHd [severe and mild] and 15 controls): **1.** High, significant correlations were seen (0.9029 affected and 0.8477 unaffected; $p < 0.001$, respectively) between the severity of dystonia and the SEF ratio of amplitude to latency. **2.** On the affected side, negative correlations were seen between the SEF ratio and the severity of dystonia with musculoskeletal performance, motor control on the target task, and fine motor skills. **3.** FHd subjects with mild dystonia tended to have a low SEF ratio and demonstrated higher performance on these tasks than subjects with severe dystonia. **4.** A significantly negative correlation was seen between fine motor skills and the SEF ratio on the affected side; those with a high SEF ratio of amplitude to latency demonstrated greater inaccuracy. **5.** On the unaffected side, a significant, moderately positive correlation was seen between the severity of dystonia and performance on the target task; subjects with mild dystonia had lower performance scores on the target task.
II. Effectiveness of Learning-Based Sensorimotor Training (LBSMT) Supervised Programs	
A. Patients with musician's cramp (MC) and writer's cramp (WC) experiment (experiment VII)[317]	In a pre/post test design study, 14 with MC and 13 WC participated in 8 weeks of LBSMT. **1.** At baseline, MC patients had a higher level of functional independence and better range of motion (ROM) but less strength in affected upper limb compared with those with WC. **2.** At baseline, subjects with MC demonstrated greater accuracy on graphesthesia, kinesthesia, and localization at baseline. **3.** No differences were noted between groups on motor performance before or after training. **4.** After training, both groups improved in musculoskeletal parameters (physical parameters, sensory processing, and motor control) but initial differences in posture, ROM, strength, graphesthesia, and kinesthesia persisted between groups, suggesting LBSMT must be adapted to the individual.
B. Patients with FHd and controls **1.** Clinical gains (experiment III)[552]	In experiment III: **1.** All subjects (12) improved significantly on all parameters of clinical performance (23%-80%), bringing performance of musculoskeletal parameters (flexibility, strength, postural alignment), sensory discrimination, and fine motor control to the level of healthy controls. **2.** After completing LBSMT, the subjects with FHd scored between 80% and 90% on the target task, but none performed at 100%. **3.** Motor reaction time was similar to that for controls on both the affected and unaffected sides. **4.** Subjects with FHd improved 37%-42% in motor accuracy (performing with the same accuracy as controls but taking more time). **5.** Accuracy improved 25%-50% on sensory tests (similar to or better than controls), but subjects with FHd required more time to perform the tests (66-197 sec compared with 37 sec for controls). **6.** All but two subjects with FHd returned to their previous work, being careful about ergonomics and taking regular breaks. However, some of the musicians did not return to professional performance in the symphony or orchestra.
2. Change in imaging (experiment I and V)[254,535]	Following training in experiment V 3 case series: **1.** Based on repeated magnetic source imaging, there were no changes in the findings for controls, but subjects with FHd improved the topographical somatosensory maps (see Figure 27-21). **a.** On the affected side, the order of the digits (digits 1 to 5) had an inferior to superior progression, but the order was still less distinct in order than controls (see Figure 27-22). **b.** On the affected side, the amplitude of the evoked somatosensory potential, integrated over time, was increased and similar to controls on the affected side. **2.** There was an increase in the spread of the area of representation on the unaffected side.

Parameter	Findings
III. Effectiveness of Home LBSMT Program	
A. Immediately after training (experiment VI)[549]	Crossover study of home program (8 wk), periodic supervision, cognitive training in 13 subjects (18 hands). **1.** Across all subjects, after 8 weeks of task-specific and cognitive training, sensory discrimination and fine motor speed improved 60%-80% (p <0.05). **2.** Task-specific performance improved by 12%. **3.** Fine motor control time improved by 14.6 sec.
B. Six months later (experiment VI)[549]	Follow-up in 6 months (11 of 13 subjects)" **1.** 10/11 returned to work. **2.** 9/11 had 85%-90% task-specific performance **3.** 34% were fully compliant on home program, 53% partially compliant, and 13% noncompliant. **4.** 4%-10% additional improvement in task-specific performance for those fully or partially compliant, but a decrease of 20% score for those noncompliant with home program.

require a multidisciplinary team with adaptations ranging from changing the strings, using a stand to support the instrument, using an orthosis to improve stability or assist movement, reconstructing an instrument, using a toggle key system, using the feet instead of the hands, transforming the sound, changing the composition of the piece, adapting the instrument to play with the unaffected side, using a digital instrument, or using a prosthesis. If a patient decides to use the unaffected hand to perform tasks, it is important for the patients to address the same neurophysiological aggravating factors that challenge repetitive use in order to avoid FHd in both limbs.

Motor Retraining. The effect of motor retraining for patients with FHd was studied by Zeuner et al.[538,539] The hand/arm was immobilized before beginning motor retraining. The purpose of immobilization was to minimize the severity of the dystonia and prime the nervous system for learning. Then patients performed general fine motor training exercises and strengthening and flexibility exercises that were not task specific. They reported a significant decrease in the severity of the dystonia and improved voluntary control. Later work by Schabrun et al.[540] confirmed that motor training was associated with normalization of the representation on the motor cortex.

Retraining Musicians. van Vugt et al.[541] carried out a retrospective descriptive study of musicians who received usual care in a musician's clinic. The rehabilitation strategies from one or more intervention strategies—including physical therapy, occupational therapy, movement classes, coaching on performance, acupuncture, acupressure, massage, biofeedback, neuromuscular simulation, and stress management—to the use of splinting or assistive devices. The outcomes measured included dystonia severity, strength, ROM, and performance; some also had objective kinematic examinations. Some of the musicians were followed for up to 4 years. Of those who responded (about 60% of the musicians who initially enrolled in the clinic), subjective feedback was solicited from a nonstandard questionnaire. Objective measurements taken at the beginning of care were also repeated at follow-up. Only those completing both the initial and follow-up kinematic examination could be included in the analysis of results. The musicians reported significant improvement in motor control and a decrease in the severity of the dystonia. A few musicians claimed they were 100% cured of dystonia. Eighty percent were back to performance but not at the original intensity. Interestingly, the self-reported improvement was not validated by the objective kinematic clinical measurements.[541]

Key Points for Effectiveness of Learning-Based Retraining

- There are no large randomized clinical trials on the effectiveness of behavioral rehabilitative training for FHd.
- Learning-based intervention strategies are effective in improving motor control, with task-specific function recovered to approximately 85% of normal.
- Some patients claim 100% cure, but this is very individual and usually based on testimonials.
- Patients may report greater improvement than documented by standardized, objective kinematic testing.
- Training gains in somatosensory discrimination can bring patients with FHd to a level of performance similar to that of healthy age-matched controls.
- Minimal gains are reported in strength or range of motion.
- Improvement in clinical skills after behavioral training is correlated with neurophysiological improvement as measured by imaging techniques.
- Large, multisite, longitudinal randomized clinical trials are needed to specifically clarify the effectiveness of comprehensive learning-based training strategies (real physical practice and imagery) combined with medications, stress management, positive health behaviors, psychological counseling, biomechanical modifications of practice and performance, and assistive technology.

Patients raise many questions about carrying out behavioral training programs in rehabilitation. At this time, most questions cannot be precisely answered. With continued basic science and clinical research, more objective answers should become available. However, based on individual differences among individuals with FHd, retraining will always need to be matched to each patient.

Questions about Retraining Based on Neuroplasticity

- How long does it take to recover normal movement?
- How long do I need to practice each day?
- How will I know the training is working?
- How many repetitions do I really need to do?
- What if I cannot stop the abnormal movement?
- How do I know if I will recover?
- Do I have to quit doing the target task altogether?
- Can I keep working?
- Do I have to retrain both sides?
- Where can I get more definitive instructions for training?
- How can I find someone in my area to help me?
- Where can I get some resources to help me?

Fortunately, basic science and clinical researchers are trying to provide answers to these questions.

Summary

FHd is a complex movement disorder that affects the hand. This condition may develop as a consequence of genetics, but it can also develop as a consequence of repetitive overuse. This condition may be likely to arise under conditions of stress and repetitive overuse in individuals whose brain is overly adaptive. The condition is associated with overexcitation of some muscles without the ability to inhibit the undesired movements. In both animal and human studies, poor sensorimotor integrative processing has been documented along with a degradation of the somatosensory and motor representations of the hand without signs of local acute inflammation. Clinical studies suggest that patients with FHd have a variety of musculoskeletal and neuromuscular limitations that increase their risks for focal dystonia. Engaging, learning-based behavioral training can lead to objective improvement in clinical function and neural structure. Some researchers also report improved outcomes following general strengthening, flexibility, and ADL training without target specificity. Patients find it difficult to stop the abnormal movements to enable them to focus on retraining. At this time, rehabilitation is rarely 100%. Clinicians do not know whether patients simply cannot stop repeating the abnormal movements, cannot learn to inhibit excessive muscle excitation, or cannot engage sufficient confidence and positive expectations to restore voluntary control. It is also possible that interventions are not adequately adapted to each patient or specific or rigorous enough to fully restore cortical organization and normal voluntary control of movement. Large, longitudinal randomized clinical trials are needed to better define the parameters of intervention and maximize neural adaptation.

Key Points Concerning Focal Hand Dystonia

- There are no clinical tests to rule in or rule out focal hand dystonia (FHd).
- FHd is a multifactorial neurophysiological movement disorder with evidence suggesting aberrant neural learning as a significant risk factor.
- Management is possible; complete recovery is less common.
- Maximizing return of function requires a comprehensive team effort with the patient taking active leadership in learning-based retraining. Randomized trials including neuroimaging and objective clinical performance measurements paired with retraining paradigms will improve our understanding of FHd and effective intervention strategies.

Resources for Patients with Focal Hand Dystonia

A variety of resources are available to help patients who have dystonia. Some organizations have support groups that meet in person. In other cases, it is possible to establish links for online support. In addition, a variety of foundations can help patients find a physician or other team members, including a coach or a teacher (e.g., Dystonia Medical Research Foundation). There are also some Internet-based training opportunities that patients may explore.

  - Anat Baniel, PhD, Feldenkrais teacher has a focus on improving movement dysfunction. Anat Baniel has a center located at 4330 Redwood Highway, Suite 350, San Rafael, CA 94903, 415-472-6622. She offers individual treatment and classes.

CONCLUSION

In U.S. industry, musculoskeletal disorders account for one in three workdays lost as a result of injuries or illness. Strong epidemiological evidence indicates that a major risk factor for the development of WRMSDs of the upper limb is the performance of hand-intensive, repetitive tasks on an ongoing basis. These tasks are often highly repetitive and forceful and require awkward positions and sustained postures. In addition, the jobs may be performed under poor environmental conditions. These factors interact with psychosocial stress, unhealthy lifestyle, and co-morbid medical conditions.

Most of the overuse impairments develop from local tissue microtrauma and inflammation. The local tissue damage can be treated effectively with anti-inflammatory medications, rest, and work modifications. However, chronic pain and movement dysfunction (e.g., neuropathic pain, FHd) can be secondary, centralized complications of excessive overuse of the hands. These problems are difficult to treat.

In these chronic, complex cases of overuse, the individual must carefully evaluate issues related to goals and objectives, lifestyle behaviors, (e.g., exercise, nutrition, sleep, stress management, mental well-being, and other medical problems), positive expectations, and specific learning-based brain retraining. It is essential to restore healthy biomechanical performance, avoid repetitive abnormal movements, improve the accuracy of sensory processing, and modify timing and amplitude of motor outputs. The retraining activities require attendance and careful grading and must be progressive in difficulty, rewarding, fun, and spaced over time. Computerized instrumentation (e.g., goal-oriented, game-formatted learning paradigms) may enhance the effectiveness of brain retraining. Where

possible, training should be supervised and guided but also integrated at home, at work, and in recreational activities.

There is moderately good evidence supporting the effective management of the movement dysfunction in FHd, but only testimonials by a few individuals report a "cure." Given the inherent, neurophysiological risk factors of excessive plasticity, decreased voluntary inhibition, and genetics, the intervention strategies should include a comprehensive, interprofessional team, matching medical management strategies with learning-based training to recover voluntary motor control to enable return to productive performance of target tasks.

CHAPTER 28

Musculoskeletal Developmental Disorders

TOBY LONG, JAMIE HOLLOWAY*

INTRODUCTION

Numerous developmental disorders include musculoskeletal impairments and require the expertise of rehabilitation specialists. Complex musculoskeletal and neurological primary and secondary impairments are present regardless of the pathophysiology. A multidisciplinary team, including the family, coordinates the child's plan of care, with the ultimate goal of maximizing the child's functional potential throughout development. This chapter discusses some of the more common pediatric pathologies and describes the accompanying musculoskeletal impairments.

ARTHROGRYPOSIS MULTIPLEX CONGENITA

Definition and Classification

Arthrogryposis multiplex congenita (AMC), a nonprogressive syndrome present at birth, is characterized by severe joint contractures, muscle weakness, and fibrosis.[1] AMC manifests in various forms, including classic arthrogryposis, or amyoplasia (43%)[2,3]; contracture syndrome (35%); neuromuscular syndrome (7%); distal arthrogryposis (7%); congenital anomalies (6%); and chromosomal abnormalities (2%). Two clinical presentations are seen. In one clinical presentation, the lower extremities are positioned with the hips flexed and dislocated and the knees extended (i.e., jackknifed position) (Figure 28-1), and the child has clubfeet. In the upper extremities, the shoulders are internally (medially) rotated, the elbows are flexed, and the wrists are flexed and ulnarly deviated (Figure 28-2). In the other clinical presentation, the hips are abducted and externally (laterally) rotated, the knees are flexed (i.e., frog-legged), and the child has clubfeet. The upper extremities are positioned in shoulder internal (medial) rotation, elbow extension, and forearm pronation, with the wrists flexed and ulnarly deviated (i.e., waiter's tip) (Figure 28-3).[2]

Etiology, Epidemiology, and Pathophysiology

The reported incidence of AMC is 1 in 3000 to 4000 live births.[2,4,5] Although AMC is nonprogressive, the long-term sequelae are disabling. The exact etiology of AMC is unknown, but it is probably multifactorial. Reported causes include a maternal fever (i.e., greater than 37.8 °C or 100 °F), causing hyperthermia in the fetus; prenatal viral infections; vascular compromise between mother and fetus; and a uterine septum.[2,6] The insult occurs during the first trimester of pregnancy and can result from neurogenic, myopathic, or connective tissue disorders.[6] The neuropathic form of AMC involves degeneration of anterior horn cell causing muscle weakness and consequent periarticular soft tissue fibrosis.[7] Failure of muscle function and joint development in the growing fetus leads to stiffness, joint deformation, and intrauterine joint fixation. The chief pathophysiological mechanism is lack of fetal movement[8]; however, decreased amniotic fluid and intrauterine compression are also cited.[2,5]

Diagnosis and Prognosis

No definitive laboratory studies or procedures, such as amniocentesis or chorionic villous sampling, are available to detect AMC. However, detailed level II ultrasound can identify a decrease in fetal movements, which suggests the diagnosis.

In the embryo, muscle formation proceeds as it typically would; however, during fetal development, fibrous fatty tissue replaces muscle. Histologically, weak muscles show fibrofatty changes. Therefore muscle biopsies and blood tests are done to rule out fatal disorders and to

*The authors, editors, and publisher wish to acknowledge Lorrie Ippensen Vreeman and Zehra H. Habib for their contributions on this topic in the previous edition.

support the diagnosis of AMC. Nerve conduction studies and electromyography (EMG) provide valuable diagnostic information only when the history, examination, and genetic evaluation are unrevealing.[2,9] Children with AMC generally have a positive prognosis. Family support and the severity of the disease, among other factors, however, can influence the prognosis. Sells et al.[10] indicates that by age 5 years, 85% of children with AMC are ambulatory and can perform most of their activities of daily living (ADLs) independently.

Figure 28-2 This 6-month-old boy has the neurogenic form of arthrogryposis. The marked deformities of the ankles and feet are evident, and the infant has flexion contractures of the wrists, elbows, and knees. (From Swaiman KF, Ashwal S, Ferriero DM: *Pediatric neurology: principles and practice,* ed 5, p 1872, Philadelphia, 2012, Elsevier.)

Figure 28-3 **A,** Infant with arthrogryposis multiplex congenita (AMC) with flexed and dislocated hips, extended knees, clubfeet (equinovarus), internally (medially) rotated shoulders, flexed elbows, and flexed and ulnarly deviated wrists. **B,** Infant with AMC with abducted and externally (laterally) rotated hips, flexed knees, clubfeet, internally (medially) rotated shoulders, extended elbows, and flexed and ulnarly deviated wrists. Clinical Manifestations and Primary Impairments

The presentation of AMC varies tremendously. Palmer et al.[11] reported that all four extremities are involved in 90% of all cases.[5] Severely affected body parts include the foot (67%), hip (50%), wrist (43%), knee (41%), elbow (30%), and shoulder (4%).[2] Associated clinical manifestations include hemangiomas, congenital heart disease, absent or decreased finger creases, facial abnormalities, respiratory problems, and abdominal hernias.[2] Additional congenital changes include low-set ears, micrognathia, a high-arched palate, and hypoplastic lungs. Speech and intelligence are unaffected.[5]

Primary Impairments in Arthrogryposis Multiplex Congenita

- Severe joint contractures
- Webbing of the joint
- Decreased muscle bulk and weakness
- Impaired integument
- Diminished deep tendon reflexes
- Clubfeet
- Dislocated hips
- Scoliosis

Medical and Surgical Management

Lower Extremity

The most common foot deformity in the newborn period is clubfoot, the most common form of which is taloequinovarus (TEV). Serial manipulation with casting in this period partially corrects the deformity, but recurrence is common.[2,11] Surgical correction of TEV should be deferred until the child demonstrates pull to stand or ambulatory potential.[2,5] The recommended surgical procedures are posteromedial release (i.e., the lateral border of the foot is shortened, and the medial border is lengthened) combined with elongation of the Achilles tendon.[2,5,12,13] After surgery, mandatory use of ankle–foot orthoses (AFOs) is recommended. In severe cases or if the surgery fails, talectomy may be performed.[14]

Hip subluxation or dislocation can be bilateral or unilateral, and its surgical management is an issue of controversy. The basic premise in surgical correction of dislocated hips is that having mobile, painless dislocated hips is more important than having very stiff located ones.[2] Asif et al.[15] however, suggested that open reduction for bilateral dislocated hips in children with AMC is a suitable option that produces satisfactory results. Along with others, they recommend surgery at an early age for optimum functional outcome.[5] Because high unilateral hip dislocation can lead to severe pelvic obliquity and secondary scoliosis if left untreated, open reduction is essential in these cases.[2,5,16,17]

Knee surgery is reserved for moderate to severe contractures and resistant cases. Posterior capsulotomy and medial and lateral hamstring lengthening are the recommended procedures for young children with a knee flexion deformity of 30° or more.[2,5] Postoperative complications may include posterior subluxation of the tibia and inconsistent muscular response secondary to loss of muscle strength and possible scar tissue formation, both of which may lead to further joint stiffness and recurrence of contracture. A distal femoral osteotomy may be more successful in realigning the knee joint in such cases.[2] Knee extension contractures have a more favorable outcome and are addressed by quadricepsplasty (surgical repair of the quadriceps).[18]

Upper Extremity

If muscle strength and control are adequate, the upper extremities are placed in the optimal position for long-term function and ADLs: one elbow in extension (to reach the perineum), and the other, in flexion (for feeding).[2,5,19] Shoulder range of motion (ROM) usually is adequate for self-care, and surgery is rarely required. The best surgical candidates for tendon transfers of the upper extremity are children older than 4 years of age who have full passive ROM of the elbow in the dominant arm and at least grade 4 muscle strength of the muscle tendons to be transferred.[20] Usually the pectoralis major, triceps brachii, or latissimus dorsi muscle[21] is used in tendon transfers to restore active elbow flexion. Wrist deformities are treated aggressively in infants and young children using passive stretching, serial casting, and custom wrist orthotics.[22] Smith and Drennan,[22] using conservative management, found that children with distal AMC had the greatest improvement in passive ROM, were functionally independent at follow-up, and had no recurrence of deformity. Those with classic AMC had rigid wrist flexion contractures and a 75% incidence of deformity recurrence. Surgical correction of the wrist involves anterior wrist capsulotomy and placement of the wrist in a neutral or slight dorsiflexion position. Long-term protective splinting is required.[5]

Spine

Approximately one-fifth of children and adolescents with AMC have a long C thoracolumbar scoliosis (Figure 28-4).[2] When the curve is less than 30°, the scoliosis is managed conservatively with bracing in ambulators.[23] If the curve progresses, combined anterior and posterior spinal arthrodesis yields the best results.[23]

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

A multidisciplinary team evaluates a child with AMC. The purpose of the initial evaluation is to determine developmental, musculoskeletal, and functional status of the child

Figure 28-4 This child, who has anterior cell arthrogryposis, has had a number of orthopedic procedures. Marked scoliosis and generalized muscle wasting, particularly of the shoulder girdle, are clearly demonstrated. (From Swaiman KF, Ashwal S, Ferriero DM: *Pediatric neurology: principles and practice,* ed 5, p 1872, Philadelphia, 2012, Elsevier.)

to set realistic goals. Photographs and videos, taken every 2 to 3 months for at least 2 years, could be helpful to show appropriate positioning and stretching of the joint contractures and to provide objective documentation.

Baseline goniometry is necessary, including passive ROM and the resting position of each joint, together with active ROM. Functional ROM (e.g., hand to mouth, hand to the top of the head, hand to forehead, hand to ear, and hand to the back of the neck) also should be assessed.[2] In infants and small children, muscle strength is evaluated by muscle palpation and observation of extremity movement against gravity. Gross motor function and developmental milestones should be evaluated.[2] Formal manual muscle testing (MMT) should begin when appropriate; it is especially important to test the strength of the lower extremity extensor muscles because this determines the appropriate level of lower extremity bracing.

Current and potential gross motor skills and functional mobility, including the use of assistive devices and a manual or power wheelchair, should be evaluated. ADL skills, movement patterns, and muscle substitutions must be assessed to establish an intervention plan with the family and the child as active team members. The ultimate goal of intervention is to maximize the child's independence in ADLs and mobility.

Family education, stretching, positioning, thermoplastic serial splinting, strengthening activities through play, promotion of developmental activities, and teaching of compensatory strategies (especially in alternative modes of mobility) form the mainstay of physical therapy (PT) in infancy and early childhood. Stretching needs to be incorporated into the daily care of infants. For example, stretching of the lower extremity can be done during diaper changes. During feeding, bathing, and dressing, both the lower and upper extremities can be stretched. The recommended regimen is three to five sets of stretches per day, with three to five repetitions in each set, and each repetition held for 20 to 30 seconds.[2] Low-load, prolonged stretching is preferred over maximum-load stretching for prolonged periods because the latter may cause skin breakdown and intolerance to splints. For infants with the first clinical presentation of AMC described earlier, prone positioning for the first 3 months is essential to stretch the hip flexor muscles. Children with the second clinical presentation of AMC have more positioning options. These children usually are frustrated with prone positioning because they are unable to prop themselves when placed on a wedge or roll. For these children, Velcro straps should be used to position the hips in a neutral position when the child is supine, and a towel roll should be used along the lateral borders of the thigh when the child is sitting (Figure 28-5). Key to positioning is incorporating the activities into daily caregiving as much as possible.

Splints are adjusted for growth and improvement every 4 to 6 weeks. For the newborn, cock-up splints

Figure 28-5 This child with arthrogryposis multiplex congenita is wearing a wide Velcro band strapped around the thighs to keep the legs in more neutral alignment. (From Donohoe M: Arthrogryposis multiplex congenita. In Campbell SK, Palisano RJ, Orlin MM, editors: *Physical therapy for children,* ed 4, St. Louis, 2012, Saunders.)

usually are provided 3 months after birth. AFOs to correct clubfeet should be worn 22 hours a day.[2] For the first 3 to 4 months, anterior thermoplastic knee flexion splints for extension contractures or posterior knee extension splints for flexion contractures should be worn 20 hours a day.[2] Knee flexion splints should not be worn at greater than 50° of flexion for sleeping, because this may encourage hip flexion. After 4 months of splinting, knee extension splints can be worn for standing activities and sleeping to help stretch the hip flexors; this encourages optimal lower extremity positioning during independent floor mobility.

Maintaining functional mobility is a major goal of intervention; therefore key functional motor skills, such as rolling, hitching on the buttocks, and standing, should be addressed. Strengthening of muscles that help maintain an upright posture is important during the first 2 to 3 years and can be accomplished through developmental play. For example, dynamic trunk strengthening is promoted by having the child manipulate or reach for toys in various positions of sitting or static standing. Standing is an integral component and should begin by 6 to 9 months of age. Standing is initiated in standing frames with the lower extremities held in as optimally correct position as possible with the help of splints and high-top shoes (Figure 28-6). Advantages of standing include self-stretching of the feet, postural alignment, and commencement of ambulation. Promoting a child's ability to assume standing from the floor or sitting should be encouraged at about 6 to 8 months of age if the child is strong enough. Limitations in strength and ROM in the lower extremities are addressed through splinting or bracing. If MMT results are less than fair in the hip extensors (3/5), bracing is required above the hip. If MMT results are less than fair in the knee extensors, bracing is required above the knee.[2,4]

In the preschool period, goals should emphasize ability, improvement of the child's function in basic ADLs, and enhancement of independence in mobility and ambulation with minimal bracing and assistive devices. Gait assessment includes evaluating distance, use of assistive devices, speed, symmetry of step length, and any gait deviations. Children with adequate strength and ROM generally require AFOs while walking to prevent recurring clubfeet deformities. Articulating AFOs may be more desirable and appropriate than static AFOs because they provide forefoot control, allow ankle dorsiflexion, and stretch the hindfoot during gait. Ideally, the least amount of bracing should be used; however, if less bracing causes the child to use assistive devices (i.e., walker, crutches, or canes) that previously were not required, then increased bracing is acceptable. Assistive devices can be customized with thermoplastic material to allow for less awkward handgrips. Forearm supports and other modifications can be added to walkers and other assistive devices when required (Figure 28-7).

Figure 28-6 Child with arthrogryposis multiplex congenital using a stand frame. (From Donohoe M: Arthrogryposis multiplex congenita. In Campbell SK, Palisano RJ, Orlin MM, editors: *Physical therapy for children,* ed 4, St. Louis, 2012, Saunders.)

Figure 28-7 Thermoplastic forearm supports can be customized to the walker for a child with arthrogryposis multiplex congenita. (From Donohoe M: Arthrogryposis multiplex congenita. In Campbell SK, Palisano RJ, Orlin MM, editors: *Physical therapy for children,* ed 4, St. Louis, 2012, Saunders.)

Shoes may need external wedges to compensate for hip and knee flexion contractures.[2] Children learning to walk may be limited in their independence if they do not have adequate strength and ROM to manipulate assistive devices. Walkers can be cumbersome and less energy efficient for such children, who typically have inadequate protective responses to falls. Power mobility may be the most energy-efficient means of ambulation for such children. Although walking should be encouraged, it may be more functional to introduce power mobility as soon as possible. Intellectual or learning disabilities are rarely seen in children with AMC, thus, children should be encouraged to interact with their peers as much as possible and participate in community activities. Power mobility may provide a means for independence and socialization.

Families may need assistance in identifying and removing architectural and environmental barriers that impede their child's independence at home. The child should be encouraged to interact with nondisabled peers in school and to participate in extracurricular activities, such as swimming classes. Additional educational and therapy services are essential at this stage to maximize the child's potential.

OSTEOGENESIS IMPERFECTA

Definition and Classification

Osteogenesis imperfecta (OI) is an inherited disorder of connective tissue characterized by increased bone fragility.[24–29] The bone fragility is secondary to decreased bone mass, disturbed organization of bone tissue, and altered bone geometry. OI comprises several distinct syndromes and is genetically heterogeneous with a range of clinical presentations.[30] According to the Osteogenesis Imperfecta Foundation, there are currently eight types of OI. The most severe forms of OI are types II, III, VII, and VIII. People with types IV, V, and VI tend to have more moderate symptoms. People with type I tend to have mild symptoms. The classification system is based on clinical, genetic, and radiological findings.[4,30,31] Table 28-1 differentiates the most common characteristics of the eight types of OI.

Etiology, Epidemiology, and Pathophysiology

In most cases, OI is caused by mutations in one of the two genes encoding type I collagen; the result is a qualitative

TABLE **28-1**

Types of Osteogenesis Imperfecta

Type	Severity	Characteristics
I	Mild	• Most common and mildest type of osteogenesis imperfecta • Few obvious symptoms • Normal or near-normal height; average or slightly shorter than average stature compared with unaffected family members but within the normal range for age
II	Most severe	• Possible infant death within weeks from respiratory or heart complications • Numerous fractures and severe bone deformity at birth • Small stature with underdeveloped lungs and low birth weight
III	Severe	• Progressive bone deformity • Fractures at birth; x-rays may reveal healed fractures that occurred before birth • Short stature • Barrel-shaped rib cage • Spinal curvature and compression fractures of vertebrae
IV	Moderate	• Mild to moderate bone deformity • Spinal curvature and compression fracture of vertebrae • Barrel-shaped rib cage
V	Moderate	• Similar to type IV in appearance and symptoms • Large hypertrophic calluses at fracture or surgical procedure sites • Restricted forearm rotation caused by calcification of the membrane between the radius and ulna • Mutation not in the collagen pathway • Dominant heritance
VI	Moderate	• Extremely rare; similar to type IV in appearance • Distinguished by a characteristic mineralization defect seen in biopsy samples of bone • Mutation not in the collagen pathway • Recessive inheritance
VII	Severe	• Recessive inheritance
VIII	Very severe	• Similar to type II but with recessive inheritance • Severe growth deficiency and under mineralization of the skeleton

and quantitative defect in collagen synthesis.[24,27–29] The incidence of OI is reported to be 1 in 20,000 to 30,000 live births,[4,25,28] and the prevalence is 16 per 1 million.[25] The defect in collagen synthesis results from an abnormality in the processing of procollagen to type I collagen, which leads to brittle bones. It affects the formation of both endochondral and intramembranous bone. The collagen fibers fail to mature beyond the reticular fiber stage.[25] Osteoblasts have normal or increased activity but fail to produce and organize collagen. Osteocytes are relatively abundant, but intracellular matrix is deficient.[25]

Diagnosis and Prognosis

The diagnosis of OI is made primarily from clinical and radiographic findings. No definitive laboratory tests exist to identify OI. In severe OI, the child is born with multiple fractures sustained in utero or during the birth process; these children have a high mortality rate. Infants and children with moderate OI are identified after they experience several fractures from light trauma or a fracture of unknown origin at a young age. In milder forms of OI, pathological fractures occur late in childhood. Joints are hypermobile, and the lower extremities are severely malaligned. Muscle strength is normal in type I OI except in the periarticular muscles of the hip joint; children with type III OI have decreased muscle strength around the hip joint.[25] Developmental progress depends on the type and severity of OI.[4] Milder presentations of OI need to be differentiated from multiple fractures sustained through child abuse.[26,32] Other differential diagnostic conditions include juvenile osteoporosis and rickets.[32]

It is important to note that the classification system does not predict functional outcome, particularly in children with the moderate types of OI (IV, V, and VI). Disuse, weakness, and osteoporosis secondary to immobilization may affect function.[31] Factors that affect independence and mobility include joint contractures, muscle weakness, and endurance capabilities, especially in the child with severe OI.[4]

Clinical Manifestations and Primary Impairments

The clinical features of OI are extremely variable and depend on the type and severity of the disorder. Primary impairments include bone fragility, short stature, scoliosis, defective dentinogenesis, blue sclerae and tympanic membrane, lax ligaments, weak muscles, failure of postnatal growth, and multiple, recurrent fractures sustained from minor or no trauma.[25,32] Bones are diffusely osteoporotic and have thin cortices and an altered trabecular pattern.

Long bones have narrow diaphyses; therefore bowing and resultant deformity are common. Lack of weight bearing in the long bones leads to a honeycomb pattern of ossification. The metaphyseal and epiphyseal areas of long bones show popcorn calcifications secondary to fragmentations of cartilaginous growth plates.[25] The pelvis has a trefoil shape, and protrusio acetabuli (protrusion of the femoral heads through a shallow acetabulum) is common secondary to repeated fractures.[25,32] Osteoporotic vertebrae fracture easily, resulting in a flattened, biconcave shape.[25]

Malformed ribs cause respiratory compromise, and ligamentous laxity results in an increased incidence of joint dislocation. Dentinogenesis imperfecta results in soft, translucent, brownish teeth. Umbilical, inguinal, and diaphragmatic hernias are common.[25,32] Metabolic abnormalities have also been reported in individuals with OI, including increased sweating, heat intolerance, elevated body temperature, and resting tachycardia and tachypnea.[32]

Medical and Surgical Management

Improvements in medical care of respiratory tract infections and orthopedic management have led to better outcomes for children with OI.[25] No effective medications are available to strengthen skeletal structures and reduce or prevent fractures.[25] Recently, the use of bisphosphonates (specifically pamidronate) has been associated with increased bone mineral density and ambulation, decreased bone pain and fracture incidence, improved vertebral shape and mass, greater cortical width, increased cancellous bone volume, and suppressed bone turnover.[24,33,34] Letocha et al.[33] in a randomized, controlled trial of intravenous pamidronate every 3 months in 18 children with OI types III and IV, found a significantly decreased fracture rate in the upper extremities, but not in the lower extremities, during the first year of treatment. Gross motor function, growth improvement, muscle strength, ambulation, and pain did not change significantly. The researchers concluded that for infants with severe OI, cyclical IV pamidronate is beneficial. Munns et al.[34] compared clinical and histomorphometric outcomes between children with OI who had received pamidronate since infancy and age-matched children who had not. They found that cyclical pamidronate treatment started in infancy led to improved bone strength, better gross motor function, and markedly suppressed bone turnover. New areas of research include gene therapy, cell replacement of the mutant gene, bone marrow transplants, and mutant allele suppression.[25]

The major purposes of intervention with children with OI are the treatment of acute fractures and maintenance of mobility and ambulation. Treatment of fractures is difficult because of the structural abnormality of bone and the vicious cycle that occurs with fractures: osteoporosis leads to a fracture, which leads to immobilization, which leads to disuse osteoporosis and further fracture. Therefore every effort is made to limit immobilization to prevent exacerbation of osteopenia. Fractures usually heal within the standard length of time, but the resultant callus is large and of poor quality. Immobilization is necessary

for pain relief and proper alignment and can be achieved through the use of splinting, thermoplastic materials or orthoses, a hip spica cast, posterior or anterior shells, or casting.[4,25] Complications of fractures include malunion, angulation and bowing of long bones, and joint contracture and disruption of the physis (i.e., growth plate), leading to asymmetrical growth and deformity. The fracture rate usually declines after puberty.[25]

Multiple corrective osteotomies combined with insertion of intramedullary rods are the most successful means of fixation of long bones in OI.[25,35,36] Advantages of intramedullary fixation include prevention of further fractures through the provision of internal support and prevention of bowing of the long bones. Indications for stabilization with rods include multiple recurring fractures and an increase in long bone deformity that interferes with the fit of orthoses and impairs function.[25] The child's age and the type of bone involved determine the type and timing of surgery.

The type of rod used depends on the type and severity of fractures. Solid rods are not advisable for children with OI because bone growth occurs beyond the ends of the rod, necessitating reoperation, which poses an increased risk of respiratory complications secondary to the use of anesthesia.[25] The extensible intramedullary rod accommodates growth and is the preferred choice. It is used most frequently for the femur but also can be used for the humerus, tibia, and bones of the forearm.[25] The major disadvantage of an extensible intramedullary rod is rotation and migration of the device. Postoperative casting and orthoses may be required.[25]

Spinal deformities, including scoliosis and kyphosis, occur in 50% of people with OI secondary to osteoporosis and vertebral compression fractures.[25] Kyphoscoliosis, present in 20% to 40% of people, can be progressive over the lifetime,[37] further compounding short stature and interfering with function. The most common curve is a thoracic scoliosis. The spinal curves are not amenable to conservative bracing, because the ribs cannot withstand the mechanical forces.[25,32] Spinal stabilization is achieved through early spinal fusion at a 40° curve to halt the progression, maintain function, and prevent respiratory complications.[32]

Bracing allows children to stand and walk earlier than would otherwise be possible.[38] Orthoses usually are used in conjunction with standing frames and parapodiums to increase the child's mobility and ambulation. Children with less severe forms of OI become good household and short distance ambulators with the use of braces.[38] Children usually are fitted with hip–knee–ankle–foot orthoses (HKAFOs) once they begin to develop balance and pull to stand. Children who do not attain independent sitting but have good head control are fitted for standing frames. Children who do not develop independent functional ambulation should be provided with a manual or power wheelchair. As seen with other children with complex motor disabilities, early introduction of power mobility may increase opportunities for mobility, as well as community activities and socialization.

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

Before starting an examination, clinicians should be knowledgeable about the child's medical history and past and present fractures. They also should know the types of immobilization used. Active ROM at the hips, knees, ankles, and elbows can be measured with a standard goniometer moved through observable ROM. Passive ROM testing is contraindicated, but assessment of functional ROM is recommended. As mentioned previously, muscle strength is assessed in infants by observing the infant's movements against gravity and by palpating contracting muscles. A gross motor developmental evaluation also should be performed to assess delays in motor milestone achievement secondary to frequent fractures and muscular weakness. The parents should be instructed in the use of appropriate equipment for seating and transporting the infant, and independent mobility should be encouraged.

Goals for infants with severe OI are to prevent deformities of the head, spine, and extremities; avert cardiopulmonary compromise by avoiding constant positioning in the supine position; and maximize the child's ability to move actively.[4] Detailed instructions on proper positioning and handling of the child during dressing, bathing, feeding, and playing are a critical component of the home management program for children with OI. An infant with severe OI may be carried and held on a standard-size pillow.[4,25] The head and trunk must be fully supported, with the arms and legs draped across the supporting arm of the caregiver (Figure 28-8).[25] Parents are instructed to avoid overdressing the child to reduce excessive sweating, and they are encouraged to use loose clothing with front and side Velcro closures to facilitate dressing and undressing. For diapering, the infant should be supported through the buttocks and rolled off the diaper rather than lifted by the ankles.[25]

Infant carriers need to be modified to support the head and trunk adequately. Bathing should be done in a padded plastic basin. Supported side-lying with towel rolls or prone positioning on a soft wedge are optimal positions from which to encourage active movements of the child (Figure 28-9). If the child is placed supine, care should be taken to support the arms and keep the hips in a neutral position with the knees over a towel roll. Optimal positioning ensures protection from fractures and minimizes joint malalignment and deformities. The child's position should be changed frequently and should not restrict active spontaneous movements because these movements promote muscle strengthening and bone mineralization.[25]

Promoting sensorimotor development is an ongoing component of the management of infants and children

Figure 28-8 **A,** In handling a young child with osteogenesis imperfecta, support the neck and shoulders and the pelvis with your hands; do not lift the child from under the arm. **B,** Placing the child on a pillow may make lifting and holding easier. (From Myers RS: *Saunders manual of physical therapy practice,* Philadelphia, 1997, Saunders.)

with OI. Comfortable play positions can promote developmental activities; "prone on a roll," for example, allows weight-bearing use of the arms with co-contraction of the shoulder musculature and promotes active control of the neck and the back extensor muscles. Other developmental activities, such as rolling and supported sitting, should be encouraged as tolerated. When the infant attempts to roll over, the arm should be placed alongside the head. Supported sitting is accomplished with seat inserts or corner chairs.[25] Upright supported sitting usually begins on a parent's lap with a pillow. When head control is achieved, short-sit and straddle activities using a roll, bolster, or caregiver's leg can be started. These activities promote equilibrium responses and protected weight bearing for the lower extremities. A **pull-to-sit maneuver is contraindicated**; instead, the child should be supported around the shoulders when attempting to sit up. Clinicians and parents should support the child through the trunk and pelvis when promoting trunk control.

Pool exercises may begin as early as 6 months. The goal is to promote active movements and weight bearing in the water. Families can be taught pool exercises that can be incorporated into bath time. The child should be supported adequately in a neck and trunk flotation device when in the pool and should wear long-sleeved clothing, because it distributes the absorbed water weight evenly over the length of the limb and thus provides a resistive component to the active movements in water.[25]

An important goal of rehabilitation for the preschool age OI child is preventing or remediating functional limitation and reduced immobility that may have been caused by the initial impairment. Other goals include exploring opportunities for multiple safe modes of mobility, formal gait training in parallel bars with orthoses, and family or parent education. In the preschool period, primary impairments include bone fragility, joint laxity, and decreased muscle strength. Secondary impairments include disuse atrophy and osteoporosis secondary to fracture immobilization.[25] If children walk without adequate support at this stage, further bending or bowing of the long bones will occur, the most common type being femoral anterolateral bowing and tibial anterior bowing. The latter can be controlled with

Figure 28-10 Child with osteogenesis imperfecta using long leg braces and a reverse walker. (From Bleakney DA, Donohoe M: Osteogenesis imperfecta. In Campbell SK, Vander Linden DW, Palisano RJ, editors: *Physical therapy for children,* ed 3, Philadelphia, 2006, Saunders.)

appropriate orthoses and assistive devices, such as modified canes, crutches, and walkers (Figure 28-10). Maintaining socialization and participation in activities with peers is crucial, thus, alternative mobility such as powered mobility should be considered as early as possible.

Rehabilitation in the preschool period also emphasizes adequate upright control, protected weight bearing, self-mobility for enhanced independence, and proper positioning, handling, and transferring. The focus eventually shifts to the child's active participation in self-care and safe independence.[25] Active exercise continues to be emphasized to increase muscle strength, especially for the hip extensors and abductors.[4,25] This is achieved through developmental play techniques, such as straddle roll or bolster activity, in which the child attempts sit to stand with the physical therapist supporting the child's pelvis. The activities can be progressed by using a lower roll or bolster.

An aquatic exercise program has excellent therapeutic value because it offers the opportunity to socialize with peers, to improve cardiorespiratory status, and to bear weight in a protected environment. Aquatic therapy is a safe method of strengthening muscles through the resistance and assistance of water.[25] The clinician can grade progression of exercise by using the buoyancy effect of water to assist weak movements. Exercises can be modified with floats. Pool sessions should be limited to 20 to 30 minutes. The water temperature and the child's activity level should be monitored closely, because an elevated water temperature increases body temperature and thus metabolism, which already is elevated at rest in children with OI. Overall, pool therapy may break the cycle of further disuse and secondary complications from immobilization.

The degree of ambulation attainable varies greatly for preschool children. Ambulation often is introduced at the deep end of the pool, where the child usually is immersed in water up to the neck region. This affords protected weight bearing with gradual progression to shallow water. Guidelines[39] to promote walking, include providing support at the pelvis from the front; practicing weight shifting sideways, backward, and forward; and progressing to walking forward.[25]

On land, unsupported standing is not encouraged because it leads to rapid bowing of long bones. Usually, standing frames and prone standers are used in conjunction with splints and orthoses, especially for children with moderate to severe OI. The first brace usually is the HKAFO without the knee joint and with a pelvic band because this helps lock the hips and minimizes femoral rotation.[25] Knee joints may be added later as the child and the limb grow and strength increases. The child graduates from using standing frames to orthoses to ambulating in knee–ankle–foot orthoses (KAFOs) or long leg braces with the knees locked in full extension. Progression from parallel bars to various walkers or crutches may or may not be achievable for children with moderate to severe OI. Customized mobility devices should be considered for children who are unable to ambulate and explore their environment adequately. Power mobility should be encouraged if the child has good head and trunk control and the cognitive ability to operate such devices.[25]

DOWN SYNDROME

Definition and Classification

Down syndrome (DS), or trisomy 21, is the most common chromosomal disorder arising from faulty cell division. This atypical cell division results in 47 chromosomes instead of the usual 46.[40] The three types of DS are nondisjunction, translocation, and mosaicism. Nondisjunction occurs in 91% to 95% of affected children; in this form, an extra small chromosome is present on the twenty-first pair of chromosomes. Translocation occurs in 3% to 4% of affected children; in this type of DS, two nonhomologous chromosomes break, and the broken pieces subsequently reattach to other, intact chromosome pairs. Mosaicism occurs in 1% of affected children; it is a mixed type of DS in which some body cells exhibit trisomy 21 and others are do not.[41] In such cases, physical and cognitive impairments correlate with the percentage of cells that have abnormal chromosomes.[41] DS is characterized by reduced brain volume, increased risk of atypical or abnormality in every body organ, and delays in all developmental areas.[40]

TABLE **28-2**

Neuropathological and Cytological Findings and Physical Characteristics in Down Syndrome

Neuropathological and Cytological Findings	Physical Characteristics
• Decreased weight (76% of normal) • Microcephaly (abnormally small head, underdevelopment of brain) • Decreased anterior-posterior diameter • Microbrachycephaly (small short head, droopy eyelids, cleft lip) • Changed convolutional pattern • Decreased number of secondary sulci • Lack of myelination of nerve fibers in the precentral areas and frontal lobes of the cerebral cortex • Structural abnormalities of the dendritic spine of the pyramidal neurons of the motor cortex • Decreased synaptogenesis (synapse formation) • Decreased number of pyramidal neurons in the hippocampus • Increased neurofibrillary tangles • Increased senile plaques	• Flat contoured face • Depressed nasal bridge with narrow openings • Narrow eyes with slightly slanted eyelids • Epicanthal folds • Micrognathia (underdeveloped jaw) • Narrow palate • Protuberant tongue • Small hands and feet • Inward curved fifth finger • Simian crease across the palm • Short toes and a gap between the first and second toes • Plantar furrows and marmoration of the skin • Short neck • Low-set ears with folded over helices • Down-turned mouth • Lax skin

Pathology

Table 28-2 presents the major neuropathological and cytological findings in the brains of children with DS,[42] as well as common physical characteristics.[40,42]

Etiology, Epidemiology, and Diagnosis

The etiology of DS is unknown, but advanced maternal and paternal age often are cited as a risk factor.[40] The incidence rate is reported to be 1.3 to 1.5 per 1000 live births,[41] and the occurrence is 700 to 800 live births.[41] There are more than 400,000 people living with DS in the United States. DS occurs in people of all races and economic levels. The incidence of births of children with DS increases with the age of the mother. But because of higher fertility rates in younger women, 80% of children with DS are born to women under 35 years of age.

Multiple options are available for prenatal detection of DS, all with varying sensitivity and specificity. First trimester choices include sonographic measurement of nuchal translucency (NT); first trimester serum screening (FSS) for free β-human chorionic gonadotropin (hCG) and pregnancy-associated plasma protein-A (PAPP-A) levels; and combination of serum and sonographic screening (NTSS). Second trimester choices include quadruple serum screening (QUAD), which includes maternal serum α-fetoprotein (AFP), hCG, unconjugated estriol, and dimeric inhibin-A; the integrated combined test (ICS), which includes NTSS and the QUAD screen; integrated serum-only screening (ISS), which includes FSS and QUAD; and sequential screening (SEQ) in which NTSS and QUAD are performed and reported serially.[42,43] Postnatal detection begins with suspected physical findings at birth (see Table 28-2), with follow-up karyotype testing to confirm the diagnosis (Figure 28-11).

Prognosis

Individuals with DS have varying degrees of developmental delays and intellectual disabilities. Most people with DS have a mild to moderate degree of intellectual disabilities. Life expectancy for people with DS has increased dramatically from 25 in 1983 to 60 years of age today.[41]

Musculoskeletal Impairments and Other Impairments

Children with DS experience a wide range of medical problems, such as seizures (5% to 6%), leukemia, thyroid dysfunction, delayed or incomplete sexual development, and intellectual disability.[26,42] Neuromuscular impairments include hypotonia with ligamentous laxity, slow reaction time,[40] and deficits in postural reactions.[44] Cardiopulmonary impairments include congenital heart defects (35% to 50%), most commonly atrioventricular (AV) canal defects and ventriculoseptal (VSD) defects; lung hypoplasia; and pulmonary hypertension.[42] Sensory deficits include hearing loss secondary to narrow eustachian tubes; frequent ear infections; otitis media; and visual defects, such as strabismus, especially esotropia (inward turning of one eye), astigmatism (difficulty focusing the eyes), nystagmus (involuntary rhythmic movement of the eyes), cataracts, myopia (nearsightedness), and Brushfield's spots (pinpoint white or light yellow spots) on the iris.[26,42]

Musculoskeletal impairments include linear growth deficits, joint hypermobility, and ligamentous laxity secondary to hypotonia.[40,45] Ligamentous laxity is a hallmark

Figure 28-11 **A,** Newborn with trisomy 21 (Down syndrome). **B,** Adolescent girl with Down syndrome. (**A** from Leifer G: *Maternity nursing,* ed 11, St. Louis, 2012, Saunders. **B** from Rodman R, Pine HS: The otolaryngologist's approach to the patient with Down syndrome, *Otolaryngol Clin North Am* 45:599-629, 2012.)

characteristic of DS and results in orthopedic impairments such as pes planus, scoliosis, patellofemoral instability, and genu valgum, among others.[45] Scoliosis becomes a problem for the older child during growth spurts and usually is treated with Dwyer instrumentation with or without spinal arthrodesis. Knee problems are associated with foot problems and interfere with ambulation.[46] Genu valgum is associated with joint laxity and if persistent can lead to chronic patellar dislocation; the latter, however, does not seem to interfere with function.[46]

Approximately 18% of individuals with DS have atlantoaxial instability (AAI), described as a large space with excessive motion between the atlas (C1 vertebral body) and axis (C2 vertebral body).[47] According to Gajdosik and Ostertag,[48] AAI can be caused by ligamentous laxity (specifically of the transverse odontoid ligament); bony anomalies; trauma, including surgical procedures; and upper respiratory tract infections. Cremers and Beijer[49] assessed general laxity and atlantoaxial distance in 172 children with DS and found no significant correlation between the two measures. Most children with AAI are asymptomatic,[50] and only 1% to 2% have symptoms of spinal cord compression caused by the enlarged space and consequent excessive motion of the atlas on the axis.[50] Many children with DS who have documented AAI also have atlanto-occipital subluxation (AOS), which is associated with AAI and probably results from ligamentous laxity.[51] Therefore radiographs obtained to screen for AAI should be carefully studied for AOS.

Other developmental anomalies of the cervical spine seen in individuals with symptomatic AAI include atlanto-occipital fusion, hemivertebrae, narrowing of the vertebral disc, ossification of atlanto-occipital ligaments, and spondylosis.[48]

Gait abnormalities in children with DS include a wide-based gait with the hips externally (laterally) rotated and the knees in valgus and flexion with the tibias externally (laterally) rotated. The feet are advanced with the medial longitudinal arch leading.[52] Parker and Bronks[53] and Parker et al.[54] reported that children with DS at 5 to 7 years of age exhibited longer stance periods, decreased hip extension, and early hip extension near the end of swing. They also reported decreased ankle sagittal plane rotation and exaggerated abduction of the swing limb for foot clearance in the 7-year-olds. The 5-year-olds showed a longer support phase, shorter step length, greater hip and knee flexion, and a more extended position of the ankle at contact.

Orthopedic concerns include AAI[48]; AOS[51]; foot deformities,[55,56] especially flexible flat foot (pes planus); scoliosis[57]; patellar instability[58,59]; hip subluxation or dislocation[60]; juvenile idiopathic arthritis[58]; and gait abnormalities.[53,54] Clinicians serving children with DS should be aware of the soft neurological signs (e.g., motor control abnormalities, sensory function integration, sensorimotor integration) that may present in children who are symptomatic for AAI.[47,61] If soft neurological signs are noted, immediate referral to a neurologist is mandatory.[50] The

role of the clinician in AAI is to serve as a resource for the family regarding education in risk, precautions, and screening recommendations and appropriate medical follow-up.

Soft Neurological Signs of Atlantoaxial Instability

- Areflexia
- Gait changes
- Brisk deep tendon reflexes (hyperreflexia)
- Headaches
- Heel cord tightness
- Incoordination
- Increased muscle tone
- Spasms of neck muscles
- Neck pain
- Neurogenic bladder
- Torticollis
- Scissoring gait
- Reluctance to move the neck
- Progressive myelopathy

Precautionary Measures for Atlantoaxial Instability

- Positions and activities that increase the risk of falling or of trauma to the head and neck should be avoided.
- Exercises that place excessive pressure on the head and neck (e.g., tumbling) should be avoided.
- Exaggerated neck flexion, extension, or rotation should be avoided.
- Caution must be used with joint approximation and compression of the cervical spine.
- Sports such as trampoline jumping and the butterfly stroke in swimming, as well as contact sports, are contraindicated, especially for individuals with documented atlantoaxial instability.

Medical and Surgical Management

Medical management of DS is directed toward specific medical problems (e.g., cardiac problems, infections, thyroid dysfunction) to maximize the child's health. Medical management also focuses on the previously mentioned orthopedic concerns.

Signs and symptoms of spinal cord compression resulting from AAI include changes in gait, torticollis, neck pain, or bowel and bladder incontinence. The American Academy of Pediatrics recommends a cautious sequence of evaluation and treatment when AAI is suspected.[62] The child must be at least 3 years of age to have vertebral mineralization and epiphyseal development for accurate radiographic evaluation of the cervical spine. When a child is symptomatic (e.g., neck pain, gait changes, hyperreflexia), plain cervical spine x-rays are taken in the neutral position. If there are no abnormalities when taken in neutral, measurements from lateral radiographs are taken in flexion and extension. If abnormalities are present in neutral referral to neurosurgery is immediate.

The use of orthoses is usually successful for children with pes planus.[56] Selby-Silverstein et al.[55] found that a decrease in rear foot eversion was obtained with neutral position orthoses in children 3 to 6 years of age. Compared with children without foot orthoses, children who wore sneakers and foot orthoses showed a decrease in gait angle with greater internal (medial) rotation, which narrowed the base of support and facilitated a more neutral alignment of the hip.

Approximately 30% of children with DS develop spontaneous hip dislocation at 2 to 10 years of age.[63] The hip is retroverted with excessive external (lateral) rotation both in flexion and extension, resulting in an out-toe gait.[63] If left untreated, spontaneous habitual dislocation after age 2, chronic subluxation with acetabular dysplasia, and fixed dislocation follow. Although a standard surgical protocol has not been established, a common surgical choice is pelvic or femoral osteotomy combined with capsular plication carried out during the habitual dislocation phase.[61]

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

The general goal of rehabilitation is to maintain alignment and encourage movement promoting optimum musculoskeletal development in children with DS. Prevention of anticipated or potential malalignment in the foot and hip region and prevention of instabilities of the atlantoaxial joint are also a focus of intervention. General goals can be achieved through the use of (1) aligned compression or weight-bearing forces to stimulate bone growth longitudinally and promote thickness and density of the bone and shaft; (2) aligned, supported weight bearing to encourage joint stability and formation; and (3) facilitation of co-contraction, force production, and increased muscle tone to support joint integrity.[45]

Clinicians should always monitor the neurological status of children with documented AAI. As recommended by the American Academy of Pediatrics, children with radiological findings indicating neck instability and/or symptomatic subluxation should be surgically fused.[62] The treating clinician, however, is responsible for performing periodic neurological evaluations, paying particular attention to deterioration of gait and fine neuromotor skills and the child's development during high risk periods (e.g., after surgery or during upper respiratory tract or ear infections). Regression in the child's neuromotor skills and the onset of atypical neurological symptoms should be "red flags," and appropriate referral to the neurologist is imperative.

Parent education also is an essential part of intervention. It includes information on symptoms of neurological compromise in AAI, periods of increased risk, and activities to avoid if AAI is identified. When discussing

the issues of participation in sports, clinicians should follow the recommendations of the Committee on Sports Medicine and Fitness of the American Academy of Pediatrics.[64]

Some activities may put undue stress on the cervical spine, placing the child at risk for atlantoaxial subluxation. Care must be taken when placing a child in the inverted position or in positions that increase the risk of a fall or trauma to the head. Msall et al.[65] documented developing spinal cord compression over a period of 1 year in a child with DS who received therapy that involved repetitive, vigorous head turning. Therefore exaggerated neck flexion, extension, or rotation movements and repetitive forceful twisting and turning of the head should be avoided.

Screening for scoliosis should be a routine part of life span management for children with DS. Parents should be taught to perform routine screening for scoliosis.[45] Biomechanical assessment of lower extremity and orthotic management, especially for pes planus, should be done on a regular basis. The functionality of the child's shoe can be enhanced by incorporating an orthotic device that is either prefabricated or custom-made to further limit pedal pronation.[46,56]

Promoting a more neutral alignment of the lower extremity during gait is also an intervention focus. Tripping and falling, which may result from a wide-based gait, can be reduced by improving the child's anterior-posterior stability. This can be accomplished by having the child wear high-top sneakers that extend up over the ankle and have rigid, flat soles.[46] Orthopedic assessment of the hip (Ortolani's and Barlow's maneuvers)[26] is a routine part of the clinical evaluation of an infant with DS (see volume 1 of this series, *Orthopedic Physical Assessment,* Chapter 11), and the child should be referred to an orthopedist if hip instability is suspected. Supported standing in a stander is not recommended unless hip stability and proper alignment have been established.[45]

CONGENITAL MUSCULAR TORTICOLLIS

Definition and Classification

Congenital muscular torticollis (CMT) is a postural deformity, usually detected at birth or shortly thereafter, that is caused primarily by unilateral shortening and fibrosis of the sternocleidomastoid (SCM) muscle.[66] The incidence of CMT ranges from 0.3% to 2% of newborns, but it has been reported to be as high as 16%.[67] Although CMT with impairment of the SCM muscle is the most common cause of torticollis in infants, torticollis can also be the result of other underlying disorders. The congenital and developmental causes of torticollis have been classified as osseous, nonosseous, and neurogenic.[68,69] A forceful birth delivery can cause clavicular fracture or brachial plexus injury (BPI), both of which can lead to torticollis.[70]

Pathology

A **pseudotumor** (i.e., a firm, moveable, benign mass) frequently is present in CMT. It is a firm, nontender enlargement of the muscle belly most commonly found in the middle to distal third of the sternal portion of the SCM muscle.[71,72] If the mechanism of injury involves a crush or stretch injury to the SCM muscle, the pathophysiology can include ischemia and reperfusion and possibly hematoma leading to a compartment syndrome. Over time, this can result in the development of scar tissue, leading to muscle shortening and pulling of the head into the typical position (Figure 28-12).[70] Neurological injury to the SCM muscle also is possible, in which damage to nerve fibers causes muscle fiber degeneration and fibrosis of the muscle body.[70] The typical lesion ranges in size from 1 to 3 cm (0.4 to 1.2 inches) in its largest transverse diameter.[73] However, after reaching maximum size, the mass generally recedes at varying rates within the first year, and in most children, resolves slowly over 5 to 21 months.[73,74]

Etiology, Epidemiology, and Diagnosis

The etiology of CMT remains unknown, but many theories have been proposed, including intrauterine crowding,[75,76] muscle trauma during a difficult delivery,[77,78] soft tissue compression that leads to compartment syndrome,[79] and congenital abnormalities of soft tissue differentiation within the SCM muscle.[71,80] The diagnosis usually is made during a physical examination when a palpable, firm,

Figure 28-12 Typical appearance of right muscular torticollis in an 18-month-old boy. (From Graham JM: *Smith's recognizable patterns of human deformation,* ed 3, Philadelphia, 2007, Saunders.)

mobile mass[81] is noted in the muscle, along with abnormal head posture, restricted cervical ROM, or plagiocephaly (i.e., malformation of the skull).[66,81] Children with CMT can be assigned to one of three clinical subgroups. **Postural CMT (type 1)** is the mildest form of CMT and presents as an infant's postural preference with no muscle or passive ROM restrictions. With **muscular CMT (type 2)**, SCM muscle tightness and passive ROM restrictions are present. **Type 3 CMT** presents with a fibrotic thickening of the SCM muscle and accompanying passive ROM limitations and is the most severe form.[67,71,82–85]

Prognosis

The chance of full correction with therapy and conservative management is excellent if intervention is initiated within the first 3 months of life, and it remains high if treatment is initiated within the first year of life.[70] When conservative treatment is started before 1 month of age, 98% of children achieve near-normal ROM within 1.5 months; however, waiting until after 1 month of age prolongs intervention to 6 months, and waiting until 6 months of age increases treatment to up to 9 or 10 months.[67] The correction of facial and cranial deformities also is much more successful if the torticollis is corrected before 1 year of age.[70] About 5% of children require surgical intervention, especially if therapy is not initiated early. More invasive procedures are reserved for persistent plagiocephaly and limited ROM after 1 year of age.[70] According to Cheng et al.,[73] predictors of fair to poor outcomes include (1) the presence of a SCM tumor; (2) an initial degree of head rotation greater than 15° from neutral; and (3) age older than 1 year at the time of initial treatment.[81]

Musculoskeletal Impairments and Other Impairments

CMT is characterized by persistent cervical lateral flexion to the involved side with rotation to the opposite side, resulting in limited ROM in lateral flexion toward the uninvolved side and rotation toward the involved side (see Figure 28-12).[26,70] The child has limited muscle extensibility of the shortened and fibrosed SCM muscle and a weakened, overlengthened contralateral SCM muscle.[70] Skewed vertical and midline orientation can result and affect the child's body awareness, midline control, and protective righting reactions, as well as the development of bilateral fine and gross motor skills.[26] The incidence of developmental hip dysplasia associated with CMT is reported to be 2.5% to 17%, and it increases with severity of neck rotation restriction.[67] Secondary impairments can include compensatory cervical and thoracic scoliosis, facial asymmetry, and plagiocephaly. Plagiocephaly is reported in up to 90% of children with CMT and can occur either in conjunction with torticollis at birth or as a result of the torticollis.[85] When plagiocephaly and torticollis coexist in the newborn, limitation of the intrauterine space is the suspected cause.[86] Plagiocephaly also can result from torticollis, because the unilateral shortening of the SCM muscle causes the infant to position the head consistently on the occiput contralateral to the tight SCM muscle while unloading the occiput on the ipsilateral side when supine. Craniofacial asymmetry also can result from torticollis.[78] These deformities include posterior displacement of the ipsilateral ear, posterior regression of the ipsilateral zygoma and forehead, mandibular deviation toward the affected side, inferior positioning of the affected eye, and deviation of the nasal tip to the affected side.[78] Functionally, the limited ROM may interfere with daily routines of dressing and positioning.[26]

Medical and Surgical Management

The initial examination should begin with a careful history to detect coexisting conditions and rule out other diagnoses, such as congenital cervical vertebral anomalies, infection, inflammation, and neoplasms.[85,87] Recommendations for the use of diagnostic procedures, such as radiographs, vary among authors. Ballock and Song[88] published a useful decision tree for differential diagnosis of young children with torticollis. Clinical practice guidelines for management of positional skull deformities in infants are available in the December 2011 issue of *Pediatrics*.[89] An ultrasound examination of the hips is often performed in the first 4 to 6 weeks of life because of the high incidence of hip dysplasia in children with CMT.

Although surgery is the most recommended treatment for residual torticollis after failure of a conservative stretching program, injections of botulinum toxin (Botox) are becoming a more common treatment.[81] Botox is thought to enhance the effectiveness of stretching on the side of the contracture and allow strengthening of overstretched, weakened muscles on the opposite side of the neck.[81] Oleszek et al.[90] reported that 74% of children had improved cervical rotation or head tilt after Botox injections after initial failure of a conservative stretching program and only 7% experienced transient adverse effects. Although initial studies are favorable, more long-term studies are needed to further examine the effectiveness, side effects, and adverse effects before it can be approved.[67]

Surgical intervention is reserved for children older than 12 months of age who have persistent torticollis and significant deformity despite conservative treatment.[70,91–96] Davids et al.[79] used a criterion of greater than 30° loss in ROM, usually with lateral flexion or significant plagiocephaly.[70] An alternative criterion reported for surgical intervention is the presence of residual deficits in rotational ROM of greater than 15° after at least 6 months of controlled manual exercises.[73,85] Surgical treatments to lengthen tight SCM muscles include unipolar release,[73,85] bipolar release,[68] endoscopic release,[97] and subperiosteal lengthening.[96] Postoperative splinting may be necessary, and PT typically is recommended.[70]

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

When examining a child diagnosed with CMT, the clinician must be aware of all possible causes and differential diagnoses. A complete history should be documented, including other significant medical information, such as the presence of hip dysplasia, type of delivery, and birth weight and length, as well as records of radiographs and previous interventions.[70] ROM should be assessed, including resting head position, active and passive cervical rotation, and lateral flexion. The primary method of estimating active ROM in young infants is through active head turning during visual tracking as the infant reaches for toys or during head righting reactions.[70,98] The **Muscle Function Scale**[99] is recommended to objectively measure active lateral flexion in infants older than 2 months. The most reliable and valid method for assessing passive cervical ROM in infants involves the use of an arthrodial protractor, as described by Cheng et al.[85] It is suggested that the normal passive range of cervical rotation is up to 110° to each side for infants.[73] Neck flexor and lateral flexor strength can be assessed during pull-to-sit and lateral head righting reactions, respectively, and documented as complete, incomplete, symmetrical, or asymmetrical (Figures 28-13 and 28-14).[70] Inspection of the neck for asymmetrical skin folds and skin condition, as well as palpation of all superficial cervical muscles, is necessary to discover the sources of abnormal head and neck posture.[66] The SCM muscle should be palpated for a lump or tightness, and its size, as well as other physical characteristics, should be documented.[70] Postural assessment should include the entire spine.[74] The hips should be evaluated for any asymmetries or dislocations.[66,70] Any facial asymmetry or plagiocephaly should be documented and described. Photographs are helpful for assessing change over time and for descriptive purposes.[70,72] In addition, pain or discomfort at rest and during active and passive movement should be assessed using the **Face, Legs, Activity, Crying and Consolability (FLACC)** scale.[67] Findings such as suspected hip dysplasia, skull or facial asymmetries, atypical presentations of CMT, abnormal tone, visual abnormalities such as nystagmus, or history of acute onset are considered red flags and warrant consultation with the primary care physician or other appropriate specialists.[67]

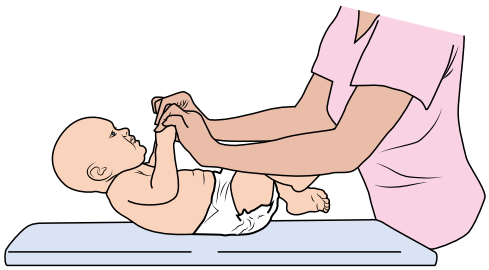

Figure 28-13 Head is kept in line with the body during pull to sit. (Redrawn from Martin S, Kessler M: *Neurological interventions for physical therapy*, ed 2, St. Louis, 2007, Elsevier.)

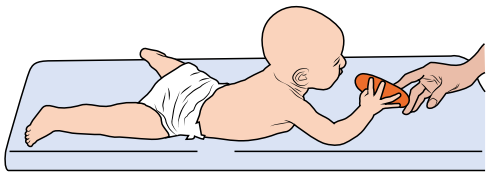

Figure 28-14 Lateral righting reaction. (Redrawn from Martin S, Kessler M: *Neurological interventions for physical therapy*, ed 2, St. Louis, 2007, Elsevier.)

Gross and fine motor development should be screened for age appropriateness because underlying impairments of muscle force may be revealed in the assessment of motor skills. Motor skill development should be assessed using age-appropriate, reliable, and valid standardized tools such as the **Test of Infant Motor Performance (TIMP)**[100] through 4 months corrected age and the **Alberta Infant Motor Scale (AIMS)**[101] from 4 to 18 months of age.[67] Challenging the infant in various positions with varying resistance to gravity can reveal muscle weakness. Any problems associated with feeding should be identified and documented, and positioning for feeding should be assessed.[66] The infant should be examined for tolerance to all developmental positions, active movement in these positions, the ability to transition between positions, tolerance to handling, and infant–parent interaction. It also is important to assess family routines and the positions of the infant throughout the day and during all daily activities to plan a therapeutic positioning program.[66]

Intervention is guided by the infant's age, the severity of the torticollis, the parents' ability to perform the exercises and repositioning procedures, the diagnosis of plagiocephaly, and the presence of associated neuromuscular or orthopedic impairments.[70,102] If deformational plagiocephaly (flattening of one side of skull) or torticollis is present, the first priority is to begin an aggressive repositioning program.[66] If facial or cranial deformities are noted but have not been diagnosed, the infant and family should be referred to the pediatrician for evaluation and assessment of treatment, including a helmet, bracing, or surgery.[26]

Conservative management of infants with CMT consists of positioning, gentle ROM, and strengthening through activation of head and trunk muscles as the infant gains control of upright postures.[102,103] Goals of the clinician should include active and passive ROM of the neck and trunk within functional limits, prevention of contractures, craniofacial symmetry, age-appropriate postural reactions, gross motor development, midline head and neck control in the upright position, and family education about home therapy.[103,104]

Families should be educated in handling, stretching, and positioning techniques, as well as activities that encourage midline head and trunk control. The home exercise program of stretching, strengthening, and positioning should be simple and comfortable and should be incorporated into the daily child care routines.[70] Parents should be educated about the importance of their involvement, basic anatomy of the area, kinesiology of the SCM muscle, and avoidance of painful stretching.

They should be provided with a home program with written instructions and pictures of appropriate exercises.[70]

Manual stretching is the most common form of treatment for CMT and should be performed when the child is relaxed.[71,73,75,85,94,102] Distractors such as toys, music, or pictures can improve the child's tolerance of handling.[26] Although proper stabilization and handling are vital, the stretching program must be modified for family and child comfort to be successful. The method of stretching is determined by the severity of the torticollis, the child's age and tolerance of handling, and the parents' ability to carry out the stretching program.[103] The greatest stretch to the SCM muscle is obtained when the neck is placed in the extended position. Reported stretching protocols vary from a 1-second stretch to a 30-second stretch repeated 5 to 15 times per session and throughout the day. The commonly accepted home stretching program focuses on attaining a sustained stretch into cervical lateral (side) flexion and cervical rotation for at least 30 seconds, repeated 10 to 15 times per session, four to six times per day.[105] A combined stretch of rotating the child's head toward the involved side and tilting away from the involved side also is suggested for the same duration and frequency. Authors agree that *stretches should not be painful* and should be carried out by the parents and caregivers throughout the day.[70,81,92] If necessary, the intensity of the stretch should be reduced to prevent pain and muscle guarding.

Stretching and strengthening exercises should be consistent and age appropriate, and they should be carried out through carrying, holding, and playing with the infant in postures and positions selected to achieve the desired active and passive movements. Strengthening and active motion can be accomplished through postural reactions, visual tracking, and righting reactions as the infant matures and gains better control of the head and trunk.[70] Gravity can be used both to assist weak muscles and to increase resistance as muscles gain strength.[70]

Parents should be given instructions on activities that encourage active ROM on the involved side and facilitate strengthening of the weakened, overlengthened muscles on the opposite side. Activities could include weight-shifting on a ball or lap or using a mobile surface to help the caregiver elicit a combination of lateral cervical flexion and rotation. Another position to elicit head righting is use of the football carry, in which the child is held around the upper trunk and tilted to the side in front of a mirror.[70] The clinician and family must remember that righting reactions can be delayed or incomplete in an infant with CMT. Environmental changes, such as arranging the child's crib and changing table to promote turning of the head to look at caregivers and stimulating active head turning in response to toys or sounds, also can be effective. Towel rolls or small, soft collars can be used to prevent the child's head from falling passively into the shortened direction. Symmetrical head lifting can be encouraged by placing the infant prone on the elbows or over a small towel roll on the caregiver's chest and encouraging the infant to look up at caregiver.[26] Cervical orthoses have been used as treatment adjuncts for children whose lateral head tilt is 6° or greater at 4.5 months of age.[70] A major role of the physical therapist is to support parents and caregivers in performing the exercises, stretching protocols, and positioning.

The most commonly used collar in children with torticollis is the tubular orthosis for torticollis (TOT) collar.[95,102,106] The TOT collar is adjusted to support the neck on the impaired side in the neutral position and is worn only during waking hours. The collar is not used for children younger than 4 months of age.[102,103]

Positioning to create symmetry and prolonged stretching in varying positions provides the opportunity and incentive for the child to perform active ROM. The side-lying position can provide a prolonged cervical stretch. Also, after the child is asleep, the head can be rotated toward the tight SCM muscle by using a towel folded like a wedge to hold the head in place.[70]

Bottle- or breast-feeding can be another preferred time to stretch, and the child can be slowly moved into positions he or she normally may resist. Symmetry of the head, neck, and spine should be achieved in all positioning devices.

Guidelines for monitoring and discharge from therapy are not well defined.[73,81] The clinician should continue to follow up and reexamine, to identify any additional exercises or information that should be given to the family, and to adjust goals appropriately. The family and multidisciplinary team determine the appropriate time for reducing the intensity and frequency of therapy sessions and ultimately for discharge. Caregivers should be informed that the torticollis posture can reappear during periods of growth, illness, teething, and acquisition of new motor functions.[103] Furthermore, the involved SCM muscle may not grow at the same rate as the uninvolved side, creating another risk for the return of contracture.[75]

BRACHIAL PLEXUS INJURY

Definition and Classification

The brachial plexus is a group of nerves that includes the four lower cervical roots, C5-C8, and the first thoracic root, T1. These nerves exit through the anterior vertebral foramen and pass under the clavicle to innervate the upper extremity (Figure 28-15). Any traction of the upper extremity or distraction of the head away from the clavicle can result in a brachial plexus injury (BPI).[107]

In approximately 46% of cases, **Erb's palsy,** a condition involving the upper trunk including the C5 and C6 nerve roots, is at fault.[108] A combination injury of the upper plexus can occur, with injury to the C7 nerve root and occasionally associated damage to the phrenic nerve at the C4 nerve root, which causes ipsilateral hemiparesis of the diaphragm.[109] In about 20% of cases, the entire plexus is injured, including the C5 to T1 nerve roots.[107,109–111] In about 4% of cases, the injury is bilateral, and about 2% of cases show pure lower trunk injury, including the

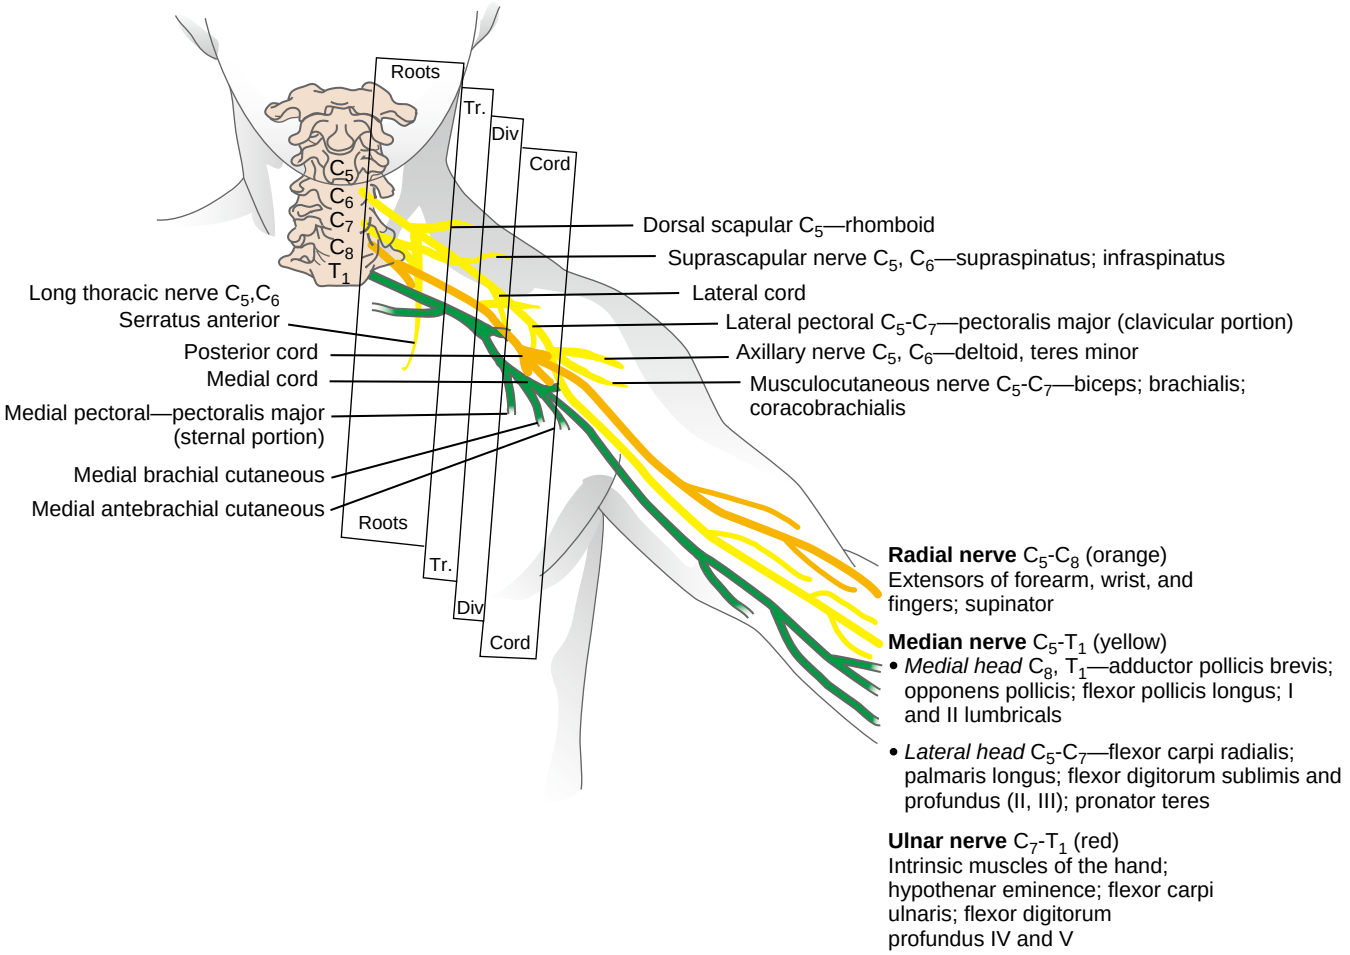

Figure 28-15 Relationship of the brachial plexus to the peripheral nerves of the shoulder and arm. Note the formation of the brachial plexus from nerve roots of spinal segments C5-T1. The brachial plexus is divided into roots, trunks, divisions, and cords. The origin of the peripheral nerves and their muscle innervations are listed. The median nerve has a lateral head from the lateral cord (C5, C6, C7) and a medial head from the medial cord (C8, T1). The ulnar nerve also arises from the medial cord, and the radial nerve comes directly from the posterior cord. (From Swaiman KF, Ashwal S, Ferriero DM: *Pediatric neurology: principles and practice,* ed 5, Philadelphia, 2012, Saunders.)

C8 to T1 nerve roots (i.e., **Klumpke's palsy**).[107,109–111] Narakas[112] and others have attempted to categorize this clinical continuum into four categorical groups.[111,113]

Clinical Continuum of Brachial Plexus Injury

Group 1	• Mildest clinical group • Classic Erb's palsy with involvement of C5-C6 nerve roots • Initial absence of shoulder abduction and lateral rotation, elbow flexion, and forearm supination
Group 2	• Group 1 impairments with involvement of C7 nerve root • Absence of wrist and digital extension (classic "waiter's tip" posture)
Group 3	• Flail upper extremity without Horner's syndrome
Group 4	• Most severe clinical group • Group 3 impairments with Horner's syndrome • May have associated phrenic nerve palsy, resulting in an elevated hemidiaphragm

Pathology

BPI can be described as (1) neuropraxia (Sunderland I), or a stretch injury that results in a temporary nerve conduction block; (2) axonotmesis (Sunderland II-IV), or varying degrees of rupture of the neural axon in which the neural sheath remains intact but internal elements are disrupted; (3) neurotmesis (Sunderland V), or complete rupture of the axon and the encapsulating connective tissue; and (4) avulsion, in which the nerve roots tear away from the spinal cord. The nerve rootlets, mixed nerve roots, trunks, divisions, cords, and peripheral nerves all can be damaged by any of these injuries. A neuroma (a benign, often painful growth of neuron and nerve fibers arising from nervous tissue) may result from a partial or complete rupture.[107,109,110]

Etiology, Epidemiology, and Diagnosis

The incidence of brachial plexus injuries is 1.6 to 3 per 1000 live births. The different rates can be attributed to obstetric care and the average birth weight of infants in

different geographical regions. [109,111,114] Numerous risk factors and other complicating factors are associated with BPI.[109] For example, upper trunk ruptures are more common with vertex delivery and dystocia involving the shoulder.[111] C5-C6 nerve root avulsions are common with breech presentations. Entire plexus involvement can result from a combination of stretching, rupture, and avulsion injuries, and this condition generally is more severe.

Risk Factors for Brachial Plexus Injury and Other Complicating Factors

- Large for gestational age
- Multiparous pregnancies
- Previous deliveries resulting in brachial plexus injury
- Prolonged labor
- Vertex delivery
- Assisted and difficult deliveries
- Maternal diabetes
- Sedated, hypotonic infant during delivery
- Shoulder dystocia
- Heavily sedated mother
- Breech delivery and difficult cesarean extraction
- Congenital anomalies (e.g., cervical rib, abnormal thoracic vertebrae, shortened scalenus anticus)

Physical examination of the muscles associated with nerves arising near the ganglion can help determine whether the lesion is preganglionic or postganglionic. A preganglionic lesion is suspected with Horner's syndrome (involvement of the sympathetic nerve chain), an elevated hemidiaphragm (involvement of the phrenic nerve), and the absence of rhomboid (dorsal scapular nerve), rotator cuff (suprascapular nerve,) and latissimus dorsi (thoracodorsal nerve) function.[111] Invasive radiographic studies with myelography, myelography plus computed tomography (CT), and magnetic resonance imaging (MRI) also have been used to distinguish between avulsion and extraforaminal ruptures.[111,115] Although these techniques may improve the quality of preoperative planning, the final diagnosis of avulsion or rupture is still made during surgery.[111] EMG and nerve conduction velocities have been used in an attempt to improve diagnostic accuracy with regard to the severity of the neural lesions.[111,112] Unfortunately, the presence of motor activity in a muscle has not been an accurate predictor of an acceptable level of motor recovery in that muscle.[111] Currently, neurophysiological studies appear to underestimate the severity of the injury and falsely provide optimism about recovery.[111]

Prognosis

It is important to determine whether the level of injury is preganglionic or postganglionic to predict the prognosis and determine the appropriate intervention.[111] Preganglionic lesions are avulsions from the cord that do not spontaneously recover. An infant with a severe avulsion injury probably will have a lifetime of disability despite extensive PT and surgical management.[111] Although recovery usually is limited after ruptures, the prognosis after axonotmesis is better because neurons reconnect more successfully through the intact neural sheath. Axon regrowth proceeds at approximately 1 mm per day, and recovery usually takes 4 to 6 months in the upper arm and 7 to 9 months in the lower arm. Recovery can continue for up to 2 years in the upper arm and up to 4 years in the lower arm.[109] Spontaneous recovery is expected over the first several months of life, and complete recovery is evident by the first year of life with neurapraxic lesions.[109]

The recovery of motor function varies greatly because of the wide variety of lesions. Furthermore, the recovery of sensation can take up to 2 years.[109] The spontaneous recovery rate for brachial plexus injuries in infants has been reported to be from 66%[116,117] to 73%.[118] The prognosis is poorer with C5-C6-C7 involvement.[111] Phrenic nerve involvement increases the likelihood of an avulsion injury and limited spontaneous recovery.[111]

Many studies have reported on the natural history of brachial plexus injuries. It is suggested that infants who recover partial antigravity upper trunk muscle strength during the first 2 months of life should show full recovery over the first 1 to 2 years of life.[108] Microsurgical reconstruction of the brachial plexus is indicated for infants who do not recover antigravity strength by 5 to 6 months of age because successful surgery results in a better outcome than natural history alone. Infants who have partial recovery of C5-C6-C7 antigravity strength at 3 to 6 months of age have permanent, progressive limitations of motion and strength.[108] These infants also are at risk for the development of joint contractures in the affected limb, which can lead to permanent functional limitations.

Musculoskeletal Impairments and Other Impairments

The most common impairments associated with Erb's palsy are paralysis of the rhomboid, levator scapulae, serratus anterior, subscapularis, deltoid, supraspinatus, infraspinatus, teres minor, biceps brachialis, brachioradialis, and supinator muscles. Therefore, the shoulder usually is held in extension, medial (internal) rotation, and adduction with elbow extension and forearm pronation. Although grasp function is intact, sensory loss usually is present.[109] If C7 is involved, impairments include paralysis of the elbow extensors and the long extensors of the wrist, fingers, and thumb, resulting in the classic "waiter's tip" posture described earlier (Figure 28-16). [109,111] Klumpke's palsy involves paralysis of the wrist flexors and extensors and the intrinsic muscles of the wrist and hand. Clinically, hand grasp is poor, although more proximal muscles are intact.[107] Total plexus injuries can be devastating. The infant presents with a clawed hand and a flail and insensate arm.[107,109] BPI frequently results in shoulder weakness,

Figure 28-16 Erb's palsy caused by a birth injury. The arm position is characteristic. The arm is adducted, with the humerus internally (medially) rotated, the elbow extended, the forearm pronated, and the wrist flexed. (From Shenaq SM, Bullocks JM, Dhillon G: Management of infant brachial plexus injuries, *Clin Plast Surg* 32:79-98, 2005.)

contracture, and joint deformity. The initial trauma during labor may cause muscular or periarticular injury, leading to myostatic contracture and glenohumeral capsular and ligamentous tightness. Infantile glenohumeral dislocation occasionally occurs during birth trauma.[111]

Commonly, shoulder abduction and lateral (external) rotation weakness from failure of neuromuscular recovery, in conjunction with muscular and periarticular tightness, lead to a medial (internal) rotation and adduction contracture. Abnormal muscle substitutions, muscle imbalance, and persistence of soft tissue contracture during neural regeneration frequently result in progressive abnormal bone growth and glenohumeral joint deformity.[115,119,120] Waters[111] described five grades of deformity progressing from minimal to severe deformity (Table 28-3).

TABLE **28-3**

Five Grades of Brachial Plexus Injury[112]

Class	Description
I	Normal glenohumeral joint: <5° difference in glenoid version compared with contralateral side
II	Increased glenoid retroversion
III	Posterior glenohumeral subluxation with posterior glenoid dysplasia
IV	Development of a false glenoid
V	Flattening of the humeral head and glenoid

These glenohumeral joint deformities complicate the already limited motion, strength, and function of the upper extremity. Other common contractures of the upper extremity include scapular protraction, shoulder extension, and wrist and finger flexion. Additional complications of absent or abnormal sensation may lead to neglect, and injuries to the skin often go unnoticed.[109]

Functional limitations vary greatly, depending on the extent of the initial pathology, nerve regeneration, and resulting secondary impairments.[109] The primary functional limitations involve reaching and grasping, manipulation of objects, and bilateral hand use; all of these affect the child's participation in learning ADLs.[109] Resultant delayed motor activities may include getting into and out of positions over the involved side, protective extension using the involved side, and delayed balance reactions. Creeping may be delayed or replaced by scooting, and some children progress straight into walking at an appropriate age.[109] Significant functional limitations in hand-to-head, hand-to-mouth, and overhead activities may result from persistent shoulder weakness and contracture. As a result of fatigue, the child also may have difficulty placing and maintaining the hand at a desired location in space and therefore, may maintain the affected limb at the side and refrain from using it.[118]

Medical and Surgical Management

Management focuses on maintaining the full passive ROM of the upper extremity to prevent myostatic and periarticular contractures. A gentle home program should begin when the child is 7 to 10 days old, and a formal therapy program should follow. Abduction and lateral (external) rotation splints have been used, but compliance can be poor. Zancolli expressed concern that these splints may increase the risk of injury to the physis and developing joint.[120,121] Botox injections have been used to reduce the contracting muscle forces.[122,123] The use of splints, spica casts, electrical stimulation, and intensified therapy after Botox injection have all been advised; however, currently no evidence is available to guide the clinician on the indications for and expected outcomes of these treatments.[111]

The spectrum of nerve surgery includes neurolysis, neuroma resection with nerve grafting, and nerve transfers.[124] The most recent information suggests that neurolysis alone should be viewed as having little therapeutic benefit.[125,126] The current microsurgical standard of care is resection of the neuroma and nerve grafting in extraforaminal ruptures.[125] Sural nerve grafts are performed in upper trunk ruptures,[127] and nerve transfers in conjunction with nerve grafting are performed using the thoracic intercostals (T2-T4), with or without a band of the spinal accessory nerve (cranial nerve [CN] XI) in the case of segmental avulsions.[112,128] Nerve transfers are the only option in total plexus avulsions and may include the intercostal, spinal accessory, phrenic, cervical plexus, contralateral C7,

or hypoglossal nerve.[129–135] In each microsurgical case, the plan is individualized according to the extent of injury and the available reconstructive options.[111]

Although most authors use the timing of specific motor function recovery and the absence of motor recovery as indications for surgical intervention, the timing of microsurgical intervention is very controversial. The most common criterion is the absence of return of biceps muscle function associated with total plexopathy and Horner's syndrome, or an upper trunk lesion. However, shoulder lateral (external) rotation and forearm supination have been reported to be more accurate predictors of full recovery than elbow flexion.[116] Surgical reconstruction of an avulsion is recommended before or at 3 months of age. Reconstruction of extraforaminal ruptures is performed between 3 and 9 months of age; however, the range for repairs cited in the literature is 1 to 24 months.[136,137] It has been suggested that microsurgery improves function and increases the possibility of future secondary tendon transfers that may improve the clinical situation.[111]

Ultimately, the best time for microsurgical intervention is unknown in the case of an extraforaminal rupture, and it often depends on the surgeon's bias toward timing.[111] Regardless of the timing, it is important that the parents understand that microsurgery rarely results in perfect ROM, strength, posture, and function.[111] Most children require secondary shoulder tendon transfers and possibly osteotomies to improve function.[111] Indications for surgical intervention at the shoulder include infantile dislocation, persistent medial (internal) rotation contracture, limitation of abduction and lateral (external) rotation function with plateauing of neural recovery, and progressive glenohumeral deformity.[111] Muscle releases or lengthenings and tendon transfers to improve lateral (external) rotation and abduction have very favorable outcomes when joint deformity is minimal (grades I to III).[115] Arthroscopic surgery also is an option because it allows direct visualization of the joint and assessment of the degree of deformity and soft tissue contractures. Anterior release of thickened middle and inferior glenohumeral ligaments and of the subscapularis can be performed, along with debridement of the joint. With mild deformity, posterior latissimus dorsi and teres major tendon transfers can be performed with excellent results.[111] A humeral lateral (external) rotation osteotomy can improve function when joint deformity is more severe and joint reconstruction is deemed not to be an option.[115]

In a residual C8-T1 neuropathy, an intact biceps muscle with weak or absent triceps, pronator teres, and pronator quadratus muscles can create an elbow flexion and supination deformity. Soft tissue contractures develop, leading to rotation deformities of the radius and ulna and possibly radial dislocation.[138] The biceps tendon can be treated with Z-lengthening and rerouting around the radius to convert it from a supinator to a pronator, thus improving pronation and elbow extension.[111]

Although flail hands and wrists are rare, they can be functionally and cosmetically disruptive to children and families. A flexor carpi ulnaris transfer can be performed to restore active wrist extension. Wrist fusion can provide stability to the flail wrist and improve assistive hand function.[111]

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

The clinical management of a child with BPI is determined by a multidisciplinary team. The physical therapist should be involved as early as possible and should assess baseline active and passive ROM in the involved upper extremity and cervical spine, being cautious of an insensate extremity and unstable joints. Motor function and active movement of the limb in all developmental positions should be observed and documented, whether spontaneous or facilitated, gravity assisted or gravity dependent. Active muscle contraction also can be assessed when testing reactions and reflexes, such as visual tracking, neck righting, Moro's reflex, Galant's reflex, the parachute reaction, and the hand placing reaction.[109] Asymmetrical abdominal or thoracic movement should be noted, because it may indicate phrenic nerve involvement.[109]

Developmental tests can be used to assess the achievement of developmental milestones. Active muscle strength should be assessed frequently and can be graded by several different methods, including the Medical Research Council grading system, Mallet's classification, or the Hospital for Sick Children scores.[111] In older children, standard manual muscle tests and dynamometers can be used to assess strength. Patterns of movement, abnormal substitutions and compensations, and posturing of the arm should be documented.[109] Muscle tone should be assessed and documented. Spasticity should not be present, and if found, the child should be referred to a neurologist for further examination.[109] Although sensory loss in infants is neither reliable nor sensitive, attempts should be made to identify areas of compromise. Narakas[112] developed a sensory grading system for children with BPI. Temperature, light touch, and two-point discrimination testing is possible in older children.[109] During examination procedures, video recording can be useful for demonstrating change over time.

The ideal outcome for a newborn with BPI is complete return of sensation and motor control. The goals of PT for the first few months are preventive. Achieving and maintaining full ROM, muscle extensibility, normal motor control, strength, functional bilateral activities, and developmental skills are appropriate goals over the first few years of life as neural regeneration continues. Goals should be revised between 9 and 24 months of age, because significant regeneration may no longer be occurring or the child may undergo a variety of orthopedic

and neurosurgical procedures.[109] At 2 years of age, goals should include achievement of age-appropriate self-care skills (e.g., dressing and grooming using either extremity) and active participation in age-appropriate movement activities and preschool programs.[109]

The clinician should collaborate with family and caregivers in designing an effective, efficient home exercise program that includes passive ROM exercises and positioning. Home programs should be embedded into the existing daily routines of the family. Education should include the goals of the home program, risk of contractures, importance of joint integrity, precautions to prevent overstretching and joint dislocation, precautions with regard to sensory loss, and how to position the infant for all activities to maintain ROM and regain muscle strength.[109]

Promoting developmental and functional skills should be implemented early and done through therapeutic play activities, such as hand-to-mouth activities; activities that involve reaching, grasping, and manipulating objects or propping on the elbows; use of hands to midline; activities that involve rolling to each side; and bilateral hand activities. Facilitation of a normal scapulothoracic and glenohumeral relationship should be emphasized. A variety of play activities should be used to promote strengthening of weakened muscles. To develop motor control throughout the ROM, the clinician should control time to fatigue, allowing the child to be successful by initially challenging the involved extremity in a gravity neutral position. Activities should involve toys of different sizes, shapes, and textures and should incorporate hand-to-mouth movement, transfer of items from one hand to the other, weight-shifting in prone position, quadruped or sitting, creeping, and reaching for toys at various angles and distances. Constraining the opposite extremity for brief periods or occupying the opposite hand with another object can be extremely helpful in focusing and encouraging the child to use the involved extremity. Transitional movements over the involved extremity, pulling to stand using bilateral hands, challenging balance reactions while sitting on a lap or moveable surface such as a ball or bolster, and performing bilateral upper extremity activities (e.g., catching a large ball, clapping to music, or opening a jar) all are recommended activities for the child with BPI (Figure 28-17). Weight-bearing activities such as wheelbarrow walking, bear crawling, crab walking and wall push-ups are important for the development of shoulder girdle strength and stability as well as to improve proprioception and body awareness.[109]

Intermittent splinting of the wrist and fingers may be indicated to preserve tendon integrity until motor function returns. Functional electrical stimulation (FES) can be used to improve sensory awareness and ROM for functional purposes; however, research on this treatment modality is limited.[109]

MYELODYSPLASIA/SPINA BIFIDA

Definition and Classification

Spina bifida results from a neural tube defect in which the spinal column closes imperfectly. This defect can occur anywhere along the spinal column but is most common in the lower segments, where it may allow herniation of spinal membranes, nerves, and meninges. Spina bifida varies in severity with respect to motor and sensory dysfunction and can be associated with a vast number of complex medical complications. Three types of spina bifida have been described. In **spina bifida occulta,** the defect is hidden, and usually no nerve damage is involved. The only evidence of this condition on physical examination may be a tuft of hair or a dimple on the skin overlying the area of the lesion. This is the least severe form of spina bifida, and frequently no evidence of any spinal dysfunction is seen; however, progressive neurological deterioration may become apparent later in childhood or adulthood.[139]

The second form of spina bifida, a **meningocele,** is a skin-covered lesion that protrudes through the spinal defect and usually contains nonfunctional nerves, meninges, and spinal fluid. Meningoceles are not usually associated with paralysis, although some individuals may suffer from minor disabilities and progressive neurological dysfunction later in life.[139–141]

The third type of spina bifida is **myelomeningocele,** which is an open spinal cord defect associated with nerve paralysis and severe disabilities (Figures 28-18 and 28-19). Spinal fluid, nerves, and meninges herniate through the spinal column defect. The extent to which neural elements are involved in the lesion and the level of the spinal column where the lesion occurs determine the clinical severity of motor and sensory deficits, which can vary from asymptomatic to severe.[140]

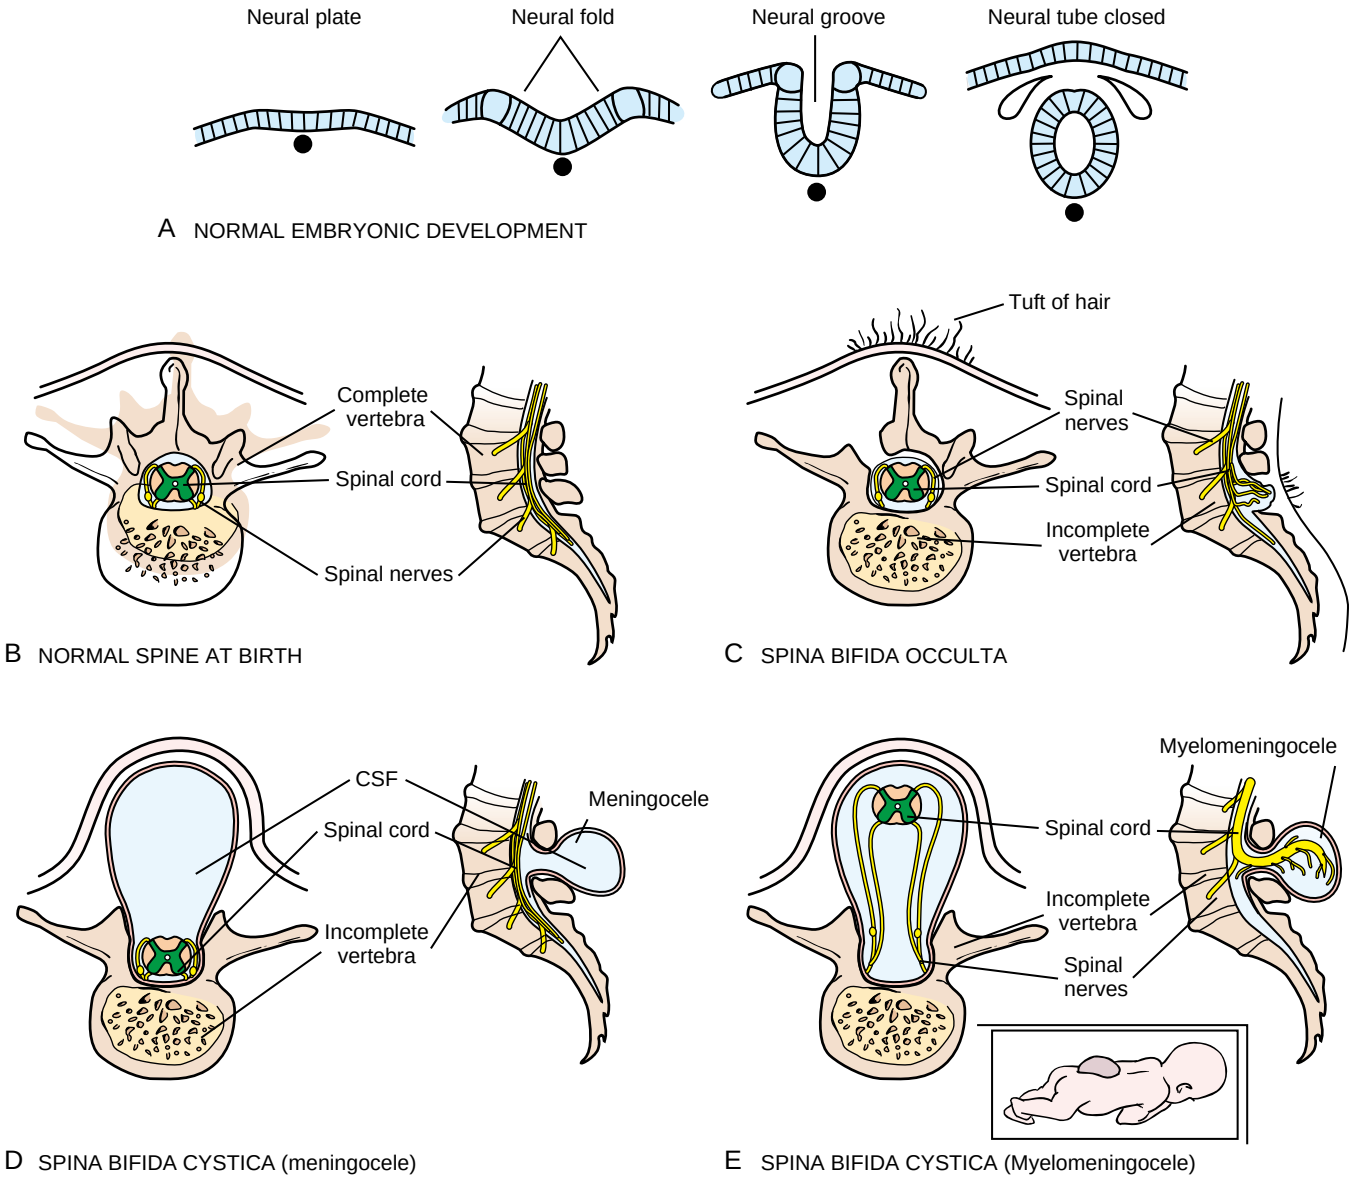

Figure 28-18 Type of spina bifida. **A,** Normal formation of the neural tube during the first month of gestation. **B,** Complete closure with normal development in cross section (*left*) and in longitudinal section (*right*). **C,** Incomplete vertebral closure with no cyst, marked by a tuft of hair. **D,** Incomplete vertebral closure with a cyst of meninges and cerebrospinal fluid (CSF); this is called a *meningocele*. **E,** Incomplete vertebral closure with a cyst containing a malformed spinal cord; this is known as a *myelomeningocele*. (From Martin S, Kessler M: *Neurologic interventions for physical therapy*, ed 2, p 156, St. Louis, 2007, Saunders.)

Pathology

Spina bifida lesions can occur at two different stages in central nervous system (CNS) development: neurulation and canalization. **Neurulation** is the process by which the neuroectoderm cells of the neural plate fold to form the neural tube, which extends from the hindbrain to S2 and gives rise to the CNS. Neurulation begins at the spinal cord level of C1 and progresses simultaneously in both the cephalad and caudal directions until completion by day 28 of gestation.[139] Because the neural tube defect can occur at any location during formation, spina bifida often is associated with other CNS malformations, such as hydrocephalus, Arnold-Chiari type II malformation (a congenital herniation of brain stem and lower cerebellum through foramen magnum into cervical vertebral canal) (Table 28-4), cognitive impairments, and cranial nerve palsies. **Canalization**, the second stage in which spina bifida can develop, is the process by which mesodermal cells distal to the S2 vertebra join to form multiple canals that ultimately fuse and join to the distal end of the spinal cord. Failure of proper canalization can result in skin-covered meningoceles, lipomas, and myelocystoceles, which frequently develop caudal to L3.[139]

Figure 28-19 Large thoracolumbar myelomeningocele in a 2-day-old female newborn. (From Zakaria Y, Hasan EA: Reversed turnover latissimus dorsi muscle flap for closure of large myelomeningocele defects, *J Plast Reconstr Aesthet Surg* 63: 1513-1518, 2010.)

TABLE **28-4**

Chiari Malformations

Type	Description
I	• Most common • Lower part of cerebellum extends into foramen magnum • Can be acquired
II	• Seen in children with spinal bifida • "Classic" Chiari formation (also called Arnold-Chiari [type II]) malformation • Extension of both cerebellum and brain stem into foramen magnum
III	• Most serious form of malformation • Herniation of cerebellum and brain stem through foramen magnum into spinal cord • Severe neurological defects • Rare
IV	• Incomplete or underdeveloped cerebellum • Rare

Etiology, Epidemiology, and Diagnosis

The etiology of improper canalization is unknown; however, improper neurulation commonly is attributed to a combination of genetics and environmental effects.[139,140] In the United States the risk of neural tube defect in siblings is 2% to 3%.[139,142] Folic acid deficiency, which occurs with maternal alcohol consumption, use of valproic acid, and poor nutrition are associated with an increased risk of myelomeningocele in the developing offspring.[139,140] According to current birth defect surveillance data, 1500 babies are born each year with spina bifida in the United States.[143] Adequate folic acid supplementation during pregnancy could theoretically prevent 50% to 75% of these cases. Women are advised to take 0.4 mg of folic acid per day 3 months before conception and during pregnancy.[139,144] Racial and regional differences are seen in the incidence of spina bifida in the United States.[139]

Spina bifida can be diagnosed prenatally through the use of ultrasound, α-fetoprotein (AFP) serum testing, and amniocentesis.[145] Because 75% to 80% of women whose fetuses have spina bifida have elevated levels of AFP, most women in the United States have AFP screening at 16 to 18 weeks of pregnancy.[145] If the condition is positively diagnosed, cesarean section usually is advised to protect the fragile neural defect from further damage during birth.

Prognosis

An estimated 75% to 90% of babies born with spina bifida survive into adulthood.[145,146] Unrecognized shunt malfunction is the most common cause of death at any age. Approximately 80% of individuals with spina bifida have IQ scores that fall within the average range, and most graduate from high school or college. An estimated 75% are able to take part in sports and recreational activities.[145,146] According to a 25-year prospective study, most individuals with spina bifida maintain stable motor function into early adulthood; shunt malfunction is the most common reason for loss of motor function and the second reason is tethered cord.[146] A 12-year longitudinal study found that most individuals with sacral and L5 level involvement maintain ambulatory ability into adulthood, regardless of spinal deformities or lower extremity flexion contractures. However, L3 and L4 level involvement was associated with deterioration in ambulatory ability over time.[146–148]

Both achievement and deterioration of ambulatory status depend on the neurosegmental lesion level, whether lower extremity and spinal deformities develop, whether upper motor neuron signs are present (e.g., spasticity and balance dysfunction), the occurrence of major medical events (e.g., shunt malfunction), familial and therapeutic support, the child's cognitive and motivational level, hand function, and the development of obesity.[147–154] Medical complications of depression, visual impairments, severe renal disease, obesity, hypertension, and pressure sores all increase with age.[146]

Musculoskeletal Impairments and Other Impairments

Myelomeningocele is associated with numerous musculoskeletal impairments. Table 28-5 presents frequently occurring lower extremity deformities, joint contractures, and postural deviations associated with the lesion level.[139] These complex orthopedic impairments can complicate positioning, energy expenditure, independence with mobility and ADLs, and self-esteem. Factors that contribute to these musculoskeletal impairments include intrauterine positioning, lack of voluntary motor control, impaired or absent sensation and proprioception, coexisting congenital malformations, habitual abnormal posture, weight-bearing and positional deforming forces, muscle imbalance, spasticity, and progressive neurological

TABLE **28-5**

Musculoskeletal Impairments Commonly Associated with Meningocele and Myelomeningocele Spina Bifida Lesions

Lesion Level	Lower Extremity Deformities and Joint Contractures	Postural Deviation
High-level lesion (thoracic to L2)	Lateral tibial torsion Knee varus and valgus Knee flexion contractures Ankle plantar flexion contractures	Increased lumbar lordosis
Middle to low-level lumbar lesion (L3-L5)	Hip flexion contractures Knee flexion contractures Genu valgus Calcaneal valgus Pronation of the foot on weight bearing	Increased lumbar lordosis
Low-level lesion (sacral)	Mild hip flexion contractures Mild knee flexion contractures Ankle and foot—either varus combined with pronated forefoot or valgus combined with supinated forefoot	Increased lumbar lordosis

Figure 28-20 Infant with bilateral clubfeet demonstrates the deformities that are part of clubfeet. Note the hyperextension and incurving of the feet. (From Moore KL, Persaud TVN, Torchia MG: *The developing human,* ed 9, Philadelphia, 2013, Saunders. Courtesy of Dr. A.E. Chudley, Section of Genetics and Metabolism, Department of Pediatrics and Child Health, Children's Hospital and University of Manitoba, Winnipeg, Manitoba, Canada.)

dysfunction.[139,155,156] Although musculoskeletal disability varies considerably, the level of the lesion can be used to anticipate future impairments and guide interventions to prevent secondary complications.[139,157,158]

Several foot deformities can occur in the various myelomeningocele levels, including ankle equinovarus or clubfoot, forefoot varus or valgus, forefoot supination or pronation, calcaneal varus or valgus, pes cavus or planus, and claw-toe deformities (Figures 28-20 and 28-21).[139,145,156] The most common contracture of the foot and ankle occurs in the ankle plantar flexors.[139,156] Foot and ankle deformities can greatly affect sitting, standing posture, balance, mobility, and shoe fit; therefore proper alignment and plantigrade foot position (walking on sole of foot with heel touching ground) are priorities, regardless of ambulatory status.

The most common knee joint impairment is knee flexion contracture, which occurs most often in children with myelomeningocele of high lumbar or thoracolumbar neurosegmental levels.[148] Knee flexion contractures are observed across all lesion levels and can result from hamstring spasticity, prolonged positioning, and adaptive shortening of muscles secondary to a crouched standing posture and gait.[139,148] Knee extension contractures are also likely, especially after a period of immobilization resulting from surgery or a fracture. According to Shurtleff,[156] knee joint contractures increase in frequency and severity in all lesion levels from early childhood into adolescence. Genu varus and valgus deformities are also found, along with lateral (external) tibial torsion.

Hip deformities are common and include flexion and extension contractures, subluxation and dislocation, and torsional deformities of anteversion and retroversion. Many individuals with high lumbar lesions experience hip deformities as a result of the unopposed voluntary muscle activity of the hip flexors and adductors.[159] Hip flexion and adduction contractures increase the risk of hip subluxation or dislocation.[148,160] The frequency and severity of hip contractures reportedly is lower with low level lesions.[156]

Spinal deformities, such as scoliosis, kyphosis, and hyperlordosis, also are frequently associated with myelomeningocele. Scoliosis deformities may be congenital (secondary to vertebral anomalies) or acquired (secondary to muscle imbalances and positional deforming forces).[155] According to Trivedi et al.,[161] the prevalence of scoliosis is as high as 90% in children with myelomeningocele,

and approximately half of the spinal curves develop before 9 years of age. Scoliosis is more frequently observed in children with a higher level lesion and becomes more prevalent and severe with increasing age in all groups.[155] Trivedi et al.[161] reported that the most useful early predictor of the development of scoliosis is the level of the last posterior arch; thoracic level lesions lead to scoliosis in 89% of cases, high lumbar lesions (L1-L3) lead to scoliosis in 44% of cases, and low lumbar lesions (L4-L5) lead to scoliosis in 12% of cases. Kyphosis may be an isolated abnormality or may occur in conjunction with scoliosis; it may be limited to the lumbar spine or may involve the entire spinal column. Hyperlordosis is more prevalent in higher level lesions of myelomeningocele.

Two of the most obvious primary impairments are motor paralysis and abnormal or complete loss of sensation, especially of proprioception and kinesthetic awareness. The lower extremities are most affected; however, motor weakness in the upper extremities can occur and often is a sign of progressive neurological dysfunction. Osteopenia and the risk of fracture are increased in the lower extremities because of the decreased active muscle contraction forces through the long bones.[139] Sensory loss, which may not correlate with motor level involvement, also is common in the lower extremities, and lack of protective sensation often leads to skin breakdown. According to Shurtleff,[142] by young adulthood, 85% to 95% of children will have had decubitus ulcers or other skin breakdown from tissue ischemia caused by excessive pressure, casts or orthoses, urine and stool soiling, friction and shear forces, and excessive weight bearing over bony prominences.

Many authors have confirmed the presence of abnormal sensory function related to proprioceptive and kinesthetic awareness deficits, which preferentially affect the upper extremity. Fine motor skills are impeded by slowness and inadequate adjustments of manipulative forces, and postural sway is affected by abnormal body position sense, possibly resulting from cerebellar ataxia, motor cortex or pyramidal tract damage, or motor learning deficits.[139,162–165] The motor level is defined as the lowest intact functional neuromuscular segment. Criteria for establishing motor levels were developed by the International Myelodysplasia Study Group using MMT.[139] Sensory levels do not consistently correlate with motor levels; therefore testing of dermatomes is imperative for light touch, pinprick, and vibration sense.[139,166]

Many other impairments or complications are associated with myelomeningocele. About 25% of children with myelomeningocele are born with hydrocephalus, with an additional 60% developing it after surgical closure of their back lesion.[139] From 80% to 90% of children with hydrocephalus require some form of central spinal fluid diversion (Figures 28-22 and 28-23). Shunt malfunction is a common complication caused by mechanical problems or infection, and as Caldarelli et al.[167] reported, almost half of children with myelomeningocele require a shunt revision in the first year of life. Early symptoms of shunt complications related to increased intracranial pressure include alterations in the level of consciousness, restlessness, irritability, headache, respiratory changes, fever, and abdominal pain.[145]

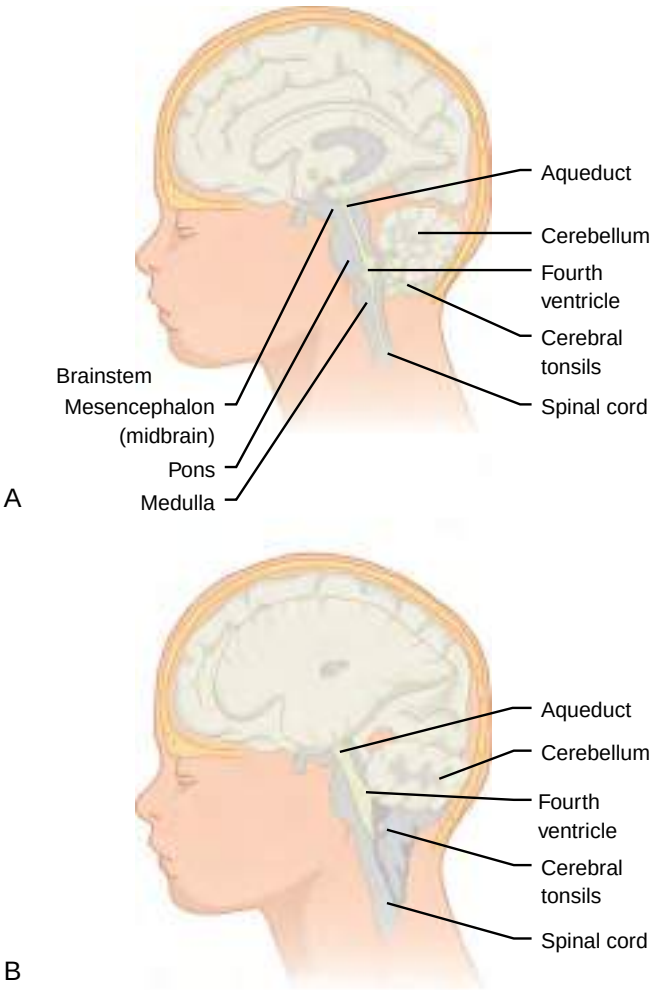

Figure 28-22 **A,** Normal brain with cerebrospinal fluid (CSF) circulation. **B,** Arnold-Chiari type II malformation with enlarged ventricles; this condition predisposes a child with myelomeningocele to hydrocephalus. The brain stem, the fourth ventricle, part of the cerebellum, and the cerebral tonsils are displaced downward through the foramen magnum, which leads to blockage of CSF flow. Also, pressure on the brain stem, which houses the cranial nerves, may result in nerve palsies. (From Goodman CC, Fuller KS: *Pathology: implications for the physical therapist,* ed 4, St. Louis, 2015, Saunders.)

Hydrocephalus frequently is associated with Arnold-Chiari type II malformation, characterized by a descent of the cerebellar vermis, fourth ventricle, and brain stem into the cervical spine.[145,167,168] Arnold-Chiari type II malformation is associated with multiple anomalies and may cause depressed respiratory drive (including apneic attacks), caudal cranial nerve palsies, or tetraparesis in the newborn. More often, symptoms arise in infants and children in the form of central apnea, cyanosis, bradycardia, dysphagia, nystagmus, stridor, vocal cord paralysis,

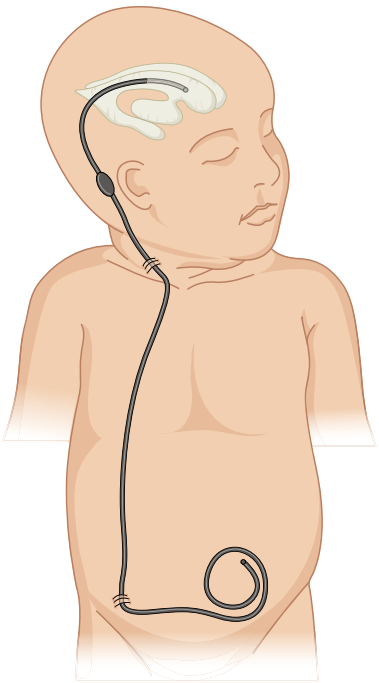

Figure 28-23 Ventriculoperitoneal shunt provides primary drainage of cerebrospinal fluid from the ventricles to an extracranial compartment, usually either the heart or the abdominal or peritoneal cavity, as shown. Extra tubing is left in the extracranial site to uncoil as the child grows. A unidirectional valve designed to open at a predetermined intraventricular pressure and to close when the pressure falls below that level prevents backflow of fluid. (From Goodman CC, Fuller KS: *Pathology: implications for the physical therapist,* ed 4, St. Louis, 2015, Saunders.)

torticollis, opisthotonus (severe muscle spasm), hypotonia, and upper extremity weakness or spasticity.[168–170] Hydromyelia is a complication with symptoms of rapidly progressive scoliosis, weakness of the upper extremities, spasticity, and ascending motor strength changes in the lower extremities.[145]

According to Wagner et al.,[169] tethered cord syndrome results from traction of the cauda equina and occurs in approximately one third of individuals with myelomeningocele. It most commonly presents with progressive scoliosis, gait changes, spasticity, or pain; less commonly, back pain, weakness, contractures of the lower extremities, or changes in bladder function may herald tethered cord syndrome.[146,171] Seizures secondary to brain malformation, cerebrospinal fluid (CSF) shunt malfunction or infection, and residual brain damage from a previous shunt infection or malfunction occur in 10% to 30% of children and adolescents with myelomeningocele.[139]

Other complications include bladder and bowel control difficulties caused by partial or complete denervation of S2 to S4. These complications, which may result from spinal cord tethering, lead to neurogenic bladder.[139,145] Fewer than 5% of children with myelomeningocele develop voluntary control of the urinary or anal sphincter.[139] Urinary tract infections are a common problem.[145]

In a study by Yeates et al.,[172] 50% of individuals with spina bifida had patterns of strengths and difficulties consistent with nonverbal learning disabilities. Dennis and Barnes[173] reported that alterations in functional numeracy, which is predictive of higher social, personal, and community independence, were directly related to the number of shunt revisions. Latex allergies, which are thought to arise from repeated exposure and contact with latex products during both diagnostic and therapeutic interventions, occur in up to 73% of children and adolescents with spina bifida.[145,148,174] Finally, 50% or more of children with spina bifida age 6 years or older are overweight, and more than half of their adolescent and adult counterparts are obese.[145] Obesity leads to the recurrence of spinal deformities, hip and knee flexion contractures, and numerous health problems, including hypertension, skin infections, pressure sores, respiratory disease, heart disease, diabetes, impaired mobility, poor performance of ADLs, and decreased self-esteem.

Medical and Surgical Management

The primary neurosurgical intervention is repair of the open neural tube defect, usually within 48 to 72 hours after birth. The treatment goals are elimination of CSF leakage, preservation of neural function, and prevention of infection and secondary tethering of the spinal cord.[169] In utero repair aims to improve the functional outcome by reducing the exposure of nervous tissue to the amniotic environment and allowing nerve repair to proceed.[149] Two benefits of in utero repair have been found: a reduced need for shunt placement as a result of a reduced incidence of hydrocephalus and reduced or even prenatal reversal of hindbrain herniation.[167,175] Fetal surgery remains controversial because of the high risks to the mother and fetus, and it has not yielded improvements in lower extremity function compared with postnatal closure.[149] Most babies with myelomeningocele are either born with hydrocephalus or develop ventriculomegaly soon after the neural tube defect is repaired. These children undergo ventriculoperitoneal shunting to manage excess CSF accumulation in the ventricles of the brain.[176]

Arnold-Chiari type II malformation, which usually is associated with hydrocephalus, is a significant cause of death and disability for individuals with myelomeningocele; therefore early detection and appropriate management are imperative. Before surgical intervention, the shunt must be evaluated for malfunction, because this may provoke or worsen a Arnold-Chiari malformation.[167] According to Griebel et al.,[177] surgical decompression of the Arnold-Chiari malformation has shown benefit in reducing upper and lower limb spasticity.

Although a goal of myelomeningocele repair is to prevent secondary tethering of the spinal cord, one third of individuals develop symptomatic spinal cord tethering.[169] Phuong et al.[178] reported that the progression of

symptoms related to cord tethering was insidious; no effective method is available to prevent retethering, and 90% of individuals eventually undergo surgery to treat recurrent symptoms.[169,178] The surgical goal is to untether the spinal cord by dissecting the encasing arachnoidal adhesions.[169,179]

Most surgeons agree that no intervention is necessary for an individual with myelomeningocele with bilateral hip dislocations; however, whether to intervene with unilateral hip dislocation remains controversial.[149,155] In studying hip dislocation and its relation to functional gait, Gabrieli et al.[180] reported that gait symmetry corresponded to the absence of hip contractures or bilateral symmetrical contractures but showed no relation to the presence of hip dislocation. These authors recommended addressing gait asymmetry by reducing soft tissue contractures rather than by surgically reducing unilateral hip dislocation.[152,180] In contrast, Lorente Moltó and Garrido[150] reported that iliopsoas posterolateral transfer performed on subluxed or dislocated hips was effective in obtaining hip stability in properly selected children with a lesion at level L3. Mayfield[155] stated that a level pelvis and good ROM were more important for function than hip reduction. Furthermore, surgery might be indicated for an individual with a lesion at level L3 or lower if quadriceps function is present and the potential exists for ambulation into adulthood.[139]

Surgical release of hip flexion contractures is frequently required.[160] Complete posterior release and posterior knee capsulotomies often are recommended for individuals with knee flexion contractures of 20° or more. For both knee and hip procedures, upright standing in the early postoperative period and limited immobilization time are recommended for successful outcomes. Knee flexion contractures do recur, usually because of inadequate bracing, postoperative fractures, lack of postoperative PT, obesity, or poor motivation to stand and walk.[181]

Derotational osteotomies for excessive lateral (external) tibial torsion also have been studied. Vankoski et al.[182] reported that children with lateral tibial torsion greater than 20° who failed to exhibit improved knee extension and extension moments in AFOs might benefit from derotational osteotomies.[183]

Numerous foot deformities can occur with all levels of myelomeningocele, leading to an array of surgical corrective procedures. Clubfoot is a deformity consisting of equinus, hindfoot varus, forefoot adductus, and cavus.[183] Treatment of clubfoot in children with myelomeningocele is somewhat controversial and has traditionally consisted of soft tissue release surgery; however, some authors have used the Ponseti serial casting method with good results.[183] Hindfoot valgus is commonly found in low-level myelomeningocele. Medial displacement osteotomy of the calcaneus was reported to be successful in preserving subtalar motion.[184] This procedure is indicated for children with severe hindfoot valgus, associated pain, ulceration, and difficulty wearing a brace.

Surgical treatment is recommended for severe scoliosis. The ideal minimum age for spinal fusion is 10 to 11 years old in girls and 12 to 13 years old in boys.[139,155] Several authors recommend combined anterior and posterior spinal fusion, each with instrumentation for individuals with thoracic level lesions.[148] Nutritional support, use of antibiotics, early mobilization, use of a brace for 1 year, and family education have been stressed.[148,185] The surgical procedure performed to reduce kyphosis is a **kyphectomy.** A kyphectomy with transverse fixation is recommended to improve stability.[149,186] A thorough assessment of the individual's status, including body weight and indications of osteopenia, should also be done.[187]

Rehabilitation Management: Evaluation, Intervention, and Clinical Implications

A child with myelomeningocele requires interdisciplinary care, and special consideration should be given to coordinating goals for the child and providing consistent information to the family. Evaluation and intervention should focus on enhancement of the child's development through management and reduction of impairments and maximization of the child's future functional potential through anticipation of secondary impairments.

After a complete history is obtained, the newborn should be evaluated for motor and sensory function before and after closure of the neural tube defect. This baseline information provides a foundation for planning and prioritizing interventions and family education, anticipating future functional potential and needs, and establishing the newborn's neurological status in order to monitor any changes. The newborn should be examined in the sidelying position to prevent further injury to the lesion.[188] The infant should be in a quiet state when light touch and pinprick sensation are tested, and the testing should begin at the lowest level of sacral innervation and progress to higher levels until a response is elicited. Both deep tendon reflexes and primary reflexes should be examined.

Motor function testing should be done while the infant is in an alert state; these results can be documented as present, weak, or absent. Techniques to elicit voluntary movement include placing the extremity in a gravity-dependent position to see whether the newborn holds the position; placing the extremity in an end-range position to see whether the newborn moves out of the position; tickling; or using a variety of toys to prompt the newborn to move in response to auditory or visual stimuli. Knowledge of motor function can help the clinician predict habitual positioning and joint contractures that may not reduce spontaneously because of decreased active muscle contraction.

The newborn's bilateral upper and lower extremity ROM should be assessed, and the examiner should keep in mind that the observed degree of flexion may be greater than the expected physiological flexion secondary

to intrauterine positioning and decreased voluntary movement in the womb. Paralyzed limbs should be moved delicately to prevent factures. Hip adduction should be assessed in the neutral position to prevent hip dislocation or subluxation of an unstable hip.

Baseline muscle tone should be assessed bilaterally in the upper and lower extremities of the newborn. Hypotonia throughout the body is common in neurogenic forms of spina bifida, especially in the neck and trunk; however, hypotonia or hypertonia can be found in the limbs as well. Early bilateral examination of the hips and feet should be performed, because hip and foot deformities are common.

Families should be educated in the handling and positioning of the newborn after closure of the neural tube. They also should be given verbal and written instructions on appropriate ROM, stretching, and soft tissue mobilization techniques, as well as initial developmental activities to facilitate head and trunk control.

During infancy, clinicians should continue to monitor joint alignment, muscle imbalance, and the development of joint contractures. Hip and knee flexion contractures are typical and can be combined with lateral (external) rotation at the hips, especially when hip muscles are very weak or absent. It is imperative to monitor ROM and muscle extensibility closely and to initiate stretching exercises early, with the goal of achieving and maintaining full ROM throughout the lower extremities. Fine and gross motor development should be assessed continually, and intervention should be provided to keep pace with the normal timing of development.[139] Standardized tools, that document attainment of motor skills can be used to monitor acquisition of skills. However, children with spina bifida (unless at a very low level) will not attain gross motor developmental milestones as would be expected. Thus it is important to document functional mobility rather than attainment of milestones. Documenting development in other areas such as cognition, language, and fine motor skills is appropriate using standardized tools. Although motor skills may be delayed because of multiple impairments, infants with spina bifida should be given frequent opportunities to explore the environment to enhance their future motor development. Visual tracking, deep tendon reflexes, and primitive reflexes should also be evaluated.

Muscle strength should be noted in relation to the infant's function, and specific muscle groups can be palpated for contraction while resistance is given in various developmental positions. If an orthosis is indicated to maintain muscle extensibility and joint alignment or to provide stability, the fit of the orthosis should be monitored closely to prevent skin breakdown. The clinician should continue to watch for behavioral changes, a decrease in function, irritability, and other subtle signs of shunt dysfunction.

Along with family education on strategies to challenge their infant's development of upright posture, additional head and trunk support may be necessary using positioning devices to maintain neutral alignment. Assessment of the need for any adaptive equipment should be ongoing. Families should be educated on sensation deficits and instructed to perform regular skin inspection. The family should be taught numerous activities to promote mobility to enhance the infant's development of initiative and independence.[139,188] For children who may not walk as their primary means of mobility, introducing power mobility is critical for environmental exploration, socialization, and independence.[189] Introducing power mobility at about 7 to 12 months of age may be appropriate for children with average cognition.[189,190]

At the toddler through preschool age, joint alignment, muscle imbalance, habitual positioning, contractures, posture, and signs of progressive neurological dysfunction warrant continued monitoring. If a child continues to have limitations in ROM, joint contractures may respond to stretching, and orthoses or positioning splints may be used to maintain alignment.[139] More fixed contractures may respond to serial casting but often require surgical intervention.

Functional muscle testing techniques are useful for assessing strength; these include heel and toe walking, climbing up and down steps, one-legged stance, toe touching, squat to stand, bridging, bicycling while supine, prone kicking, wheelbarrow walking, sit-ups, pull to sit, and standing push-ups.[191] Light touch and position sense can be assessed by eliciting a tickling response or by having the child point to where the examiner or a toy touched him or her.

Assessment of fine and gross motor development should continue, both informally and formally. Table 28-6 lists the typical ambulation prognosis for children based on the level of lesion. Photographs and videos can be helpful for documenting progress over time.

The level of independence in ADLs and mobility should be assessed and appropriate adaptations provided where necessary. If independent mobility is not achieved within the first year, an alternative means must be considered for independence in the home and short distances in the community. A caster cart, Dani stander with wheels,

TABLE **28-6**

Ambulation Potential for Children with Meningomyelocele

Level	Ambulation
High lumbar-thoracic	Early childhood: short distances with long leg braces Adolescents: primarily wheelchair user
Low lumbar	Walk with short leg orthosis and forearm crutches
High sacral	Walk with ankle–foot orthosis and a gluteal lurch

or power or manual wheelchair are all options to consider. Butler et al.[192] reported power drive wheelchairs to be beneficial for children as young as 24 months. More recently, Lynch et al.[190] reported that children as young as 7 months can learn to drive a power drive adapted car, providing increased opportunities for environmental exploration, cognitive development, and socialization. The toddler should learn how to be independent in skin inspection, pressure relief, and joint protection. Creative play activities that promote strengthening and upright posture can involve the entire family. Independence, efficiency, and effectiveness in ADLs should be encouraged throughout preschool.

The need for orthotics to assist with independent standing and walking should be assessed once a child begins to pull to stand. Numerous benefits of encouraging a child with myelomeningocele to walk early include fewer fractures, fewer pressure sores, and greater independence.[157,193] Because bone and joint deformities can develop as a result of unbalanced or abnormal forces, protective stabilization of the lower limb often is required. Orthoses can prevent bone and joint deformities and provide greater independence.[194] Most orthoses for children with myelomeningocele are custom-made AFOs, which are either floor reaction or posterior solid AFOs. Floor reaction AFOs are particularly beneficial because they provide a knee extension force at anterior proximal tibias and a toe lever footplate, which restricts dorsiflexion.[194] Duffy et al.[195] evaluated the effect of AFOs on gait and energy expenditure in children with L4-S1 neurosegmental level conditions and reported that the use of AFOs improved walking speed, stride length, hip flexion at heel strike, oxygen cost, and ankle power generation.

The impact of sensory deficits on functional performance must be kept in mind during gait training and functional tasks. Skin irritation, most common around the medial and lateral malleoli, is reported to be one of the biggest problems associated with unsuccessful use of orthoses.[194] Biped ambulation is feasible for toddlers and preschoolers with a lesion at level L3 and below. When working on upright standing and walking, it is essential that the clinicians maintain ROM and upright posture to evenly distribute weight-bearing forces. Upper limb support may be necessary, and a reverse walker is advised when the child is first learning to stand and walk because it minimizes upper extremity weight bearing and facilitates postural alignment.[196] Once upright gait is established, the child can transition to the use of forearm crutches. Moore et al.[197] evaluated the energy expenditure of reciprocal versus swing-through gait in adolescents with low lumbar myelomeningocele. They found no difference in the rate of oxygen consumption; however, the walking velocity was slower and the oxygen cost was higher for the reciprocal gait pattern. These researchers concluded that the swing-through gait pattern is more energy efficient and faster than the reciprocal gait pattern.[197]

Children with L5-S1 lesions often abandon upper limb aids when they are young. However, these aids may be necessary, even as the child gets older, for endurance activities and to reduce trunk sway and joint stress for longer distances or rough terrain. Bare et al.[198] concluded that a hip abductor strengthening program to reduce compensatory trunk and pelvic motion may enable a more energy-efficient gait for children with sacral level involvement.[194]

For children with higher level lesions, emphasis should be on preparatory activities for wheelchair mobility, including sitting balance, transfer training, wheelchair propulsion, electrical switch operation, and safety. Children with lesions at the thoracic to L2 levels may use a parapodium, HKAFO, KAFO, or reciprocating gait orthosis for household distance ambulation (Figure 28-24). These orthoses typically require a high energy expenditure; therefore wheelchairs are commonly used for community mobility. When evaluating and teaching functional gait, the clinician must keep in mind that symmetrical alignment of the trunk and extremities is important and extreme ranges of motion, as well as a couch posture, should be avoided. Shoes with nonskid soles for improved traction and long distance capabilities should be considered.

Motor and sensory function should be assessed continually. Education in bowel and bladder management should be provided if necessary, and clinicians must be aware of methods used for bowel and bladder emptying as they relate to toileting, transfer techniques, and orthoses so that assistive devices do not interfere with effective performance. Clinicians must continually assess for signs and symptoms of shunt malfunction and postural deficits of scoliosis and kyphosis. Orthotic intervention for scoliosis and kyphosis may be helpful in maintaining improved trunk position for function; however, it may not prevent progression and sometimes may worsen skin ulcers.[139,188,194] Severe postural deficits can limit chest wall expansion and result in restricted lung ventilation and frequent respiratory infections, which can limit exercise tolerance and also can be life threatening.[139]

Clinicians must be aware of the secondary impairments of upper extremity deformities that result from overuse. Restricted shoulder girdle motion, carpal tunnel syndrome, and pain are common secondary impairments that can be reduced by proper joint alignment, proper fitting of assistive devices, and energy-efficient propulsion mechanisms.[139] Activities emphasizing position sense and body awareness can improve upper extremity coordination. Clinicians should educate families on how to create latex-free environments, and they should provide latex-free environments in the clinic to prevent anaphylactic reactions caused by common latex allergies.

Figure 28-24 **A,** Hip guidance orthosis. **B,** Reciprocating gait orthosis (RGO). (**A** from Nawoczenski DA, Epler ME: *Orthotics in functional rehabilitation of the lower limb,* Philadelphia, 1997, Saunders. **B** courtesy Center for Orthotic Design, Redwood City, California.)

SUMMARY

Numerous developmental disabilities have musculoskeletal involvement requiring the consistent and combined efforts of an interdisciplinary team that includes the family and the child. The mainstays of therapeutic management are the promotion and maintenance of joint integrity and ROM, enhancement of functional motor skills, and facilitation of strength and postural control. Prevention of secondary complications and family education and empowerment are essential aspects of intervention of a child with a developmental disability.

CHAPTER 29

Pediatric and Adolescent Populations: Musculoskeletal Considerations

DONNA L. MERKEL, CAROLE HIGH GROSS, JOSEPH T. MOLONY, JR.*

INTRODUCTION

It is important that physical therapists, along with other health care professionals, parents, teachers, and coaches, understand that children are not small adults.[1–3] Although some aspects of the rehabilitative process may be similar to the adult population, differential diagnosis and the decision-making algorithm of rehabilitation are very different for the skeletally immature individual. As a result, a sound understanding of the immature skeleton and the rapidly maturing and developing body of a child and adolescent allows for accurate diagnosis and management of injuries sustained by this population. This understanding includes recognition of the extremes of overaggressive and improper training of youth athletes as well as childhood obesity and sedentary lifestyles. More than 45 million children and adolescents participate in organized sports in the United States.[2,4]

Benefits of Participation in Sport Include:[2,4–8]

- Regular exercise integrated into lifestyle
- Higher self-esteem
- Improved discipline
- Improved strength and agility
- Enhanced motor skills
- Improved social skills
- Development of healthy nutritional choices (i.e., fruits and vegetables)
- Potentially less interest in taking health risks

Sports participation can assist in reducing the incidence of childhood obesity. Pediatric and adolescent obesity has been increasing since the 1980s, and currently one out of three children in the United States is at risk for obesity. Those at a higher risk of being physically inactive are preadolescent and adolescent children (more often girls) from ethnic minorities, affected by poverty, living in apartments or public housing, or in neighborhoods where outdoor activity is limited due to safety, lack of play areas, and poor climate. This high-risk group also includes children with physical disabilities.[2,9]

Secondary Complications of Obesity Include:[2,3,10]

- Heightened risk of developing
  - Diabetes
  - Heart disease
  - Hypertension
  - Cancer
  - Asthma
  - Sleep apnea
- Low self-esteem
- Musculoskeletal dysfunction
- Pain

On the other side of the spectrum is the culture of intense organized youth sports. In the past, children participated in multiple different sports throughout the year and spent more time with recreational versus organized physical activities. Nowadays, emphasis is placed on single sport participation with year-round seasons.[1,2,4–8] In the United States, 75% of families have at least one child in an organized sport.[2] Many children are participating at earlier ages with sports specialization. Enrolling children in sports that are beyond their developmental ability has

*The authors, editors, and publisher acknowledge Jane Gruber, Peter G. Gerbino, Pierre A. d'Hemecourt, and Mychelle L. Shegog for their contributions on this topic in the previous edition.

led to anxiety, stress, frustration, and early dropout and attrition.[2,8,10] Traumatic and overuse sports-related injuries contribute to approximately 25% of all childhood injuries. In the United States, more than 3.5 million children under the age of 14 receive medical care each year, and for those involved in sports, the majority of the injuries occur during practice instead of games.[4,8,9,11]

Sports readiness matches a child's stage of motor development with the requirements of a sport.[2,4–8] It is not until approximately 6 years of age that children have fundamental physical, psychological, and cognitive skills sufficient to allow participation in organized team sports.[2,5,6] Fundamental athletic skills, such as running, jumping, catching, throwing, tumbling, and balance, should be emphasized before the child specializes in a single sport. These skills should also be integrated into a rehabilitation treatment program to improve safety at high activity levels and return to play.[1,2,6]

The American Academy of Pediatrics, Committee on Sports Medicine Recommends That:[2,6,7]

- Weekly training time, number of repetitions, or total distance is not increased by more than 10% per week
- Participation is with only one team per season
- Allowance is made for 1-2 days off per week to recover both physically and psychologically
- 2-3 months of recovery time from a specific sport are provided per year
- The focus of sports participation should be on having fun, acquiring skill, and learning safety and sportsmanship

AGE CHANGE ISSUES

The complex and progressive physical, cognitive, and emotional maturity of each individual youth guides and directs sports readiness recommendations. A child's chronological age may differ from a child's skeletal maturity. Skeletal maturity is based on maturation of skeletal bones and may be affected by factors such as gender, environment, genetic influences, and sexual characteristics.[5,12] The **Tanner Stages of Development** (Figures 29-1 to 29-3) describe sexual maturity and physical changes during puberty that relate to skeletal growth and open growth plates (Table 29-1). Two individuals with the same chronological age may have different skeletal maturities.[5,12] The following provides a general summary of chronological development and sports focus.

Clinical Point

A child's chronological age commonly differs from a child's skeletal age.

During **early childhood**, approximately ages 6 to 9 years, increased flexibility and the incidence of hypermobility are evident. Growth plates are open and bones are just beginning to ossify. Children have limited attention spans. Vision is developing, although children may still have difficulty identifying the direction of a moving object. Sport focus should include skill development, fundamental transitional movements, and fun.[2,4–6,9]

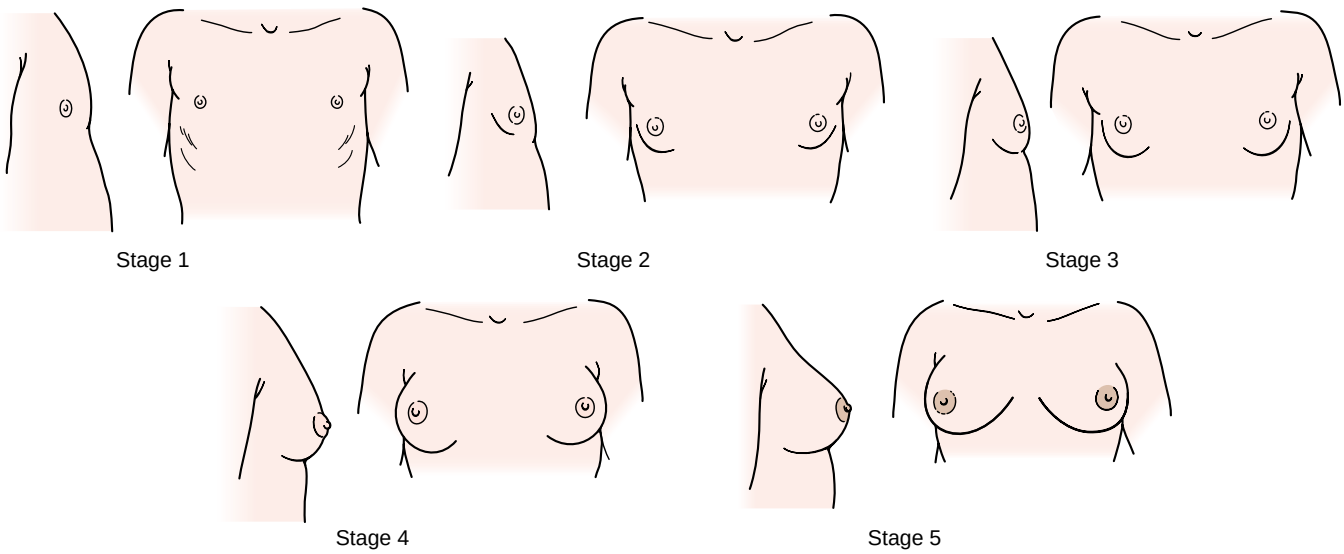

Figure 29-1 Breast development in girls. The development of the mammae can be divided into five stages. In stage 1, only the nipple is raised above the level of the breast (as in the child). In stage 2, the budding stage, there is bud-shaped elevation of the areola. On palpation, a fairly hard button can be felt that is disk or cherry shaped. The areola is increased in diameter, and the surrounding area is slightly elevated. In stage 3, there is further elevation of the mammae; the areolar diameter is further increased, and the shape of mammae is visibly feminine. In stage 4, fat deposits increase, and the areola forms a secondary elevation above that of the breast. This secondary mound occurs in approximately half of all girls and in some cases persists in adulthood. In stage 5, the adult stage, the areola usually subsides to the level of the breast and is strongly pigmented. (Redrawn from Halpern B, Blackburn T, Incremona B et al: Preparticipation sports physicals. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 855, Philadelphia, 1996, WB Saunders.)

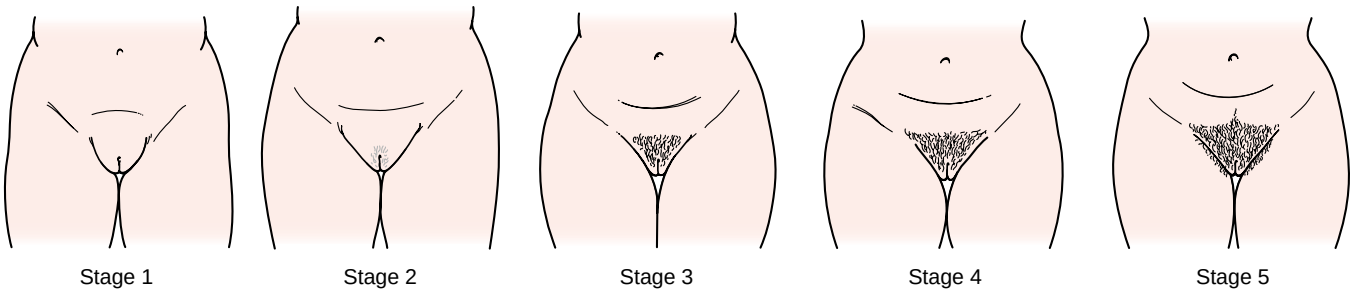

Figure 29-2 Pubic hair development in females. In the development of pubic hair, five stages can be distinguished. In stage 1, there is no growth of pubic hair. In stage 2, initial, scarcely pigmented hair is present, especially along the labia. In stage 3, sparse dark, visibly pigmented, curly pubic hair is present on the labia. In stage 4, hair that is adult in type but not in extent is present. In stage 5, there is lateral spreading (type and spread of hair are adult). (Redrawn from Halpern B, Blackburn T, Incremona B et al: Preparticipation sports physicals. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 855, Philadelphia, 1996, WB Saunders.)

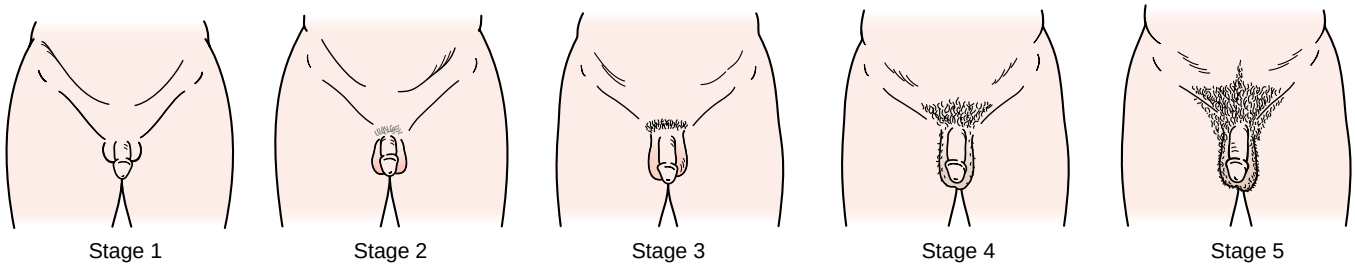

Figure 29-3 Genital and pubic hair development in males. The development of external genitalia and pubic hair can be divided into five stages. In stage 1, the testes, scrotum, and penis are the same size and shape as in the young child, and there is no growth of pubic hair (hair in pubic area is no different from that on the rest of the abdomen). In stage 2, there is enlargement of the scrotum and testes. The skin of the scrotum becomes redder, thinner, and wrinkled. The penis has not grown (or just slightly so). Pubic hair is slightly pigmented. In stage 3, there is enlargement of the penis, especially in length, further enlargement of testes, and descent of scrotum. Dark, definitely pigmented, curly pubic hair is present around the base of penis. In stage 4, there is continued enlargement of the penis and sculpturing of the glans, with increased pigmentation of the scrotum. This stage is sometimes best described as not quite adult. Pubic hair is definitely adult in type but not in extent (no further than the inguinal fold). In stage 5, the adult stage, the scrotum is ample, and the penis reaches almost to the bottom of the scrotum. Pubic hair spreads to the medial surface of the thighs but not upward. In 80% of men, hair spreads along the linea alba. (Redrawn from Halpern B, Blackburn T, Incremona B et al: Preparticipation sports physicals. In Zachazewski JE, Magee DJ, Quillen WS, editors: *Athletic injuries and rehabilitation*, p 855, Philadelphia, 1996, WB Saunders.)

During **late childhood**, from approximately ages 10 to 12 years, positive and negative influences from the emergence of puberty impact the musculoskeletal system, gross motor skills, and overall sports performance. These children are able to perform more complex gross motor skills, attention span widens, and vision and eye-hand coordination improves. However, growth spurts during this time contribute to alteration of length-tension relationships of soft tissues and joint position sensory information as bones grow more quickly than neighboring muscle, tendon, and ligaments. These changes lead to decreased muscular flexibility as well as neuromotor and strength impairments. In girls, menarche is observed approximately 2 years after breast bud appearance and/or 3.3 years after the initial growth spurt. Girls may be taller than boys at this age because puberty typically occurs 1 to 2 years earlier in girls. Distal growth plates may begin to close in both sexes. Sport focus should emphasize tactics and strategies of sport and continued skill development.[2,4–6]

Early adolescence, from approximate ages 13 to 15 years, involves more rapid growth spurts causing further loss of flexibility, predisposition to injury, and maybe even a temporary decline in sport performance. Adolescence is the time between puberty and adulthood and is a time of physical, cognitive, sex gender, and psychological maturation. Growth plates begin to close distally to proximally, and bones continue to ossify. Growth centers typically close in females 18 to 24 months following menarche. In males, growth plates close later than they do in females. A beard or mustache typically signifies closure of the majority of growth centers in males.[4–6,9] Apophysitis (i.e., irritation of the growth center at the attachment of a tendon) is more evident at this time. Boys begin to become quicker, stronger, and faster. Girls steadily improve on previous skills. The adolescent and coach need to be patient as the emerging individual grows into his or her "new body." Progression from concrete to abstract thinking begins, attention span and memory increases, and the concept of team and sportsmanship expands. The focus of sport should emphasize individual performance of strengths and weaknesses.[2,4–6,9]

Late adolescence, from approximate ages 16 to 18 years, demonstrates a time of skeletal maturity, and injuries will closely mimic those of an adult. Proximal growth plates at the spine and pelvis may still be open; however, the skeleton is maturing rapidly. Males far

TABLE **29-1**

Tanner Staging and Growth Plate Closure

	MALE		FEMALE		GROWTH PLATES
Tanner Stage	**Genital Development**	**Pubic Hair**	**Breast Development**	**Pubic Hair**	
Tanner I	Preadolescent: identical to early childhood	No pubic hair present	Preadolescent: elevated papilla, small flat areola	No pubic hair present	Open
Tanner II	Enlargement of testes, scrotum, and penis. Scrotum color becomes a reddish hue, altering its skin texture	Sparse amount of long darker hair at the base of the penis	Breast bud formation. Papilla and areola elevate, areola diameter increases	Sparse amount of long darker hair bilaterally along medial border of the labia majora	Open
Tanner III	Testes, scrotum continue to grow. Penis increases in length	Hair becomes darker, begins to curl and spread laterally, small amount	Breast bud and areola enlarges. No separation of breast contours is noted	Darker hair, curls, spreads sparsely over mons pubis	Distal extremity closure begins
Tanner IV	Growth continues; scrotal skin darkens. Penis grows in width and glans penis develops	Increased curl and coarseness, adult type of distribution but smaller amount	Areola and papilla separate from breast contour to form a secondary mound	Increases in curl, coarseness, and amount	Distal extremity closure. Incomplete proximal physeal closure (pelvis, sternum and spine)
Tanner V	Mature: adult size and shape of testes, scrotum, penis	Mature: with spread to medial thigh. 80% of males have hair grow along the linea alba	Mature: areolar mound recedes into the breast contour, papilla continues to project	Mature: adult female triangular pattern, with spread to surface of medial thigh	Closed

From Merkel DL, Molony JT, eds: *Pediatric and adolescent sports medicine: management and prevention of injuries unique to the young athlete,* American Physical Therapy Association (APTA) Sports Section Home Study Course, 2011.

exceed females in speed, size, strength, power, endurance, and functional testing. Females may have to work harder to make performance gains. The late adolescent individual is more goal oriented and now has the added pressures of attending college and their future. Sport focus should be on promoting enjoyment with achievement of personal and team goals. Typically, athletes will choose a sport at which they are successful and enjoy.[2,4,5,9]

SPECIFIC INJURY CONSIDERATION

Fractures

During the period of skeletal immaturity, bone physiologically differs from the adult in several ways. In general, bone is a viscoelastic material, made up of a mineral-rich matrix, which gives bone rigidity and strength, as well as organic collagen, giving bone flexibility and resilience. The outer portion of bone is the cortex, and the inner portion (containing the marrow) is made up of cancellous bone (also referred to as spongy or trabecular bone). In a long bone, the central shaft is called the diaphysis, and the area of bone between the diaphysis and the physis (growth plate) is the metaphysis. The area of bone between the physis and the joint space is the epiphysis. During growth the physis expands through the metaphysis (Figure 29-4).

Clinical Point

A fracture in a child is a common occurrence. For the clinician, this provides an opportune "teaching moment" to educate the parents and family or review with them the basics of injury prevention, including the use of seat belts and appropriate protective gear for sports (e.g., helmet, kneepads, wrist guards).

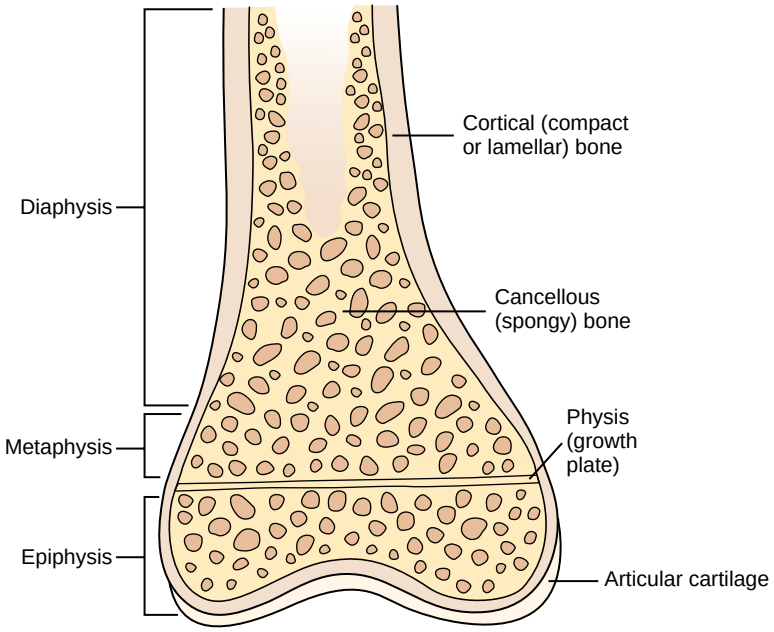

Figure 29-4 Diagram of the immature bone showing different parts of the bone. (From Barr JB, RE Berg: Imaging joints and musculoskeletal tissue: pathoanatomical considerations. In Magee DJ, Zachazewski JE, Quillen WS, editors: *Scientific foundations and principles of practice in musculoskeletal rehabilitation*, p 588, St Louis, 2007, Saunders.)

Healthy bone has the capacity to deform when it is loaded and will return to original shape when unloaded. Children's bones contain more collagen and cartilage than the ossified bones of adults and therefore are much weaker than muscles, tendons, and ligaments. A majority of injuries in children and adolescents occur in the midshaft and at growth centers.[12–14] Immature bone has a faster healing rate (Table 29-2) and better capacity for remodeling due to increased vascularity and thickened periosteum. However, injury to the physis can cause growth disruption.[12–14] Bone growth is critical during adolescence as bone development and formation is greater during puberty than any other

TABLE **29-2**

Treatment and Time Frames for Fracture Healing

Bone	Treatment	Time
Clavicle	Sling	6 wk
Physeal separation	Activity restriction	3-6 wk
Tubercle avulsion	ORIF, sling	3 wk
Humeral shaft	Coaptation splint or functional brace	4-6 wk
Supracondylar fracture, elbow	ORIF, cast	3 wk
T-condylar fracture, elbow	ORIF, cast	6 wk
Medial/lateral epicondyle, elbow	ORIF, cast	6 wk
Olecranon	ORIF, cast	6 wk
Radial head		
Minimally displaced	Sling	1-2 wk
Displaced	ORIF, cast, then sling	2 wk 2-4 wk
Radial neck		
Minimally displaced	Sling	1-2 wk
Angulation >45°	CR or ORIF, cast, then sling	1-2 wk 1-3 wk
Radius and ulna (both bones)	CR or ORIF, cast, then splint	6 wk 3 mo for sports
Distal radius		
Buckle	Cast	3 wk
Displaced, greenstick	CR or ORIF, cast	6 wk

(Continued)

TABLE 29-2

Treatment and Time Frames for Fracture Healing—Cont'd

Bone	Treatment	Time
Scaphoid		
Nondisplaced	Cast (long arm), then cast (short arm)	4 wk 4-8 wk
Displaced	ORIF, cast (long arm) then cast (short arm)	2 wk 6-8 wk
Metacarpals	CR or ORIF, cast	3-4 wk
Phalanx	Splint Buddy taping	3 wk 3 wk
Tuft	Splint	3 wk
Rib	Activity restriction	3-6 wk
Acetabulum	ORIF, PWB	6-10 wk
Femoral head or neck	ORIF, PWB	6-8 wk
Femoral shaft		
Over 6 years old	ORIF, PWB	6 wk
Under 6 years old	Spica cast	6 wk
Distal femoral physis	CR or ORIF, cast	6 wk
Tibial spine	CR, cast ORIF, brace	6 wk 6 wk
Tibial plateau		
Minimally displaced	Hinged brace, PWB	6 wk
Displaced	ORIF, hinged brace, PWB	6 wk
Tibial shaft	ORIF, PWB	10 wk
Tibial plafond	ORIF, PWB	6 wk
Lateral malleolus		
Minimally displaced	Cast, PWB	6 wk
Displaced	CR or ORIF, cast	6 wk

CR, Closed reduction; *ORIF,* open reduction and internal fixation; *PWB,* partial weight bearing.

time of life, except infancy. Peak height velocity occurs at approximately 15.8 years for girls and 17.5 years for boys. During this time, teenagers often lack adequate calcium necessary for bone mineralization.[15]

Signs and Symptoms of Children with Fractures

- Tears or crying with movement
- Limp during ambulation (lower limb)
- Decreased weight-bearing ability
- Swelling
- Increased pain with palpation over bone
- Bones close to surface of skin most susceptible

From Merkel DL, Molony JT: Clinical commentary: recognition and management of traumatic sports injuries in the skeletally immature athlete, *Intl J Sports Phys Ther* 7:691-704, 2012.

Stress on bones, cartilage, ligaments, and tendons may produce bone failure and subsequent fractures in children and adolescents. With adults, these same stresses more often develop into soft tissue injury. Underlying pathology may be a contributing factor to fractures when presented in infants less than 12 months of age or with children who acquire multiple fractures over time. Fractures usually present with swelling, deformity, bruising, and positive bone tenderness. Any bone tenderness should be treated as a fracture until proven otherwise. Some physeal fractures may not be evident on plain radiography and therefore absence of a visible fracture line does not disprove the presence of a fracture if tenderness is at a physis. Fractures are described by their location (i.e., diaphyseal, metaphyseal, physeal, or epiphyseal [see Figure 29-4]).[1,12–14]

Immature skeletal fractures can be epiphyseal (i.e., involving epiphysis or part of the bone closest to the joint), physeal (i.e., occurring at the growth plate), metaphyseal (i.e., involving the expanding end of the bone), diaphyseal (i.e., involving central bone shaft), or osteochondral (i.e., including cartilage with involvement of underlying bone).[12,13] Architectural components of the immature skeleton, such as the presence of physes, dense growth lines, secondary centers of ossification and large nutrient foramina, make radiographic diagnosis of bone problems more challenging than in the adult; therefore a comparison of the uninjured extremity may be used to assist in proper diagnosis.[12] It is important to note when viewing a conventional radiograph of the immature skeleton that the cartilaginous physis is radiolucent. Therefore fractures that exist solely within the physis are not visible, unless significant

Figure 29-5 Greenstick fractures of the radial and ulnar diaphyses in an 8-year-old boy. The fracture lines only extend through part of the cortex. (From Strouse PJ: Skeletal trauma. In Slovis TL, editor: *Caffey's pediatric diagnostic imaging*, 11 ed, Philadelphia, 2008, Mosby Elsevier.)

displacement has occurred sufficient to identify the physis as widened. As mentioned previously, a comparison view can assist in the determination of physeal widening.

Incomplete fractures occurring in the long bones of children include *Greenstick*, *Torus or buckle*, and *plastic bowing*. A **Greenstick fracture** (Figure 29-5) occurs when a long bone shaft cortex is fractured on the tension side and the cortex and periosteum remain intact on the compression side of the bone. Plastic bowing or angular deformity may be evident with a Greenstick fracture.[12–14]

A **Torus** or **buckle fracture** (Figure 29-6) is an incomplete, impaction fracture in children that results in buckling of the bony cortex. This fracture typically occurs at the junction of the diaphysis and metaphysis of long bones. This junction is predisposed to failure in the presence of compressive forces because the thicker diaphysis causes disruption of the adjoining metaphysis. This can occur when children fall onto an outstretched hand (FOOSH) or arm. A torus fracture can occasionally be seen in adults with underlying pathology.[12–14]

Plastic bowing (Figure 29-7), often observed in younger children, is an incomplete fracture resulting in a bowing deformity of bone due to excess pressure being placed on the bone. When pressure is released, the bone cannot rebound and remains bowed. This is due to the unique biomechanical nature of developing bone when a longitudinal, compressive force is imposed on a growing bone that is naturally curved. Microscopic fractures and microscopic fatigue lines are evident in deformed bone, and an increase in force can lead to further bone deformation and fracture. Plastic bowing may also be seen with bone pairs, such as the radius and ulna, when a Greenstick fracture is evident in one bone and plastic bowing is evident at the paired bone.[12,13]

Physeal fractures, occurring at the physes or epiphyseal grow plate, account for up to 15% to 30% of all fractures in children. Often children can heal quickly without issue; however, caution must be exercised with growth plate disturbances and resultant partial or complete growth arrest, which occurs in 15% of all physeal injuries.[12–14] Fractures involving the growth plate often increase at the onset of puberty due to biomechanical and structural weaknesses in the physis at this time. Physeal fractures typically heal twice as rapidly as

Figure 29-6 Childhood buckle fracture. Posteroanterior (**A**) and lateral (**B**) views show a dorsal distal radial metaphyseal buckle fracture (*arrows*). Note that the epiphysis of the ulna has not yet formed and bony evidence of carpal bones is not complete. (From Manaster BJ, May DA, Disler DG, editors: *Musculoskeletal imaging: the requisites*, ed 4, St. Louis, 2013, Mosby Elsevier.)

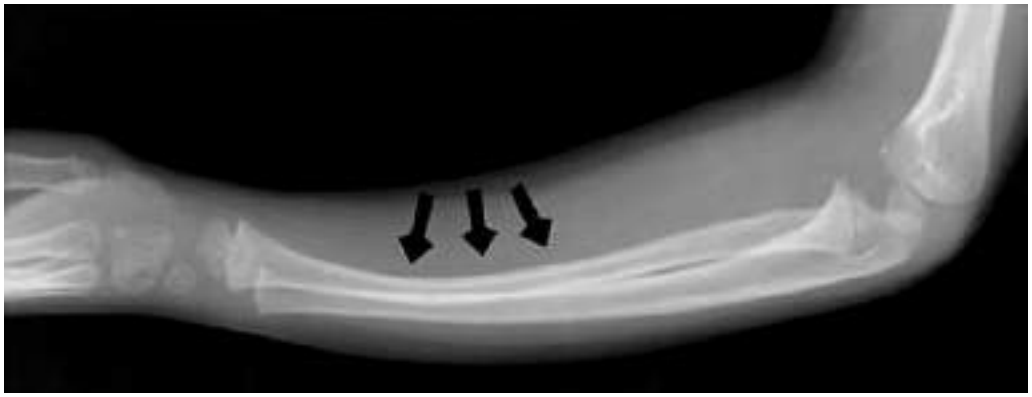

Figure 29-7 Lateral view of a plastic or bowing deformity of the forearm. (From DiFazio R, Atkinson CC: Extremity fractures in children: when is it an emergency? *J Pediatr Nurs* 20:298-304, 2005.)

diaphyseal fractures. The Salter-Harris Classification identifies epiphyseal growth plate fractures according to their fracture line pattern and location (Figure 29-8).[1,12–14] Rang type VI and Ogden VII through IX describe fractures that do not directly involve the physis; however, they describe physeal bridge development as the bone repairs, which may impact bone growth (Figure 29-9).[12,13]

Salter-Harris Classification System for Pediatric Fractures

Type I Fracture lines extend through the physeal plate—*Growth arrest uncommon*

Type II Fracture lines extend through the physeal plate and metaphysis—*May or may not cause growth arrest. Outcomes favorable*

Type III Fracture line extends from the joint surface through the epiphysis and across the physis causing a portion of the epiphysis to become displaced—*Growth arrest likely, often require open reduction internal fixation, an intra-articular injury*

Type IV Fracture line extends from joint surface through the epiphysis, physeal plate, and metaphysis causing a fracture fragment—*Growth arrest likely, almost always require open reduction internal fixation, an intra-articular injury*

Type V Crush injury to the growth plate, not identified until after growth arrest has occurred (6-12 months)—*Rare, growth arrest certain, poor outcomes*

Rang and Ogden classification VI-IX (Expansion of Salter-Harris Classification)

Rang Type VI Injury to perichondral ring or periosteum of the growth plate; little to no direct injury to physis; reparative process may cause osseous bridge; *Possible growth arrest; possible angular deformity; may disrupt physeal blood supply*

Ogden Type VII Osteochondral fracture of epiphysis at articular surface; no injury to physis; *may disrupt physeal blood supply; possible growth disturbance*

Ogden Type VIII Fracture of metaphysis; no injury to physis; *may disrupt physeal blood supply; possible growth disturbance*

Ogden Type IX Avulsion fracture or injury of periosteum; no direct injury to physis; *may disrupt physeal blood supply; possible growth disturbance*

Stress fractures (Figure 29-10), which can be further classified as fatigue and insufficiency stress fractures, are microfractures occurring from repetitive microtrauma to bone. These fractures occur when imbalances exist between bone reabsorption and bone replacement, leading to increased bone weakness, increased stresses, bone fatigue, and finally fracture, and are part of a repetitive injury-overuse syndrome that begins with shin splints (i.e., periostitis) and, if the stress is not relieved, can progress to a stress fracture (see fatigue stress fractures later). Stress fractures commonly occur in the lower extremity; however, they can occur in most bones of the body. Symptoms may begin as dull aching during activity, relieved with rest, progressing to constant pain. Pain may then begin to localize to a specific spot and be reproduced with palpation or the fulcrum test.[1,8,13,14,16] Conventional radiographs are quite commonly negative for stress fracture initially and may continue to not show fracture for several weeks. According to the Academy College of Radiology ACR Appropriate Criteria®, a stress fracture may appear negative on initial radiograph 60% to 82% of the time and remain negative in 40% to 60% of cases.[16] Therefore, magnetic resonance imaging (MRI), due to both its high sensitivity and specificity, may be indicated to confirm if initial radiographs are negative.[1,4] Bone edema and the fracture line can often be identified with MRI.

Fatigue stress fractures involve abnormal activity on bone of normal mineralization or otherwise stated repetitive microtrauma on normal bone. This microtrauma may occur due to a sudden increase in intensity or frequency of activity, change of equipment, malalignment, difference of playing surface or terrain, improper training technique, poor nutrition, inadequate rest, or inappropriate footwear. Young athletes (female more often than male) commonly experience stress fractures from overuse. With the female athlete, additional history needs to be obtained regarding nutrition, menstrual regularity, fatigue and energy level, and activity intensity to address possible additional bone insufficiency.[1,2,13,16]

Insufficiency stress fractures result from normal activity placed on bone deficient of minerals or, as otherwise

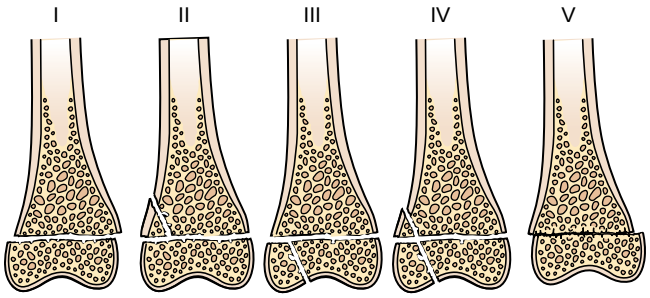

Figure 29-8 Salter-Harris classification of bone fracture in children. Type I: Separation of the epiphysis. Type II: Fracture-separation of the epiphysis. Type III: Fracture of part of the epiphysis. Type IV: Fracture of the epiphysis and the epiphyseal plate; bony union causes premature closure of the plate. Type V: Crushing of the epiphyseal plate; premature closure of the plate on one side with a resultant angular deformity. (Modified from Barr JB, RE Berg: Imaging joints and musculoskeletal tissue: pathoanatomical considerations. In Magee DJ, Zachazewski JE, Quillen WS, editors: *Scientific foundations and principles of practice in musculoskeletal rehabilitation*, p 589, St Louis, 2007, Saunders.)

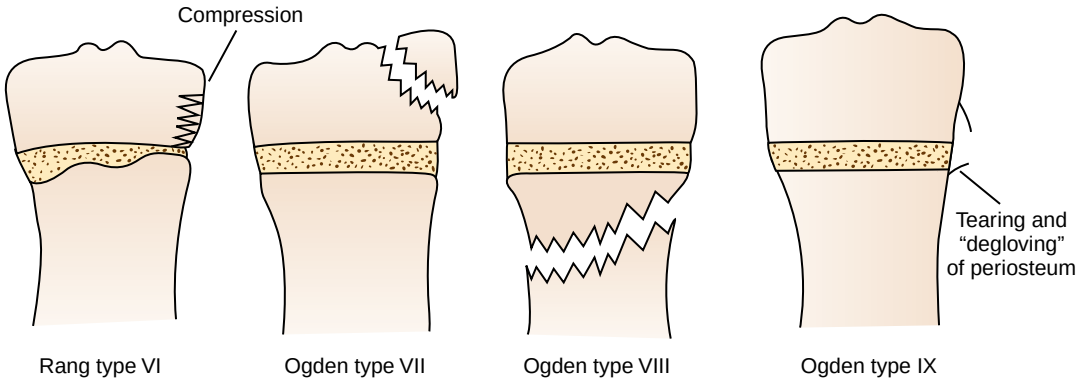

Figure 29-9 Rang-Ogden classification (continuation of the Salter-Harris classification) of bone fracture in children.

stated, normal loading on bone weakened by bone disease or pathology. Some contributing pathologies include osteopenia, rheumatoid arthritis, or metabolic diseases. A differential diagnosis is necessary to ensure proper treatment and to determine the cause of pain. Osteoid osteoma and osteomyelitis may present similarly to a stress fracture, although treatment would be very different.[6,8,12,13]

Risk Factors for Stress Fractures

- Dramatic increase in activity
- Anorexia
- Menstrual irregularity
- Rheumatoid arthritis
- Neuropathy
- Metabolic diseases

Fractures of the clavicle are commonly experienced by those under the age of 25.[17] They represent 4% of all fractures. Ninety percent are caused by a direct blow to the lateral aspect of the shoulder with the arm at the side, with the remaining 10% caused by a FOOSH injury.[18,19] Initial examination indicates pain with overhead and shoulder motions, localized swelling, a palpable defect, and crepitus with movement.[18] Plain radiographs commonly confirm the diagnosis (Figure 29-11). The majority of these fractures occur in the midshaft of the clavicle, are stable, and respond well to conservative nonsurgical treatment. A figure-eight harness or upper extremity sling may be used for 2 to 4 weeks to reduce pain by promoting anatomical alignments. Some athletes report more discomfort when immobilized. In either case, rehabilitation after healing is minimal, and the focus is on posture and restoration of normal motion and strength of the shoulder. Most of these fractures heal with a shortened malunion or enlarged callus, which presents like a bump around the clavicle. The size of the malunion often correlates with the age of the victim, with a younger child having the ability to remodel more quickly and more accurately.[19] Surgery, which is rare especially in this age group, is indicated if there is an open fracture, tenting of the skin over the fracture site, neurovascular compromise, or other surrounding trauma to the area.[19,20]

Supracondylar fractures of the elbow are the most common pediatric elbow fracture in the 5- to 10-year age group due to a thinner cortex and ligament laxity, and these fractures constitute greater than 50% of all elbow fractures.[21] The majority of supracondylar fractures (95%) are caused by a FOOSH injury with a hyperextended elbow that forces the olecranon into the olecranon fossa causing disruption at the anterior cortex.[21] These injuries can be severe and require a thorough neurovascular evaluation and often surgical management.[21] Complications

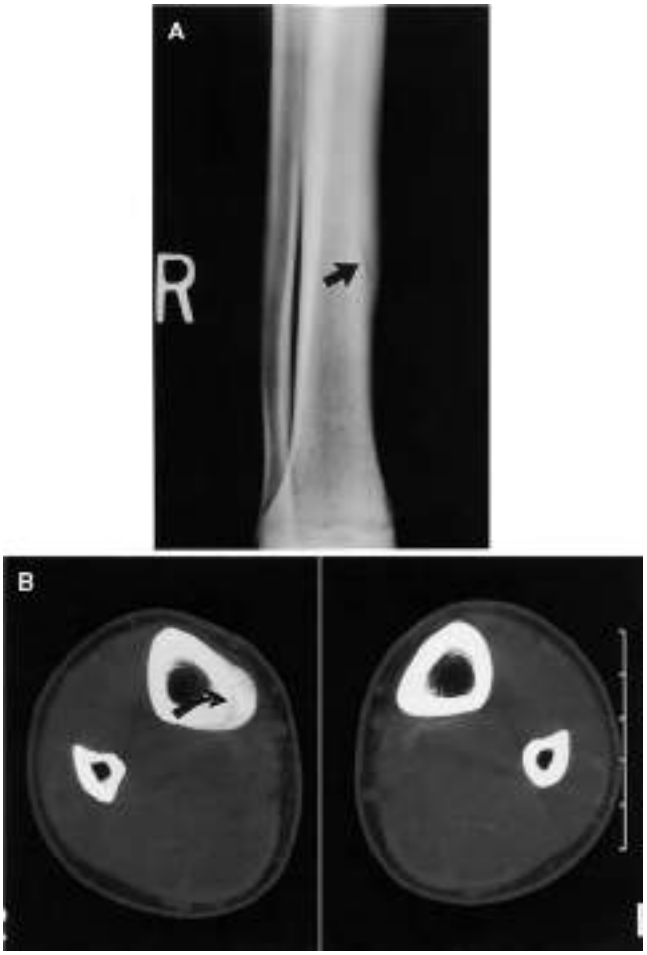

Figure 29-10 Tibial stress fracture. **A,** AP radiograph of the right tibia demonstrates cortical thickening of the tibia medially. There is an oblique fracture line identified in the cortex (*arrow*). **B,** Axial CT scan through both lower legs demonstrates benign periosteal new bone formation along the medial aspect of the right tibia (*curved arrow*). In this patient with an atypical pain pattern for stress fracture, the CT scan was obtained to rule out an osteoid osteoma. There is no radiolucent nidus identified. (From Spitz DJ, Newberg AH: Imaging of stress fractures in the athlete, *Radiol Clin North Am* 40:313-331, 2002.)

Figure 29-11 Fracture of right clavicle. (From Clark DA: *Atlas of neonatology*, p 8, Philadelphia, 2000, WB Saunders.)

may include loss of motion, neurological deficits, compartment syndrome, and avascular necrosis of the trochlea. Skin integrity is evaluated for color, radial pulse, and temperature because the anterior interosseous nerve may be compromised in 10% to 15% of these fractures. Flexion of the thumb and distal phalanx of the index finger to make the "okay" sign is used to test the integrity of the median nerve.[21] Physical examination reveals swelling, localized tenderness, and a depression over the triceps region. Uncomplicated fractures are immobilized in 70° to 80° of elbow flexion to avoid brachial artery occlusion which may occur if the elbow is maintained in a position of 90°.[21] Excessive swelling and ecchymosis are indicative of extensive soft tissue damage and places the child at risk for compartment syndrome.[22] **Acute compartment syndrome** is an emergent condition with the risk of limb loss and function as a result. Signs of compartment syndrome include pain with passive finger extension, loss of color in the hand, numbness, tingling, loss of movement, and decreased radial pulse. If compartment syndrome is present, a surgical compartment fasciotomy is performed to relieve pressure and restore circulation to the surrounding tissues. A complicated fracture requires closed reduction and pinning within 24 hours of the incident. Hand color and sensation is monitored post reduction to assess neurovascular status.

A less common mechanism for supracondylar fractures occurs if the child falls directly onto the elbow with the arm positioned in flexion. The ulnar nerve is most at risk during this type of fall.

The second most common type of elbow fracture is the distal humerus lateral condyle fracture. It is caused by a FOOSH injury through an avulsion varus force or by a direct blow to the capitellum by the radial head. Treatment consists of closed or open reduction depending on whether the condylar displacement is greater or less than 2 mm. A nonoperative, long arm cast for 4 to 6 weeks is recommended if the displacement is less than 2 mm. Rehabilitation after cast removal may be necessary to restore full elbow and wrist range of motion (ROM) and strength before unrestricted activities.[21]

Avulsion fractures at the elbow (Figure 29-12) are most often seen in teenage boys because the forces generated across the elbow increase with the larger body mass and greater strength of the maturing athlete.[21] The combination of valgus stresses and forceful contraction of the flexor-pronator muscles causes the medial epicondyle to avulse from the underlying bone.[23] A "pop" is often heard or felt at the time of acute onset.[18,21,23] Swelling, ecchymosis, point tenderness, loss of elbow extension, and possible joint instability are present. Anteroposterior (AP) and lateral radiographic views and valgus stress views demonstrate the presence of an avulsion fracture and the amount of displacement.[21,23] Surgical fixation is based on the size and the distance of the displaced fracture

Figure 29-12 **A,** Oblique projection of a child's elbow with an avulsion fracture of the lateral epicondyle (*arrow*). **B,** Notice that the child's contralateral elbow is normal (*arrow*). Although some advocate taking a radiograph of contralateral anatomy for comparison, it should not be a routine practice in the light of concerns for added cost and radiation exposure. A comparison with an atlas of normal skeletal development would provide the same information without these associated drawbacks. (From Marchiori D: *Clinical imaging*, ed 2, St. Louis, 2005, Mosby Elsevier.)

TABLE **29-3**

Common Sites of Avulsion Fractures of the Pelvis, Associated Muscles, and Mechanisms of Injury in the Skeletally Immature

Site	Associated Muscles	Mechanism of Injury
Anterior superior iliac spine	Sartorius	Passive hip extension coupled with knee flexion or active hip flexion coupled with knee extension
Anterior inferior iliac spine	Rectus femoris	Sudden contraction of rectus femoris such as with a vigorous kick
Ischial tuberosity	Hamstrings and adductor magnus	Passive hip flexion coupled with knee extension or active hip extension coupled with knee flexion
Lesser trochanter	Iliopsoas	Sudden active hip flexion
Iliac crest	Abdominal obliques	Sudden contraction of obliques

Modified from Merkel DL, Molony JT: Clinical commentary: recognition and management of traumatic sports injuries in the skeletally immature athlete, *Intl J Sports Phys Ther* 7:691-704, 2012.

(>2 mm), associated joint instability, and the presence of ulnar nerve symptoms. Conservative management with cast immobilization is recommended for 3 weeks for a nondisplaced or minimally displaced fracture of less than 2 mm, as long as there is no nerve involvement or joint instability.[23,24] After cast removal, a hinged brace is worn for 4 to 6 weeks.[23] Gentle ROM exercises begin early to maximize the achievement of terminal elbow extension. Flexor-pronator strengthening is initiated when the athlete is symptom free. A return to throwing program begins when radiographic union is visible.[23]

Avulsion fractures around the hip and pelvis occur at the same six sites as the apophyseal areas.[25,26] The most common sites are the anterior superior iliac spine (ASIS) and the ischial tuberosity. These are acute injuries caused by a sudden powerful contraction of the attached muscles or quick stretch at end ROM that pulls violently on the nonossified apophysis.[25,26] Sports that require running, sprinting, twisting, jumping, cutting, kicking, and lower extremity hyperflexibility have the highest incidence of this type of injury. These injuries are often misrepresented as muscle strains that occur in the adult athlete after the apophysis (secondary growth plate) has closed. A sudden pop is heard or felt followed by pain, swelling, weakness, and possible ecchymosis. Table 29-3 identifies the mechanism of injury at each specific apophysis and corresponding muscle involvement. Radiographs show gross displacement, and a contralateral comparison view may be necessary to identify subtle changes. Nonoperative treatment includes protected weight bearing, rest, ice, and avoidance of the offending activities. Protective weight bearing lasts until callus formation is noted on the radiographs. Physical therapy begins with symptom resolution. Aquatic therapy may begin early if the child can perform water activities without increasing symptoms. Gentle ROM and active movements with a slow progression to full weight bearing comprise the first phase of rehabilitation. Strengthening of the entire hip area, progression of resisted activities, and unilateral exercises follow. Bilateral and unilateral plyometric and return to sport activities complete the rehabilitation process. Low volumes and decreased intensity and speed are initiated as the child or adolescent returns to activities and sports. Full, symptom-free ROM and the involved extremity displaying 90% of strength compared with the uninvolved side are criteria for return to play.[25–27] Complete resolution of symptoms and full return to play may take up to 3 months. Surgical reattachment of displaced fragment is recommended if the displacement is greater than 3 cm.[28]

In the skeletally immature patient, the tibial spine where the anterior cruciate ligament (ACL) inserts into the tibial plateau is weaker (due to its incomplete ossification) than the ACL and often fails under valgus rotation stresses with

the knee extended before rupture of the ACL. **Tibial spine avulsion fractures** are primarily observed in children ages 8 to 14 years and can occur with or without contact.[29–33] Physical findings include pain, rapid onset of effusion, and reduced weight bearing. A positive anterior drawer test may be noted. Extreme ranges of knee motion are limited due to increasing pain. Tibial spine avulsion fractures are best viewed on lateral radiographs. MRI is used to rule out concomitant meniscal tears or other ligamentous injury, which occur in approximately 40% of tibial spine injuries.[30–32] There are four types of tibial spine fractures: type I nondisplaced, type II partially attached, type III displaced, and type IV comminuted.[29,30,32] Acute management involves immobilization and immediate medical evaluation. Minimally displaced fractures are treated with cylinder casting and protective weight bearing for 2 to 6 weeks. Surgical screw fixation is recommended for types III and IV avulsions or when reduction cannot be achieved through casting. Potential complications include loss of ROM, muscle atrophy, nonunion (rare) or malunion, growth disturbance, and residual laxity. Subjective reports of laxity are rare, but positive physical examination findings should be noted.[29,30,32] The residual laxity does not improve with maturation. Loss of knee motion with a tibial spine fracture may be as a result of mechanical impingement of the displaced fracture or arthrofibrosis following immobilization. Early motion after surgery is recommended to prevent stiffness. Rehabilitation goals begin with restoration of ROM, light strengthening exercises, and gradual weight-bearing progression. Intermediate and final phases of rehabilitation follow ACL protocols with a cautious return to sport.

Seventy percent of all carpal bone fractures occur at the scaphoid. A **scaphoid fracture** (Figure 29-13) is often seen in active people between the ages of 15 and 30 years. The scaphoid has a complicated vascular anatomy that impacts healing and therefore treatment decisions.[34] A FOOSH injury is the most common mechanism, with tenderness reproduced in the anatomic snuff box, decreased wrist ROM, as well as swelling and pain with wrist extension. Radiographs may be negative; therefore clinical suspicion of a scaphoid fracture warrants an MRI. Scaphoid fractures are initially treated conservatively to optimize healing and obtain fracture union.[34] In addition to the physical characteristics of the fracture, the sport and position played and goals of the athlete may impact management. The scaphoid fracture is managed initially with casting but some do require surgery. Slow healing or nonunion scaphoid fractures are frequently seen in athletes in which a delay in proper care and diagnosis was evident.[34]

Figure 29-13 Transverse fracture of the scaphoid (*arrow*) in a 16-year-old boy. (From Strouse PJ: Skeletal trauma. In Slovis TL, editor: *Caffey's pediatric diagnostic imaging*, ed 11, Philadelphia, 2008, Mosby Elsevier.)

General Management of Scaphoid Fractures

- Cast immobilization for 8-10 weeks without playing
- Cast immobilization and a playing cast for return to sport participation
- Surgical fixation

Chondral (Cartilage) Injuries

Cartilage injuries, occurring in the immature skeleton, may or may not extend to the underlying cancellous bone. If underlying bone is involved, the inflammatory process will assist in healing at the bony level. Cartilage does not have a direct blood or lymphatic circulation or nerve supply; therefore it has minimal ability to self-repair following injury. Generally, bone repair in children is more effective due to increased vascularity to the periosteum and metaphysis. Factors influencing osteochondral lesions are trauma, uneven or excessive pressure, disruption of blood supply to the bone, and genetics.[12,13]

Panner's Disease

Panner's disease (Figure 29-14) is an osteochondrosis of the capitellum at the distal end of the humerus and is often confused with osteochondritis dissecans (OCD) of the same bone. Both diagnoses have similar pathological processes and mechanisms of injury due to repetitive compression forces at the lateral elbow, which compromises blood flow to the capitellum, but differ in stages of development and resultant outcomes.[35,36] Panner's disease is seen in the young athlete (ages 4 to 10 years) who competes in throwing, racquet sports, or gymnastics. A vague description of lateral elbow pain and loss of 10° to 20° extension are classic signs of the condition.[37] Radiographs may show demineralization, fissuring, or fragmentation of the capitellum, avascular necrosis of the ossific nucleus, and flattening of the capitellum.[38] Repeated radiographs are a part of the monitoring process to ensure healing is occurring. Surgery is not indicated unless the condition does not resolve with rest and activity modification. Return to sport usually occurs in the next season without sequelae, and long-term success rates are excellent.[35] Physical therapy prepares the athlete to return to sport

Figure 29-14 Panner's Disease. Note fragmentation of the humeral capitellum and flattening of the articular surface (*arrow*). (From Landry GL: Management of musculoskeletal injury. In Kliegman RM, Behrman RE, Jenson HB, Stanton BF: *Nelson textbook of pediatrics*, ed 18, Philadelphia, 2007, Saunders/Elsevier.)

when sufficient healing has occurred. Reshaping and restoration of the capitellum can take up to 1 to 3 years.

Osteochondritis Dissecans

Osteochondritis dissecans (OCD) of the capitellum occurs in the 10- to 17-year-old athlete, with the median age at 14, when the cartilage separates from the underlying subchondral bone due to vascular compromise from repetitive microtrauma at the lateral elbow.[37,39–41] At this stage of growth, the capitellum is almost fully developed and blood supply is tenuous. High-level athletes who participate in overhead throwing, gymnastics, or weight lifting are at most risk.[42–45] Boys are 2 times as likely as girls to experience this injury; however, gymnasts are at particular risk due to excessive weight bearing with high compressive loads placed across the elbow and are often advised to discontinue gymnastics in the presence of severe OCD injuries. Pain and loss of motion are observed as in Panner's disease, but grinding, clicking, or locking due to fragmentation or loose bodies could be present as well as synovitis. In addition to the extension loss, mild loss in flexion and forearm rotation may also be observed.[40,42,43] MRI is the imaging of choice for full visualization of the OCD lesion, cartilage integrity, and viewing of loose bodies within the joint space.[38] Management of OCD lesions of the capitellum is dependent on the size of the fragment, history of injury, presence of loose bodies, and integrity of the cartilage as well as the age of the patient. Early recognition and appropriate management are extremely important to produce good results and return the athlete to sport. Younger patients with smaller lesions and an intact articular cartilage have the best outcomes. Older athletes with larger lesions, detached cartilage, and/or loose bodies demonstrate less favorable results and are often unable to return to sports participation at previous level of play because pain and ROM deficits persist.[41,44,45] Surgical interventions depend on the extent of the injury and may constitute loose body removal or refixation, debridement, and/or resurfacing. Techniques to facilitate healing, such as subchondral bone drilling or abrasion chondroplasty, may be used.[40,43,45,46] Postoperative treatment protocols include continuous passive motion (CPM) for 4 to 6 weeks, low-impact physical therapy at 6 weeks, and strenuous exercises and return to sport activities at 6 to 12 months, based on completion of ROM, strength, and symptom goals.

OCD occurs most commonly in the knee, most often on the lateral aspect of the medial femoral condyle. With the condition, there is separation of the articular cartilage from the underlying subchondral bone.[47] OCD lesions are classified in stages I to IV to describe the extent of the lesion and subsequent treatment algorithm. The deformation of the cartilage surface is illustrated in Figure 29-15. Boys ages 5 to 15 years are more susceptible than girls by a 2:1 or 3:1 ratio.[47] The athlete presents with persistent vague knee pain that is worse with activity initially and then the pain becomes constant if ignored.[47] Swelling and stiffness may also be present in the knee. AP, lateral, tunnel, and merchant radiographic views are used for improved viewing of all potential injured structures. MRI is very useful in evaluating the status of the OCD lesion and surrounding structures.[47] Management of OCD lesions depends on the size, fragmentation, and presence of loose bodies in the joint. Small lesions without loose fragments are treated conservatively with several weeks of immobilization and protected weight bearing.[47] Younger

Figure 29-15 Stage III OCD lesion (*arrow*) of the medial femoral condyle.

patients with open growth plates have better outcomes than adolescents with closing growth centers.[47] Surgical intervention is required if conservative treatment (i.e., 3 to 6 months of rest, activity modification and rehabilitation) fails or the presence of large lesions with loose bodies is observed. Surgical approaches include debridement, loose body removal, drilling, or autologous chondrocyte implantation (ACI) transplantation. Rehabilitation focuses on protecting the cartilage while gently reestablishing ROM and strength. Gradual progression of weight bearing occurs as cellular healing is established. Both open- and closed-chain exercises are used in restricted ROM for protection of the healing structures. Initiation of impact activities is delayed for 6 to 9 months, depending on the surgical procedure. Return to sport may take up to a year following surgery.

Growth Plate (Physis) Injuries

Apophysitis

Apophysitis, uniquely seen with the immature skeleton, is the irritation of the apophysis (secondary growth plate). Many of these injuries have been named after individuals (e.g., Sever's) and have been labeled as diseases. However, the pathological process, although it does involve inflammation of a structure (the physis or growth plate), does not follow a disease process. Therefore to call these inflammatory processes a disease is a misnomer. The apophysis is the cartilaginous structure in children, located on a long bone serving as attachment site for the musculotendinous unit. In adults, tendonitis would be experienced because tendons attach directly to bone. Additional stress on the apophysis is most common during times of growth spurts when tendons or ligaments are stronger and muscles are weaker and less flexible. Some examples of apophysitis, which will be covered in detail later in this chapter, are Sever's disease, Osgood-Schlatter syndrome or disease, Sinding-Larsen-Johansson syndrome, and apophysitis occurring in the spine and pelvis. If the traumatic episodes exceed the strength of the apophysis, a child is at risk for an avulsion injury at the apophysis. An avulsion injury occurs when excessive forces separate the apophysis from the underlying bone.[1,8,12,13]

Shoulder Physeal Stress Fracture (Little Leaguer's Shoulder)

The rotational stress about the proximal humerus during repetitive overhead throwing (i.e., pitching) may produce a stress fracture of the humeral physis known as "little leaguer's shoulder."[18,19,23] The throwing athlete (age 11 to 15 years) is most vulnerable, although in general, proximal humeral physeal fractures make up only 3% of all physeal fractures.[19,23] The majority of these fractures (75%) are Salter-Harris type II (see Figure 29-8) and demonstrate excellent nonoperative results if rest and rehabilitation recommendations are followed.[19] Salter-Harris type I fractures are seen in upper extremity impact sports, such as gymnastics.[23] Because 80% of humeral growth is determined by the humeral physis, early detection is important in prevention of premature closure of the physis, limb shortening, a varus deformity, and possible resultant shoulder impingement. Radiographs are the initial imaging of choice with AP, axillary, stryker notch, and comparison views conducted. Widening of the physis is noted and illustrated in Figure 29-16. Imaging is useful to rule out unicameral bone cysts and bone tumors as a source of pain. Physical examination shows swelling, weakness, decreased ROM, and muscle atrophy around the proximal anterior and lateral humerus. Pain on palpation over the proximal humerus and lateral physis is observed in approximately 70% of patients.[19,23] Treatment consists of rest from throwing and any additional offending activity for 1 to 3 months or until the next season.[19,23,48] Once symptom free, the athlete begins physical therapy to reestablish strength, ROM, neuromuscular control, and gradual symptom-free return to sport.

Little Leaguer's Elbow

The term "Little Leaguer's Elbow" has been discussed and described in the literature, sports medicine offices, and on the field in many different ways. Originally, little leaguer's elbow referred to apophysitis of the medial epicondyle of young baseball pitchers due to the repetitive valgus stresses that occur to the medial elbow during late cocking and the acceleration phase of throwing.[49] Over time, the term has been used to describe many overuse entities around the elbow in the young athlete that occur with lateral compression forces, medial traction stresses, and posterior extension overloads. Panner's disease, OCD of the capitellum, medial epicondyle apophysitis, and posterior elbow pain are often grouped together under "little leaguer's elbow" but should be described as separate pathological processes and are observed in gymnasts,

Figure 29-16 AP image of the proximal humerus showing a widened lateral physis (*arrow*), indicative of a stress fracture of the physis.

weight lifters, and other overhead athletes in addition to throwers. A rise in these injuries has been noted with increases in youth sports participation, and it appears contributory factors include early specialization, high activity volumes, participation on multiple same sport teams in a season, attempting or performing sports skills above physical and skeletal readiness, and decreased rest times, with most athletes resting only 1 day a week. Prevention strategies for overuse injuries of the upper extremity are shown in the following textbox.

Upper Extremity Injury Prevention Strategies

- Limit onset of teaching of difficult pitches
- Use of a smaller, youth-sized baseball
- Optimize technique and throwing mechanics
- Insure appropriate strength and conditioning of arms, shoulders, core and legs
- Limit number of pitches
- Recognize total volume of throwing (multiple leagues and teams, free play)
- Recognize that unconditioned athletes tend to have poor mechanics
- Recognize that highly conditioned athletes are predisposed to exceed the limits of the musculoskeletal system

NOTE: Detailed pitching recommendations can be found on the USA Baseball Medical and Safety Advisory Committee Guidelines webpage http://www.asmi.org/asmiweb/usabaseball.htm

From Merkel DL, Molony JT: Clinical Commentary: Recognition and management of traumatic sports injuries in the skeletally immature athlete, *Intl J Sports Phys Ther* 7:691-704, 2012.

Medial epicondyle apophysitis is a traction injury caused by repetitive valgus stresses at the medial elbow and is observed in young athletes (age 8 to 14 years) who exhibit open growth centers. The same mechanism of injury produces ulnar collateral ligament injuries in adult throwers, but because the physis in the young is the "weak link," injury occurs there rather than to the ligament.[50] Symptoms include medial elbow pain, decreased elbow ROM, pain with activity that is initially relieved by rest, and a decrease in performance. Physical examination reveals pain with the following tests: palpation over the medial epicondyle, valgus stress testing, and resisted wrist flexion and pronation.[50,51] Contralateral elbow radiographs assist in depicting widening and fragmentation of the apophysis (Figure 29-17).[50] Rest from offending activities, such as throwing, weight bearing, and sports participation, for 4 to 6 weeks is recommended. Education regarding the risk of continued participation and potential avulsion fracture occurrence is necessary. Physical therapy may begin once symptoms have subsided and the condition is improving. Initially, periscapular, low-resistance exercises and activities below shoulder level are implemented. Gentle stretching to the flexor-pronator mass is performed if the ROM is restricted. Shoulder and core strengthening should also be addressed because proper use of the whole kinetic chain

Figure 29-17 AP radiograph showing widening of the medial apophysis (*arrow*).

can decrease the stress on the elbow. Resistance exercises with elastic bands and weights are slowly progressed as tolerated. Good shoulder strength and muscular balance around the entire shoulder complex assists in supporting the elbow during the stresses of throwing. A biomechanical evaluation and gradual return to sport are the focus at the end stages of rehabilitation. The athlete cannot return to sport participation until the highest level skill is practiced and demonstrated in the clinic without symptoms.

Slipped Capital Femoral Epiphysis

Obese, pubescent males are at higher risk for acquiring a slipped capital femoral epiphysis (SCFE). This diagnosis is not sports related but can affect athletes as well. Excessive stresses across the cartilaginous growth plate cause the distal portion of the femoral head, called the epiphysis, to displace from its normal alignment (Figure 29-18).[52] The slippage occurs much like a scoop of melted ice cream falling off its cone. The adolescent presents with pain into the groin, medial thigh, or knee. Limping with the leg positioned in lateral (external) rotation is common. In supine, the patient position of comfort is hip flexion, abduction, and lateral (external) rotation. A loss of medial (internal) rotation and a positive log roll test are characteristic. Surgical pinning of the slipped bony fragment is recommended for best outcomes and to prevent avascular necrosis of the epiphysis.[52] Because the presence of bilateral SCFE occurs in up to 30% of those adolescents affected, monitoring of the unaffected hip is recommended until epiphyseal closure has occurred.[52] Postsurgical physical therapy is recommended following established protocols.

Clinical Point

In children, medial knee pain with no history of trauma should include examination of the hip.

Figure 29-18 **A,** Right slipped capital femoral epiphysis. Note Klein's line and how epiphysis does not cross line (*arrow*). Compare with normal left hip. **B,** Slipped capital femoral epiphysis in an overweight boy, aged 11. (*A*, from Adam A, Dixon A, Grainger RG, Allison DJ, editors: *Grainger & Allison's diagnostic radiology*, ed 5, Philadelphia, 2008, Churchill Livingstone; *B*, from Long BW, Frank ED, Ehrlich RA: *Radiography essentials for limited practice*, ed 3, St. Louis, 2010, Saunders Elsevier.)

Risk Factors for Slipped Capital Femoral Epiphysis

- Age (adolescence)
- Male
- High activity level
- Obesity

Hip Apophysitis

Apophyseal injuries are more prevalent in the immature skeleton until ossification of the cartilaginous growth centers is complete. Older adolescents and young adults (age 14 through 25 years) commonly experience apophysitis at the remaining open growth centers around the hip and pelvis.[25] The six major sites for apophysitis in this region include the iliac crest, ASIS, anterior inferior iliac spine (AIIS), ischial physis, greater trochanter, and lesser trochanter.[25] The ASIS is the last apophysis to mature, and may remain open until the age of 25. Iliac crest apophysitis is the most frequently observed and often plagues runners, dancers, ice skaters, and football and soccer players. Painful palpation over the iliac crest is noted and pain is reproduced by resisted trunk rotation due to the pull of the abdominal oblique muscles at their insertion on to the pelvis. General treatment for all six sites includes activity modification or complete rest if symptoms have been prolonged and are constant. Therapeutic exercises include trunk and hip joint ROM as well as flexibility, extensive core and hip strengthening without symptom reproduction, and technique evaluation and adjustment if poor execution of skill is a contributory factor to this overuse syndrome. Biomechanical evaluation of the entire lower kinetic chain is important as weakness or dysfunction away from the site of injury could be problematic.

Distal Femoral Physis Fracture

An adult athlete who sustains a valgus force to a fully extended knee may suffer a medial collateral ligament (MCL) tear. The same mechanism in the immature skeleton of the youth athlete potentially produces a distal femoral physeal fracture due to the origin of the MCL on the femoral epiphysis and the insertion into the stronger tibial metaphysis. Although occurring in less than 1% of pediatric fractures, distal femoral physeal fractures are evaluated thoroughly because growth disturbance at the physis can cause significant angular deformities and leg length discrepancies due to growth centers at the knee that are large and fast growing.[13,30] Acute neurovascular compromise may also be a complication. The young athlete presents with medial knee pain, pain on valgus stress testing, and

painful palpation over distal femoral physis with or without tenderness to the MCL. Plain films and MRI are recommended to appropriately view physeal separation and the size of fracture displacement. Salter-Harris fracture classification I through IV (see Figure 29-8) may potentially occur with this mechanism of injury. Salter-Harris I diagnosis is evident with physeal widening without involvement of the epiphysis or metaphysis.[30] Radiographs are usually normal, and the MRI will be positive. Type I injuries are treated conservatively with immobilization for 2 weeks. Fifty-four percent of distal femoral physeal fractures are Salter-Harris type II.[30] The fracture line transverses the physis then exits obliquely across one corner of the metaphysis. If the fracture is nondisplaced, then knee immobilization is initiated for 4 to 6 weeks. A displaced type II fracture requires closed reduction under anesthesia and cast immobilization for 6 to 8 weeks with 2 weeks of non-weight bearing. Salter-Harris type III and type IV often require open reduction and internal fixation. All types of Salter-Harris fractures of the distal femoral physis require long-term monitoring with serial radiographs to identify healing and premature physeal closure.[30]

Apophyseal Injuries of the Knee

Osgood-Schlatter disease or syndrome and **Sinding-Larsen-Johansson** injuries are an inflammation of the apophysis at the tibial tubercle and inferior pole of the patella, respectively. Both of these diagnoses are overuse traction injuries of the anterior knee and are caused by sports that require repetitive running or jumping. Pain occurs during activities and is relieved by rest in the early stages. Preadolescents, both males and females, at the height of their growth spurts are most affected. Osgood-Schlatter disease is painful on palpation of the tibial tubercle and is reproducible with performance of aggravating activities in the clinic. Many athletes acquire a permanent bump on the tibial tubercle. Plain films may show tibial tubercle displacement (Figure 29-19) or avulsion in cases of disease progression. Sinding-Larsen-Johansson shows pain on palpation at the inferior pole of the patella, and the athlete may demonstrate a quadriceps lag during a straight leg raise. In prolonged cases, the inferior pole of the patella, along with the cartilage and surrounding retinaculum, can avulse and be displaced inferiorly. This is referred to as a **sleeve fracture**.

Figure 29-19 Lateral radiograph of showing tibial tubercle fragmentation and physical widening in advanced Osgood-Schlatter disease (*arrow*).

Athletes with apophysitis are allowed to continue to play with mild pain symptoms, if pain is less than 3 out of 10 on a visual analogue scale (VAS), relieved with rest, and abolished by the next practice session. If the athlete requires pain medication to play or is limping while playing, participation in sport is not advised.

Salter-Harris Fractures of the Distal Fibula

The ankle is a commonly injured body part of athletes of all ages.[21] It is the third most common site of physeal injury in the young athlete.[53] The athlete with an immature skeleton is more likely to suffer a distal fibula growth plate fracture during an ankle inversion injury than an ankle sprain. The presence of a physeal fracture needs to be ruled out in this population. The point of maximal tenderness during palpation is over the physis, which is located one finger width above or proximal to the distal end of the fibula. Ligamentous tenderness on palpation may also be noted. Swelling, ecchymosis, or the ability to weight bear may or may not be present. Plain films may not demonstrate widening of the physis in Salter-Harris type I fractures but palpatory pain over the physis will clinically implicate a fracture. Palpation of the base of the fifth metatarsal and head of the fibula is necessary to identify associated fractures with a lateral ankle injury. Salter-Harris type I and type II fractures of the distal fibular physis most often heal rapidly without sequelae. Cast or boot immobilization for 2 to 4 weeks is commonly implemented.[29] Rehabilitation after immobilization follows treatment protocols for an ankle sprain. Salter-Harris type III and IV are intra-articular, with fracture fragmentation, and required open reduction and internal fixation to restore alignment. Delay in proper diagnosis may create chronic pain, instability, and reduced function.

Clinical Point

In young children, a growth plate fracture due to an ankle inversion injury is more likely than an ankle sprain.

Sever's Disease

Sever's disease (Figure 29-20) is apophysitis of the calcaneus. It is characterized by heel pain, a positive calcaneal squeeze test, and tight gastrocnemous-soleus complex. Sever's disease is typically seen in 8- to 15-year-olds during or just after a rapid growth spurt.[54] Running and jumping activities aggravate the symptoms. Treatment focuses on pain reduction and stretching of the calf muscles. Heel cups and heel lifts which position the foot in slight plantar flexion reduce stress on the calcaneal apophysis.[55,56]

Figure 29-20 Sever's disease in an 11-year-old male with fragmentation of the calcaneal apophysis. (From Macias C, Gabor R: Overuse syndromes and inflammatory conditions. In Baren J, Rothrock S, Brennan J, Brown L editors: *Pediatric emergency medicine*, Philadelphia, 2008, Saunders Elsevier.)

Modification of footwear and orthotics may be indicated. Symptoms typically resolve in a few weeks when early intervention is implemented. Participation in sport is allowed if symptoms are mild and controlled without pain medications. Cast or boot immobilization is indicated for prolonged symptoms, failed conservative methods, and/or a decreased ability to bear weight. *Iselin's disease* is another apophysitis of the foot and is located at the site of attachment of the peroneus brevis muscle on the fifth metatarsal.

Growing Pains

One of the most common complaints of children and adolescents is musculoskeletal pain and in some cases is a cause for missing school and other activities. There can be many contributing overlapping factors to childhood musculoskeletal pain, including night pains, benign hypermobility syndrome, inflammatory conditions, rheumatological conditions, lyme disease, overuse injuries (covered extensively in this chapter), psychogenic factors, or conditions such as osteoid osteoma. A thorough history, observation, and examination are imperative, including overall "ill" versus "well" appearance, school absences, joint pain, muscle atrophy, limitation in extremity, and/or back ROM, tender points, tenderness at apophyses or bony insertion of tendons for older children, swelling, stiffness, weakness, rashes, eye manifestations, and genitourinary or bowel issues.[57,58]

Systemic Musculoskeletal Issues in Children

Anatomical Alignment

Similar to adults, children can develop problems related to variations in their anatomy. Certain malalignment problems tend to be related to particular overuse injuries. Good posture and anatomical alignment are the result of balance in a multisegmental system. Movement takes place at the most flexible segments rather than the area of restrictions. Alterations in the patterns and precision of movement can cause microtrauma, which leads to macrotrauma and pain if not corrected.

Table 29-4 presents a list of some common malalignment conditions, the overuse injury that results, and the means of correction. Historically the grouping of the most common biomechanical features often associated with many overuse injuries (i.e., an increased quadriceps [Q] angle, excessive pronation, increased femoral anteversion, and genu valgum, especially in females) was referred to as *miserable malalignment*. Although this term is rarely used in orthopedics today, it is important that clinicians know its meaning if they encounter it.

Night Pains

Night pains in the lower extremities, of unknown etiology, sometimes occur with children. These pains are not always indicative of serious illness. Toddlers and preadolescent children who sometimes experience thigh and/or calf muscle soreness may respond to anti-inflammatory pain medication, stretching, or vigorous massage before bed. Pain in this age group appears to increase after a busy day. Many young people over age 12 also may complain of leg or foot cramps unrelated to exertion which often interrupts sleep patterns. Stretching is recommended for these adolescents.[1]

Hyperlaxity

Benign hypermobility syndrome is an inherited disease of the connective tissue. It is defined as the presence of joint hypermobility, which is measured using a validated, nine-point scoring system such as the **Beighton-**

TABLE **29-4**

Common Malalignments

Malalignment	Injury	Correction
Femoral anteversion	Snapping psoas	Prevention of pelvic rotation by establishing muscle balance in pelvic girdle
Genu valgum	Patella subluxation	Vastus medialis obliquus (VMO) strengthening
Pes planus	Foot pain, knee pain	Orthotic inserts
Medial (internal) tibial torsion	In-toeing, tripping	None, osteotomy

BOX 29-1

Beighton-Horan Ligament Laxity Scale[59]

1 Passive dorsiflexion of the little finger beyond 90° (1 point left; 1 point right)
2 Passive opposition of the thumbs to the flexor aspect of the forearm (1 point left; 1 point right)
3 Hyperextension of the elbows beyond 10° (1 point left; 1 point right)
4 Hyperextension of the knees beyond 10° (1 point left; 1 point right)
5 Ability to forward flex the trunk with the knees straight and the palms resting easily on the floor (1 point)

Horan Ligament Laxity Scale (Box 29-1).[59,60] One point is given to each side of the body for items 1 to 4, and a final point is given based on trunk flexion. Benign hypermobility syndrome commonly occurs with children and adolescents, especially females who are involved with activities such as gymnastics. Hyperlaxity in different joints (four out of nine positive sites of laxity) is evident and may be complicated by recurrent sprains, dislocations, or chronic overuse issues. Blood tests are normal and symptoms include diffuse joint pain that worsens at the end of the day and after activity. Children typically do not miss school or activity. Prognosis is excellent with supportive care. Recovery may be gradual because the child's body matures and the child becomes less flexible with age.[57,58]

Hypermobility syndrome is a diagnosis of exclusion, one that is reached after more serious diseases have been ruled out. No widely accepted, effective intervention or physical therapy treatment is available for the condition. Exercise or activity may appear to make the pain worse because a clear link does not always exist between an activity and the onset of pain. The plan for therapy emphasizes joint protection strategies, supportive splints, and avoidance of bringing joints to the end of ROM, as well as stabilization through postural training, strengthening, and proprioception. Children and adolescents with joint laxity or hypermobility should be assessed for preparedness to participate in their desired play and recreational activities.

Growth Spurts

The rapid growth of a child can lead to relative muscle tightness, especially during the adolescent growth surge. This tightness can lead to apophyseal stress or injury. For the extremities, the primary growth centers (i.e., where most growth occurs) for the upper limb are the shoulder and wrist, whereas for the lower limb, it is at the knee.

Inflammatory Disorders

Rheumatic or inflammatory disorders may present with joint pain, swelling, limited ROM, stiffness, and weakness. Rheumatic issues may present with rashes, eye manifestations, genitourinary and bowel symptoms, and the child may not look well. Physicians will be able to assess and order appropriate blood testing and imaging to further determine diagnosis. Some examples of these disorders include spondyloarthropathy syndromes, Reiter's syndrome, seronegative enthesopathy and arthropathy syndrome, spondyloarthritis, and juvenile rheumatoid arthritis.[57,58]

Psychological Considerations

An increasing number of adolescents and preteens appear to experience musculoskeletal symptoms as an emotional defense mechanism to managing pressure for achieving high levels of accomplishment at sports and academics. These children will often miss school or activity time. It is important to promptly provide supportive treatment and to explore the possibility of this phenomenon occurring.[57,58]

Upper Extremity Injuries

Traumatic upper extremity injuries as a result of a FOOSH are common in children because they inadvertently tumble off bikes, scooters, swing sets, and other moving apparatus.[21] These injuries are an inherent risk as youths participate in sports and play, but the risks are well worth taking to combat sedentary lifestyles and childhood obesity. Traumatic injuries of the upper extremity include but are not limited to fractures and dislocations about the shoulder, elbow, wrist, and hand. However, overuse injuries, which can be minimized, are on the rise because early specialization and year-round participation in only one sport is increasingly emphasized. These repetitive stress injuries are preventable, and the trained physical therapist can influence the reduction of these injuries through preventative programs.

Glenohumeral Joint Dislocations

The glenohumeral joint can dislocate both traumatically and atraumatically in three different planes: anterior, posterior, and inferior. Most dislocations occur anteriorly and are more common in adolescents and young adults (Figure 29-21).[19,23,61] Less than 2% of these dislocations occur under the age of 10 years. Most dislocations that do occur in children under the age of 12 are atraumatic, often bilateral, and the result of pathological joint laxity.[23] The most common mechanism of injury for an anterior shoulder dislocation is a blow to the shoulder while positioned in abduction, extension, and lateral (external) rotation.[62] Following anterior dislocation, the affected upper extremity is commonly positioned in slight abduction and medial (internal) rotation.[19] Due to a risk of neurovascular compromise and/or physeal involvement, the adolescent's shoulder reduction is performed in a medical facility where pre and post radiographs and sensation testing are performed to ensure an uncompromised relocation.[63] Immobilization protocols post reduction

Figure 29-21 An anteroposterior radiograph of right shoulder showing anterior dislocation of the shoulder joint in a 2-year-old child. (From Pawar M, Trikha V, Yadav CS, Rastogi S: Post-traumatic shoulder joint dislocation in a very young child, *Injury Extra* 37:145-146, 2006.)

vary greatly because the literature is inconclusive regarding preferred treatment methods. Many physicians recommend 3 to 6 weeks of immobilization followed by gradual ROM, whereas some physicians advocate early motion within 5 to 7 days of reduction. Conservative management of shoulder dislocations have not shown a difference in re-dislocation rate between shoulder immobilization in lateral (external) versus medial (internal) rotation.[64] Treatment algorithms considering both surgical and nonsurgical interventions for anterior shoulder dislocations are athlete- and surgeon-specific based on presentation, history, sport involved, time of injury (mid-season versus end of season), presence of a Bankart lesion, presence of a Hill-Sachs lesion, amount of pain and dysfunction, and whether physical therapy has been prescribed. A Hill-Sachs lesion is an impaction fracture of the posterior lateral margin of the humeral head as it forcefully contacts the glenoid rim during anterior dislocation.[19,48] Such lesions during dislocation increase shoulder instability if greater than 30% of the humeral articular surface is involved.[19] Detachment of the labrum from the anterior glenoid is called a Bankart lesion and has been shown to occur in 97% of patients who were examined arthroscopically following dislocation.[19,62] Depending on the literature source, a high incidence of reoccurrence (55% to 100%) has been observed for those under the age of 20 years.[19,23,62] Athletes have a 3 times higher rate of redislocation than nonathletes.[62] Intervention for an athlete who sustains a first-time dislocation may include counseling regarding the high incidence of reoccurrence, conservative management after immobilization, and exploration into surgical options, although commonly surgery is not considered unless at least one redislocation has occurred. Shoulder stabilizing braces may be a nonsurgical option for some athletes depending on their sport and position played. There are numerous braces on the market with both positive and negative aspects.[62] Comfort, ease of application, ROM limitation, impact on athletic performance, and warmth of brace varied among the different types of braces and contribute to the athlete's satisfaction. Some braces may be comfortable and breathable but do not sufficiently restrict motion to prevent instability. Others may adequately prevent instability but negatively impact athletic performance. The main purpose of shoulder brace is to limit shoulder motion to provide stability which may be counterproductive for those sports and positions that require full or extreme ROM for participation.[62] Physical therapy initially consists of gentle motion, periscapular and rotator cuff strengthening, restoration of muscular balance around the glenohumeral joint, and avoidance of provocative positions of abduction and lateral (external) rotation. As healing occurs, pain is reduced, full ROM is achieved, and resistive strengthening in both open- and closed-chain positions is emphasized. Neuromuscular re-education is initially performed in the mid range of ROM, in the plane of the scapula (scaption). As dynamic stabilization improves, these exercises can be progressed toward end range positions, particularly medial (internal) and lateral (external) rotation with the glenohumeral joint elevated to 90° of abduction. As with all upper extremity injuries, core and lower extremity strength and functional deficits are addressed and treated to ensure the whole kinetic chain plays an appropriate role in the child's activities. A gradual return to throwing or sport is initiated with modifications of intensity, frequency, and duration implemented. The player cannot progress to the next phase in rehabilitation unless symptom free at the lower level. Mild symptoms that resolve within 2 hours after exercise and are relieved by cryotherapy are acceptable. Surgery may be indicated for individuals who require full shoulder stabilization to participate in their sport, such as those involved in collision or contact sports or those experiencing recurrent instability in the dominant or throwing arm.[48,65] Postoperative management is often surgeon- or institution-dependent. Preestablished protocol guidelines are usually available from the physician or surgeon. In general, the patient will be placed in an immobilizer for 2 to 4 weeks. Periscapular strengthening and posture begins early and progresses over 12 weeks.[48,65] Active-assisted ROM is initiated approximately 2 to 3 weeks after surgery with limitations on shoulder rotation and end ROM. Return to sport is possible 3 to 4 months after surgery if the following criteria are met: symptom-free full ROM and appropriate strength and endurance for the functional and sport-specific activities the child will return to. Individuals involved in collision or contact sports require longer healing times, and return to sport is not until 4 to 6 months postsurgery.[48,65] Overhead athletes may take as long as 9 months before they are ready to play.[48]

Prevention and Treatment of Overuse Injuries in Throwing Athletes

- Ensure proper conditioning, training practices, and warm-ups
- Keep sessions short
- Limit volume (i.e., innings, number of pitches)
- Ensure 3 to 4 days of rest between games
- Provide coaching in proper techniques
- Discourage pitching at home during and after the season
- Discourage curve balls, sliders, and breaking balls

Multidirectional Shoulder Instability

The majority of multidirectional instability (MDI) or microinstability around the glenohumeral joint is an atraumatic, overuse injury with underlying hypermobility, which occurs in more than one directional plane: anterior, posterior, or inferior.[18,48] The individual often demonstrates MDI in the opposite shoulder and exhibits hyperlaxity of multiple joints in the body.[18,48] A score of greater than 5 may be present on the **Beighton-Horan ligament laxity scale** (see Box 29-1).[66] Erhlos-Danlos or Marfan's syndrome may be present. The individual with congenital ligament laxity can often voluntarily sublux their shoulders and often refer to themselves as "double jointed." The young girl in Figure 29-22 demonstrates bilateral voluntary shoulder inferior subluxation. A positive sulcus sign and apprehension tests are present on examination. Patients will describe diffuse pain, soreness, fatigue, and a decline in performance as symptoms progress.[48] Secondary impingement due to the instability of the glenohumeral joint is often seen in this adolescent and young adult population.[48] Symptoms mimic those of adult rotator cuff pathology with positive Neer and Hawkins impingement signs, pain on palpation over biceps and/or supraspinatus tendons, and restrictions in medial (internal) rotation. Initial conservative management is treatment of choice with physical therapy lasting 6 months before surgical intervention is considered.[48] Physical therapy intervention for glenohumeral dislocation, MDI, and secondary impingement is similar. Rest, activity modification, and pain-reduction techniques are implemented early. Reestablishing muscular balance around the glenohumeral joint and proper scapular kinematics are crucial. Except for posterior capsular restrictions, ROM is usually not a problem for this population. Caution should be taken to only stretch tissue structures that are restricted and avoid overstretching hypermobile areas. Strengthening of the periscapular and rotator cuff muscles begins below shoulder level and progresses above 90° of shoulder elevation as symptoms subside. Aggressive activities with arms above shoulder level before establishing good strength and scapular control can increase instability and pain. Low-intensity, high-repetition, and multiple sets of one exercise are recommended because many of the muscles that support the glenohumeral joint are postural and need to sustain prolonged activity without fatigue. Technique evaluation by an established expert in each sport for the overhead athlete is important to prevent symptom reoccurrence. In addition, adhering to current recommended pitching guidelines established from the U.S. baseball safety and advisory committee[18] is equally beneficial in prevention of reinjury.

Figure 29-22 Voluntary instability. Note how the patient uses her muscles to sublux the humerus in the glenoid, resulting in an anterior sulcus in each shoulder. (From Magee DJ: *Orthopedic physical assessment*, ed 6, p 259, St. Louis, 2014, Saunders Elsevier.)

Traumatic Elbow Injuries

Traumatic injuries around the elbow occur less often than at the forearm or wrist.[21] However, due to the superficial location of the neurovascular supply to the upper extremity, aggressive management of elbow injuries is warranted to achieve good results without sequelae. Elbow anatomy of the immature skeleton demonstrates that the physis is weaker than ligaments, the MCL is the primary stabilizer to valgus stress, and bony alignment is the primary stabilizer to varus stress.[67] Acute injuries include avulsion fractures, supracondylar fractures, distal humerus fracture, and elbow dislocations. Painful loss of elbow ROM in either direction compared with the contralateral elbow is a warning sign of elbow pathology. Elevation of the elbow fat pad, known as a positive fat pad sign, has been demonstrated to be indicative of a fracture around the elbow 70% of the time.[21]

Elbow Dislocations

Elbow dislocations are seen in the 13- to 14-year-olds as the physis begins to close. A FOOSH injury produces an axial load, elbow hyperextension, and valgus stress applied to the elbow. It is the common cause of a dislocation or more often a fracture dislocation with the medial epicondyle being the most common site of the fracture. Studies show an associated fracture 75% of the time with elbow dislocations.[68] AP and lateral radiographs are taken to rule out associated fractures. Reduction by conscious sedation is recommended with postreduction radiographs to

ensure proper alignment. Neurovascular status is checked throughout the evaluation, paying close attention to the median nerve and brachial artery. Cast immobilization for 2 to 3 weeks with gentle ROM is started immediately after cast removal to prevent flexion contractures. Surgical management is indicated if closed reduction cannot be achieved, an open fracture has occurred, or there is a displaced osteochondral fracture.

Valgus Extension Overload

An increase in forced extension at the olecranon-triceps interface in the posterior elbow may produce olecranon apophysitis via traction of the triceps or mechanical abutment of the olecranon into the olecranon fossa.[69] Loose bodies and osteophytes of the olecranon tip are common. Pain is experienced with forced elbow extension during the acceleration phase of throwing or during upper extremity impact activities, such as gymnastics. Repetitive hyperextension and increased valgus mobility may be contributory to this syndrome.[70] Pain is reproduced at the olecranon with forced extension and valgus stress. Continued sports participation could result in an avulsion fracture of the proximal olecranon. As with medial epicondyle avulsion fractures, the older adolescent is more at risk of suffering an olecranon avulsion. There is an acute onset of posterior elbow pain with throwing. Posterior swelling and ecchymosis with painful palpation over the tip of the olecranon is observed. Tricep weakness and loss of extension are found on examination. In addition to conservative management, treatment may include surgical reattachment of the extensor mechanism.[21]

Wrist and Hand Injuries

Wrist and hand injuries represent some of the most common injuries of all sports.[34] They comprise 3% to 9% of all sports injuries. Fractures of the hand increase rapidly after the age of 8 years and peak around 13 years in boys. Finger dislocations, ligamentous injuries, and nail bed involvement are all very common.[21,34] Hand injuries represent approximately 15% of football injuries. Racquet and batting sports produce both distal ulnar and radial wrist pain. In-depth discussion of hand injuries in athletics is beyond the scope of this chapter, and the more common injuries to the young wrist and hand will be discussed. In the young athlete, wrist sprains are rare, with fractures to the wrist and hand being significantly more common especially in the presence of posttraumatic wrist swelling.

Quick Screen for Hand Injuries

- "Make a fist"
- The fist should close easily without pain
- Nail beds are parallel in the palm
- Finger tips should not overlap
- Finger tips point to the scaphoid tubercle with finger flexion
- Thumb easily crosses the fist and touches the fifth digit

Gymnast's Wrist

Wrist injuries are common in gymnastics and affect 70% to 80% of all gymnasts.[71] Repetitive impact forces placed across the gymnast's wrist during floor, bar, and vault routines compromise the integrity of the distal radial physis. Gymnasts between the ages of 12 and 14 years who participate in gymnastics greater than 35 hours a week are most vulnerable.[72] Dorsal (posterior) wrist pain usually occurs bilaterally but may be seen unilaterally and is exacerbated by wrist extension loading. Radiographic evaluation reveals the extent of physeal involvement.[72] A series of radiographs can be used to identify healing and assist with return to sport recommendations. Treatment consists of rest from offending activities, cross-training, total body strengthening, and interval training to maintain fitness level for return to sport. Modification of upper extremity weight-bearing exercises by keeping the wrist in neutral (resting) position (slight extension) (Figure 29-23) facilitates maintaining strength and stability throughout the upper extremity while decreasing stress at the extremes of ROM. Special wrist splints designed for gymnasts, called Tiger Paws, assist with neutral wrist alignment and load dispersion and can be worn during practices. Continued injury to the physis through reoccurrence or lack of appropriate rest leads to early physeal closure and growth arrest.[71] As the distal radius growth plate closes, the ulna remains open and continues to grow. Depending on the age and Tanner stage of the child, the resultant ulnar variance could be small or large. If the disparity between the ulna and radius becomes too great, ulnar-sided wrist pain may develop as well as injury to the triangular fibrocartilage complex (TFCC). Ulnar shortening surgery may be indicated if this occurs.

Spine Injuries

Unlike adults, complaints of back pain in children and adolescents that warrant a visit to a physician are significantly less.[73] Although back pain incidences are lower, the under-

Figure 29-23 Plank exercise performed in neutral wrist position. Dumbbells positioned correctly may help keep the wrists in neutral position to avoid hyperextension overuse injuries while exercises are performed.

lying pathology may be more serious than in adults, requiring a thorough and extensive evaluation. The presence of vertebral fractures, metabolic diseases, neoplastic disorders, and spinal cord involvement produce a heightened concern in the pediatric patient presenting with back pain.[73] Persistent complaints of pain require plain radiographs of AP, lateral, and oblique views followed by MRI or bone scan if initial radiographs are inconclusive.[73–75] Figure 29-24 provides a pictorial representation of the vertebral structures. CT scans are used minimally in the young patient due to the exposure of high levels of radiation.[75]

Spondylolysis

Spondylolysis is a defect in the pars interarticularis, most commonly a stress fracture (Figure 29-25). It occurs in up to 11.5% of the general U.S. population. It is the most

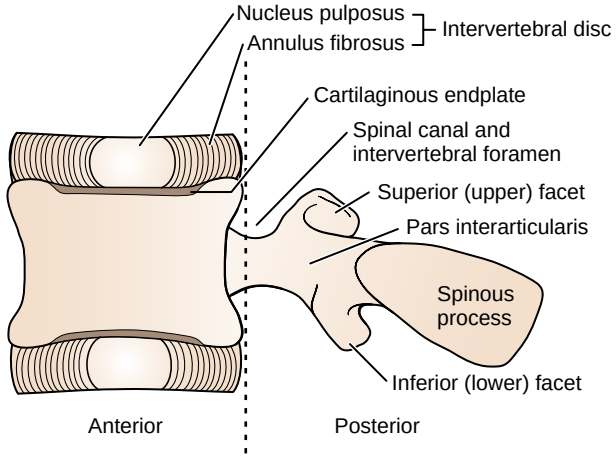

Figure 29-24 The anterior elements of the spine include the intervertebral disc and the vertebral bodies. The posterior elements include the posterior arch with the pedicles, zygapophyseal joints (facets), lamina, spinous process, transverse processes, and attached ligaments.

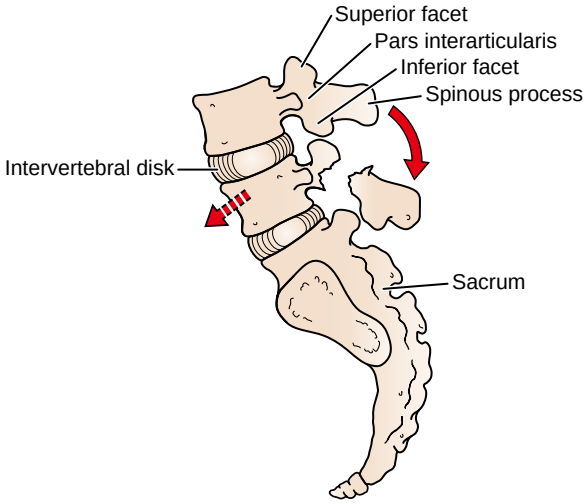

Figure 29-25 The pars interarticularis is the thinnest part of the posterior arch between the facet joints. This is the location of spondylolysis, most commonly a stress fracture, which is caused by overloading with excessive extension and can result in the superior vertebra sliding forward on the inferior vertebra which is called spondylolisthesis.

common cause of low back pain in the young athlete.[76] Young males are twice as likely to sustain this injury compared with females; however, when viewed within individual sports, female athletes who engage in high volumes of lumbar extension activities, such as gymnastics, diving, ice skating, and dancing, have a considerably higher frequency.[77–79] The growing adolescent who participates in activities that require repetitive trunk rotation, lumbar hyperextension, and heavy lifting is most vulnerable. In addition to the previously mentioned sports, football, soccer, and hockey players are also at risk. The majority of fractures or stress reactions occur at the L5 level, with L4 being second most frequent.[76] Symptoms include low back pain with or without buttocks or leg pain, muscle spasm in low back area, and increased pain with trunk rotation, lumbar extension, and end ranges of spinal motions. Standing, walking, and sports participation aggravate the symptoms. Early symptom relief in the presence of mild symptoms includes sitting, slouching, or spinal flexion. As symptoms progress, pain becomes constant and finding a position of comfort becomes more difficult. Physical examination reveals pain on repeated extension and rotation, decreased spine mobility, and lower extremity tightness. Studies show that hamstring tightness is prevalent in the majority of patients with symptomatic spondylolysis.[80] The **one-legged hyperextension test** has been viewed in the literature as both accurate and nonaccurate for the evaluation of spondylolysis in the clinic.[81–83] A positive test reproduces pain on the ipsilateral standing leg when the patient moves into lumbar hyperextension.[82] Due to its potential inaccuracy the interpretation of this special test should be used with caution. Prompt and accurate diagnosis is pertinent for quicker pain-free return to active lifestyle and sport with an average time of 3 to 6 months.[84] A delay in treatment may push the healing time to 1 year. Management of spondylolysis consists of rest and activity modification, symptom-free cross-training and core strengthening. Patients respond well to neutral core principles (i.e., maintenance of a neutral lumbar spine position, primarily avoiding lordosis or kyphosis during exercises and functional activities, from posture through sports participation), spine flexion activities, and avoidance of hyperextension exercises. An isometric hold of a forearm plank activity with lumbar spine in neutral position is an excellent way to facilitate core strength and neuromuscular education (Figure 29-26). When the athlete becomes symptom free, a gradual progression of higher-risk movements, such as lumbar extension and rotation, is implemented to prepare the athlete for return to sport. The achievement of the necessary spinal motion that is required for the athlete to perform his or her sport-specific skill is a prerequisite to return to full, unrestricted sport. For example, a gymnast or dancer needs greater than normal lumbar extension to perform their required skills. The use of a thoracolumbarsacral orthosis (TLSO) is often recommended for symptom relief but is not used

Figure 29-26 Planks are an excellent way to use body weight as resistance. Proper performance requires core strength and stabilization of the scapula.

by all physicians.[82,85] Depending on the sport and type of brace (a soft noncustom[85] versus a hard custom clam shell) the athlete may be allowed to return to sport in the brace once symptom free. Eighty-five percent to 90% of young athletes recover within 6 months without the need for surgical intervention. Surgery is usually only recommended when conservative treatment has failed.

Spondylolisthesis

Spondyloisthesis is the forward slippage of the defected, unstable, superior vertebrae on the adjacent inferior vertebrae (see Figure 29-25). Approximately 5% of young athletes with an acquired spondolytic defect will progress to spondylolisthesis.[86] Bilateral pars defects, which compromise the stability of the vertebrae, are at more risk for slippage than unilateral defects. Symptomology for these two conditions is similar and is often treated in the same conservative manner unless the vertebrae slip is too progressive and problematic. A five-level grading system, which represents the severity of the slip, is used in the treatment algorithm. The different grades[87] and subsequent treatment recommendations for spondylolisthesis are outlined in (Table 29-5). The progression of the vertebral slip depends upon the degree and angle of the slip, child's age, gender, and Tanner stage. Younger patients, females, and prepubescents are at most risk for vertebral slip progression.[80]

TABLE **29-5**

Spondylolisthesis Grades

Grade	Amount of Slip	Treatment and Return to Sport Recommendations
Grade I	0%-25% of vertebral body	Conservative treatment, return to sport unrestricted
Grade II	25%-50% of vertebral body	Conservative treatment, surgical treatment if failure of conservative treatment, noncontact sports (contact sports ???)
Grade III	50%-75%	Surgical indication, noncontact or noncollision sports possible based on symptoms and physician
Grade IV	75%-100%	Surgery, no sports participation
Grade V	Entire vertebral body off the one below	Immediate surgery

Schmorl's Nodule

The presence of a Schmorl's nodule in the immature spine may or may not be a significant source for back pain in the young athlete.[88] It is more often seen on MRI than radiographs. A Schmorl's nodule is a vertical disk herniation through the cartilaginous vertebral body endplate referred to as an apophysis at this stage of development.[88] It occurs often in the mid- to low-back region and affects those 14 to 18 years of age. Evidence of Schmorl's nodules exists in both the athlete and nonathlete at the same rates. Surgical intervention is not indicated and conservative treatment which addresses pain and dysfunction is recommended.

Scheuermann's Kyphosis

Scheuermann's kyphosis refers to a structural deformity in the thoracolumbar region where three or more consecutive vertebrae demonstrate 5° of anterior wedging and produce a Cobb angle of greater than 45° of thoracic kyphosis.[89] Radiographs may show the presence of a Schmorl's nodule, irregularity in the vertebral endplates, and/or disc space narrowing. High volumes of repetitive spinal flexion activities during sports may cause deformation of the softer cartilaginous vertebral endplate. Gymnasts, swimmers, and wrestlers who engage in greater than 400 hours a year of sport participation are increasingly vulnerable to this stress deformity.[90] Patients present with generalized pain, muscular fatigue, and difficultly maintaining good posture. An increase in kyphosis may also be acknowledged by the athlete. Scheuermann's kyphosis in the lumbar region is referred to as atypical Scheuermann's or lumbar Scheuermann's. It is characterized by hypolordosis in this region.[89,91] Conservative treatment with rest, pain reduction techniques, physical therapy, posture education, and bracing is beneficial.[89]

Backpack-Related Problems

The use of backpacks is no longer limited to hiking trails. Sports bags, particularly hockey bags, cause problems as well. Very young children bring their lunch and diapers to daycare in backpacks. An association between the weight of a backpack and pain has been reported in adolescents.[92] Adolescents often are seen with a backpack slung over one shoulder or hanging very low on the back.

Prevention first is aimed at choosing a backpack that fits the child or adolescent properly. Shoulder straps should be padded and rest comfortably. The bottom of the pack

should rest on the contour of the lower back rather than sagging onto the buttocks. The wearer should distribute the weight evenly by wearing both straps, and the contents of the backpack should be packed evenly, with compression straps adjusted to hold the contents stable. The heaviest items should be placed close to the spine. Students should be taught proper lifting techniques and to limit the weight of the contents. Suggestions for the weight of backpack contents range from 10% to 20% of the body weight.[93–96]

Compensatory Postures When Wearing a Backpack

- Increased forward-leaning trunk
- Increased craniovertebral extension angle
- Increased lumbar lordosis

Some evidence indicates that back pain prevention programs in preadolescents have positive results.[97] Multidisciplinary approaches involving teachers, parents, physicians, physical therapists, and psychologists are encouraged to promote healthy habits in childhood. Working with injured students or students in school prevention programs provides more opportunities for encouraging overall physical fitness. More evidence is needed to confirm the long-term effects of these programs.

Hip Injuries

An acutely limping child or adolescent, either through traumatic or atraumatic means, requires a thorough evaluation of the entire lower extremity, including spine, hip, thigh, knee, lower leg, and ankle. Hip pathology can present as general or localized pain, pain referred to the thigh, groin, or knee and have either gradual or acute onset.[25,98] The seriousness of the underlying pathology varies from minor to life threatening, which warrants the conservative management and evaluation of all lower extremity joints and body systems. Recent illnesses, fever, infections, weight loss, or pain at night are part of the subjective examination. If the patient is unable or having extreme difficulty weight bearing, crutches or a wheelchair is necessary until orthopedic evaluation is completed and definitive diagnosis is established. Clinically, ROM restrictions, joint motion asymmetries both within the same joint and contralaterally, weakness, and painful palpation are evaluated. Radiographs include AP, lateral, and frog views.[29,52,98] The patient's age directly influences differential diagnosis. Table 29-6 outlines presentation and physical examination findings by age group.[52,98]

Legg-Calve-Perthes Disease

Legg-Calve-Perthes disease is a self-limiting avascular necrosis of the femoral head. It appears in children between the ages of 3 and 13 with the majority being present at 5 to 7 years of age. Boys are 3 to 5 times more affected than girls. Clinical presentation includes a limp, Trendelenburg gait pattern, pain in the groin, thigh, or knee, and loss of hip medial (internal) rotation and abduction.[52,98] Positive log roll test is present, and a hip flexor contracture may be noted as well. Suspicion of Legg-Calve-Perthes disease requires referral to a pediatric orthopedic surgeon for further evaluation and possible surgical intervention. Radiographs show disruption and collapse of the femoral epiphysis.[52] Figure 29-27 illustrates the possible incongruity of the femoral head in Legg-Calve-Perthes disease. Reduction of symptoms and protection of the femoral head in hopes of remodeling are initial treatments. Protective weight bearing is emphasized. If the condition does not improve, surgery may be indicated.

External Snapping Hip or Trochanteric Bursitis or Iliotibial Band Syndrome[99]

The above-mentioned terms all produce lateral hip and thigh pain. Each diagnosis can exist separately but commonly are found overlapping each other. External "snapping hip" occurs as the iliotibial band (ITB) moves over the greater trochanter, often producing an audible or palpable snap.[100] It is often seen in artistic athletes—those who participate in dancing, gymnastics, and ice skating—where repetitive hip rotation and joint hyperflexibility are required.[101] Most athletes can voluntarily reproduce the snap. Runners, football, soccer, and ice hockey players who suffer from a tight ITB and hip abductor and lateral (external) rotation weakness are susceptible as well. Reoccurring "snapping" or rubbing of the ITB over the greater trochanter eventually irritates the underlying bursae which leads to bursitis. Trochanteric bursitis occurs more often in the older athlete and is painful while lying on it. Point tenderness on palpation is noted over the greater trochanter. Lateral hip and thigh pain without snapping which can extend to the lateral knee is indicative of ITB syndrome. A positive Ober test is noted on examination and palpation reveals tenderness along the length of the ITB. Treatment principles for the abovementioned conditions are similar when a conservative approach of rest, ice, activity modification, and physical therapy is implemented.[102–106] Surgical intervention is usually a surgery of last resort if prolonged pain and dysfunction persist. After pain reduction, stretching of ITB and other restricted hip structures begins.[27] Soft tissue massage and self-massage to the ITB may be part of the treatment program.[103] Core and hip strengthening is crucial.[27] Analysis of running gait and dance technique is often necessary to prevent a recurring problem.

Internal Snapping Hip or Iliopsoas Bursitis[99]

Repetitive snapping of the iliospoas muscle over the iliopectineal eminence or femoral neck produces pain in the anterior and medial thigh and groin area.[107,108] Symptoms are reproduced with resisted hip flexion, full passive flexion, and flexion-extension movements of the

TABLE 29-6

Differential Diagnoses of Hip Pain in the Child and Adolescent

Age (yr)	Diagnosis	History	Physical Examination
4-10	Legg-Calve-Perthes	Limp with hip or knee pain, insidious onset (1-3 mo)	Limited hip abduction, flexion, and internal rotation
	Transient synovitis	Fever, chills, erythema, pain	Trendelenburg gait, stiffness, guarding of movements
11-16	Slipped capital femoral epiphysis (SCFE)	Hip pain, referred pain to anterior thigh or knee. Acute or chronic presentation	Pain, limited internal rotation. Position of comfort hip flexion, abduction and external rotation
	Avascular necrosis of femoral head	Pain in groin, lateral hip and buttock. History of steroid use, prior fracture or SCFE	Pain with ambulation, hip abduction, internal and external rotation
	Femoral neck stress fracture	Endurance athlete, female athlete triad. Pain increases with weight bearing and impact. Groin pain	Pain on palpation over greater trochanter, painful ROM, positive single leg hop test
	Hip pointer	Direct trauma to iliac crest	Pain on palpation, painful ambulation and active hip abduction
	Avulsion fractures	Sudden forceful muscle contraction or stretch. May hear/feel "pop"	Pain over involved apophysis. Pain on PROM or resisted muscle activity.
All ages	Internal snapping hip or iliopsoas bursitis	Pain or snapping in the anterior medial hip and groin area. Can be felt or heard. Excessive snapping irritates the iliopsoas bursae	Pain and snapping occurs when hip is moved from a flexed position into extension. Resisted hip flexion increases pain
	External snapping hip/ greater trochanter bursitis Iliotibial band syndrome (ITB)	Lateral hip or thigh pain, snapping as the ITB moves across the greater trochanter. Excessive snapping irritates the trochanteric bursae. Difficult to lie on involved side. Pain can be local to proximal hip or diffuse along entire ITB.	Tight iliotibial band, pain on palpation over ITB and greater trochanter. History and areas of painful palpation will separate these three overlapping conditions.
	Septic arthritis	Chills, fatigue, fever	Decreased ROM, pain with limb movement and internal rotation, swelling, warmth. Preferred position (flexion, abduction, lateral rotation)
	Osteomyelitis (bone infection)	Fever, chills, irritability, fatigue. Develops rapidly over 7-10 days	Pain/tenderness over hip joint, pain with movement, difficulty weight bearing
	Neoplasms	Night pain, pain that wakes the child up, pain unrelated to activity	Palpable mass, inconsistent musculoskeletal examination findings

PROM, passive range of motion; *ROM*, range of motion.

Modified from Merkel DL, Molony JT: Clinical commentary: recognition and management of traumatic sports injuries in the skeletally immature athlete, *Intl J Sports Phys Ther* 7:691-704, 2012.

hip. The "snap" is felt when the athlete moves the hip from a position of flexion to extension against gravity. Artistic athletes and runners experience this injury. Treatment is conservative as with external snapping hip. Stretching the tight hip iliopsoas muscle is important.[25] Core strengthening and eccentric control of hip flexors help to elevate the tension across the iliopsoas muscle while moving the hip from a flexed to extended position. Imaging is used to rule out intra-articular pathology as a cause for pain and snapping but may fail to identify tendon pathology.[106]

Knee Injuries

Many of the same evaluative procedures and special tests performed on the adult patient experiencing knee problems are used in evaluating the young athlete's knee. Youth athletes, whose growth plates remain open, often encounter different diagnoses than adult athletes when faced with the same mechanism of injury. Pain, limping, decreased weight bearing, effusion, loss of motion, and increased pain on palpation over the bone or physis are indications for knee imaging. Recommended radiographs include AP, lateral, merchant, and notch views.[29–32]

Figure 29-27 Legg-Calvé-Perthes disease, with collapse of the femoral head.

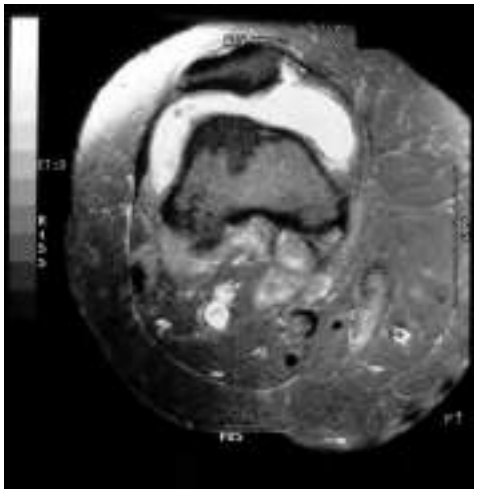

Figure 29-28 MRI scan after dislocation and reduction of the patella showing hemarthrosis, a medial retinaculum tear, and bone bruising to the lateral femoral condyle.

Comparison views are taken if physeal injury is suspected. MRI is indicated in the young athlete if there is suspicion of the following knee injuries: intra-articular, ligamentous, bone contusions, meniscal involvement, and/or physeal injury.[29–32]

Patellar Dislocations

Traumatic patellar dislocations can be suspected with an acute knee injury. Commonly, the dislocation occurs laterally. Recurrent patellar dislocations may occur when athletes, usually females, have an underlying congenital ligament laxity that causes patellar hypermobility or an underdeveloped lateral condyle of the femur. A twisting or pivoting moment at the knee when the foot is planted forces the patella to move laterally. The patella may spontaneously reduce and rarely remains laterally displaced. Subjectively, the athlete may report the knee twisting, feeling or hearing a snap, and a sensation of the knee giving away.[109] Physical examination shows an effused knee, diffuse pain both medial and lateral, positive lateral apprehension test, and decreased ability to bear weight. A hemarthrosis may be present on joint aspiration.[109,110] Merchant view radiographs show the patella position within the femoral groove when the knee is positioned in 30° of flexion. An MRI is used to rule out other injuries, including ACL tears. Figure 29-28 shows a reduced patellar dislocation with hemarthrosis and demonstrates concomitant osteochondral defects and cartilage damage to the patellofemoral joint. Acute patellar dislocations are treated conservatively unless a large osteochondral fracture is present.[109,110] Two to 4 weeks of immobilization followed by physical therapy for quadriceps and hip strengthening is recommended.[29,111] A patellar stabilizing brace is often used for support during jumping, pivoting, and twisting movements. One in six patients who sustains a patellar dislocation will have a recurrence.[29] If repeated patellar dislocations are sustained by the athletes, medial patellar ligament reconstruction may be performed to stabilize the patella. Rehabilitation for return to sport after this procedure may take up to 6 months.

Knee Overuse Injuries

Overuse injuries of the lower extremity are prolific in the growing young athlete. Repetitive loads, inappropriate training, early specialization, lack of rest, and proper nutrition can all be extrinsic factors that are contributory. Generalized anterior knee pain plagues the young athlete and differential diagnosis includes adult-like pathology and injuries unique to the immature skeleton. Table 29-7 lists special tests and corresponding diagnoses to assist in identifying knee pathologies of the young athlete.

General treatment for overuse injuries of the lower extremity includes rest, ice, activity modification, stretching of tight lower extremity muscles (especially the hamstrings, quadriceps, hip flexors, and ITB), and strengthening throughout the kinetic chain, including core and hip. Analysis of biomechanical alignment both in static stance and during activity is necessary to identify additional areas of dysfunction within the lower extremity. Teaching the athlete proper lower extremity alignment and landing technique has been shown to be beneficial. The use of foot orthotics, either custom made or over the counter, to assist with alignment and reduction of symptoms is conflictual. Analysis and modification of footwear (i.e., sneakers, cleats, turf, and dance shoes) may be necessary for proper fit, support, and performance.

Meniscus Injuries

Menisci can be torn when they are compressed and twisted by the femoral condyles against the tibial plateaus. The blood supply to the menisci is limited to the outer one third but is slightly better in younger children.[112] Few meniscal tears heal on their own, and tears can become enlarged, causing more frequent symptoms, such as pain, swelling, locking, and degeneration.

ACL, anterior cruciate ligament; *ITB*, iliotibial band; *LCL*, lateral collateral ligament; *MCL*, medial collateral ligament; *OCD*, osteochondritis dissecans; *PFPS*, patellofemoral pain syndrome.

The history of a meniscal tear is a twisting knee episode followed by gradual synovial swelling over 12 to 24 hours. The child has pain medially or laterally and might report an inability to fully extend the knee (locking). The physical examination may or may not show an effusion. Joint line tenderness is common, but a classic McMurray's test with a painful medial click during extension is found only with large tears. Associated bone bruising or collateral ligament injury can confuse the examination. MRI is definitive but is not necessary to make the diagnosis in most cases (Figure 29-29).

Most meniscal tears, if being repaired, can be addressed operatively within several weeks. Repairs to the outer one third have the best healing potential, but in the young, many surgeons repair any tears in the outer half, because the healing potential is better than in adults.[112] To protect

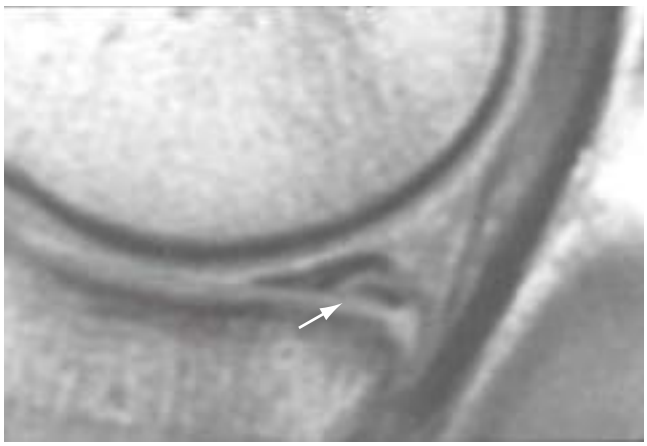

Figure 29-29 MRI scan showing a complex posterior horn medial meniscal tear (*arrow*).

the repair, motion and weight bearing are restricted for 6 to 8 weeks, and sports are allowed at 4 months. No definitive studies suggest that rehabilitation after meniscal repair is different for adults and children.

Discoid Meniscus

A congenital defect of the meniscus, where it is shaped like a disc rather than being semilunar (as is normal), is called a **discoid meniscus**.[113] It occurs primarily in the lateral compartment of the knee and presents as a lateral meniscal tear. The preschool-aged child may complain of snapping during play but does not present with pain until school age, in which an increase in activity occurs.[113] Tenderness along the lateral joint line, along with a positive McMurray test, is found on examination. Diagnosis is confirmed with MRI. Virtually asymptomatic, stable lesions without meniscal degeneration are treated with rehabilitation. Surgical indications include the presentation of pain and dysfunction with a degenerated and/or unstable meniscus.[113] Postsurgical rehabilitation follows the guidelines of meniscal repairs.

Ligament Injuries

The ACL is torn either by a direct blow to the knee that leads to a valgus, varus, hyperflexion, or hyperextension sprain, or by indirect stressing of the knee in those directions with a sudden start, stop, change in direction, or landing from a jump.

When the ACL is torn, the patient often experiences a "pop" and rapid knee swelling within 1 hour, indicating blood swelling (hemarthrosis). The ACL stump, hemarthrosis, and/or a torn meniscus (usually lateral) can block knee extension. An MRI scan shows the ACL tear and any associated meniscal tearing or bone bruising.

Currently, reconstruction is necessary to restore function.[114] Most athletic individuals with an ACL tear require ACL reconstruction to restore knee stability. Surgery can be performed within 48 hours; however, it usually is performed more than 4 weeks after injury to ensure that ROM and swelling have returned to normal, thereby reducing arthrofibrosis postoperatively.[115]

The open physes present a problem for surgeons performing ACL reconstruction in the young. Placing bone or hardware across an open physis can result in premature closure, with subsequent joint deformity or limb shortening. The use of soft tissue through a physis has a much lower rate of problems. In the preadolescent, few surgeons would place any new material through the physis. Current guidelines call for the use of an adult ACL reconstruction technique if less than 2 cm (approximately 1 inch) of growth remains, otherwise adolescents get soft tissue (hamstring or allograft) through the physes, with fixation away from the physes. For preadolescents, hamstring or ITB autograft is used with an intra-articular, extraphyseal technique.

Some authors recommend a slower rehabilitation program for children than adults in an effort to control an overzealous youngster,[116] whereas others advocate programs with similar phasing.[117–119] For the first week, the patient is mostly non-weight bearing, uses ice and compression, and works on ROM and leg control exercises. As ROM is achieved, closed-chain strengthening progresses.

Lower Leg, Ankle, and Foot Injuries

Shin Splints

Shin splints is a lay term for any activity-induced leg pain. It refers to pain from medial tibial periostitis, tibial or fibular stress fractures, exertional compartment syndrome, or vascular pain. Medial periostitis, stress fracture, and compartment syndrome have been described in the child. Medial periostitis is pain along the medial tibial border where the soleus and posteromedial muscles attach. It is thought to occur when shock absorption is poor and the muscle-bone attachment becomes damaged. In reality, it is part of a pathological process that can lead to a stress fracture.

Patients usually report anterior leg pain that begins after several minutes of running and diminishes only after stopping. Radiographic films are negative in many cases. Physical therapy goals include strengthening of the weak lower leg muscles to aid shock absorption. Stretching of the long and short calf muscles is included. Correction of training errors is essential, including running on softer surfaces and cautious changes in training speed, distance, or intensity. Proper footwear is essential to control pronation and increase shock absorption. Orthotics may be used to correct biomechanical faults.

Tarsal Coalition

A congenital malformation in which two or more tarsal bones are fused is referred to as **tarsal coalition** (Figure 29-30). Calcaneonavicular coalition, talocalcaneal coalition, and talonavicular coalition are observed most frequently.[120] Recurrent ankle injuries may be an indicator of this pathology. Symptoms appear between the ages of 8 and 18 years with descriptions of vague pain over the midfoot and hindfoot.[120] The appearance of pain in the foot in this age group corresponds to changes in activity level and intensity, body size, and ossification of the coalition.[121,122] Males are more affected than females. Physical examination reveals a fixed pes planus (flatfoot) deformity, restricted subtalar motion, excessive calcaneal valgus, and pain on inversion.[123–125] Calf muscle tightness may also be present. Treatment recommendations include both surgical and nonsurgical approaches. Conservative management consists of orthotic devices, physical therapy, cortisone injections, and cast immobilization for pain reduction.[123,126] Surgical options include resection of the involved bones or arthrodesis if joint degeneration is problematic.[123,125]

Figure 29-30 Right tarsal (calcaneonavicular) coalition. **A,** Radiograph (*arrow*). **B,** CT scan illustrating bony bridge. (From Blickman JG, Parker BR, Barnes PD: *Pediatric radiology*, ed 3, Philadelphia, 2009, Mosby/Elsevier.)

Accessory Navicular

The accessory navicular is an extra bony ossicle that is present from birth on the medial aspect of the navicular (Figure 29-31).[127] Approximately 12% are embedded in the tibialis posterior tendon. Medial navicular pain, which is aggravated by impact activities, presents around 12 years of age with girls 3 times more likely than boys to be afflicted by this condition. The athlete often has a pes planus foot.[127,128] Proper diagnosis is important because an accessory navicular can be confused with posterior tibial tendonitis or a navicular stress fracture. Positive palpation on the medial aspect of the navicular in contrast to pain on the dorsum of the navicular is indicative of an accessory involvement. Conservative treatment of rest, ice, immobilization, foot orthosis, and physical therapy for stretching, balance, and foot intrinsic facilitation is attempted before surgical excision of the ossicle. Surgical excision of the accessory navicular is usually successful and may return the athlete to sport sooner than a trial of conservative management.

Figure 29-31 Fourteen-year-old dancer with medial foot pain and swelling. An oblique radiograph of the foot demonstrates an accessory navicular bone (*circle*). (From Chambers HG: Ankle and foot disorders in skeletally immature athletes, Orthop Clin North Am 34:445-459, 2003.)

TRAINING THE PEDIATRIC AND ADOLESCENT POPULATION

Resistance training has proved safe and effective for the growing child when it is appropriately designed and provided in a supervised environment. Clinicians may need to relieve parents' fears that resistance training is harmful. Questions and concerns often arise about epiphyseal plate injuries, soft tissue injuries, and the potential improbability of strength gains in the absence of testosterone in the young child. Use of the correct terms for different types of training clears up confusion and helps dispel parents' anxieties (Table 29-8).

Whether the setting is a rehabilitation clinic or a fitness gym, the equipment used should fit the child. Some adolescents may be able to use adult-sized equipment. As an alternative, free weights or body weight can be used as resistance to provide a safe, effective program.

TABLE 29-8

Correct Terms for Different Types of Training

Term	Description
Body building	Competitive training that builds up muscle mass symmetry and definition
Body weight	Training using sit ups, push ups, and chin ups
Free weights	Training using dumbbells, barbells, and sandbags
Strength training	Training that uses a systematic method of applying resistance to increase the ability to exert or resist force
Weight lifting	Training involving competitive, Olympic-type lifts
Weight training	Training using free weights or machines

Modified from Vehrs PR: Strength training in children and teens: dispelling misconceptions. Part 1, *ACSM's Health Fit J*, July/August:8-12, 2005.

Readiness for progression to power lifting and weight lifting can be judged by Tanner staging (see Figures 29-1 to 29-3). Power lifting and weight lifting should be restricted to athletes who have reached or passed Tanner stage V. Individuals at Tanner stage IV or lower can safely participate in a strength training program that is specifically and carefully designed for younger athletes. Some authors believe that with proper supervision and cautious progression with quality form, individuals at a lower stage than Tanner stage V can safely participate in weight lifting.[129]

Elements of a Resistance Training Program for Children

- The program should be fun
- Exercises should involve more repetitions with less load
- Child-sized equipment should be used, and free weights or body weight should be used as resistance
- Individual achievement should be encouraged

No conclusive evidence indicates that strength training reduces injury or improves athletic performance in children. Any program designed for this age group, whether a rehabilitation program or a general exercise and strength training program, needs to provide a fun atmosphere to motivate the child to adhere to the program. Identifying the exercises or program with funny or unusual names or making it a game to which the child can relate adds an aspect of fun. Encouraging individual achievement rather than competition among the group provides realistic goals.

The American College of Sports Medicine (ACSM) supports the efficacy and safety of plyometric training for children and adolescents as part of an overall training program. Plyometric exercises use the muscle cycle of stretching and shortening to increase muscle power[130] and enable the muscle to reach maximum strength as quickly as possible.[131] Elements of plyometrics are integral to normal childhood activities, such as jumping, hopping, and skipping. Ball throwing can be added for upper body training beginning with unweighted balls and progressing to medicine balls. These activities and games such as hopscotch and jumping rope can be adjusted for age appropriateness.

CONCLUSION

Musculoskeletal injuries in the active pediatric and adolescent population are an inherent risk with participation in play, recreational activities, and sports. The physical and psychosocial consequences of a sedentary lifestyle make a compelling argument for fostering active lifestyles in the young population. Minimizing sequelae, injury reduction, and keeping youth engaged in physical activities need to be the goals of the health care practitioner who participates in the care of the maturing child. Caring for the young athlete is more dependent on the stage of development than chronological age. The pediatric patient with an immature skeleton sustains different injuries than older mature adolescents.

CHAPTER 30

Management of Osteoarthritis and Rheumatoid Arthritis

MARIE B. CORKERY, MAURA DALY IVERSEN*

INTRODUCTION

The term *arthritis* comprises a complex of diseases that are manifested in more than 100 forms and affect more than 21% adults in the United States.[1] This chapter focuses on **osteoarthritis** (OA) and **rheumatoid arthritis** (RA) and provides analysis and discussion of the rehabilitation management of these two conditions.

Categories of Osteoarthritis

- Primary OA: Results in articular changes, although the etiological basis for the disease is unknown
- Secondary OA: Caused by underlying factors that accelerate age-related degeneration of cartilage
  - These factors include inflammatory arthritis (e.g., RA or spondyloarthritis), hypermobility syndromes, metabolic diseases (e.g., diabetes), and congenital and acquired joint surface incongruities, which accelerate damage to the cartilage, as well as trauma or sports-related injuries

OSTEOARTHRITIS

Epidemiology and Pathophysiology

OA involves the entire joint but is primarily a disease of the cartilage (Figure 30-1). Nearly 27 million people in the United States have clinical signs of OA, making it a leading cause of disability.[2] The exact pathogenesis is unknown. The most commonly affected and symptomatic joints are the apophyseal joints of the spine; the distal and proximal interphalangeal joints; the carpometacarpal joints; the first metatarsophalangeal joint; and the knee, hip, and patellofemoral joints.[3] Table 30-1 presents the prevalence rates of each form of OA, stratified by gender.

Risk factors for OA, also referred to as *osteoarthrosis*, can be classified into two major categories: intrinsic and extrinsic. **Intrinsic factors** include knee alignment (a determinant of joint load), muscle strength, obesity, ligament laxity, and proprioception. **Extrinsic factors** include repetitive physical activity and injury.[3] A link between youth sports injury of the knee and ankle and OA has been suggested.[18] Scientists recognize that OA is a slowly progressing, dynamic disease that involves biomechanical, environmental, genetic, and biochemical factors (e.g., cytokines).[19]

Early OA is a focal disease that presents as a distinct lesion of the cartilage.[20,21] Patients with early OA present with joint stiffness and pain on loading of the affected joint. Over time, OA evolves from progressive cartilage destruction to affect the subchondral bone and entire joint. Repeated biomechanical loading, synovial membrane inflammation, and release of cytokines stimulate the production of matrix metalloproteinases, which cause cartilage degradation and loss. Eventually the joint surface is destroyed. The classic appearance of primary OA on radiographs is localized disease with evidence of unequal joint space narrowing, subchondral bone eburnation (i.e., a hard, white appearance), subchondral cysts, and osteophytes (Figure 30-2). These findings increase in frequency after age 50. Only 40% of patients with severe radiographic features present with pain.[22,23]

The Kellgren scale is commonly used to grade the radiographic features of OA (Table 30-2). On radiographs, secondary OA may appear as diffuse or localized disease, depending on the etiology (e.g., RA, diabetes, or trauma). Secondary contractures occur around the involved joint and contiguous joints, altering joint alignment, increasing biomechanical forces on the joint, and accelerating cartilage loss.

*The authors, editors, and publisher wish to acknowledge Linda Steiner for her contributions on this topic in the previous edition.

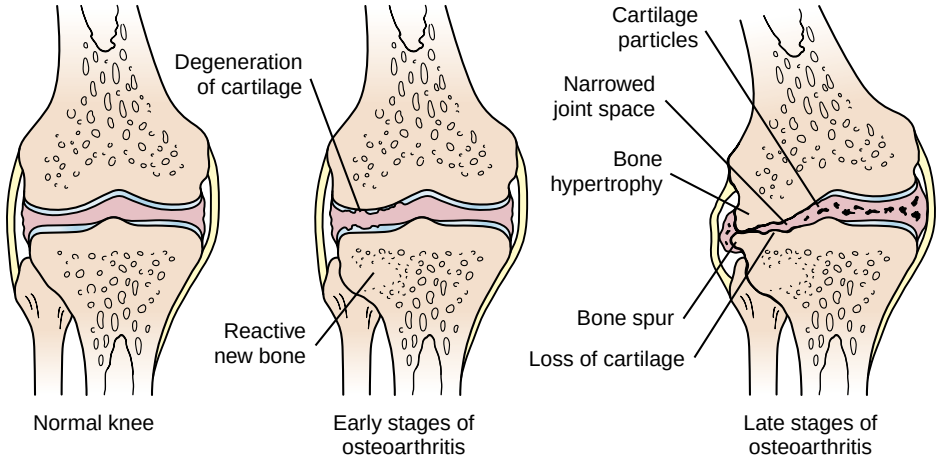

Figure 30-1 Osteoarthritis of the knee.

TABLE **30-1**

Prevalence Rates of Osteoarthritis in Joints

Joints Commonly Affected by Osteoarthritis	Prevalence in Men	Prevalence in Women
Spinal apophyseal	44.7%-74.2% (adults ages 40-60), 69.2%-89% (adults age 60+)[4,5]	
Proximal interphalangeal	4.8%-18.1% (ages 50-65), 20%-29.8% (age 66+)[6–9]	10.2%-29.6% (ages 50-65), 31.6%-35.2% (age 66+)[6–9]
Distal interphalangeal	9.8%-40.5% (ages 50-65), 49.2%-58.8% (age 66+)[6–9]	21.8%-55.5% (ages 50-65), 56.3%-76.0% (age 66+)[6–9]
Carpometacarpal	6%-30.3% (ages 55-65), 23.5%-27% (age 66+)[6–10]	13.5%-34.5% (ages 55-65), 33.9%-46.7% (age 66+)[6–10]
Metatarsophalangeal	5.8%-31.4% (ages 35-60)[6,11,12]	7.9%-43.2% (ages 35-60)[6,11,12]
Hip	0.9%-45%; mean 11.5% (age ≥18)[13]	0.9%-45%; mean 11.5% (ages ≥18.9)[13]
Knee	8%-24% (age 50+)[14,15]	22.3%-47.6% (age 50+)[14–16]
Patellofemoral	13.3%-34.5% (age 55+)[16,17]	24.3%-39.9% (age 55+)[16,17]

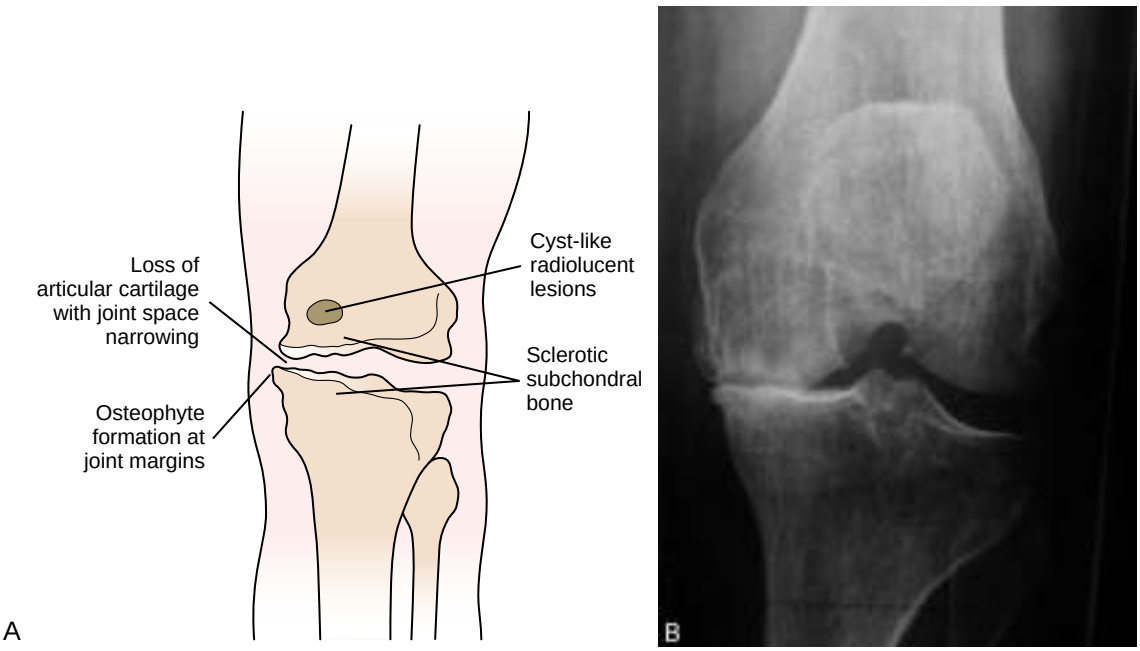

Figure 30-2 **A,** Radiographic hallmarks of osteoarthritis (Kellgren scale). **B,** Radiograph showing the main radiological signs of osteoarthritis. (**A** redrawn from McKinnis LN: *Fundamentals of orthopaedic radiology,* Philadelphia, 2005, FA Davis; **B** from Harris ED, Budd RC, Firestein GS et al: *Kelley's textbook of rheumatology*, ed 7, Philadelphia, 2005, Saunders.)

TABLE 30-2

Kellgren-Lawrence Classification of Radiological Joint Changes in Osteoarthritis

Classification	Description
Grade 0	No features
Grade 1	Doubtful: Minute osteophyte, doubtful significance
Grade 2	Minimal: Definite osteophyte, unimpaired joint space
Grade 3	Moderate: Moderate diminution of joint space
Grade 4	Severe: Greatly impaired joint space with sclerosis of subchondral bone

Data from Kellgren JH, Lawrence JS: Radiological assessment of osteo-arthrosis, *Ann Rheum Dis* 16:494-501, 1957.

Table 30-3 shows the American College of Rheumatology diagnostic classification criteria for OA of the hand, hip, and knee.

Signs, Symptoms, and Impairments

Joint Pain, Stiffness, Restricted Motion, and Alterations in Alignment

OA causes pain, aching, or stiffness and eventually altered joint alignment. Cartilage does not have nerve endings; therefore OA pain may be caused by stretching of the joint capsule as a result of inflammation, the release of inflammatory cytokines in the synovial fluid, muscle spasm, and/or pressure on the subchondral bone.[27] Patients frequently report that pain increases with activity and is relieved with rest. Some patients have nighttime pain and report stiffness on waking. With OA, the stiffness often resolves in less than an hour and may be present after rest or with prolonged sitting. The clinical features of OA are presented in Table 30-4.

Limitations in joint range of motion (ROM) may result from osteophyte formation, soft tissue and tendon contractures surrounding a joint, periarticular muscle spasm, destruction of joint cartilage, persistent faulty posture, or muscular imbalance. Although a flexed position minimizes intra-articular pressure and reduces pain, maintaining a flexed posture can lead to flexion contractures. Patients may also present with crepitus (a grinding sensation felt under the skin as the joint is passively moved through ROM). This sensation results when irregular opposing cartilage surfaces rub together. In patients with erosive OA, localized joint swelling may also be present.[28]

Pain associated with hip OA may be experienced in the hip, groin, anterior thigh, knee, or buttocks. ROM is often restricted, particularly with medial rotation, and may be accompanied by crepitus. Patients may report difficulties with mobility and personal hygiene, difficulty walking, and experience increased energy expenditure with

TABLE 30-3

American College of Rheumatology Diagnostic Classification Criteria for Osteoarthritis

Classification Criteria for Osteoarthritis of the Hand[24]	• Hand pain, aching, or stiffness and 3 or 4 of the following features: **1.** Hard tissue enlargement of 2 or more of 10 selected joints **2.** Hard tissue enlargement of 2 or more DIP joints **3.** Fewer than 3 swollen MCP joints **4.** Deformity of at least 1 of 10 selected joints	The 10 selected joints are the second and third DIP joints, the second and third PIP joints, and the first CMC joints of both hands. This classification method yields a sensitivity of 94% and a specificity of 87%.
Clinical Classification Criteria for Osteoarthritis of the Hip[25]	• Hip pain and hip medial (internal) rotation <15° and hip flexion ≤115°, or • Hip medial (internal) rotation ≥15°, and • Pain on hip medial (internal) rotation, and • Morning stiffness of the hip ≤60 min and age >50 yr	• Sensitivity 86% • Specificity 75%
Clinical Diagnostic Criteria for Osteoarthritis of the Knee[26]	• Knee pain and at least 3 of the following: **1.** Age >50 yr **2.** Stiffness <30 min **3.** Crepitus **4.** Bony tenderness **5.** Bony enlargement **6.** No palpable warmth	• Sensitivity 95% • Specificity 69%
Clinical and Radiographic Diagnostic Criteria for Osteoarthritis of the Knee[26]	• Knee pain and at least 1 of the following: **1.** Age >50 yr **2.** Stiffness <30 min **3.** Crepitus **4.** Osteophytes	• Sensitivity 91% • Specificity 86%

DIP, Distal interphalangeal; *MCP*, metacarpophalangeal; *PIP*, proximal interphalangeal; *CMC*, carpometacarpal.

TABLE 30-4

Pathology and Clinical Features of Rheumatoid Arthritis and Osteoarthritis

Disease	Tissue Predominantly Involved	Clinical Features	Radiographic Features
Rheumatoid arthritis	Synovium (inflammation)	Symmetrical and bilateral joint involvement Joint pain, swelling, stiffness, and contracture Muscle weakness and fatigue *Acute:* Red, hot, swollen, painful joints; boggy feeling, fatigue, with or without fever; ligamentous laxity; morning stiffness up to a few hours *Subacute:* Effusion, reduced redness and pain *Stable:* Generally no effusion, minimal stiffness	Periarticular swelling, joint effusion, regional osteoporosis, subchondral osteolytic erosions, joint subluxation
Osteoarthritis	Cartilage (degradation)	Affects hips, knees, spine, ankles, distal interphalangeal joints, proximal interphalangeal joints, and metacarpophalangeal joints Joint pain, malalignment Decreased proprioception Muscle weakness *Early:* Focal cartilaginous lesions *End stage:* Loss of cartilage, bone on bone	Osteophytes at joint margins, joint space narrowing, subchondral sclerosis and cysts

Modified from Iversen MD, Liang MH, Bae SC: Exercise therapy in selected arthritides: rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, systemic sclerosis, and polymyositis/dermatomyositis. In Frontera WR, Dawson DM, Slovik DM, editors: *Exercise in rehabilitation medicine*, Champaign, IL, 2006, Human Kinetics.

activities. Loss of hip range adversely affects the spine and other joints in the kinematic chain. Preventive stretching of soft tissue is important and should be initiated early and often. Functionally based exercises, such as repetitive sit to stand and repeated controlled stepping up and down a stair, can help maintain hip and knee extensor strength. For patients unable to tolerate full gravity exercise, aquatic therapy can be used to allow exercise with reduced load.[27]

The knee is the most commonly affected weight-bearing joint. Knee malalignment, either varus or valgus, may be evident with severe disease (Figure 30-3), although knee varus is the more common presentation. Data indicate that knee varus or valgus is associated with a threefold to fourfold increase in the odds of OA progression in the medial compartment of the knee.[3] Malalignment and abnormal patella tracking may produce retropatellar pain and chondromalacia patellae. Retropatellar pain often is experienced when the individual walks upstairs or sits for prolonged periods. Despite the location of pain, knee pain can lead to disuse atrophy and deconditioning.[3,29] However, one research study suggested that muscle weakness may be a cause rather than a result of knee OA.[30] Muscle weakness may alter joint biomechanics and produce unequal forces across the joint surface. Joint laxity from muscle inhibition or joint space narrowing unequally distributes the forces across the cartilage surface and can accelerate cartilage degeneration.[27]

Common features of hand OA are Heberden's and/or Bouchard's nodes, which are the result of bony overgrowths (Figure 30-4). Heberden's nodes appear at the medial and dorsolateral aspects of the distal interphalangeal (DIP) joints, and Bouchard's nodes appear at the proximal interphalangeal (PIP) joints. Finger joints appear bony and become less stable and less functional. Effusions, if present, can over time lead to joint ankylosis.

Figure 30-3 Valgus deformity of the knees. This is a common knee deformity that develops in patients with osteoarthritis of the lateral compartment. (From Scott WN: *Insall & Scott surgery of the knee,* ed 5, Philadelphia, 2012, Churchill Livingstone.)

Figure 30-4 Osteoarthritic joint changes of the hand, including Heberden's nodes at the distal interphalangeal joints and Bouchard's nodes at the proximal interphalangeal joints. (From Little JW, Falace D, Miller C, et al: *Little and Falace's dental management of the medically compromised patient,* ed 8, St. Louis, 2013, Mosby.)

These deformities may affect the ability to manipulate small objects or to make a tight fist.

OA of the spine, also known as *spondylosis,* may affect the cervical, thoracic, and/or lumbar regions. Common changes evident on radiographs include osteophytes, which may form adjacent to the end plates and reduce blood supply to the vertebrae; stiffening and bone sclerosis (i.e., thickening or hardening); facet joint degeneration; and disc degeneration. Severe facet joint OA can lead to spinal stenosis. Limited ROM, especially neck rotation pain and stiffness, is evident with cervical OA.[19]

Muscle Weakness

Periarticular muscular weakness adds to OA progression through functional instability and diminished neuromuscular protective mechanisms.[28] Disuse atrophy likely results from ligament stretching, reflex inhibition from pain, capsular contraction, and joint irritation caused by pain and effusion.[27] Muscle atrophy due to reflex inhibition starts a vicious cycle (Figure 30-5), increasing force across the damaged cartilage and altering joint mechanics.

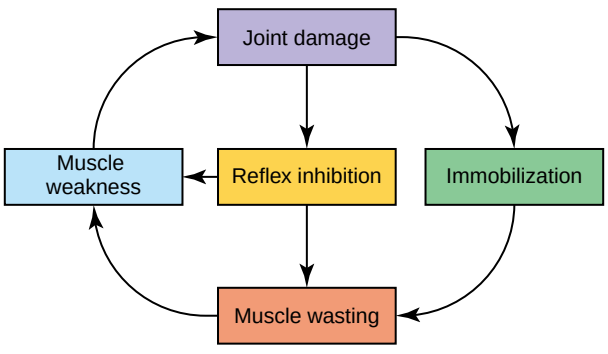

Figure 30-5 Vicious circle of injury. (Redrawn from Stokes M, Young A: The contribution of reflex inhibition to arthrogenous muscle weakness, *Clin Sci* 67:7-14, 1984.)

Proprioceptive Deficits

Proprioception is necessary for appropriate spatial and temporal limb coordination during movement. This increased coordination enhances stability and leads to more normal load distribution, reducing injury risk. Proprioceptive changes occur with age,[31] with sedentary lifestyles and joint instability. Changes in proprioception may result from destructive alterations in the ligaments, cartilage, capsule, or muscle and tendon that alter joint alignment.[22] On examination, reduced joint proprioception may be present along with joint hypermobility. Barrett et al.[32] and Hassan et al.[33] reported that individuals with knee OA have poorer knee proprioception than their healthy age-matched counterparts. In another study designed to assess the impact of OA on joint proprioception,[34] researchers recruited 28 adults with unilateral knee OA (Kellgren scale grade 2 or higher) and 29 adults without knee OA. A computer device and a stepper motor provided angular motion at 0.3°/sec and recorded angular displacement as patients reported the point at which they detected knee joint deflection. Patients with unilateral knee OA demonstrated worse proprioception than their healthy counterparts. Levinger et al.[35] assessed the fall risk of 35 people with knee OA before surgery and at 4 months after surgery and compared this risk to the risk of falls in a control group consisting of 27 asymptomatic age-matched controls. The authors reported that the surgical group exhibited a greater fear of falling and reduced lower limb proprioception and knee extensor strength before and after surgery compared with the control group. Levinger et al.[36] also reported that deficits in lower limb proprioception persisted at 12 months after surgery despite improvements in knee strength and reaction time.

Basic Principles of Rehabilitation and Studies on the Effects of Exercise in Patients with Osteoarthritis

Goals of Rehabilitation and Studies on the Effects of Exercise

The goals of rehabilitation in OA are to maximize function, ROM, and muscle force production and to reduce OA-associated deconditioning of the weight-bearing joints. Studies of regimens to correct or to prevent contractures are almost nonexistent. Heat, followed by passive ROM exercises and joint mobilization, is used clinically to reduce contractures and to improve joint ROM. Proper posture and positioning during extended inactivity or sleep, along with active ROM exercises, are used to maximize functional range and muscle strength. Proprioceptive and balance training are incorporated, particularly for weight-bearing joints to improve functional mobility. In difficult cases, serial casting or splinting can reduce contracture when followed by maintenance exercises.

The American College of Rheumatology (2012) has recommended that nonpharmacological treatment of hip and knee OA include a strong recommendation to

participate in cardiovascular and/or resistance, land-based and aquatic exercise, and weight loss (for persons who are overweight).[37] The **Osteoarthritis Research Society International (OARSI) Guidelines** also recommended exercise therapy and weight loss for patients with hip and knee OA.[38] A Cochrane review of land-based therapeutic exercise for knee OA reported that exercise interventions of varying modes yielded small treatment benefits for pain (effect size of 0.4 [95% confidence interval (CI) 0.3 to 0.5]) and physical function (effect size 0.37 [95% CI 0.25 to 0.49]).[39] These effect sizes were comparable with those reported for nonsteroidal anti-inflammatory drugs. The review included a wide range of exercise programs, including individual, class, and home-based modes of delivery, along with aerobic, strengthening, and balance exercises. Studies with exercise programs of fewer than 12 supervised treatments had smaller treatment effects than programs with more than 12 directly supervised sessions.[39] Fransen et al.,[40] in their meta-analysis of land-based therapeutic exercise for hip OA, reported land-based exercise resulted in reduced pain (standardized mean difference [SMD] –0.38, 95% CI –0.55 to –0.20) and improved physical function (SMD –0.38, 95% CI –0.54 to –0.05]. These benefits in decreasing pain and improving function persisted at least 3 to 6 months after monitored treatment ended.[40] Although studies have examined the impact of exercise on function, few investigators have examined the impact of strengthening programs on cartilage.

Evidence suggests that programs incorporating balance and proprioceptive training may be beneficial for patients with lower extremity arthritis.[41,42] However, other studies have reported no additional benefit from adding balance exercises to an impairment-based program for patients with knee OA.[43] Various exercises—such as double-limb stance and single-limb stance activities, weight shifting, walking on toes, standing on unsteady surfaces, and use of boards such as the biomechanical ankle platform system (BAPS) and tilt/rocker boards—were used for balance and proprioception training. Although different underlying mechanisms have been proposed to explain how these interventions affect balance and proprioception, clinicians agree that addressing proprioception is important and may help improve stability during gait and functional activities. Smith et al.[44] conducted a systematic review and meta-analysis to investigate the effectiveness of proprioceptive exercises for patients with knee OA. Clinical outcomes of patients who received an exercise program that included proprioceptive exercises were compared with those without a proprioceptive component or that had a nontreatment control group. Seven randomized, controlled trials (RCTs) involving 560 patients were included in the analysis. Results showed that groups engaged in proprioceptive exercises showed improved joint position sense compared with nonproprioceptive exercise groups (mean difference in joint position angulation error, –2.18; 95% CI –2.7 to 1.66). However, there was no difference in self-reported physical function between groups (mean difference in Western Ontario and McMaster Universities Osteoarthritis Index [WOMAC] physical function score, –12.19; 95% CI –15.67 to –8.71). The authors concluded that, although more evidence was needed, there appeared to be an advantage to adding proprioceptive training to an exercise program for patients with knee OA.

There is evidence that tai chi may be an effective intervention for patients with knee OA. Song et al.[45] examined the effects of a 6-month tai chi program on knee muscle strength, bone mineral density (BMD), and fear of falling in older women with knee OA ($n = 30$) compared with a control group ($n = 35$). Women in the tai chi group had significantly greater knee extensor endurance (mean change, 36.4 for the tai chi group compared with 1.1 watts/kg for the control group), greater BMD in the proximal femoral neck (mean change of 0.09 in T score for the tai chi group compared with –0.1 in the control group), and reported a greater reduction in fear of falling (mean change of –2.4 in the tai chi group compared with 0.66 in the control group). Wang et al.[46] enrolled 40 patients with knee OA in a 12-week tai chi program and compared outcomes to a control group that received a program of stretching and education. The intervention group was highly adherent and reported reduced pain and improved physical function at the end of the trial. This program had the added benefit of improving self-efficacy, depression, and health status for patients with knee OA.

Most studies evaluating the effects of exercise focused on strengthening exercises for patients with mild to moderate OA. A review by Uthman et al.[47] reported that interventions combining strengthening, flexibility, and aerobic conditioning (land or water based) were most effective for patients with hip or knee OA. Table 30-5 presents randomized controlled trials (RCTs) of exercise for hip and knee OA.

Silva et al.[51] compared water and land-based exercises. In their study, 57 patients with knee OA completed an 18-week intensive exercise program, lasting 50 minutes per session. Results demonstrated that patients in both the water- and land-based exercises groups had significant reductions in pain measured by a visual analog scale (VAS) and improved function measured by the WOMAC and Lequesne Index. Reductions in VAS scores of 35.2 mm for the water-based group and 30.9 mm for the land-based group were reported, both exceeding the minimal clinical important difference (MCID) of greater than 17.5 mm, which is considered clinically significant for patients with knee OA. Additionally, patients allocated to the water-based exercise group exhibited significantly greater pain relief before and after completing a 50-feet walk test at week 18 compared with the land-based group. Hinman et al.[49] reported that a 6-week program of aquatic physical therapy resulted in significantly less pain and improved physical function, strength, and quality of life in patients with hip and knee OA compared with a control group who did not receive aquatic therapy. Aquatic

TABLE 30-5

Randomized, Controlled Trials of Exercise and Manual Therapy in Hip and Knee Osteoarthritis (Since 2005)

Author	Sample	Intervention/Groups	Duration	Study Outcomes
Studies That Included Aerobic Exercise				
Tak et al.[48] (2005)	109 patients with HOA ages 55 yr and older	**1.** Hop with the Hip program: eight 1-hr weekly sessions of strength training under PT supervision. Also offered home exercise program, personal ergonomics advice from OT, and dietary advice from dietitian **2.** Control group: self-initiated standard care	8 wk	The program had a positive effect on pain measured by the pain component of the HHS. Effect size, 0.51 immediately after the intervention program; 0.38 at a 3-mo follow-up. Effects sizes were smaller for VAS pain measurements (effect size, 0.00 after treatment and 0.17 at a 3-mo follow-up). There were improvements in post-test hip function measured by the HHS (effect size, 0.41), self-reported disability, measured by the Sickness Impact Profile at follow-up (effect size 0.29), and the timed up and go test (effect size, 0.35) at follow-up. It did not affect QOL, other measures of observed disability, or BMI.
Hinman et al.[49] (2007)	71 patients with HOA or KOA	**1.** Treatment group: aquatic physical therapy 2×/wk for 6 wk; program included walking and strengthening exercises **2.** No aquatic physical therapy, continued with daily activities	6 wk	For the intervention group, there was increased hip muscle strength, physical function, and QOL, along with decreased pain and joint stiffness. Aquatic therapy participants reported an average reduction in pain of 33% from baseline compared with no change for the control group. Benefits were maintained for 6 wk after completion of therapy.
Lund et al.[50] (2008)	79 patients with KOA	**1.** Land-based exercise group: warm-up, strengthening/endurance exercise, balance exercise and stretching exercise **2.** Aquatic-based exercise group: warm-up, strengthening/endurance exercise, balance exercise and stretching exercise **3.** Control: interventions consisted of two 50-min sessions per week for 8 wk	8 wk with 3-mo follow-up	No effects observed at 8 wk. At 3-mo follow-up, land-based exercise showed a small improvement of pain and strength compared with the control group. Aquatic exercise group showed no changes compared with the control group but had significantly less adverse effects compared with the land group.
Silva et al.[51] (2008)	57 patients with KOA	**1.** Water-based exercise group **2.** Land-based exercise group Both land and water groups participated in 50-min sessions of lower extremity strengthening, stretching, and gait training, 3×/wk for 18 wk	18 wk	Decrease in pain and improvements in WOMAC and Lequesne index were similar between the two groups. Pain before and after the 50-ft walk test decreased for both groups, but the water-based group experienced a significantly greater decrease in pain after the 50-ft walk test at week 18.
Wang et al.[46] (2009)	40 patients with KOA	**1.** Exercise group: 60 min of tai chi 2×/wk **2.** Attention control (wellness education and stretching): 2×/wk	12 wk with follow-up at 24 and 48 wk	Patients assigned to tai chi exhibited significantly greater improvement in WOMAC pain, patients global VAS, physician global VAS, chair stand time, CES-D index, self-efficacy score, and SF-36 physical component summary.

TABLE 30-5

Randomized, Controlled Trials of Exercise and Manual Therapy in Hip and Knee Osteoarthritis (Since 2005)—cont'd

Author	Sample	Intervention/Groups	Duration	Study Outcomes
Fernandes et al.[52] (2010)	109 patients with HOA with mild to moderate symptoms	**1.** Patient education **2.** Patient education and supervised exercise The patient education program comprised three group sessions and one individual physical therapy session 2 mo after the group session. The supervised exercise component was 2×/wk for 12 wk. It included warm-up, strengthening, functional, and flexibility exercises.	12 wk with 4-, 10-, 16- mo follow-up	No significant difference was reported in the WOMAC pain score between the two groups. Significant improvements were reported at 10 and 16 months in patients receiving supervised exercise and education compared with patient education alone.
Song et al.[45] (2010)	65 women with KOA	**1.** Tai chi 2×/wk for 3 wk and then 1×/wk for the remainder of the 6-mo study period **2.** Control group received a self-help education program designed for arthritic patients for 2 hr once a month for 6 mo	6 mo	Women in the tai chi group had significantly greater knee extensor endurance and greater bone mineral density in the proximal femoral neck and reported a greater reduction in fear of falling compared with the control group.
Juhakoski et al.[53] (2011)	120 with HOA ages 55-80	**1.** Combined exercise and general practitioner care group received 12 supervised (1×/wk) and four additional sessions 1 yr later **2.** Received general practitioner care only	12 wk; after 1 yr, 4 booster sessions; regular follow-up for 2 yr	No significant difference in self-reported pain scores between the two groups. Patients in the combined exercise group demonstrated significant improvement in WOMAC function after 6 mo and 18 mo, compared with the control group. Shows positive effect of exercise for HOA in the long term. There was no significant difference in health care costs between groups.
Svege et al.[54] (2013)	109 patients with HOA	**1.** Exercise therapy and patient education[48] **2.** Patient education[52]	6yr cumulatively	22 patients in the group receiving both exercise therapy and patient education and 31 patients in the group receiving patient education only underwent THR during the follow-up period. Median time to THR was 5.4 and 3.5 yr, respectively. The exercise therapy group had better self-reported hip function before THR or end of study, but no significant differences were reported for pain and stiffness.
Studies That Included Manual Therapy Interventions				
Deyle et al.[55] (2005)	134 Patients with KOA	**1.** Clinical treatment group, supervised exercise, manual therapy, and home exercises for 4 wk **2.** Home exercise program	8 wk	Both groups had significantly improved WOMAC scores. The treatment group improvement was 25% more than the home exercise group.

TABLE 30-5

Randomized, Controlled Trials of Exercise and Manual Therapy in Hip and Knee Osteoarthritis (Since 2005)—cont'd

Author	Sample	Intervention/Groups	Duration	Study Outcomes
Poulsen et al.[56] (2013)	111 patients with HOA	1. Patient education program, 2 individual sessions and 3 group sessions 2. Patient education program plus manual therapy (MT), 2×/wk for a 6-wk intervention period 3. Minimal control intervention (MCI) group	6 wk; follow up at 1 yr	No difference between the patient education and MCI groups. Combined intervention of MT and patient education was more effective than MCI for pain relief, with a clinically relevant reduction in pain score of 1.9 points (effect size, 0.92, 95% CI 0.41-1.42). Patient education alone was not superior to the MCI.
French et al.[57] (2013)	131 Patients with HOA	1. Exercise therapy (ET), 6-8 individual 30-min physiotherapy sessions 2. Exercise therapy and manual therapy (ET and MT), 6-8 individual 45-min physiotherapy sessions, 30 min of exercise therapy, 15 min of manual therapy 3. Waiting list control group; no exercise therapy or manual therapy	8 wk	There was no significant difference in WOMAC physical function between the ET (n=66) and ET+MT (n=65) groups at 9 wk (mean difference, 0.09; 95% CI –2.93-3.11) or 18 wk (mean difference, 0.42; 95% CI, –4.41-5.25), or between other outcomes, except patient satisfaction with outcomes, which was higher in the ET+MT group. Improvements in WOMAC, hip ROM, and patient-perceived change occurred in both treatment groups compared with the control group. Self-reported function, hip ROM, and patient-perceived improvement occurred after an 8-wk program of exercise for patients with OA of the hip.
Abbott et al.[58] (2013)	193 patients with HOA or KOA	1. Manual therapy procedures including thrust and nonthrust joint mobilization, soft tissue mobilization, and home program of joint range of motion activities 2. Multimodal exercise program 3. Exercise therapy and manual therapy 4. Usual care only, no exercise therapy or manual therapy Intervention groups attended therapy for 50 min 7 times within the first 9 wk, and then 2 more sessions before 16 wk, home exercise program 3×/wk.	16 wk; 1 yr follow-up	Manual therapy provided significant benefits over usual care. Exercise therapy provided significant benefits over usual care. There was no significant benefit in providing manual therapy and exercise therapy together.
Bennell et al.[59] (2014)	102 patients with HOA	1. Active group: consisted of 49 patients. 10 sessions over 12 wk; treatment included education, manual therapy, home exercise, and gait aid if appropriate; continued with unsupervised home exercises for 24 wk after treatment 2. Sham treatment: 53 patients; included inactive ultrasounds and inert gel; applied gel 3×/wk for 24 wk after treatment	12 wk with a 24-wk follow-up	The between-group differences for pain improvements were not significant. The function scores were also not significant between groups. Physical therapy had no significant improvements compared with sham treatment.

HOA, Hip osteoarthritis; *PT*, physical therapist; *OT*, occupational therapist; *HHS*, Harris hip score; *VAS*, visual analog scale; *QOL*, quality of life; *BMI*, body mass index; *KOA*, knee osteoarthritis; *WOMAC*, Western Ontario and McMaster Universities Osteoarthritis Index; *CES-D*, Center for Epidemiology Studies Depression index; *SF-36*, Short Form 36 Health Survey; *THR*, total hip replacement; *ROM*, range of motion.

therapy participants reported an average reduction in pain of 33% from baseline, from an average of 6 to 4 on a 0 to 10 cm VAS scale (effect size, 0.24). Of aquatic therapy participants, 72% reported improvements in pain and 75% reported improvements in function, compared with 17% of the control participants. Lund et al.[50] compared the efficacy of aquatic exercise and a land-based exercise versus control in 79 patients with knee OA. The primary outcome was pain with physical function, quality of life, balance, and knee muscle strength also being assessed. However, Lund et al.[50] reported that patients in the land-based exercise group demonstrated slight improvement of pain and strength compared with the control group, with no significant differences detected between the aquatic exercise and the control group. The authors noted that subjects in the aquatic exercise group reported significantly fewer adverse effects. Thus they recommended a combination of aquatic and land-based exercise as the preferred exercise regimen for patients with knee OA.

Juhakoski et al.[53] enrolled and allocated 120 patients with hip OA either to exercise combined with general practitioner (GP) care or to standard GP care. The combined care group completed a 12-week exercise program administered in weekly sessions at a facility, followed by home-based exercises with four additional sessions 1 year later. Subjects in the combined group demonstrated significant improvements in function (WOMAC scores) at 6 months (mean, −7.5; 95% CI −13.9 to −1.0) and 18 months (mean, −7.9; 95% CI −15.3 to −0.4). compared with the usual care group. These findings suggest some long-term benefits of exercise on function for patients with hip OA. In a study of 109 patients with hip OA, Fernendes et al.[52] reported that adding supervised exercise to a patient education program may improve physical function but not pain over 16 months. The patient education program comprised three group sessions and one individual physical therapy session 2 months after the group session. The supervised exercise component was twice a week for 12 weeks. Significant improvements were reported at 10 and 16 months in patients receiving supervised exercise and education compared with patient education alone. Effect sizes were modest, −0.48 (−0.91 to −0.06,), and −0.47 (−0.93 to −0.02) at 10 and 16 months, respectively. Improvements in WOMAC physical function scores from baseline to 10 and 16 months were 25% and 28%, respectively, indicating a clinically significant change. A long-term follow-up of this randomized trial was conducted to determine the effect of exercise and education on the patients' need for a total hip replacement.[54] Patients were followed up to a duration of 6 years to determine whether they received a total hip replacement. Patients with hip OA who performed supervised exercise in addition to a home exercise program were less likely to have a total hip replacement (THR).[54] Forty percent of patients in the exercise group underwent a THR compared with 57% in the control group. The authors concluded that their findings supported the use of exercise as a first-line treatment for patients with hip OA. To determine the effects of exercise among older adults with hip OA, Tak et al.[48] conducted an RCT of an 8-week exercise and education program in 109 older adults with hip OA (aged 55 years and older). The intervention consisted of weekly 1-hour strengthening exercises and personalized OA advice on ergonomics and diet ($n=55$) compared with a control group ($n=54$). Outcomes were measured at baseline, after completion of the program, and at a 3 month follow-up. Data suggested exercise resulted in a moderate effect on pain relief as measured by the Harris Hip Score (HHS), at posttest, and at follow-up (effect sizes, 0.51 and 0.38, respectively) and resulted in small effects for improvements in hip function as measured by the HHS (effect size, 0.41), in disability as measured by the Sickness Impact Profile (effect size, 0.29), and mobility as measured by the timed up and go test (effect size, 0.35). These findings support the use of exercise for older patients with hip OA.

There is evidence suggesting that combining a weight loss program with exercise is more effective than exercise alone for patients with lower extremity OA.[60,61] Paans et al.[61] reported significant improvements in pain and physical function (including walking) in 35 overweight patients (mean body mass index [BMI] 32 kg/m^2 ± 3.9, age 56.9 ± 11.9) with hip OA who completed an 8-month exercise and weight loss program. Messier et al.[60] reported similar improvements in pain and physical function after an 18-month program comparing exercise only, dietary weight loss only, dietary weight loss plus exercise, and usual care healthy lifestyle (control) in 252 older (age 60 years or older), overweight and obese patients with knee OA. The combination of modest weight loss (5.7% of body weight [BW]) combined with moderate exercise provided better overall improvements in function, pain, and mobility in overweight and obese adults ($n=76$, mean BMI 34 ± 0.7 kg/m^2) with knee OA compared with either intervention alone.

A number of studies have examined the effect of manual mobilization techniques combined with exercise in patients with OA. In Table 30-5, RCTs that included manual therapy for hip and knee OA are described. Poulsen et al.,[56] in a study of 111 patients with hip OA, reported that a combined intervention of manual therapy and patient education was more effective than patient education alone or a minimal control intervention of hip stretching. Patients who received manual therapy and patient education exhibited greater pain relief with a clinically relevant reduction in pain score of 1.9 points (effect size, 0.92, 95% CI 0.41 to 1.42) compared with the minimal intervention group. Abbott et al.[58] investigated the long-term effectiveness of manual physical therapy, multimodal exercise, combined exercise, and manual therapy in patients with hip or knee OA. Patients were randomly allocated to one of the four groups; 193 patients completed the trial, and the primary outcome

measure was a change in WOMAC score after 1 year. Patients in the intervention groups received nine 50-minute sessions in the first 7 weeks and two additional sessions at week 16. Adjusted reductions in WOMAC scores at 1 year compared with the usual care group were as follows: usual care plus manual therapy, 28.5 (95% CI 9.2 to 47.8); usual care plus exercise therapy, 16.4 (−3.2 to 35.9); and usual care plus combined exercise therapy and manual therapy, 14.5 (−5.2 to 34.1). All intervention groups improved, but only the usual care plus manual therapy and usual care plus exercise therapy groups achieved clinically significant reductions of greater than 28 WOMAC points from baseline. There was no added benefit reported for combining exercise and manual therapy. The authors theorized that the combined therapy group spent less time on each intervention, thereby decreasing the effectiveness of both.

French et al.[57] conducted an RCT of 9 weeks of exercise therapy compared with exercise combined with manual therapy (and 18-week follow-up) in 131 patients with hip OA. Participants in the exercise group attended six to eight individual 30-minute physical therapy sessions over 8 weeks, which included flexibility and strengthening exercises. The exercise and manual therapy group participants attended six to eight individual 45-minute physical therapy sessions over an 8-week period, which included 30 minutes of exercise and up to 15 minutes of manual therapy. Participants in the control group remained on the wait-list. The researchers reported no significant difference in WOMAC physical function between the exercise ($n=66$) and combined exercise and manual therapy ($n=65$) groups at 9 weeks (mean difference, 0.09; 95% CI −2.93 to 3.11) or 18 weeks (mean difference, 0.42; 95% CI −4.41 to 5.25), nor did they report any significant differences between other outcomes, except patient satisfaction with outcomes, which was higher in the exercise and manual therapy group. Improvements in function (WOMAC), hip ROM, and patient-perceived change occurred in both treatment groups compared with the control group. The mean improvement in the WOMAC physical function at 9 weeks was 6.25 for the exercise and manual therapy group and 4.21 for the exercise group. Improvement for the exercise and manual therapy group exceeded the MCID for the WOMAC physical function, which is 5.4. Self-reported function, hip ROM, and patient-perceived improvement occurred after an 8-week program of exercise for patients with OA of the hip. The authors concluded that manual therapy as an adjunct to exercise provided no further benefit, except for higher patient satisfaction.

Bennell et al.,[59] in a randomized placebo-controlled trial, compared the effects of a 12-week multimodal physical therapy program ($n=49$) with sham physical therapy ($n=53$) in patients with symptomatic hip OA. Participants attended 10 treatment sessions over 12 weeks. Active treatment included education and advice, manual therapy, home exercise, and a gait aid, if appropriate. Sham treatment included inactive ultrasound and inert gel. For 24 weeks after treatment, the active group continued unsupervised home exercise, while the sham group self-applied gel three times weekly. Primary outcome measures were average pain and physical function (WOMAC scores). Interestingly, the authors reported that, although both groups showed improvements in pain and function, there was no significant difference in pain and function scores between groups who received physical therapy consisting of exercise and manual therapy and the group who received a sham treatment.

These mixed findings on the benefits of manual and exercise therapy specifically for patients with hip OA may indicate that there may be a subgroup of patients who might benefit most from manual therapy interventions and that interventions should be specifically selected for patients using a clinical reasoning approach that integrates data from the clinical presentation and stage of pathology. Additionally, interventions may need to be more frequent and intense than those provided in many clinical trials. However, combining interventions such as manual therapy and exercise may result in a reduction in the dose and intensity of both, thereby reducing their effectiveness.

A number of authors have attempted to identify patients with hip OA who were most likely to have a favorable response to physical therapy.[62] Baseline variables that might predict a favorable response to physical therapy include unilateral hip pain, age of 58 years or younger, pain greater than or equal to 6/10 on a numeric pain rating scale, 40-m self-paced walk test time of 25.9 seconds or less, and symptom duration of 1 year or less. However, additional research is needed to validate these findings. The American Physical Therapy Association (APTA) clinical practice guidelines for hip OA recommend that clinicians consider the use of manual therapy procedures to provide short-term pain relief and improve hip mobility and function in patients with mild hip OA.[63]

Variables That May Predict a Favorable Response to Physical Therapy*[62]

- Unilateral hip pain
- Age ≤58 years
- Pain ≥6/10 on numeric pain rating scale
- 40-m self-paced walk test time ≤25.9 seconds
- Symptoms duration ≤1 year

*Based on 90+ subjects.

There appear to be some immediate and long-term benefits from manual therapy in patients with knee OA.[55,64] Moss et al. reported an immediate local and more widespread hypoalgesic effect when patients with knee OA receive joint mobilization. The authors suggested that knee joint mobilization might be an effective

method for reducing osteoarthritic pain. Deyle et al.[55] reported that 4 weeks of supervised exercise, manual therapy, and home exercises produced significantly greater improvements in outcomes for adults with knee OA compared with a home exercise program alone. Subjects in the clinic treatment group ($n=66$) received supervised exercise, individualized manual therapy, and a home exercise program over a 4-week period. Subjects in the home exercise group ($n=68$) received the same home exercise program initially, reinforced at a clinic visit 2 weeks later. Outcomes included the distance walked in 6 minutes and the WOMAC Index. Both groups showed clinically and statistically significant improvements in 6-minute walk distances and WOMAC scores at 4 weeks. Improvements were still evident in both groups at 8 weeks, while WOMAC scores at 4 weeks improved by 52% in the clinic treatment group and by 26% in the home exercise group. The average 6-minute walk distances improved by roughly 10% in both groups. The authors concluded that a home exercise program for patients with knee OA provided important benefits and the additional manual therapy and supervised exercise added greater symptomatic relief.

Jansen et al.,[65] in a systematic review and meta-analysis of 12 RCTs of patients with knee OA, reported that the addition of manual mobilization to an exercise program resulted in a superior effect on pain compared with strengthening exercises or a combination of strengthening, ROM, and aerobic exercises alone.

Aerobic walking at moderate intensity appears to improve aerobic capacity by up to 20% without exacerbation of symptoms. In studies by Minor et al.[66] and Kovar et al.,[67] patients with mild to moderate OA of the hips and knees not only improved aerobic capacity but demonstrated improvements in mood when aerobic walking was coupled with supervised stretching and strengthening exercises. Messier et al.[68] showed that aerobic exercise and strengthening programs improved balance and postural control. They enrolled 103 patients with knee OA in an 18-month trial and allocated them to one of three groups: (1) supervised aerobic exercise at 50% to 85% of the maximum heart rate for 50 minutes three times a week for 3 months, followed by a home prescription; (2) supervised upper and lower extremity weight training consisting of 2 sets of 10 repetitions three times a week for 3 months, followed by a home exercise prescription; or (3) monthly educational sessions and scheduled contacts from the research team. At the end of the trial, patients in the exercise groups showed improved balance and postural stability. A meta-analysis by Roddy et al.[69] compared the efficacy of aerobic walking or strengthening exercises for patients with knee OA. The weighted pooled effect size for pain reduction from aerobic walking for the four included studies was 0.52 (98% CI 0.34 to 0.7). An indirect comparison of aerobic walking and quadriceps strengthening showed no advantage of one approach compared with the other with regard to pain and disability.

Conclusions about Exercise, Manual Therapy, and Osteoarthritis

The evidence demonstrates that patients with mild to moderate knee and hip OA can safely engage in effective aerobic, strengthening, aquatic, and tai chi exercise without exacerbating joint symptoms. Improvements in mood, strength, and aerobic capacity are reported, ranging from 15% to 40%, depending on the intensity of the prescribed exercise.[27] Gains in functional performance and reductions in limitations are greatest when the program lasts at least 8 weeks and exercises are performed at least three times a week.[66,67,70–78] As with other populations, compliance with an exercise program is critical to its effectiveness.[69] Efficacy can be improved when home exercise is supplemented with a supervised program. Data also indicate that exercise programs combined with weight loss are more effective than exercise alone in overweight patients with hip and knee OA. Manual therapy interventions in combination with exercise result in improved outcomes in patients with knee OA. Although the evidence to support the use of manual therapy in patients with hip OA is less compelling, it appears to be an effective intervention for appropriately selected patients. The benefits of manual therapy for patients with OA may result in part from pain modulation, which results in improved tolerance to exercise. Additional research is needed to explore the efficacy of balance and proprioceptive training in patients with lower extremity OA and its effect on function and fall prevention.

Clinical Point

- Few studies have addressed the impact of resistance or aerobic exercise on patients with severe osteoarthritis
- The long-term effects of exercise on joint integrity and disability are unknown
- There is growing evidence to support the use of manual therapy combined with exercise to treat patients with knee OA and less so with hip OA

Aerobic exercise improves endurance, reduces fatigue, and has modest effects on muscle strength. With structured exercise (three times a week over 4 months), individuals can improve strength and endurance, leading to decreased dependency and pain and increased functional activity. Some of these benefits continue for up to 8 months after an intense program.[79] The concept that inactivity is a risk factor for OA, rather than just an outcome of the disease, emphasizes the importance of aerobic exercise in disease management.

Achieving a Therapeutic Effect with Exercise. Some evidence indicates that exercises that focus on proprioception and balance may reduce disability and improve strength. However, more research is needed in this area. Despite the evidence that symptoms of hip and knee OA can be improved with exercise and that exercise is recommended

in practice guidelines, most patients with OA have not had a prescription for exercise. Even when physicians prescribe exercise, only a small percentage of patients exercise in a manner that can achieve a therapeutic effect.[80] A systematic review and meta-analysis of 48 RCTs by Juhl et al.[81] found that aerobic and knee strength training exercises reduced pain and lowered self-reported disability in patients with knee OA. For best results, exercise programs should be supervised and carried out at least three times per week and consist of at least 12 sessions.

Certain patients with hip OA can exercise at home just as effectively as with outpatient hydrotherapy to improve joint mobility and increase muscle strength.[82] Including manual therapy with exercise appears to provide added benefits. With respect to exercise in adults with knee osteoarthritis (KOA), *caution needs to be applied in patients with lax or malaligned knees, especially with tibiofemoral OA, in which quadriceps strengthening may exacerbate symptoms.* Table 30-6 summarizes the exercise recommendations for OA based on pain level and pathology.

Gait Problems and Use of Assistive Devices

Patients with hip and knee OA exhibit gait adaptations including reduced gait speed.[83] Patients describe difficulty and pain when walking or climbing stairs and reduced functional independence. Decreased muscle strength and reduced joint proprioception also are associated with an increased incidence of falls.[84]

In one study,[79] an exercise program consisting of individualized progressive training, including isometric and dynamic exercises for patients with knee OA, significantly improved muscle function, functional capacity, and walking time (as much as 21%) and reduced self-reported difficulty with walking and pain. Stationary cycling also has demonstrated improvements in walking speed, aerobic capacity, and pain.[85]

Studies have also reported improved rates of recovery in patients with end-stage hip arthritis after preoperative and perioperative exercise programs for total hip arthroplasty (THA).[86,87] Assistive devices are recommended as needed for patients with hip and knee OA.[37] An RTC by Jones et al.[88] found that patients with knee OA, who used a cane daily for 2 months, reported reduced pain and improved function compared with patients who did not use a cane. Gait modification strategies have also been suggested to offload the medial compartment of the knee and further research is needed in this area.[89]

TABLE **30-6**

Summary of Rehabilitation Interventions for Osteoarthritis

Type of Osteoarthritis (OA)	Recommendations
OA of the hip and knee	
Mild pain	• AROM exercises (10 repetitions), 3-5 repetitions of flexibility and static exercises (8-10 repetitions of 6 seconds' duration) • Dynamic exercises, especially of the quadriceps and hamstrings (8-10 repetitions) • Low-impact aerobic activities (pool, bicycling) 20 min 3×/wk • Balance activities (BAPS and tilt boards), single-limb stance
Moderate pain	• Static and dynamic exercises—reduce to 5 repetitions • Flexibility exercises, 3-5 repetitions • Low-impact aerobic exercises (pool, bicycling) for 20 min 3×/wk • Balance and proprioception activities—bilateral • Use of cane or lateral heel wedge foot orthosis, neoprene knee sleeve
Severe pain	• Static and dynamic exercises (no resistance), 3-5 repetitions except with internal joint derangement • Low- or no-impact aerobic exercises (pool) • *Note: Advise functional activities to keep moving*
Bone on bone	• Same as for severe form but few or no repetitions of dynamic exercises; patient education is important • *Note: Caution should be used in prescribing quadriceps strengthening exercises for patients with ligamentous laxity and malalignment.* • Orthosis: Varus unloader-type knee orthosis; may need crutches or walker
OA of the hand	• Active movements, few repetitions, low resistance • Teach home exercises, which the patient should repeat daily • Aim to maintain full range of motion of MCP, PIP, and DIP joints

AROM, Active range of motion; *BAPS,* biomechanical ankle platform system; *MCP,* metacarpophalangeal; *PIP,* proximal interphalangeal; *DIP,* distal interphalangeal.

Modified from Iversen MD, Liang MH, Bae SC: Exercise therapy in selected arthritides: rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, systemic sclerosis and polymyositis/dermatomyositis. In Frontera WR, Dawson DM, Slovik DM, editors: *Exercise in rehabilitation medicine,* Champaign, IL, 2006, Human Kinetics.

Gait problems are common in patients with OA of any of the weight-bearing joints and are a clue to underlying pathology of the soft tissues or the joints themselves. Left untreated, they can cause problems. Clinicians should be attentive to this diagnosis and design treatments that maximize joint function.

Orthoses for Osteoarthritis

Much of the research examining the effects of bracing for OA has concentrated on devices to relieve knee pain and disability. In OA, the knee is subjected to increased medial compartment pressures secondary to varus loading during gait. Two techniques have been used to decrease these excessive forces: unloader-type knee orthoses (KOs) and lateral wedge insoles at the foot. An unloader KO for varus gonarthrosis, or knee varus (genu varum), can be either a thrust-type (Figure 30-6) or prestressed brace. The thrust-type, hinged KO has a single upright designed to create a valgus-correcting force at the knee to unload the medial compartment.[90] Kirkley et al.[91] compared the use of a varus unloader KO with a neoprene sleeve or with medical treatment alone in a group of 119 subjects with OA. After 6 months, the subjects who wore the unloader KO showed a significant difference in pain relief with functional tasks (i.e., a 6-minute walk and a 3-minute stair-climb) compared with the group that wore the neoprene sleeve. Both groups performed better than the nonbrace group. Brouwer et al.[92] studied the additive effect of a valgus brace on medial knee OA and a varus brace on lateral knee OA on conservative care. At a 12-month follow-up, patients who wore a brace reported less knee pain than patients in the control group. However, treatment effects were small, and adherence to the brace was poor. A subgroup analysis indicated that patients with medial compartment knee OA who were younger than 60 years of age had a better therapeutic response to a valgus brace. Lindenfeld et al.[93] assessed biomechanical properties of the brace to reduce the varus forces as well as pain. The authors compared 11 subjects with OA before and after 4 weeks of brace wear and then compared them with 11 healthy controls. As measured on the Cincinnati Knee Rating System, pain, function, and biomechanical alignment all improved in the brace group. Alignment levels were reported to approach that of the normal control group.

Figure 30-6 A thrust-type varus unloader knee brace. Note single lateral hinge.

Lateral wedge insoles or a variant, subtalar strapped insoles, are prescribed to make use of the closed chain properties of a foot orthosis (FO) to reducing compressive forces on the medial tibiofemoral joint compartment. Brouwer et al.[94] reported that some limited evidence indicated that lateral wedges reduced the use of pain medication by patients with OA when compared those who wore a neutral insole. However, function, as measured by the WOMAC functional scale, was not improved in the group that used neutral insoles after 6 months of wear. These researchers also reported that a lateral wedge insole with strapping for the subtalar joint demonstrated a biomechanical realignment effect, as measured by the femorotibial angle (FTA), but that those wearing these insoles reported more low back and foot pain. In contrast with these findings, Bennell et al.,[95] in an RCT of 200 patients with medial knee OA, reported no benefit to wearing lateral wedge insoles compared with flat insoles. Van Raaij et al.[96] compared the use of a lateral wedge insole with use of a valgus brace in 91 patients with medial compartmental knee OA and reported no difference in pain or WOMAC scores between groups after 6 months. Patients wearing the insole were more adherent and responded slightly better than the patients wearing the brace. These authors suggested that a lateral insole might be an alternative to valgus bracing. Arazpour et al.[97] compared the use of an unloader KO with the use of a lateral wedge insole in 56 patients with medial compartment knee OA. The Knee Injury and Osteoarthritis Outcome Score (KOOS) was used to assess status at baseline and 6 months after intervention. There were significant decreases in pain and increases in daily living activities, recreational and sport function, and quality of life with each intervention. The knee unloader orthoses were more effective than lateral wedge insoles in reducing pain levels. However, the lateral wedge insoles were more effective at improving quality of life as measured by the KOOS quality of life subscale. The authors concluded that lateral wedges were a suitable alternative to knee unloader orthoses for patients with medial compartment knee OA. There is some preliminary evidence that the use of a medial wedge orthosis is helpful in reducing knee pain in patients with valgus knee OA[98]; however, additional research is needed in this area. There is also evidence to support the use of medially directed knee taping to reduce pain in patients with knee OA.[99]

The clinical decision to use these devices should be based on current research findings, the patient's degree of disability, the potential for compliance with an orthosis, and the cost of the device.

Case Study in Osteoarthritis

John is a 77-year-old male who presents with a diagnosis of right hip OA. His radiographic findings suggest decreased joint space with small acetabular osteophytes off the anterior aspect of the joint. He has opted to delay surgical intervention and wants to use physical therapy to enhance his overall physical status. He reports minimal difficulty with activities of daily living (ADLs) and instrumental activities of daily living (IADLs) (see Volume 1 of this series, *Orthopedic Physical Assessment,* Chapter 1). However, he has been increasingly sedentary since retiring from the post office 10 years ago. Currently, he reports late afternoon soreness on the anterior aspect of the leg and along the groin to his medial thigh, especially after doing a lot of walking.

On examination, John walks with a slow, deliberate gait pattern. He demonstrates decreased stance time on the right leg, and his right hip is maintained in flexion throughout the gait cycle. Decreased step length is noted on the left, and a positive Trendelenburg's sign is noted on the right. Right hip flexion ROM is 20° to 100° with a firm, unyielding end feel and restricted extension ROM; medial (internal) rotation and abduction is 0° to 20° with a firm end feel; and lateral (external) rotation is 0° to 35°. Left hip ROM is within normal limits (WNL). Right hip muscle strength is in the fair range. Lower abdominal strength is poor. Knee strength is good, and ankle strength is WNL. The patient has a positive Thomas test (20°) on the right. He demonstrates an inability to squat without visible muscle shaking and altered posture, a positive Trendelenburg's sign with unilateral squat, and increased trunk flexion with bilateral squat. Sensation is intact to light touch, but right hip kinesthesia and proprioception are reduced. He is able to maintain single-limb stance for approximately 5 seconds with eyes open. His past medical history is significant for coronary artery disease (no history of myocardial infarction), hypercholesteremia, gastroesophageal reflux disease, and a weight gain of 13.6 kg (30 lb) over the past 10 years. His BMI is 27 kg/m^2. He currently is taking the following medications: Zestril, Lipitor, and Prilosec.

1. *What rehabilitation program would you advise?*
2. *What education about restrictions to his activities would you recommend?*
3. *What type of exercise would you recommend?*
4. *Do you think an assistive device would be useful?*

Case Discussion

The patient's impairments of decreased hip muscle flexibility, poor muscle performance of the hip and trunk, poor motor control, pain, joint mobility, and diminished proprioception contribute to his altered gait and should be addressed in the rehabilitation program. Flexibility exercises and joint mobilization, including hip distraction techniques, will help restore mobility and unload the hip joint while allowing a more normal gait pattern. Depending on the degree of pain, short-term use of a straight cane can further unload the joint for long-distance walking. He will benefit from an exercise program that emphasizes strengthening of the proximal musculature of the hip, especially the weak gluteus medius. An exercise program should be started that incorporates stability exercises in weight bearing, such as rhythmic stabilization in standing, and progresses to unilateral static and dynamic control. The progression should take place as pain diminishes and proximal motor control improves. These activities not only improve motor coordination and strength but also enhance proprioception. Aerobic exercise, such as aquatic classes and/or elliptical training, performed at 60% to 80% of his maximum heart rate, three times per week, should be incorporated into his program. The patient needs to learn how to modify his exercise regimen to adjust for his level of pain and to progress his exercises over time. Because his BMI is in the overweight range, research indicates that his exercise program will be more effective if combined with weight loss. A consultation with a nutritionist may be indicated to provide assistance with dietary modification to assist with this process.

RHEUMATOID ARTHRITIS

Epidemiology and Pathophysiology

Classic RA is a chronic systemic inflammatory disorder that not only affects joints but also has multiple systemic manifestations. RA affects approximately 1.3 million adults in the United States[1] and shortens life expectancy by about 10 years.[100] RA begins in early to middle life and affects women more often than men, and its incidence increases with age.

Inflammation of the synovium of diarthrodial joints is the predominant pathology, leading to a state of chronic synovitis. Synovitis that goes uncontrolled can lead to joint destruction (see Table 30-4). The chronic fluctuating course of RA can follow various patterns of exacerbation and remission. Patients may experience a continuous, low-grade exacerbation or have periods of remission followed by exacerbations of various intensities. Although exacerbations are a feature of the disease, they can be triggered by infection or trauma or can occur after medications have been stopped. Fewer than 10% of patients with RA go into prolonged remissions.[101]

The pattern of joint involvement is typically symmetrical and polyarticular. Nearly 10% of those affected develop some joint deformities within 2 years of diagnosis. Radiological changes often are seen first in the feet and

hands. The Sharp score, as modified by van der Heijde,[102] is a method of documenting the disease progression. Radiologists score the number of bony erosions and areas of joint space narrowing in 30 to 32 joints of the hand and 12 joints in the feet. The total score is recorded (maximum involvement equals 448 points) and monitored on successive radiographs to track progression.

Although RA can affect any area, the most commonly affected joints are the wrists, metacarpophalangeal (MCP) joints, and PIP joints in the upper extremity (Figure 30-7) and the ankle and foot (Figure 30-8) in the lower extremity. In the spine, RA is more common in the cervical area but can involve all segments. Because this is a systemic disease, extra-articular clinical symptoms may involve the cardiovascular system, pulmonary system, integumentary, and/or nervous system. Pleurisy, often presenting as shortness of breath or dyspnea on exertion, has been reported in up to 70% of patients with RA. Pericarditis,

Figure 30-7 **A,** Swelling and capsular injury at the metacarpophalangeal (MCP) joint, resulting in lateral slippage of the extensor tendon and ulnar deviation of the fingers in a patient with rheumatoid arthritis. **B,** Radiograph showing the destructive changes associated with advanced rheumatoid arthritis. Note especially the marked bone destruction at the wrist, the subluxation and ulnar deviation at the MCP joints, and the dislocation of the interphalangeal joint of the thumb. **C,** Rheumatoid arthritis of the hand, showing advanced changes with ulnar drift and palmar subluxation at the MCP joints and swan neck and boutonniere deformities in the fingers. (From Harris ED, Budd RC, Firestein GS et al.: *Kelley's textbook of rheumatology,* ed 7, Philadelphia, 2005, WB Saunders.)

Figure 30-8 **A,** Advanced rheumatoid foot showing severe hallux valgus deformity, dorsal subluxation of lesser toes and consequent metatarsalgia, with keratotic skin noted under the metatarsal heads. **B,** Rheumatoid arthritis of the ankle, showing diffuse loss of cartilage space with erosions of the fibula *(arrow and arrowhead)*. The scalloping along the medial border of the distal fibula *(arrow)* is called the fibular notch sign and is a characteristic finding in rheumatoid arthritis. The hindfoot is in valgus alignment. (**A** from Walker R, Redfern D: The foot in systemic disease: management of the rheumatoid or diabetic patient, *Orthopaed Trauma* 25:241-252, 2011. **B** from Firestein GS, Budd RC, Harris ED, et al: *Kelley's textbook of rheumatology,* ed 8, Philadelphia, 2009, Saunders.)

myocarditis, and vasculitis, which may affect as many as 30% of patients, as well as renal effects secondary to vasculitis or to the toxic effects of long-term drugs used to control the disease, are all conditions that affect the physical functioning and exercise tolerance of patients with RA.[100,101,103]

Features of Rheumatoid Arthritis

JOINTS COMMONLY AFFECTED
- Wrist, metacarpophalangeal joints, proximal interphalangeal joints, foot, ankle, knee

SYSTEMIC FEATURES
- Pleurisy
- Pericarditis, myocarditis
- Vasculitis and renal disease

In RA, osteoporosis is more prevalent than in age-matched cohorts.[104,105] In addition to the risk factors normally seen with primary osteoporosis, individuals with RA have additional risk factors such as periods of immobilization, long-term use of corticosteroids, and use of disease-modifying antirheumatic drugs (DMARDs) (see Volume 2 of this series, *Scientific Foundations and Principles of Practice in Musculoskeletal Rehabilitation,* Chapter 12). Patients with RA have a 1.5 times greater risk of osteoporotic fracture than patients who do not have RA.[106] However, Haugeberg et al.[107] reported that even with the use of DMARDs and corticosteroids, bone loss can be mitigated if the patient with RA is treated with antiresorptive drugs, calcium, and vitamin D.

Fatigue is a hallmark of RA and may result from a combination of cytokine production, deconditioning from lack of exercise or activity, and altered biomechanics of involved joints. As with many chronic diseases, patients with RA have a higher risk of depression, which may also contribute to the fatigue. This factor coupled with the systemic nature of RA and increased metabolic cost of daily activities may significantly limit function and restrict independence as the disease progresses. The American College of Rheumatology provides guidelines to help clinicians classify the effect of the multiple impairments on the patient's global functional capacity (Table 30-7).[108]

RA may also affect children. **Juvenile rheumatoid arthritis** (JRA; referred to as *juvenile idiopathic arthritis* [JIA] by the European League Against Rheumatism) is diagnosed when symptoms occur before 16 years of age and persist for at least 6 consecutive weeks. No specific diagnostic tests can be used to confirm JIA; rather, several tests can be performed to support the clinical impression of the disease. The three primary subtypes of JIA established by the American College of Rheumatology are pauciarticular JIA, polyarticular JIA, and systemic JIA. These subtypes are based on the number of joints involved, the presence or absence of systemic features, and in some cases, the age of onset.[109] Because these classifications are based on

TABLE 30-7

American College of Rheumatology's Classification of Global Functional Status in Rheumatoid Arthritis

Classification	Description
Class I	Completely able to perform usual activities of daily living (self-care, vocational, and avocational*)
Class II	Able to perform usual self-care and vocational activities but limited in avocational activities
Class III	Able to perform usual self-care activities but limited in vocational or avocational activities
Class IV	Limited in ability to perform usual self-care, vocational, and avocational activities

* Self-care activities include dressing, feeding, bathing, grooming, and toileting; avocational activities (recreational and/or leisure activities) and vocational activities (work, school, homemaking) are patient desired and age and gender specific.

From Hochberg MC, Chang RW, Dwosh I et al: The American College of Rheumatology 1991 revised criteria for the classification of global functional status in rheumatoid arthritis, *Arthritis Rheum* 35:498, 1992.

the characteristics of the disease at onset, they may not indicate its course over time.[110]

Pauciarticular JIA is defined as synovitis in four or fewer joints, usually the elbows, knees, and ankles, and is most often asymmetrical and nonsystemic. In pauciarticular JIA, the rheumatoid factor usually is negative. Pauciarticular JIA has two subtypes, based on the onset of disease and the clinical presentation. Early-onset pauciarticular disease often occurs in girls before the age of 5. Late-onset pauciarticular disease occurs around the ages of 10 to 12 years and most often affects the large weight-bearing joints (i.e., hips and knees) and entheses (muscle insertions). Stiffness and pain are the predominant complaints.[109]

Classification of Rheumatoid Arthritis in Children

- Pauciarticular (≤4 joints)
  - Early onset
  - Late onset
- Polyarticular (≥5 joints)
- Systemic

Polyarticular JIA affects girls more often than boys. It is characterized by synovitis in five or more joints, often symmetrical. Patients may present with systemic features. Although polyarticular JIA may involve any joint, the cervical spine frequently is affected. It is important to note that polyarticular JIA also affects normal growth and development.[109]

Systemic JIA can occur at any age and may occur in boys or girls. It is characterized by high, spiking fevers; a classic rash (pink to salmon colored) that often occurs on the trunk and proximal extremities; and synovitis in one or more joints. The fever generally is the first symptom and may precede other symptoms within months. Malaise, anemia, pericarditis, thrombocytopenia, lymphadenopathy, hepatomegaly, and other systemic features evident with adult RA may be present. These children are so ill that they often present with severe functional limitations and growth retardation (below the 5th percentile).[109]

Signs, Symptoms, and Impairments

Pain, Stiffness, and Swelling

RA can cause adaptive shortening of the soft tissues, tendons, and joint capsules. Bone erosion and cartilage loss reduce joint space and may contribute to subluxation, limiting joint motion. Swelling associated with joint effusion and extra-articular edema further reduces mobility. These changes result in significant mobility impairments and pain, especially during exacerbations. Analgesic and anti-inflammatory medications are the mainstays of medical management for these patients (see Volume 2 of this series, *Scientific Foundations and Principles of Practice in Musculoskeletal Rehabilitation,* Chapter 12). However, physical modalities and exercise play an important role in reducing functional loss.

Signs and Symptoms of Rheumatoid Arthritis

- Chronic inflammation
- Exacerbations and remissions
- Symmetrical, polyarticular joint involvement
- Osteoporosis
- Fatigue
- Pain
- Deformity (subluxations)
- Mobility impairment
- Muscle weakness
- Depression

Studies That Address Pain, Stiffness, and Swelling. Cold helps reduce inflammation and pain when the joints are acutely inflamed. Heat should be avoided at this time because heat may exacerbate the inflammatory process.[111] When the inflammation resolves, either heat or cold can be used to relieve pain.[112] Local heat may be preferred before gentle exercise to reduce joint stiffness. In general, few studies examine the effectiveness of modalities. An Ottawa Panel[113] concluded that some (but limited) evidence supported the use of ultrasound, paraffin, transcutaneous electrical nerve stimulation (TENS), and low-level laser therapy in the management of pain and flexibility. The panel's guideline further stated that evidence for including or excluding electrotherapy modalities is inconclusive at this time.

Exercise stimulates endogenous opiates and may be used to reduce joint pain and stiffness. Ekdahl et al.[114] studied endorphin levels in patients with RA during exercise. Serum levels of internal opiates were directly related to the intensity and frequency of active exercise. Numerous research studies have reported that ROM exercises safely and efficiently maximize joint motion in patients with RA even when performed for long periods.[115–119] Lee et al.[120] and Wang et al.[121] reported physical and psychological benefits from tai chi exercise in patients with RA. Patients with early or stage I disease can safely perform daily exercise, including active flexibility and ROM, doing a few repetitions at each joint. Passive stretching should be deferred until the joints are not in an active exacerbation.[27]

Muscle Weakness

Muscle weakness is common with RA.[110,122] Weakness may be attributable muscle fiber atrophy. Myositis, characterized by inflammation within the muscle itself, is not always present or apparent but can be assessed through muscle enzyme testing. If myositis is not present or is minimal, muscles can be exercised sufficiently so that training effects for muscle strengthening can be achieved.[123] Atrophy has been shown to occur in both type I and type II muscle fibers and may stem either from disuse or from changes to the muscle tissue itself.[124]

Studies of Strength Training. Studies of strength training for patients with RA have focused on effectiveness and safety.[125–127] Early studies of strength training focused on the impact of low-intensity training, such as active ROM, isometric, or low load-resistance exercise programs.[124] These studies incorporated exercise of varying intensity, frequency, and duration to avoid exacerbation of symptoms. More recent investigations studied moderate- to high-intensity strength training programs, which are defined as 50% or greater of maximum voluntary contraction (MVC). Considerable emphasis was placed on determining whether patients with RA could tolerate higher loads without sacrificing joint integrity. The RCTs of exercise in patients with RA are reviewed in Table 30-8.

TABLE **30-8**

Randomized, Controlled Trials of Exercise in Rheumatoid Arthritis (Since 2005)

Author	Sample	Intervention/Groups	Duration	Study Outcomes
Studies That Included Aerobic Exercise				
Bilberg et al.[128] (2005)	46 patients with class I, III disease; stable medications	**1.** Group pool exercise, moderate-intensity aerobic and strength exercise 2×/wk **2.** Home exercise	12 wk	Moderate pool exercise resulted in significant improvement in muscle endurance and vitality score on SF-36. No significant difference was seen in aerobic capacity measured by submaximum cycle ergometer.
Neuberger et al.[129] (2007)	220 adults with RA	**1.** Low-impact aerobic exercise class, 1 hr 3×/wk for 12 wk **2.** Video recorded home-based exercise, 1 hr 3×/wk for 12 wk **3.** Control group: exercised at baseline amounts	12 wk	Overall symptoms (pain, fatigue, and depression) decreased significantly at 12 wk for the class exercise group compared with the control group. Walk time and grip strength were significantly improved in both treatment groups compared with the control group. Disease activity was unchanged in all groups compared with baseline.
Breedland et al[130] (2011)	34 patients with RA	**1.** Intervention group: physical exercise (circuits, bike training, sports, aqua jogging) and an educational component **2.** Control group	8 wk with 22-wk follow-up	Intervention group showed a significant improvement in VO_2max (12.1%), muscle strength (elbow and knee flexors and extensors), health status, and perceived self-efficacy.

(Continued)

TABLE **30-8**

Randomized, Controlled Trials of Exercise in Rheumatoid Arthritis (Since 2005)—cont'd

Author	Sample	Intervention/Groups	Duration	Study Outcomes
Stavropoulos-Kalinoglou et al.[131] (2013)	40 patients with RA	1. Exercise group: 6-mo individualized aerobic and resistance high-intensity exercise intervention, 3×/wk, two supervised, one unsupervised 2. Control: received advice on exercise benefits and lifestyle changes	6 m	Participants in the exercise group demonstrated significant improvements in VO_2max, blood pressure, triglycerides, high-density lipoprotein (HDL), total cholesterol-to-HDL ratio), BMI, body fat, 10-year CVD event probability, CRP, DAS28, and HAQ compared with those in the control group.
Studies of Strengthening Exercises, Flexibility, and Other Interventions				
Lee et al.[120] (2012)	21 patients with RA	1. Tai chi exercise program 2×/wk for 12 wk 2. Tai chi exercise program 2×/wk for 12 wk and auricular acupressure	12 wk	Tai chi exercise improved balance, grip strength, pinch strength, self-efficacy in relation to pain control, etc. Tai chi exercises appeared to be helpful both mentally and physically. No evidence suggested that auricular acupressure enhanced Tai chi.
Cima et al.[132] (2013)	20 women with RA	1. Patients participated in exercise program that targeted hand grip strength, pinch strength, and motor coordination of the hand, 20 sessions 2×/wk for 10 wk 2. No hand treatment	10 wk	Exercise group had significant gains in hand grip strength and pinch strength as well as functionality.
Manning et al.[133] (2014)	108 patients with RA of <5 years	1. Usual care 2. EXTRA program: 4 (1-hr) group education, self-management, and global upper extremity exercise training sessions supplementing the first 2 wk of a 12-wk individualized, functional home exercise regimen in addition to usual care	12 wk	EXTRA program improved upper extremity disability, function, hand grip strength, and self-efficacy for pain, symptoms, and disease activity.

SF-36, Short Form SF-36; *RA,* rheumatoid arthritis; *VO_2max,* maximum amount of oxygen in milliliters; *BMI,* body mass index; *CVD,* cardiovascular disease; *CRP,* C-reactive protein; *DAS28,* Disease Activity Score-28; *HAQ,* Health Assessment Questionnaire.

In the aggregate, studies demonstrate that both static and dynamic strengthening programs improved strength and function in patients with RA in the range of 15% to 50%. Most studies included exercise at a frequency of two to three times a week. Studies of low to moderate intensity (25% to 50% MVC) demonstrated improvements in strength of approximately 15% to 30%; those of higher intensity showed greater gains. For example, McMeekan et al.[134] assigned 36 patients with nonactive RA either to a control group or to a group that performed knee flexor/extensor strengthening exercises at 70% MVC for 45 minutes, two to three times a week, for 6 weeks. At the 6-week follow-up, patients in the exercise group were able to generate significantly greater isokinetic torque than the control group. In addition, the exercise group reported less pain and greater function and mobility on a health assessment questionnaire (HAQ).

Hakkinen et al.[135] compared the effect of a home strength training program performed at 50% to 70% maximal repetitions for upper extremity and lower extremity muscle groups with a home program of ROM exercises with both groups exercising twice weekly. Both groups also performed an aerobic exercise program three times a week. Variables studied included knee extension and hand grip strength, BMD of the femoral neck and lumbar spine, and radiographic joint changes. At the 2-year point, 62 patients had completed the program. The exercise group demonstrated significant gains in maximum strength on a dynamometer and little joint damage. BMD showed little or no change. Subjects continued the exercise program on a self-monitored basis for 3 years. At the end of 3 years (i.e., 5 years total of exercise), 59 of the original 62 patients were evaluated again. Strength gains were maintained for the resistance-trained groups through the subsequent 3-year self-monitored phase. BMD was unchanged, and radiographic evidence of joint damage continued to be low. Cima et al.[132] reported on the effects of an exercise program aimed at improving handgrip strength (HS), pinch strength (PS), and motor coordination of the hand in patients with hand RA. Twenty women with hand RA were randomly allocated to an exercise group ($n=13$) and a control group ($n=7$) that received no treatment. Patients in the exercise group completed a hand exercise program for 20 visits over 10 weeks and exercises at home. The exercise group reported improvements in HS, PS, and functionality. Manning et al.[133] compared the effectiveness of usual care to a program consisting of group education, self-management, and global upper extremity exercise training sessions, supplementing a 12-week individualized, functional home exercise regimen (EXTRA program). One hundred and eight patients with RA of 5 years' or less duration were randomly allocated to either group. Outcome measures included the Disabilities of the Arm, Shoulder and Hand questionnaire (primary outcome measure), the Grip Ability Test, HS, the Arthritis Self-Efficacy Scale (pain, function, and symptoms subscales), and the 28-joint Disease Activity Score and were assessed at baseline, 12 weeks (primary end point), and 36 weeks. Results indicated a significant ($p<0.05$) between-group difference at 12 weeks, in the mean change in disability (–6.8 [95% CI –12.6, –1.0]), function (–3.0 [95% CI –5.0, –0.5]), nondominant HS (31.3 N [95% CI 9.8, 52.8]), self-efficacy (10.5 [95% CI 1.6, 19.5] for pain and 9.3 [95% CI 0.5, 18.2] for symptoms), and disease activity (–0.7 [95% CI –1.4, 0.0]), all favoring the EXTRA program.

Hurkmans et al.,[136] in their review of eight RCTs, reported that short-term (pooled effect size 0.47 [95% CI 0.01 to 0.93]) and long-term land-based aerobic capacity and muscle strength training showed moderate evidence for a positive effect on aerobic capacity and muscle strength in patients with RA.

Fatigue and Endurance

Studies have reported that aerobic capacity is diminished in patients with RA compared with healthy subjects. Physical inactivity and/or pain combined with direct effects of the disease on the cardiovascular or pulmonary systems may contribute to reduced aerobic capacity. However, physical function can increase and cardiovascular fitness can be improved by 20%, as measured by VO_2max with short-term cardiovascular programs.[116,119] The greatest improvements in aerobic capacity are gained with exercise regimens at 50% to 80% of VO_2max.[27]

Aerobic exercise programs for patients with RA should be designed to accommodate the patient's functional limitations and degree of joint involvement. Non–impact-loading forms of land exercise, such as walking or cycling, reduce stress to joints. Swimming and other aquatic exercise regimens have the advantage of using the buoyancy of water to reduce load. The recommended water temperature for patients with arthritis is 37° to 40 °C (98.6° to 104 °F), warm enough to help control pain and reduce muscle tension and joint stiffness.[122]

Studies of Aerobic Exercise. Initial studies of aerobic exercise enrolled patients with nonactive disease and used bicycle ergometry. In these earlier trials, exercise prescriptions were maintained at a relatively low intensity. Neuberger et al.[129] studied 220 adults with RA who completed a 12-week program of class exercise or home exercise and a control group who exercised at baseline. The exercise class was 1 hour, three times weekly, and consisted of four phases: warm-up exercises, strengthening exercises, low-impact aerobic exercises, and cool-down exercises. Participants in the home exercise group exercised at home using a videotape of the same exercise program. Significant improvements were reported in overall symptoms (i.e., fatigue measured with the 14-item Global Fatigue Index of the Multidimensional Assessment of Fatigue questionnaire; pain measured with the Short Form of the McGill Pain Questionnaire, and depression measured with the Center for Epidemiologic Studies Depression Scale) in the class group compared with the

control group. Walk time and grip strength were significantly improved in both treatment groups compared with the control group.

Van Ende et al.[137] studied 100 patients with RA in a 12-week program of high-intensity exercise versus ROM and isometric exercises. The high-intensity program included weight-bearing exercises and bicycling at 70% to 85% of the patient's age-predicted maximum heart rate. The low-intensity groups did ROM and static strengthening exercises for the trunk and lower extremity, or an individual low-intensity ROM and static exercise program, with instruction from a physical therapist, or a written home program of ROM and static exercises. At the end of 12 weeks, those exercising at the higher intensities showed significant improvement in aerobic capacity and knee muscle strength and mobility. An important find was that no exacerbation of joint symptoms was seen in any group, and joint symptoms actually decreased among the high-intensity exercisers. Muscle strength gains were maintained, but aerobic gains were lost at a follow-up 12 weeks after the program ended.

Research on alternative forms of aerobic exercise, such as aquatic programs, have demonstrated mixed results. A study by Bilberg et al.[128] assigned 46 subjects with class I to class III RA to either a treatment group, which participated in supervised aquatic therapy two times a week for 12 weeks, or to a control group, which continued with their regular activities. These authors reported no significant aerobic effect from water exercise, as measured by cycle ergometry. However, they did report improved muscle endurance for both upper and lower extremity muscle groups, as measured by isometric grip strength and a functional chair rise test. A Cochrane Review by Hurkmans et al.,[136] which included eight RCTs, reported that short-term, land-based aerobic capacity training showed moderate evidence for a positive effect for aerobic capacity (pooled effect size 0.99 [95% CI 0.29] to 1.68) and short-term, water-based aerobic capacity training showed limited evidence of a positive effect on functional ability and aerobic capacity in patients with RA. An RCT by Breedland et al.[130] reported on the effects of a group-based exercise and educational program on the physical performance and disease self-management of patients with RA. A total of 34 patients diagnosed with RA were randomly assigned to either an intervention group ($n = 19$) or a waiting list control group ($n = 15$). The intervention was an 8-week, multidisciplinary, group therapy program consisting of physical exercise designed to increase aerobic capacity and muscle strength together with an educational program to improve health status and self-efficacy for disease self-management. The physical exercise component was conducted in group sessions and consisted of a muscle exercise circuit and bicycle training once a week for 60 minutes, sports once a week for 60 minutes, and aqua jogging twice a week for 30 minutes. Each participant exercised for a total of 3 hours per week on two separate days. Main outcome measures were maximum oxygen uptake (VO_2max), elbow and knee flexors and extensors muscle strength, health status, and perceived self-efficacy. All data were recorded at baseline, after 9 weeks, and at follow-up in week 22. The intervention group showed significant improvement (12.1%) in VO_2max at week 9 compared with the control group (–1.7%). Significant within-group changes were reported over time for muscle strength of the upper and lower extremities and health status that favored the intervention group. However, no between-group changes were reported regarding these outcomes.

There is some evidence that individualized aerobic and resistance exercise intervention can improve cardiorespiratory fitness (CRF), cardiovascular disease (CVD) risk factors, and physical function in patients with RA. A case control study by Stavropoulos-Kalinoglou at al.[131] matched 40 patients with RA to a control group. Patients were allocated to either an exercise program (receiving 6 months individualized aerobic and resistance high-intensity exercise intervention three times per week) or a control group (receiving advice on exercise benefits and lifestyle changes). Participants were assessed at baseline, 3 months, and 6 months for aerobic capacity (VO_2max), individual CVD risk factors (i.e., blood pressure, lipids, insulin resistance, body composition), 10-year CVD event probability, and RA characteristics (i.e., C-reactive protein [CRP]), Disease Activity Score 28 (DAS28), and HAQ. Participants in the exercise group demonstrated significant improvements in VO_2max, blood pressure, triglycerides, high-density lipoprotein (HDL), total cholesterol-to-HDL ratio, BMI, body fat, 10-year CVD event probability, CRP, DAS28, and HAQ compared with those in the control group.

Articular Changes

The effect of moderate to high-intensity exercise on joint integrity has been examined. De Jong et al.[125,126,138,139] reported on a series of studies in which patients with stable class I to class III RA who participated in higher levels of exercise were monitored over 2 years. In one study, 309 patients with stable RA who were enrolled in the Rheumatoid Arthritis Patients in Training (RAPIT) program were randomly assigned either to a usual care group or to an intensive supervised exercise group. The exercise group met for 75 minutes two times a week for 2 years. The exercise program was threefold: bicycle aerobic training for 20 minutes, a 20-minute exercise circuit consisting of 8 to 10 exercises, and a sport or game for 20 minutes. The exercise session also included warm-up and cool-down periods. Impact loading for joints included jumping during the warm-up and the selection of sports such as basketball, volleyball, indoor soccer, and badminton (281 subjects finished the study). Researchers assessed the effect of high-intensity impact-generating

exercise on the small joints of the feet and hands of 136 participants (145 subjects had usual care). After 2 years, not only did the rate of joint changes for the small joints not increase, the exercisers' feet showed less progression. In the larger weight-bearing joints (i.e., the knee and hip), the mean radiographic change was not significant for the whole group. However, participants who began the study with more radiological evidence of changes in the larger weight-bearing joints did show a progression of changes.[125,138] The researchers also reported improved aerobic capacity for the exercise group. These studies suggest caution in prescribing exercise to patients who already have significant joint damage, especially in the large weight-bearing joints; however, they also support the use of such exercise in the small joints of the hands and feet.[126]

Basic Principles of Rehabilitation and Studies on the Effects of Exercise in Patients with Rheumatoid Arthritis

The goals of rehabilitation in the management of RA are to maximize strength, flexibility, endurance, and mobility and to promote independence while minimizing the potential for further joint destruction and deformity. A well-designed intervention program incorporates information about the extent of the joint impairments, as well as the patient's stage of disease, motivation, and adherence to therapy.[27] It is also important to consider the patient's psychological state and motivation for rehabilitation. Depression and reduced self-efficacy are common in a chronic disease such as RA.[140,141] Interventions used in the management of RA include various forms of exercise, orthoses, adapted ambulatory aids, modalities, and patient education in energy-conservation techniques.

Physical activity levels are low in patients with RA. A study on physical fitness and health perceptions of individuals with RA indicated that 47% of 298 participants reported low to fair levels of activity on a regular basis.[142] Patients with a chronic disease such as RA have to incorporate exercise and physical activity into their daily lives. A trial by Munneke et al.,[143] which examined exercise adherence in 146 patients with RA, reported that 81% of the participants were still engaged in the supervised exercise program after 2 years. Patients with high disease activity and low functional ability at baseline were slightly more likely to drop out of the trial. However, strategies can be used to enhance adherence. Iversen et al.[144] reported that a positive social support system can improve the adherence rate by 300%. It also is important to recognize the impact of the clinicians' own beliefs and expectations on the patient's adherence to therapy. Provider expectations and beliefs about various modes of exercise have been shown to affect patient adherence to exercise prescriptions.[145,146]

Summary of Exercise Recommendations for the Patient with Rheumatoid Arthritis

Exercise should be considered an important, lifelong component in the management of RA. Exercise improves mobility, strength, endurance, daily function, and mood in patients with RA. Table 30-9 summarizes the exercise recommendations at various levels of disease presentation

TABLE **30-9**

Summary of Rehabilitation Interventions for Rheumatoid Arthritis

Form of Rheumatoid Arthritis	Recommendations
Acute flare (hot joint)	AROM exercises for involved joints, 2 repetitions/joint/day Resting orthoses and assistive devices with built-up handles or platform attachments
Subacute	AROM exercises, 8-10 repetitions/joint/day Static exercises, 4-6 contractions lasting 6 seconds each Isotonic exercises with light resistance (avoid if joints are unstable or with tense popliteal cysts or internal joint derangement) Aerobic training, 15-20 min 3×/wk; cardiac evaluation recommended for men >35 yr and women >45 yr; establish heart rate parameters and use perceived rating of exertion scale (e.g., Borg scale of perceived exertion)
Stable or inactive	AROM and flexibility exercises Static and dynamic strength training (avoid dynamic exercises if joints are unstable or with tense popliteal cysts) Aerobic training, 15-20 min 3×/wk; cardiac evaluation recommended for men >35 yr and women >45 yr; establish heart rate parameters and use perceived rating of exertion scale Orthoses: lower extremity—accommodative or custom foot orthoses in extra-depth shoes or moldable shoes; upper extremity—consider working wrist/hand support

AROM, Active range of motion.

Modified from Iversen MD, Liang MH, Bae SC: Exercise therapy in selected arthritides: rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, systemic sclerosis and polymyositis/dermatomyositis. In Frontera WR, Dawson DM, Slovik DM, editors: *Exercise in rehabilitation medicine,* Champaign, IL, 2006, Human Kinetics.

for RA. ROM exercises, incorporated into daily routines, should be performed on affected joints to maintain mobility and prevent contractures. During an exacerbation, two to three repetitions of active range of motion (AROM) exercises can be performed without unduly stressing the joints. Byers[147] recommends that patients exercise in the evening to help reduce the morning stiffness associated with RA. When the disease is in remission, ROM exercises can be increased to 8 to 10 repetitions a day for each involved joint.

Strengthening programs can incorporate isometric or active exercises with resistance when the patient is not experiencing an active flare-up (also called a *flare*), or exacerbation. Isometric exercise generally results in less inflammation, less of an increase in intra-articular pressure, and less shear.[110,148] The clinician must keep in mind, however, that sustained exercises of large muscle groups may put an increased load on the cardiovascular system and may be contraindicated in patients with RA who have cardiac problems.

Clearly, aerobic exercise programs, including those with weight-bearing components, appear to be better tolerated than previously thought, at least in patients with stable disease (i.e., disease that is not in a period of active flare-up). The effect of more intensive exercise on patients with a more aggressive disease process is not yet clear, but the most recent studies recommend caution with high intensity or impact loading on the larger weight-bearing joints if the patient shows significant radiological joint changes. In addition to other signs of inflammation, pain should be a guide to determining the appropriate intensity of the program. Acute pain during exercise indicates a need to modify the program; vague, diffuse pain that resolves in less than 2 hours does not indicate a need for program modification.[112] Patients must recognize the signs of an acute flare (i.e., redness, inflammation, pain, and stiffness) and reduce the frequency and intensity of exercise. Exercise prescriptions should include the intensity, frequency, and duration at which each exercise should be performed and take into account the current stage of the disease.

Orthoses for Rheumatoid Arthritis

Orthoses, splints, and special shoes often are recommended, with the stated goals of relieving pain, reducing edema, providing increased joint stability, and thereby improving overall function. The most commonly prescribed devices are wrist and hand splints, extra-depth shoes, and custom or prefabricated insole or foot orthoses.

Wrist and hand splints are categorized as resting splints and working splints (i.e., those designed to be worn for functional activities). Such splints can be custom-made for the individual or purchased over the counter. Janssen et al.[149] evaluated the effect of using a resting splint on pain, grip strength, and swollen joints and reported no difference between use and nonuse. Similarly, Kjeken et al.[150] reported no differences in pain, stiffness, grip strength, or self-reported quality of life between patients who used a working splint and those who did not. However, they did find evidence of some loss of motion while the splint was worn for work tasks. Stern et al.,[151] on the other hand, evaluated three common commercial elastic working splints and reported no difference in dexterity with or without the splints in any of the ones used. Egan et al.,[152] in a Cochrane review, concluded that, because working wrist splints do not appear to be detrimental in terms of motion, they might be useful for a degree of pain relief in some patients. The authors further concluded that the evidence currently is insufficient to support the use of resting splints, although the authors acknowledged that some patients report a preference for wearing them for comfort reasons during acute exacerbations.

In the foot, thinning of plantar fat pads and interossei muscle atrophy are often seen. Along with subluxation of tendons, these changes can lead to deformities, especially of the forefoot, such as hammer toes and metatarsal subluxation.[153] Loss of medial arch support from overstretching of repetitively inflamed soft tissues may lead to significant overpronation. Extra-depth shoes and shoes made of heat-moldable material are commonly prescribed footwear.[154] The extra-depth shoe has an additional 0.64 to 0.95 cm (0.25 to 0.38 inch) of volume to accommodate any foot deformities and to allow use of an insert or FO (Figure 30-9). Inserts in the form of both accommodative and custom posting often are prescribed. In one study, patients who wore extra-depth shoes with a semirigid orthotic for 12 weeks reported less pain than when they wore just an extra-depth shoe.[155] Soft inserts were not reported to provide any further pain relief over just wearing the extra-depth shoe alone. However, in another study, use of a functionally posted, semirigid FO alone did not appear to make a difference in pain or disability measures compared with a placebo insert.[156]

Ambulatory Aids and Adaptive Equipment

Many patients with RA have significant upper extremity joint dysfunction, especially of the hands and wrists,

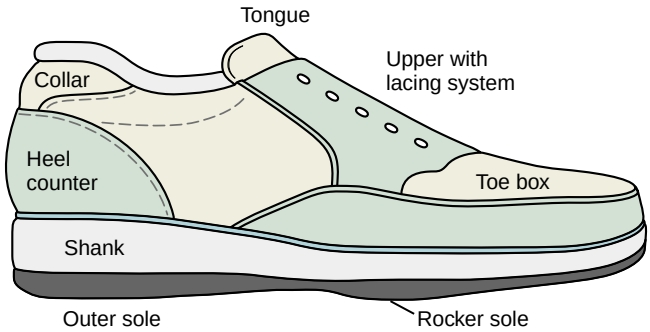

Figure 30-9 Extra-depth foot segments and shoe design. (Modified from the Association of Rheumatology Health Professionals: *Clinical care in the rheumatic diseases,* ed 3, p 268, Atlanta, 2007, The Association.)

which makes use of a cane, crutch, or walker difficult or painful. The use of platform attachments that distribute weight-bearing forces over the forearm may reduce stress on the hands and wrists. Devices with wider, flatter handgrips often are more comfortable than the standard grip. Cone-type handgrips are designed so that the ulnar side of the hand is on the wider part of the cone; this improves grip strength and resists the tendency for ulnar drift or deviation. A low-cost alternative is to build up the handgrip of ambulatory aids or utensils and writing implements with moldable foam, which helps prevent compression on vulnerable joints while improving the ability to grip.

Energy Conservation Techniques

Because RA is a systemic disease, patients can easily become fatigued. Although all patients should be encouraged to participate in exercise programs as appropriate, educating patients in strategies for conserving energy while performing routine ADLs is equally important.[157] This becomes imperative during periods of exacerbation.

Energy Conservation Strategies[155]

- Schedule activities so that demanding physical tasks are alternated with less strenuous ones
- Sit to perform tasks when possible
- Gather all necessary supplies before a task
- Limit trips, especially up and down stairs
- Schedule adequate rest periods

In addition, patients should be taught to avoid positions and activities that perpetuate joint deformity. Squeezing a ball for hand exercise should be avoided because it may contribute to subluxation at the MCP and interphalangeal (IP) joints as a result of excessive force on the ulnar side of the joints. Prolonged flexed positions of the hands and other extremity joints may shorten soft tissue and contribute to contractures.

Suggestions for Patient Education

- Provide simple, clear instructions
- Link the exercise or modality to a clear outcome and explain its use
- Provide patients with key symptoms that indicate a flare and the need for exercise modification
- Provide guidelines for modifying an exercise
- Encourage social support for exercise
- Ask patients to explain their expectations and attitudes toward exercise to help determine their willingness to exercise and perceived barriers to exercise

Case Study in Rheumatoid Arthritis

Holly is a 38-year-old female who presents with 5 months of bilateral knee, wrist, and hand pain. Upon examination, she exhibits pain (VAS score, 6/10) and 2+ swelling in the PIP joints, MCP joints, and wrist, with limited ROM. Several PIP joints exhibit 15° hypertension, and subcutaneous nodules are evident on the right fourth and fifth PIP joints. Slight ulnar deviation of the MCP joints is seen, left greater than right. Her knees are warm, painful, and swollen, and these symptoms are greater on the left than the right. The patella ballottement test is positive bilaterally. She has restricted ROM in her left knee of 10°. Both feet show hallux valgus and hammer toe deformities. The stiffness and swelling in her fingers, wrists, feet, and knees are worse in the morning, lasting up to 3 hours. By late afternoon, her hands, wrists, feet, and knees are aching, and she states that aspirin does not alleviate her pain. She is having difficulty performing her job as a university professor. Her typing is labored, and she has trouble demonstrating manual skills that require hand dexterity; she also has trouble with prolonged standing while conducting her laboratory courses. She saw her rheumatologist, who prescribed prednisone (10 mg), methotrexate, folic acid, and a multivitamin and referred her to physical therapy.

Case Discussion

This patient is in a "flare". The prescribed medical therapy—a fast-acting pharmaceutical agent (i.e., prednisone) combined with a slow-acting disease-modifying drug (i.e., methotrexate)—hopefully will bring the disease under control. Her rehabilitation program should include gentle ROM exercises for the whole body, with special emphasis on her wrists, hands, fingers, knees, and feet. The synovitis evident in her hands and knees can lead to stretching of the joint capsule and ligaments. With synovitis, biomechanical forces across the joint are increased, and ligaments and tendons can become involved, leading to joint instability. Common changes evident in the hands (the joints commonly involved first) are radial deviation of the wrist, subluxation of the proximal carpal row, and radial rotation of the distal carpal bones. Therefore it is important to check for volar drop of the MCP joints by palpating the heads of these joints in relation to the extended first phalanx. Although flexed posturing generally is more comfortable, flexion can lead to intrinsic tightness. Resting splints for evening and dynamic splints may help maintain alignment during physical activities. Resistive dynamic exercises should be avoided with synovitis. In the hand, forceful squeezing results in joint deformities and may result in pathomechanical changes. ROM and isometric exercises are preferred, along with the use of ice to reduce swelling. A can of food or a cylinder can be used to perform isometric grasping and is preferred to ball squeezing, which can lead to ulnar drift.

Proper footwear that provides adequate support and allows accommodation of her foot deformities should

be recommended. An extra-depth shoe allows for use of a soft insole with enough room to accommodate the foot deformities. An ergonomic evaluation of her work space and home environment should be done so that recommendations can be made for individualized energy-conserving techniques. She may benefit from an ergonomically designed computer keyboard and/or mouse that minimizes ulnar drift and allows an easier grasp. Because prolonged standing is fatiguing, an appropriate supportive chair should be sought. Frequent monitoring of blood pressure is required with the use of steroids because these drugs can lead to weight gain and subsequent hypertension.

SUMMARY

This chapter discussed the roles of exercise therapy, ambulatory aids, modalities, and orthoses in addressing OA and RA. The evidence supporting the use of various types of exercise, the strengths and limitations of these studies, and new recommendations were presented. The importance of prescribing the correct frequency, duration, intensity, and type of exercise for the various stages of disease was highlighted, as was the current data on the use of orthoses and appropriately adapted aids and assistive devices. Suggestions were presented for important patient educational material that can be included in the intervention plan.

CHAPTER 31

Systemic Bone Diseases: Medical and Rehabilitation Intervention

PART A | Medical Intervention

ASHLEY G. STERRETT, ALEJANDRO RAMIREZ, HELEN E. BATEMAN*

INTRODUCTION

Systemic bone disease, also known as **metabolic bone disease**, refers to a heterogeneous group of disorders affecting the skeletal system. Disorders of the skeletal system may affect ambulation, protection of vital soft tissues, and calcium and other mineral homeostatic metabolic processes.

This chapter addresses three common systemic bone diseases: osteoporosis, primary hyperparathyroidism (PHPT), and Paget's disease of bone (PDB), which are all affected by changes in bone turnover and remodeling. Other, less prevalent bone diseases are described elsewhere.[1]

OSTEOPOROSIS

Introduction

Osteoporosis, the most common metabolic bone disease, is a systemic skeletal disorder characterized by low bone mass and microarchitectural deterioration of bone. The most important sequelae of osteoporosis is a **fragility fracture**, which is defined as a fracture that occurs when falling from equal to or less than standing height.[2] Low bone mass (also known as **osteopenia**) is the stage before osteoporosis, and its recognition is key to prevent progression to osteoporosis and fractures.

Epidemiology

Fifty-four million Americans have either osteoporosis or low bone mass. Studies suggest one in two women and one in four men over the age of 50 will have a fragility fracture (i.e., osteoporotic fracture). More than 2 million osteoporotic fractures occur in the United States each year, resulting in $19 billion in related costs. The most common sites for osteoporotic fractures are the spine (Figure 31-1), wrist, and hip.[2,3]

Pathogenesis and Etiology

To understand osteoporosis and systemic bone disease, a basic understanding of the bone turnover process is necessary. Disruption in bone turnover can lead to a reduction in bone strength and ultimately osteoporosis. The mature skeleton uses a regenerative process called **bone remodeling** to repair damage that occurs during daily activities. Remodeling preserves skeletal strength using intrinsic bone cells called **osteoclasts** to remove bone. **Osteoblasts**, the "bone builders," subsequently replace localized areas of removed skeleton.[4] The bone remodeling cycle is divided into four phases: activation, resorption, reversal, and formation.

Phases of the Bone Remodeling Cycle[4]

1. Activation: osteoclasts stimulated
2. Resorption: microtrench formed
3. Reversal: osteoblasts stimulated
4. Formation of new bone

Within activation, osteoclasts are stimulated to remove localized packets of bone. Both the mineralized and the organic components of the skeleton are removed. Over several days, osteoclasts excavate a "microtrench" on the surface of the skeleton. In reversal, osteoclastic bone resorption abates, the osteoclasts leave, and osteoblasts are stimulated to migrate onto the surface of the resorption cavity (i.e., in the microtrench), where the organic components (i.e., calcium and phosphorus) of the skeleton are laid down and subsequently mineralized, leading to bone formation.[4] In healthy individuals the amount of resorbed skeleton is replaced by normal bone. As people age, the balance between osteoblasts and osteoclasts is disrupted, which can induce

*The authors, editors and publisher acknowledge James W. Edmondson and Emily Veeneman for their contributions on this topic in the previous edition.

Figure 31-1 Lateral radiograph of the lumbar spine showing the biconcave appearance and compression of vertebral bodies seen in senile osteoporosis. (From Gartland JJ: *Fundamentals of orthopedics,* p 120, Philadelphia, 1979, WB Saunders.)

loss of bone mass and ultimately osteoporosis. Other factors can also influence the bone remodeling cycle, including parathyroid hormone (PTH) and serum vitamin D.

An understanding of the importance of vitamin D in the pathophysiology of osteoporosis requires a review of the feedback loop involving PTH, calcium, and phosphorus. Vitamin D is obtained from two main sources: diet and the conversion of 7-dehydrocholesterol to cholecalciferol through ultraviolet sunlight in the skin.

Although osteoporosis is considered a disease of the elderly, the foundation for good bone health starts early in life. Bone mass steadily increases from birth and reaches its peak early in the third decade of life.[5] Peak bone mass is affected by gender, race, and heredity, along with diet and activity level. Osteoporosis may be primary or secondary. **Primary osteoporosis** is the most common, due to both age (known as **senile or type II osteoporosis**) and declining hormonal levels (also known as **postmenopausal or type I osteoporosis**), leading to a rate of bone resorption that exceeds the rate of formation resulting in a net loss of bone. Bone density testing via dual-energy x-ray absorptiometry (DXA) is usually considered in postmenopausal women and men over age 70.[2]

Secondary osteoporosis can be seen with various other etiologies (Table 31-1). With regard to medications and conditions listed in Table 31-1, a baseline DXA at a younger age may be considered to assess for iatrogenic low bone mass or osteoporosis.

Additional risk factors for osteoporosis include a family history of osteoporosis, patients of Asian or Caucasian descent, and lifestyle factors, including excessive alcohol intake, smoking, and extreme weight loss. Marfan's disease, Ehler Danlos syndrome, and osteogenesis imperfecta are inherited connective tissue disorders that carry additional risks for osteoporosis.

Finally, a history of prior fragility fracture significantly increases the risk of future fractures as highlighted by important studies by Wasnich et al.[6] and Davis et al.[7] Furthermore, data from the Study of Osteoporotic Fractures also illustrated that women with a history of a premenopausal fragility fracture are 35% more likely to suffer a subsequent fracture once they are postmenopausal.[8] Lindsey et al.[9] showed that the risk of repeat fracture is greatest 1 year after the first fragility fracture. A subsequent study has supported this: one in four postmenopausal women with incident vertebral fractures has an osteoporotic fracture again within 2 years.[10]

Osteoporosis in Men

Although osteoporosis is less common in men than women, it is still underappreciated and underdiagnosed. Approximately 1.5 million U.S. men have osteoporosis and another 3.5 million are at risk (with low bone mass).[2] A 60-year-old man has a 25% chance of having an osteoporotic fracture. The prevalence of vertebral and hip fractures in men is one third that of women, and the prevalence of a Colles fracture is one sixth as common.[11] However, the morbidity and mortality associated with

TABLE **31-1**

Secondary Causes of Osteoporosis[2]

Medications	Lifestyle	Medical Conditions
• Steroids • Antiandrogens and antiestrogens • Anticonvulsants • Heparin • HIV medications • Chemotherapy • Lithium • High-dose thyroid replacement • Pioglitazone • Proton pump inhibitors	• Female athlete triad (i.e., eating disorder, amenorrhea, osteoporosis) • Thin body habitus: women less than or equal to 57.6 kg (127 pounds) • Smoking and/or alcohol abuse (more than three drinks per day)	• Endocrine: hyperthyroidism, hyperparathyroidism, Cushing's disease, hypogonadism • Malignancy, such as multiple myeloma • Surgical menopause • Vitamin D deficiency • Malabsorption syndromes (e.g., celiac disease, bariatric surgery, inflammatory bowel disease) • Decreased weight bearing (e.g., severe complex regional pain syndrome, stroke, spinal cord injury, multiple sclerosis)

osteoporotic fractures in men are higher, and men are less likely to be screened and treated appropriately for osteoporosis.[12,13] Therefore education about screening of men is important and more understanding about the pathogenesis of osteoporosis in men is needed.

Clinical Features and Assessment

Osteoporosis is typically a silent, slowly progressive disease but may present with kyphosis, which is excessive curvature of thoracic spine also known as "Dowager's hump" (Figure 31-2) due to spontaneous vertebral compression fracture in postmenopausal women. Vertebral compression fractures may be asymptomatic or significantly painful. Other fragility fractures include Colles fracture of the radius and femoral neck fractures. The presence of these fractures, in the absence of trauma or other underlying causes, indicates clinical osteoporosis.

According to the Centers for Disease Control and Prevention (CDC), approximately 300,000 patients are admitted for hip fractures in the United States each year. Age and bone density are independent risk factors for hip fractures (Figure 31-3). Hip fractures carry a significant increase in morbidity and mortality—in-hospital mortality rates range from approximately 1% to 10%, varying upon the location of the fracture and patient characteristics, and 1-year post hip-fracture mortality rates range from 12% to 37%.[14,15] Nearly half of patients are unable to live independently after a hip fracture.[16] Therefore prevention of hip fractures can significantly reduce morbidity and mortality.

The gold standard for diagnosis of osteoporosis before fragility fracture is by central bone densitometry (DXA) testing. In 2004, a World Health Organization (WHO) expert panel refined the original diagnostic criterion for normal and low bone mass and osteoporosis based on bone mineral density (BMD) (Figure 31-4).[17] The WHO international reference standard for the diagnosis of osteoporosis by DXA is a T-score of –2.5 or less at one of the following regions: the total lumbar spine (L1-L4), femoral neck, or total hip.[2] The reference standard from which the T-score is calculated is the Caucasian female (National Health and Nutrition Examination Survey [NHANES] III database).[2] When one of the standard sites (i.e., total spine, total hip, or femoral neck) is unable to be used, the distal 33% radius (also called one-third radius) may be used applying the International Society for Clinical Densitometry (ISCD) guidelines.

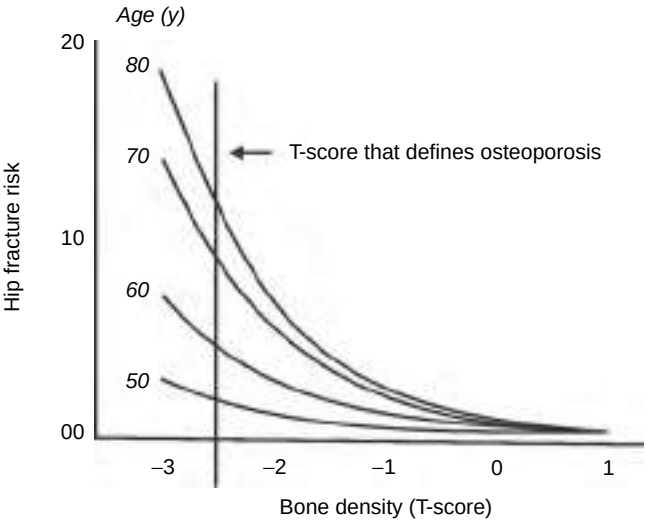

Figure 31-3 Age and bone density are independent predictors of the risk of hip fracture. (Data from De Laet C, Kanis JA, Oden A et al: Body mass index as a predictor of fracture risk: a meta-analysis, *Osteoporos Int* 16:1330-1338, 2005.)

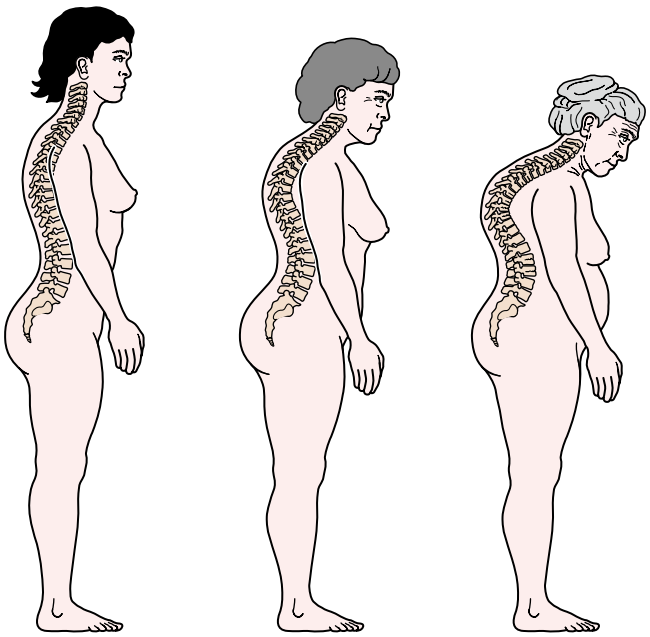

Figure 31-2 Progressive thoracic kyphosis with advancing age and vertebral compression fracture. "Dowager's hump" is illustrated on the right.

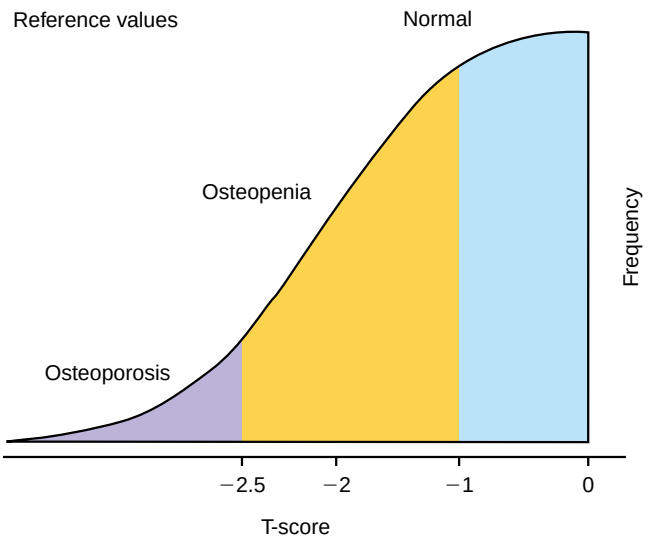

Figure 31-4 World Health Organization's definitions of bone density classification.

The application of T-score is used to diagnose osteoporosis in postmenopausal women or men over the age of 50. Bone density cannot diagnose osteoporosis in premenopausal women or men under the age of 50. In those patients a *Z*-score is used to compare the patient's BMD to age-, sex-, and ethnicity-matched individuals, and the BMD is reported as normal or lower than expected for the patient's age. The *Z*-score is also used in children.[2] The indications for DXA screening are listed in the following textbox.

Considerations for DXA Screening[2]

- All women aged 65 and older or women who are at risk for low bone mass, including postmenopausal women
- All men age 70 and older or men aged 50 and older who are at risk for low bone mass
- Previous fragility fracture
- Starting a medication, such as steroids, that increases risk for low bone mass
- Patients with a disease that could affect bone density

Many of the current preventive goals have been directed toward individuals with significantly low bone density. However, data from the National Osteoporosis Risk Assessment (NORA) study and other studies indicate that 50% of osteoporotic fractures occur in those whose BMD has not reached the osteoporotic range.[3] It is currently believed that BMD and age contribute only approximately half of the risk to osteoporotic fractures. Given this disparity, an additional tool, FRAX, was developed to further identify patients at risk.

FRAX®: World Health Organization Fracture Risk Assessment Tool

Developed by the WHO as a tool for underdeveloped countries without access to DXA (the calculation can be performed without a prior bone density), the FRAX® assesses osteoporotic fracture risk over the next 10 years. It is a web-based calculator (www.shef.ac.uk/FRAX) in which a patient's unique characteristics such as race, gender, previous fragility fracture, as well as femoral neck BMD (if available) are entered into a program (Figure 31-5).

FRAX® Calculation Tool (to be completed online at: www.shef.ac.uk/FRAX/tool.jsp)

Please answer the questions below to calculate the ten year probability of fracture with BMD.

Country: US (Caucasian) Name/ID:

Questionnaire:

1. Age (between 40 and 90 years) or Date of Birth
   Age: Date of Birth: Y: M: D:
2. Sex ○ Male ○ Female
3. Weight (kg)
4. Height (cm)
5. Previous Fracture ○ No ○ Yes
6. Parent Fractured Hip ○ No ○ Yes
7. Current Smoking ○ No ○ Yes
8. Glucocorticoids ○ No ○ Yes
9. Rheumatoid arthritis ○ No ○ Yes
10. Secondary osteoporosis ○ No ○ Yes
11. Alcohol 3 or more units/day ○ No ○ Yes
12. Femoral neck BMD (g/cm^2)

Select BMD ▼

Clear Calculate

For USA use only

Consider FDA-approved medical therapies in postmenopausal women and men aged 50 years and older, based on the following:

- A hip or vertebral (clinical or morphometric) fracture
- T-score ≤ -2.5 at the femoral neck or spine after appropriate evaluation to exclude secondary causes
- Low bone mass (T-score between -1.0 and -2.5 at the femoral neck or spine) and a 10-year probability of a hip fracture ≥ 3% or a 10-year probability of a major osteoporosi-related fracture ≥ 20% based on the US-adapted WHO algorithm
- Clinicians judgement and/or patient preferences may indicate treatment for people with 10-year fracture probabilities above or below these levels

(*Continued*)

Risk factors

For the clinical risk factors a yes or no response is asked for. If the field is left blank, then a "no" response is assumed. See also notes on risk factors.

The risk factors used are the following:

Age	The model accepts ages between 40 and 90 years. If ages below or above are entered, the programme will compute probabilities at 40 and 90 year, respectively.
Sex	Male or female. Enter as appropriate.
Weight	This should be entered in kg.
Height	This should be entered in cm.
Previous fracture	A previous fracture denotes more accurately a previous fracture in adult life occurring spontaneously, or a fracture arising from trauma which, in a healthy individual, would not have resulted in a fracture. Enter yes or no (see also notes on risk factors).
Parent fractured hip	This enquires for a history of hip fracture in the patient's mother or father. Enter yes or no.
Current smoking	Enter yes or no depending on whether the patient currently smokes tobacco (see also notes on risk factors).
Glucocorticoids	Enter yes if the patient is currently exposed to oral glucocorticoids or has been exposed to oral glucocorticoids for more than 3 months at a dose of prednisolone of 5mg daily or more (or equivalent doses of other glucocorticoids) (see also notes on risk factors).
Rheumatoid arthritis	Enter yes where the patient has a confirmed diagnosis of rheumatoid arthritis. Otherwise enter no (see also notes on risk factors).
Secondary osteoporosis	Enter yes if the patient has a disorder strongly associated with osteoporosis. These include type I (insulin dependent) diabetes, osteogenesis imperfecta in adults, untreated long-standing hyperthyroidism, hypogonadism or premature menopause (<45 years), chronic malnutrition, or malabsorption and chronic liver disease
Alcohol 3 or more units/day	Enter yes if the patient takes 3 or more units of alcohol daily. A unit of alcohol varies slightly in different countries from 8-10g of alcohol. This is equivalent to a standard glass of beer (285ml), a single measure of spirits (30ml), a medium-sized glass of wine (120ml), or 1 measure of an aperitif (60ml) (see also notes on risk factors).
Bone mineral density (BMD)	(BMD) Please select the make of DXA scanning equipment used and then enter the actual femoral neck BMD (in g/cm2). Alternatively, enter the T-score based on the NHANES III female reference data. In patients without a BMD test, the field should be left blank (see also notes on risk factors) (provided by Oregon Osteoporosis Center).

Notes on risk factors

Previous fracture

A special situation pertains to a prior history of vertebral fracture. A fracture detected as a radiographic observation alone (a morphometric vertebral fracture) counts as a previous fracture. A prior clinical vertebral fracture or a hip fracture is an especially strong risk factor. The probability of fracture computed may therefore be underestimated. Fracture probability is also underestimated with multiple fractures.

Smoking, alcohol, glucocorticoids

These risk factors appear to have a dose-dependent effect, i.e. the higher the exposure, the greater the risk. This is not taken into account and the computations assume average exposure. Clinical judgment should be used for low or high exposures.

Rheumatoid arthritis (RA)

RA is a risk factor for fracture. However, osteoarthritis is, if anything, protective. For this reason reliance should not be placed on a patient's report of 'arthritis' unless there is clinical or laboratory evidence to support the diagnosis.

Bone mineral density (BMD)

The site and reference technology is DXA at the femoral neck. T-scores are based on the NHANES reference values for women aged 20-29 years. The same absolute values are used in men.

Figure 31-5, Cont'd

The tool then calculates the patient's risk of fracture for both major osteoporotic fracture and hip fracture. Currently the National Osteoporosis Foundation (NOF) recommends that any patient with a major osteoporotic fracture risk of 20% or greater in the next 10 years or a risk of hip fracture of 3% or greater in the next 10 years (based on the FRAX® tool calculation) be considered for treatment with osteoporosis medication (based on clinical judgment).[18]

When evaluating a patient with osteoporosis or low bone mass, it is important to consider secondary causes (see Table 31-1) through a careful history and physical examination. Initial basic laboratory evaluation may include serum testing of 25-hydroxyvitamin D, thyroid-stimulating hormone (TSH), PTH, renal function, phosphorus, magnesium, serum protein electrophoresis, and in males, testosterone levels. If a malabsorption syndrome is suspected, a celiac disease screen is recommended. Additional testing should be guided by a patient's clinical presentation.

Prevention and Management of Low Bone Mass and Osteoporosis

Diet

Adequate daily calcium and vitamin D, either by diet or by supplemental intake, are essential to good bone health. For those living in well-developed countries, foods such as fortified milk, bread, and cereal, as well as fatty fish, provide much of the dietary source of vitamin D. Table 31-2 lists the age-specific recommendations for vitamin D daily intake.

Elderly patients have the highest incidence of vitamin D deficiency for several reasons: poor diet, malabsorption, and reduced sunlight exposure from increased time indoors. For all ages, risk factors for vitamin D deficiency include: bariatric surgery and post-gastrectomy, pancreatic insufficiency, and small bowel disease, including celiac disease or inflammatory bowel disease. Although deficiency of vitamin D has traditionally been considered in locations further from the equator, it has also been reported in southern states, such as Florida.[19–21]

Renal failure, nephrotic syndrome, and obesity cause vitamin D deficiency. In addition, as people age, liver and kidney functions tend to decline, which can lead to problems with hydroxylation of vitamin D. Medications, such as anticonvulsants that increase P-450 enzymatic activity, can also result in the inactivation of vitamin D and reduce hepatic conversion of 25-hydroxyvitamin D.

Severe, chronic vitamin D deficiency ultimately can result in myopathy, osteomalacia, weakness including loss of muscle mass (i.e., sarcopenia), and osteoporosis.[22] There is some suggestion of a link between low vitamin D and an increased fall risk.[23,24] Although studies have not supported the reduction in fractures, vitamin D supplementation in nursing home populations did reduce the risk of falls, but the mechanism is unclear.[24] In addition, a study by the NHANES III found that postmenopausal women with low levels of 25-hydroxyvitamin D stores have lower DXA scores.[21]

Exercise

Moderate exercise of 30 minutes 3 times per week has been shown to reduce the incidence of osteoporotic fractures in older adults by meta-analysis of 10 trials.[25] The effects were statistically significant for hip but not vertebral fractures. Exercise has also been shown to improve BMD by another systematic review of 43 prospective trials.[26] Non–weight-bearing exercise, such as resistance strength training, was most effective for improving femoral neck BMD, whereas a mixed exercise program was more effective for improving lumbar spine BMD. There is no evidence that high-intensity exercise, such as running, is superior to low-intensity exercise, such as walking.[27]

Lifestyle

Patients should be counseled to stop smoking and reduce alcohol intake. A meta-analysis in 2005 linked an increased risk of hip fractures with smoking (Figure 31-6).[28] Although there is more evidence and known association of alcoholism and bone loss in men, alcohol abuse has been shown to increase the rate of hip fractures and osteoporosis and lead to more falls.[29]

TABLE **31-2**

Recommended Dietary Allowances (RDAs) for Vitamin D

Age	Male	Female	Pregnancy	Lactation
0-12 mo*	400 IU (10 mcg)	400 IU (10 mcg)	—	—
1-13 yr	600 IU (15 mcg)	600 IU (15 mcg)	—	—
14-18 yr	600 IU (15 mcg)	600 IU (15 mcg)	600 IU (15 mcg)	600 IU (15 mcg)
19-50 yr	600 IU (15 mcg)	600 IU (15 mcg)	600 IU (15 mcg)	600 IU (15 mcg)
51-70 yr	600 IU (15 mcg)	600 IU (15 mcg)	—	—
>70 yr	800 IU (20 mcg)	800 IU (20 mcg)	—	—

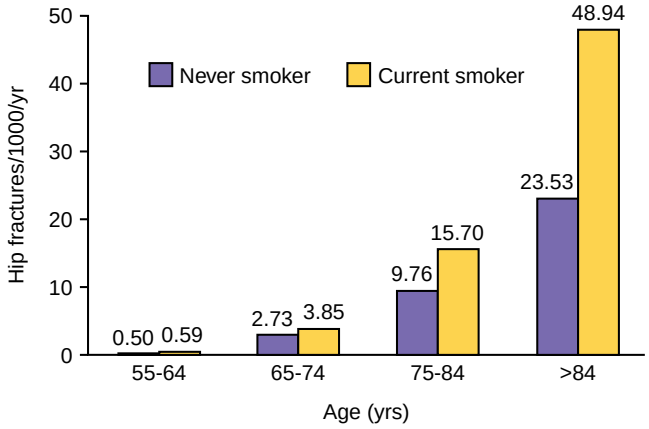

Figure 31-6 Effect of smoking on hip fractures in 11,861 subjects. (Data from Law MR, Hackshaw AK: A meta-analysis of cigarette smoking, bone mineral density and risk of hip fracture: recognition of a major effect, *Br Med J* 315:841-846, 1997.)

Osteoporosis Pharmacotherapy

The NOF recommends treatment for patients based on one of the following criteria: (1) fragility (osteoporotic) fracture, (2) T-score of –2.5 or less at the hip or spine, or (3) high 10-year risk of fracture based on FRAX® calculation (see the FRAX® section). Response to therapies can be monitored by scanning with bone densitometry (frequency of scanning is determined by individual patient risk).

Therapy is mediated via two mechanisms: (1) osteoclast inhibition or (2) osteoblast activation. The following textboxes summarize these mechanisms along with first- and second-line therapy.

Calcium and Vitamin D. Calcium and vitamin D are essential for the bone matrix. In order to enhance intestinal calcium intake and skeletal mineralization, optimum daily elemental calcium intake for adult men and women is thought to be approximately 1000 to 1200 mg, plus 800 International Units of vitamin D (see Table 31-2 for age-specific recommendations). The metabolite 25-hydroxyvitamin D is used as a marker of vitamin D adequacy. The optimum serum range is 30 to 50 ng/mL, vitamin D insufficiency is 20 to 30 ng/mL, and vitamin D deficiency is less than 20 ng/mL. Vitamin supplements are available as a combination tablet with both calcium and vitamin D for patient convenience. For patients with significant vitamin D deficiency (e.g., levels under 20 ng/mL), higher supplementation of vitamin D, on the order of 50,000 International Units per week for 8 to 12 weeks, may be needed to replenish the vitamin D stores.

Bone Resorption Inhibitors

- Bisphosphonates: first line of defense
- Denusumab: second line of defense
- SERMs: second line of defense
- Calcitonin: second line of defense

Bone Formation Stimulators

- Teriparatide: second line of defense
- Strontium: not available in the United States

Bisphosphonates: Antiresorptives.

Formulations and Mechanism of Action. Bisphosphonates have emerged as the first-line therapy for both the prevention and treatment of osteoporosis for several reasons. First and foremost, the clinical literature demonstrates the efficacy of bisphosphonates in the prevention of vertebral and nonvertebral fractures. Their efficacy has also been shown in postmenopausal women, males with osteoporosis, and patients of both genders with glucocorticoid-induced osteoporosis in preventing further bone loss and fracture.

Before the results of the Women's Health Initiative (WHI), hormone replacement therapy (HRT) was often used for the prevention and treatment of osteoporosis in postmenopausal women. However, the WHI raised concerns about the increased risk of thromboembolic and cardiovascular disease and breast cancer with HRT.[30] Consequently, HRT is not used as a treatment for osteoporosis but may be used for prevention of the problem in certain patient populations.

Several different bisphosphonates are available in the United States. Oral preparations include alendronate and risedronate, zolendronate is given intravenously, and ibandronate is available in both oral and intravenous (IV) forms. All are used routinely in the prevention and treatment of osteoporosis; however, ibandronate does not have data supporting reduction in the rate of hip fractures. All bisphosphonates inhibit osteoclastic bone reabsorption, and this antiresorptive action is especially pronounced at sites of increased active absorption. Therefore, bisphosphonates have a potent ability to help counterbalance the increase in the resorption:formation ratio characteristically seen in osteoporotic bone. Pamidronate, etidronate, and tiludronate are no longer used for the prevention or treatment of osteoporosis given the newer, more effective nitrogen-containing bisphosphonates now available. These older bisphosphonates can still be used in the treatment of Paget's disease (see later in chapter).

The American College of Rheumatology (ACR) and the American College of Endocrinology also recommend consideration of bisphosphonate treatment for patients on prolonged oral steroids, which can accelerate bone loss; thus these patients are at risk for osteoporosis. If a postmenopausal woman or man over age 50 who is considered at risk for osteoporotic fractures (FRAX calculation recommended) is expected to be on a steroid dosage greater than 7.5 mg per day for more than 3 months, the ACR recommends consideration for treatment with a bisphosphonate as well for at least the duration of corticosteroid therapy.[31]

Dosages and Administration. The bisphosphonate agents most commonly used for osteoporosis and their doses are listed in Table 31-3. The absorption of

TABLE 31-3

Therapies for Osteoporosis and Paget's Disease of the Bone

Drug	Treatment Dosage for Osteoporosis	Prophylaxis Dosage for Osteoporosis	Paget's Treatment
Alendronate	70 mg PO weekly; 10 mg PO daily	35 mg PO weekly	40 mg PO daily×6 mo
Risedronate	150 mg PO monthly; 35 mg PO weekly; 5 mg PO daily	150 mg PO monthly; 35 mg PO weekly	30 mg PO daily×2 mo

PO, By mouth; *IV*, intravenous; *SC*, subcutaneous; *qday*, 4 times per day; *IM*, intramuscular; *NA*, not applicable.

Data from Crandall C, Newberry S, Diamant A et al: Comparative effectiveness of pharmacologic treatments to prevent fractures: an updated systematic review, *Ann Intern Med* 161:711-723, 2014.

oral bisphosphonates is 1% to 5% of the total dose.[32] Approximately 30% of the medicine is expected to be taken up by the bone, and the remainder of the drug is excreted by the renal system.[32] The antiresorptive effects of bisphosphonates continue long after a patient has finished taking them—in terms of oral bisphosphonates, BMD can be stable for over 1 year; with zolendronate the effects of one dose can be seen for more than 5 years.[33]

Side Effects and Precautions. The main concerns with bisphosphonate therapy are the gastrointestinal (GI) side effects, such as pill-induced esophagitis, esophageal ulcers, gastroesophageal reflux disease (GERD) symptoms, and esophageal stricture. GI side effects are more common in patients who do not properly follow precautions for taking the medication.

Because of the high renal clearance of bisphosphonates, caution should be used in patients with renal insufficiency (testing creatinine level is recommended before each IV bisphosphonate dose).

The risks of several unusual side effects from bisphosphonates must be discussed with patients. For example, osteonecrosis of the jaw (ONJ) has been reported in approximately 1 per 10,000 to 100,000 patient-years.[34] Some risk factors for ONJ are de novo malignancy without bisphosphonate, the use of IV bisphosphonate (particularly in high dosages used for cancer), and radiation therapy as well as dental extractions, dental implants, poorly fitting dentures, use of glucocorticoids, smoking, and preexisting dental disease.[34] There are no data to suggest that discontinuing bisphosphonates before dental procedures lowers ONJ risk. The task force for the American Society for Bone and Mineral Research recognized that the risk of ONJ is increased with length of therapy and for patients on IV bisphosphonate.Another potential but rare concern is the occurrence of an atypical femur fracture (AFF), which is seen after prolonged duration of treatment with a bisphosphonate (e.g., approximately 10 years of therapy). These fractures occur mid-femur (not typical of an osteoporotic fracture) and can be heralded by thigh pain and cortical thickening (seen on plain x-ray films). A calculated risk based on patients from Kaiser Southern California revealed an incidence of approximately 1.8 per 100,000 patients when on bisphosphonates for 1 to 2 years. That incidence rose to 113 per 100,000 when the patients were on bisphosphonate for 8 to 10 years. The conclusion was that the overall risk of AFF was still significantly lower than that of an osteoporotic fracture but did rise with prolonged use of bisphosphonates.[35] Therefore the current recommendation is to consider not prescribing the drug for a prolonged period of time in patients with stable BMD after 5 to 7 years of bisphosphonate therapy for osteoporosis.[36]

Denosumab (Prolia): Antiresorptive. Denosumab (Prolia) is the first biologic for osteoporosis. It is a fully human monoclonal antibody that binds the cytokine RANKL (receptor activator of NF-κB ligand), an essential factor initiating bone turnover. RANKL inhibition blocks osteoclast maturation, function, and survival, thus reducing

bone resorption. Denosumab reduces both hip and vertebral fractures in women[37] but has also been shown to improve bone density in men.[38] Denusumab is used as a second-line agent for the treatment of osteoporosis in patients who fail or are intolerant to bisphosphonates.

Cellulitis has been reported in early studies and therefore it is recommended that denosumab be avoided in immunosuppressed patients or patients on immunosuppressive or biological therapy.[38] Other side effects include back pain and general musculoskeletal pain. There have also been rare cases of ONJ, and atypical fractures have been reported in follow-up studies; therefore it carries similar recommendations to bisphosphonates for routine dental care and consideration of a drug interruption.[39] (For dosage and administration see Table 31-3.)

Teriparatide: Increase Bone Formation. **Formulations and Mechanism of Action.** Teriparatide is a recombinant injectable human PTH 1-34 and is the only therapy that stimulates osteoblast function to promote bone formation. It also increases both renal tubular reabsorption and GI absorption of calcium, which improves BMD and prevents fractures. The effects of teriparatide on bone remodeling are transient, peaking at 9 to 12 months, and then begin to decline. Thus treatment duration is limited to 2 years.[40]

Indications. Teriparatide has been shown to be effective in reducing both vertebral and nonvertebral fractures. It is indicated for both men and women at high risk for fractures in whom other therapies have failed. It may also be given to patients who cannot tolerate other osteoporosis therapies (such as bisphosphonates). Trials showed a decreased benefit of combining a bisphosphonate with teriparatide because the effect on BMD was blunted.[41] (For dosage and administration see Table 31-3.)

Side Effects and Precautions. Orthostasis has been described with the initial dose; therefore the first dose usually is given under supervision. Headache is a possible side effect, and nausea and dyspepsia also have been reported (approximately 9% and 5% of patients, respectively). Musculoskeletal side effects include leg cramps and arthralgias. Transient hypercalcemia has been described and occurs most often 4 to 6 hours after administration of the dose.[40]

A theoretical risk of osteosarcoma exists with the use of teriparatide. Studies with rats found an association with osteosarcoma when the rats were exposed to high doses of teriparatide for most of their lifetime. Though no case reports of osteosarcoma in humans undergoing treatment with teriparatide have been described, it should not be used in patients with risk factors for bone cancer or elevated serum alkaline phosphatase due to this potential concern. In addition, because osteosarcoma appears most often in children and young adults, careful consideration and caution should be exercised in the use of teriparatide in young adults. It is not approved for use in pediatric patients.[40] This drug is also not recommended for use in patients with a history of hypercalcemia, hyperparathyroidism, PDB, prior bone radiation, or other skeletal cancer metastases.[40]

Selective Estrogen Receptor Modulators: Antiresorptive. Raloxifene belongs to the class of antiresorptive agents used for prevention and treatment of osteoporosis as a selective estrogen receptor modulator (SERM). It is unique in that it acts as both an agonist and an antagonist at the site of estrogen receptors, enabling different uses for different SERMs. For example, in bone, SERMs mimic the action of estrogen and prevent bone loss. Studies have shown reloxifene to be effective at reducing the risk of repeat vertebral fractures in women, but they did not reduce the risk of nonvertebral fractures (e.g., hip).[42] Notably trials with other SERMs, bazedoxifene and lasofoxifene, have showed significant promise as a treatment for osteoporosis.[43,44]

Indications. Raloxifene can be taken with or without food at any time of day. Approximately 60% of the drug is absorbed. If used in the United States, bazedoxifene is given with a conjugated estrogen (20 mg/0.45 mg).[44]

Side Effects and Precautions. One of the main concerns with the use of SERMs is the increased risk of superficial thrombophlebitis and deep vein thrombosis (DVT). Studies have found the risk of DVT to be comparable to that seen with the use of estrogen in HRT in postmenopausal women. Therefore, the use of SERMs is not recommended in patients with other risk factors for DVT or pulmonary embolism or a history of either of these conditions. Furthermore, women with a history of uterine or cervical cancer are not good candidates for SERMs given the variable effects of each medication on the endometrial and cervical cells.

The potential cardiovascular effects of SERMs have not been well defined. Data from the WHI study showed an increased risk of cardiovascular events in postmenopausal women with known coronary artery disease (CAD) who were in the hormone replacement group; this has led many clinicians to avoid the use of SERMs in general.

Some women experience significant hot flashes with SERM therapy, which are severe enough to prevent further use of these as antiosteoporotic agents. Other infrequent side effects may include sinusitis and flulike symptoms. Arthralgias have been reported in approximately 10% of patients taking raloxifene.

Calcitonin: Antiresorptive. **Formulations and Mechanism of Action.** Calcitonin is a weak antiresorptive agent. Its mechanism of action involves binding to osteoclasts to inhibit bone resorption. Both human and salmon calcitonin are prescribed clinically, but salmon calcitonin is favored because it has a longer half-life and higher affinity for the calcitonin receptor. Nasal calcitonin is the preferred mode of administration, but a randomized controlled study of oral salmon calcitonin use in postmenopausal women showed an increase in lumbar spine BMD with few GI side effects.[45]

Indications. Studies have found calcitonin to be effective for treatment of osteoporotic fractures of the spine

but not for nonvertebral fractures, such as hip fractures, which is why the medication is considered second line.[46,47]

One feature that seems to be unique to calcitonin is its ability to reduce pain in patients with an acute vertebral compression fracture.[48] The mechanism of action involved in this analgesic property is not clearly known. Therefore in a patient with significant pain from an osteoporotic vertebral fracture, one choice of therapy is initial treatment with calcitonin and then changing to another, more potent antiresorptive agent once the pain has subsided.

Side Effects and Precautions. The most commonly reported side effects of calcitonin include flushing, nausea and vomiting, anorexia, and diarrhea. These side effects can be minimalized if taken at bedtime. There has been a concern for an association of calcitonin with an increased risk of cancer, although a direct association has not been found. A Food and Drug Administration (FDA) advisory committee concluded that the risks of calcitonin use do not outweigh the potential benefits, but if it is used, the duration should be limited to less than 6 months.[49]

Strontium Ranelate. Strontium is a bone-stimulating agent (anabolic) composed of an organic moiety, ranelic acid, and two atoms of stable strontium. Many patients prefer it over teriparatide because it is taken orally. Data from phase III human studies support the effectiveness of strontium ranelate's mechanism of action in both stimulating bone formation and inhibiting bone resorption. Studies also indicate a significant increase in BMD T-scores at both the lumbar spine and the femoral neck. These studies show a reduction in both vertebral and nonvertebral fracture rates after 1 and 2 years of therapy.[49–51]

Side Effects and Precautions. Although it has been shown to be effective in the treatment of osteoporosis in patients with known osteoporosis, strontium ranelate is not currently available in the United States. The main side effect of strontium ranelate is diarrhea, which typically remits after 3 months. Strontium ranelate offers promise as a future bone-stimulating agent in the therapy of osteoporosis.[50]

Emerging Therapies. There are several new therapies undergoing trial at this time. Odanacatib is an antiresorptive medication that inhibits cathepsin-K. Three anabolic agents (bone-building agents) are also in trial: antisclerostin monoclonal antibodies (i.e., romosozumab and blosozumab) and a PTH-related peptide (i.e., abaloparatide). Ideally these new therapies will provide better efficacy with reduced potential side effects.

Surgical Management of Vertebral Fractures

Kyphoplasty and Vertebroplasty

Kyphoplasty and vertebroplasty are minimally invasive techniques that can be performed in an outpatient setting to treat vertebral compression fractures related to osteoporosis. In kyphoplasty a patient lies prone under local or general anesthesia. The surgeon then inserts a small tube into the collapsed vertebra. A balloon is passed through the tube and is inflated to restore height to the vertebra. Cement is then injected into the vertebral body (Figure 31-7) to maintain the height of the vertebra. Vertebroplasty is a similar procedure in which the cement is injected, but a balloon is not initially used to expand the vertebra. Although there have been past randomized studies that found no difference between surgical intervention and placebo,[52] a more recent study found both procedures to be superior to medical management and reported kyphosplasty superior to vertebroplasty in terms of balance improvement and risk of cement leaking.[53]

A randomized controlled trial, which included 138 patients in the kyphoplasty group and 128 in a control group (i.e., nonsurgical care), found that kyphoplasty was a safe and effective procedure for patients with vertebral fracture.[54] The study was conducted at 21 sites in eight different countries. Patients were eligible if they had one to three vertebral fractures from T5 to L5. At 12 months, 33% of patients in the kyphoplasty group and 25% of the control group had new or worsening radiographic vertebral fractures (7.7% difference, 95% confidence interval [CI] –4.5 to 20.0; $p = 0.220$). However, the authors made note that the study was not powered to detect differences in fractures between the two groups. In a retrospective study of 38 patients, Fribourg et al.[55] found that 10 of these patients

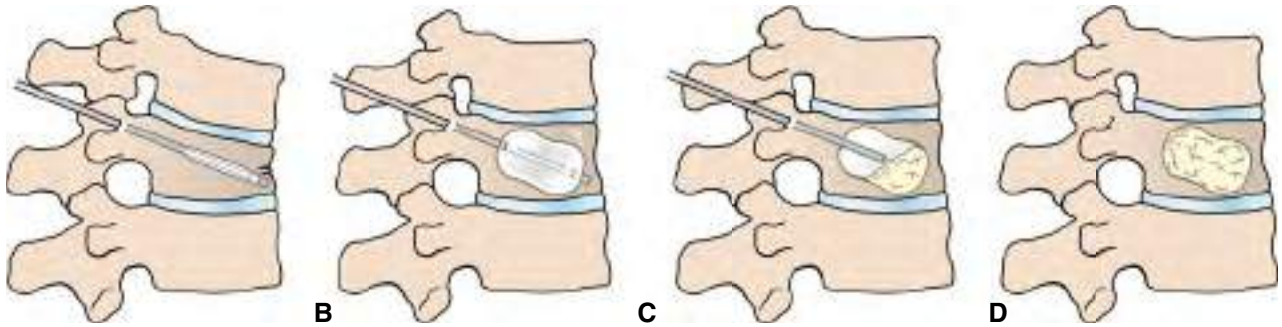

Figure 31-7 Kyphoplasty. **A,** Balloon tamp in place. **B,** Balloon tamp inflated and collapsed vertebral bone restored to near normal height. **C,** Cavity being filled with cement. **D,** Cavity completely filled with cement.

sustained an additional 17 fractures. Eight patients had a second fracture within 2 months of the procedure, and all had at least one fracture at an adjacent level. At this time, more research is needed on the outcomes of this surgical procedure, especially with respect to long-term effect. Because osteoporotic bone is a low-density material, placement of a high-density material, such as cement, adjacent to these vertebrae alters the biomechanical relationship between them and changes the transfer and absorption of forces.

Overall, quick recovery and reduction in pain occur if either procedure is performed early in acute vertebral fractures.[56] However, the procedure is not without potential side effects: osteoporotic bone is a low-density material and placement of a high-density material (cement) adjacent to these vertebrae alters the biomechanical relationship between them and changes the absorption of forces, which can result in fractures above and below "cemented" vertebrae. In a population-based retrospective study of patients with previous vertebral compression fracture, 48 patients who received vertebroplasty or kyphoplasty were compared with 164 patients who did not (comparison group). Treated patients had a significantly greater risk (30%) of subsequent vertebral compression fractures.[57] Extravasation of the cement can also occur into surrounding tissues and rarely can travel in the vasculature tissue post-procedure, resulting in embolization.[58] Subsequent trials have also identified patient age >80 years, cement leakage, vitamin D deficiency, need for procedures at multiple levels, and low BMD as significant risk factors for new vertebral compression fracture following vertebroplasty.[58]

PRIMARY HYPERPARATHYROIDISM

Introduction: Anatomy and Physiology of Parathyroid Glands

Parathyroid hormone (PTH) and vitamin D, which play a key role in bone mineralization, are the most important hormones regulating calcium, phosphate, and magnesium levels in the body. These two hormones act in bone, kidney, and the GI tract to increase serum calcium. PTH is produced by four small parathyroid glands adjacent to the thyroid gland in the lower part of the anterior neck. PTH is responsible for the conversion of inactive vitamin D into its active form 1,25-dihydroxyvitamin D (activated vitamin D).

Extracellular ionized calcium concentrations are closely regulated within a narrow physiological range that is optimal for many processes within cells and organ systems, to play a number of roles as a cofactor for enzymes, secondary messengers, neurotransmitters, and building materials for bone formation. Most of the total body calcium is sequestered in the skeleton (99%), with extracellular and intracellular calcium constituting only 1%. PTH and vitamin D closely regulate these dynamic calcium pools. In addition, their actions over bone-forming osteoblasts and bone-resorbing osteoclasts determine bone density and mineralization.[59,60] Calcitonin (a hormone produced by the thyroid) also decreases bone resorption, playing a minor role in regulation of serum calcium under normal circumstances.[61]

PTH has a very short half-life of 2 to 4 minutes and is secreted constantly to provide immediate and tight regulation to ionized calcium levels.[62] This seemingly instantaneous response is mediated by the calcium-sensing receptor (CaSR), a protein located in the cell membranes of both parathyroid cells and thyroid C cells (which produce calcitonin). CaSR binds to ionized calcium, its main agonist, which activates a cascade of intracellular events leading to the suppression of PTH secretion. PHPT occurs when one or several cells in the parathyroid gland lose their ability to be regulated, developing autonomous excessive release of PTH.

Epidemiology

Primary hyperparathyroidism (PHPT) is the most common cause of hypercalcemia and is associated with long-term complications, such as osteoporosis, disability,[63] hypertension, cardiovascular disease, and cancer.[64] Among ambulatory patients, PHPT accounts for 75% of all causes of hypercalcemia. Figure 31-8 demonstrates some of the typical causes of disorders of calcium homeostasis.

PHPT presents most commonly in women (i.e., 75% of cases) in the sixth and seventh decades of life[63,64] due to a decrease in the restraining effect of estrogen on PTH secretion. The incidence of PHPT has been estimated to be 4 per 100,000 population, a rate lower than before automated laboratory screening panels were introduced.[65]

Etiology

In most patients with PHPT, no clear cause can be identified. Risk factors that have been associated include head and neck irradiation (either by exposure or after radioactive iodine therapy for thyroid diseases) and long-term lithium therapy.[66–68] There are several genes implicated in sporadic and familial PHPT—Cyclin D1 overexpression, a protein of PRAD1/Cyclin D1 gene that has been found in 39% of sporadic parathyroid adenomas.[69] Mutations to multiple endocrine neoplasia type 1 (MEN1), HRPT2, RET, and CDKI have been found in families with familial hyperparathyroidism, and several different germline mutations have been identified. MEN1 is a proto-oncogene implicated in MEN1 syndrome, which is characterized by PHPT, usually starting at an early age (i.e., around the second and third decade of life), as well as other tumors, such as pancreatic and pituitary tumors. Mutations to this gene have been associated with both parathyroid adenoma and hyperplasia development. Presence of acquired somatic MEN1 mutations has been

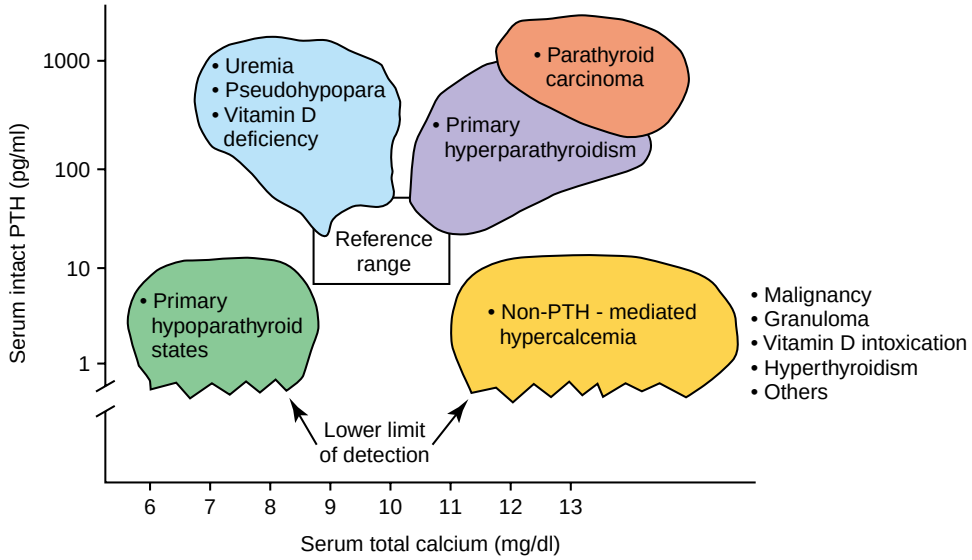

Figure 31-8 Calcium-intact parathyroid hormone (iPTH) relationships.

identified in approximately 30% of sporadic parathyroid tumors.[70] HRPT2 is a tumor suppressor gene associated with the hyperparathyroidism-jaw tumor syndrome and has also been implicated in sporadic parathyroid carcinomas.[71] RET is a proto-oncogene implicated in MEN2A and 2B syndromes, with PHPT reported in 10% to 25% of patients with MEN2A but not in 2B; MEN2A, as well as MEN1, is associated with multigland hyperplasia.[72]

Table 31-4 summarizes the current understanding of the forms of PHPT.

Clinical Features

Advances in modern medicine have made PHPT classic presentation of "stones, bones, moans, and psychic overtones" a rare occurrence thanks to routine calcium measurements that demonstrate hypercalcemia at early stages of disease. This condition is most commonly diagnosed in preclinical stages as asymptomatic PHPT. However, there is evidence that approximately 15% to 20% of these "asymptomatic" patients will still have chronic complaints, such as anxiety, weakness, depression, fatigue, nephrolithiasis, acid reflux, or bone disease, even when calcium levels are only modestly elevated.[63,73–75] In addition, PHPT is associated with increased insulin resistance, hypertension, and metabolic syndrome. It remains unclear whether surgical cure induces regression to these changes.[76] Bone changes related to PHPT are characterized by loss of mineral density, particularly at sites rich in cortical bone, such as the radius. The more severe form of this type of bone loss is osteitis fibrosa cystica, which currently is almost exclusively seen in developing countries or as part of the metabolic bone disease related to chronic kidney disease (i.e., secondary hyperparathyroidism). Cross-sectional studies show an increased rate of fractures among persons with PHPT, with fracture risk not returning to normal until years after surgical cure.[77] Other abnormalities frequently encountered in patients with PHPT are hypophosphatemia (due to renal losses), normal or low 25-hydroxyvitamin

TABLE **31-4**

Genes and Syndromes Associated with Familial Hyperparathyroidism

Gene	Pathology Associations	Clinical Features
MEN1	MEN1 syndrome	Pituitary, pancreatic tumors, Zollinger-Ellison syndrome, VIPoma, carcinoid, angiofibromas
HRPT2	Hyperparathyroidism-jaw tumor syndrome	Parathyroid adenoma and parathyroid carcinoma (HRPT)
RET	MEN2A MEN2B (PHPT is not associated)	MEN2A: Familial medullary thyroid carcinoma (FMTC), pheochromocytoma MEN2B: FMTC, Mucosal neuromas, Marfanoid habitus
CDKI	Sporadic parathyroid adenoma	PHPT
PRAD1/Cyclin D1	Sporadic parathyroid adenoma	PHPT

MEN1, multiple endodrine neoplasm, type 1; *HRPT2*, hyperparathyroidism 2; *RET*, ret proto-oncogene; *CDKI*, cyclin-dependent kinase inhibitor gene; *PRAD1*, parathyroid neoplasm gene

D (a higher PTH correlates with lower vitamin levels), and hypercalciuria.[78]

During a study of patients with fragility fractures or osteoporosis by DXA, PTH levels are frequently measured, and as a consequence a variant of PHPT known as normocalcemic PHPT has been identified. This is characterized by normal calcium but persistently elevated PTH levels. This diagnosis should be made only after all causes of secondary hyperparathyroidism have been ruled out.[79,80] Its prognosis and indications for treatment are the focus of current and future research.

Diagnosis

The classic features of PHPT are an elevated serum calcium level (i.e., hypercalcemia) and an elevated or inappropriately normal (for the level of serum calcium) intact parathyroid hormone (iPTH) level. In the evaluation of suspected PHPT, a 25-hydroxyvitamin D level should be obtained and any deficiency corrected.[78] When PHPT is determined, a biochemistry panel is recommended, including blood urea nitrogen, creatinine, phosphate, and alkaline phosphatase levels. A 24-hour urine calcium excretion should be obtained as well. If patients have a history of nephrolithiasis (i.e., process of morning a kidney stone) or if initial results show hypercalciuria (i.e., elevated calcium in the urine), patients should have a 24-hour urine biochemical stone profile, which helps to determine the risk of future stone formation. Surgery is recommended for asymptomatic patients with estimated glomerular filtration rates below 60 mL/min or high risk of nephrolithiasis.[81] An elevated alkaline phosphatase level is a risk factor for postoperative hypocalcemia, also known as hungry bone syndrome.[82]

BMD should be obtained at the time of diagnosis of PHPT by central DXA using spine, hip, and in addition, distal third of radius scanning for higher sensitivity to detect cortical bone loss.[83] When clinically indicated, useful additional studies are vertebral x-rays and vertebral fracture assessment by DXA.[81]

Because approximately 30% of circulating calcium is bound to albumin, the total serum calcium levels should be adjusted with albumin concentrations using the following formula:

$$\text{Corrected total calcium} = \begin{pmatrix}\text{measured total calcium}\\ \text{in mg per deciliter}\end{pmatrix} + \left[0.8 \times \begin{pmatrix}4.0 - \text{patient's}\\ \text{serum albumin}\\ \text{concentration in}\\ \text{g per deciliter}\end{pmatrix}\right]$$

Hyperalbuminemia (i.e., increased concentration of albumin in the blood) occasionally results in artifactual hypercalcemia; therefore measurement of ionized calcium levels may be useful in these circumstances.[80]

iPTH values more than 40 pg/mL accompanied by hypercalcemia strongly point to a diagnosis of PHPT. Similarly hypercalcemia with low or low-normal iPTH levels usually suggests another etiology, such as malignancy-associated hypercalcemia (the second most common cause of elevated calcium levels).

Mild hypercalcemia associated with normal or unsuppressed PTH levels is commonly seen in patients taking thiazide diuretics or lithium, as well as in a rare condition called familial hypocalciuric hypercalcemia (FHH). The differential diagnosis is summarized in Table 31-5. Lithium can induce multigland hyperplasia or adenoma as documented in multiple case series with persistent hypercalcemia after withdrawal.[68] Whenever possible, discontinuation of thiazides and lithium is recommended with hypercalcemia. Early or mild PHPT is thought to be unmasked by these agents, for which monitoring of calcium and PTH levels is recommended after cessation of thiazides and lithium. FHH is caused by an inactivating mutation in the gene encoding the CaSR protein. It leads to an upward shift in the threshold for suppression of PTH secretion and consequent mild, asymptomatic hypercalcemia starting in childhood. This condition is inherited in an autosomal dominant pattern with high penetrance. Obtaining calcium levels from first-degree relatives (i.e., parents) helps clarify the diagnosis. A 24-hour urine calcium to creatinine ratio is recommended, and results of less than 0.01 (during normal calcium consumption and off any diuretics) can confirm the diagnosis. Treatment is not indicated for FHH because of its benign prognosis.[84]

Familial PHPT accounts for approximately 5% of cases and should be considered in patients younger than 30 years, those with family history of hypercalcemia, and/or other neuroendocrine tumors (Table 31-5). When suspicion is high, serum calcium should be measured in all first-degree relatives. This may help to support the diagnosis and offer early diagnosis and counseling to affected relatives. Genetic testing is available and may be offered in cases of familial forms of PHPT and FHH.[83]

Localization of an adenoma (or hyperplasia) can also be attempted by means of parathyroid scintigraphy or diagnostic ultrasound, but studies[85,86] have demonstrated a variable sensitivity. Imaging studies are not required for diagnosis. These tests are usually reserved for patients who meet criteria for surgery. In one study, the use of planar sestamibi scanning performed the morning of the operation was sufficient to assist the surgeons achieve a surgical cure rate of approximately 95%.[64]

Ultrasonography and spiral computed tomography of the kidneys are useful to quantify nephrolithiasis, hydronephrosis, and nephrocalcinosis, and screening in asymptomatic patients without a history of stones is recommended.[81] Parathyroid carcinoma, which is very rare, should be suspected in patients with extremely elevated PTH levels (i.e., greater than threefold above normal), severe hypercalcemia (i.e., greater than 14 mg/dL), and those with a neck mass.

TABLE **31-5**

Differential Diagnosis of Common Causes of Hypercalcemia

	Calcium Elevation	25- (OH) D	Phosphorus	iPTH	Improves with Medication Withdrawal	Age	Urine Calcium
PHPT	+/+++	Normal/low	Low	High	No*	6th-7th decade	+++
Familial hypocalciuric hypercalcemia (FHH)	+	Normal	Normal†	Normal/ mildly high	No	All ages	—
Cancer-Associated Hypercalcemia	+++	Normal	Normal	Low‡	No	Usually elderly	+++
Thiazide	+	Normal	Normal	Normal	Yes	Middle-age adult	—
Lithium	+/++	Normal/low	Normal/low	High	Yes	Middle-age adult	++
Artifactual Hypercalcemia	+ / Corrects to normal	Normal	Normal	Normal	N/A	All ages	Normal

iPTH, Intact parathyroid hormone. *PHPT*, primary hyperparathyroidism; *25-(OH) D*, 25-hydroxyvitamin D

* Thiazides and lithium have the potential to worsen hypercalcemia in patients with PHPT.

† Magnesium levels are typically elevated in FHH.

‡ Commonly mediated by parathyroid hormone related-protein (PTHrp).

Treatment of Primary Hyperparathyroidism

Greater than average fluid intake is recommended to all patients with PHPT and emphasized on those who do not undergo surgery. Acute hypercalcemia due to PHPT may require hospitalization, especially when calcium levels are severely elevated or when symptomatic. For patients with severe hypercalcemia (>12 mg/dL), IV hydration is recommended. Use of loop diuretics (i.e., diuretics that act in the loop of Henle in the kidneys) can be added later to prevent fluid overload and support calciuria. IV bisphosphonates and denosumab have been demonstrated to produce significant reductions in calcium levels, usually after 36 to 72 hours of administration.[87,88] These drugs are usually reserved for more severe cases.

Parathyroid Surgery

Surgery remains the mainstay of treatment of PHPT and reported cure rates are as high as 95% after 10 years. Surgery is recommended for all symptomatic patients with PHPT, and remains an option for all asymptomatic patients as the only curative treatment available.

Guidelines from the fourth international workshop on hyperparathyroidism, published in 2014, recommend surgery for asymptomatic patients who are younger than 50 years of age, have moderate-to-severe hypercalcemia (i.e., >1 mg/dL above normal), have reduced renal function glomerular filtration rate (i.e., <60 mL/min), or renal changes (i.e., high risk of stone formation, nephrolithiasis, or nephrocalcinosis) detected by screening studies, or are complicated by osteoporosis. Asymptomatic patients in whom long-term follow-up is not possible should also be referred for surgery. Table 31-6 summarizes current indications for surgery.

Multiple approaches and surgical techniques have been developed, including a minimally invasive approach. Many centers prefer a unilateral or single gland approach,[89] whereas others have adopted four parathyroid gland explorations.[64,90] Parathyroidectomies should be performed by experienced surgeons to maintain complication risks under 1% to 3%.[91] Intraoperative PTH has been used as a marker of success during surgery.[62] A drop of 50% in PTH levels has been associated to a cure rate of greater than 90% to 95% at 1 year. However, others argue that multiple gland explorations are required to provide a long-term cure because multiple adenomas or hyperplasia are present in up to 25% of cases.[64,90] This latter technique does not rely on intraoperative PTH.

Medical Therapy for Primary Hyperparathyroidism

Patients who cannot undergo surgery but present with symptomatic hypercalcemia may benefit from cinacalcet.[88] This agent is commonly used for secondary hyperparathyroidism secondary to renal failure, and the FDA has approved its use in PHPT with severe hypercalcemia. It increases sensitivity in the CaSR of the parathyroid glands, thereby decreasing PTH secretion. Doses of 60 to 120 mg divided twice per day help to normalize calcium levels in most cases, although PTH reductions are usually more modest. It has been studied in a wide range of stages of PHPT with consistent success and tolerability.[92] The effects are short lived and patients must remain under treatment to avoid recurrence. BMD remained stable for up to 5 years in one study with this agent.[93]

TABLE **31-6**

Indications for Parathyroid Surgery

Variable	Criterion for Surgery	Suggested Following without Surgery
Age	Younger than 50	—
Calcium (serum)	>1.0 mg/dL above upper range	Once yearly
Kidney	GFR <60 mL/min × 1.73 m²	Once yearly
	Urine calcium >400 mg/day/ biochemical stone profile	
	Renal imaging (ultrasound, CT scan, or x-ray)	
Bone disease	T-score <−2.5 at any site* and/or previous fracture fragility* by central DXA; VFA, CT scan, MRI, or vertebral x-ray	Every 1-2 years (include distal one-third radius)†
	Pathological fractures	

mg, milligrams; *dL*, decaliter; *GFR*, glomerular filtration rate; *CT*, computed tomography; *DXA*, dual-energy x-ray absorptiometry; *VFA*, vertebral fracture assessment; *MRI*, magnetic resonance imaging.

*ISCD recommends use of Z-scores instead of T-scores when evaluating BMD in premenopausal women and men younger than 50 yr.

†Lumbar spine, total hip, femoral neck, or distal third of radius. There may be different time frame recommendations according to specific countries.

PAGET'S DISEASE OF BONE (OSTEITIS DEFORMANS)

Introduction

PDB (also known as osteitis deformans) was first described by Sir James Paget in 1877. Although it is considered a systemic bone disease, it is more accurately described as a localized disorder of bone remodeling that may occur at multiple sites.[94] The most commonly affected sites of the skeleton are the skull, femur, pelvis, vertebra, and tibia. One skeletal site (monostotic) or multiple sites (polyostotic) may be involved.

Paget's disease affects approximately 3% of people in the United States over age 50 and 10% of those over age 80.[95] Men and women are affected with nearly equal frequency, but it is relatively uncommon before age 25. It is most common in the United Kingdom and in those

of northern European descent, and it is uncommon in Africans and Asians. The disease is often asymptomatic and is usually discovered incidentally through radiographs or by an increase in serum alkaline phosphatase activity.

Pathogenesis and Etiology

Although the etiology of Paget's disease is incompletely understood, both genetic and environmental pathogenesis have gained strong research support.[96] In the past, several pedigrees of families with several afflicted individuals have been described, thus providing a strong basis for a genetic cause of the disease. Paget's disease has since been linked to chromosome 18q and other loci with mutations in the coding of the ubiquitin-associated (UBA) domain of the sequestosome-1 (SQSTM1) gene, which encodes the p62 protein, leading to elevated NF-κB in osteoclasts.[95,96] However, when bone from patients with this mutation is examined microscopically, the osteoclasts do not appear to be "pagetic" (see later), and therefore an environmental factor is suspected to be necessary to induce the expression of Paget's disease. Chronic measles infection has been the most suspected and thus the most studied, but other viral mechanisms could be responsible.[95]

In Paget's disease there are a disproportionate number of osteoclasts compared with osteoblasts. These osteoclasts have abnormal nucleoli along with hypersensitivity to vitamin D. This combination results in accelerated bone turnover leading to abnormal deposition of lamellar bone. The "new" bone is disorganized in appearance, with thickened trabeculae rimmed by numerous osteoblasts. This characteristically mosaic pattern is formed by randomly arrayed units of lamellar bone delineated by irregular "cement lines." The disorganized bone increases the bone volume but not the strength, and the bone marrow is replaced by highly vascular stromal (connective) tissue. The pagetic bone is mechanically weaker and more susceptible to fractures despite its sclerotic appearance and a higher density by DXA.

Clinical Features

Although the disease is commonly asymptomatic, the most common symptom in Paget's disease is bone pain. Fractures may also occur from Paget's disease and healing is slow because of the altered mechanical structure of the bone itself. The incidence of nonunion fractures has been reported as high as 40%, especially when the fracture involves the proximal femur.[97] In addition, increased weight bearing, which stimulates bone growth and remodeling in normal bone, is a less effective means of fracture prevention in individuals with Paget's disease.[95,97] Osteoarthritis secondary to Paget's disease, when affecting bones adjacent to joints, may eventually require a total joint replacement.

When Paget's disease is suspected, a careful history and physical examination should be performed to look for skeletal deformity, pain, and a temperature change over the affected areas of bone. Pagetic bone may have an increased vasculature supply with increased warmth and occasionally a bruit (i.e., abnormal sound of blood indicating increased turbulence to blood flow) can be heard (by stethoscope). Rarely patients with polyostotic Paget's disease may have congestive heart failure, particularly if they become inactive or suffer fracture of the affected bone. Patients with Paget's disease of the basilar skull may have sensorineural hearing loss due to entrapment of the eighth cranial nerve.[97]

Symptoms of Paget's Disease[97]

- Bone pain from microfractures or osteoarthritis
- Bowing of a limb
- Thoracic kyphosis and compression fracture
- Loss of hearing—when skull is involved
- Neurological symptoms from nerve compression caused by bone growth (spine, skull, limbs)
- Spinal stenosis
- Heart failure if active polyostic involvement and patient is suddenly immobile
- Hypercalcemia if significant bone involvement and patient is immobile and/or fractures

Diagnosis

The diagnosis of Paget's disease is typically made radiographically by the characteristic localized disruption of skeletal architecture (Figure 31-9), although pagetic bone can also be recognized on scintigraphic bone scans. Most often the differential diagnosis includes Paget's disease, osteoblastic malignancy (e.g., prostate cancer, thyroid cancer, osteosarcoma), hyperparathyroidism, and severe vitamin D deficiency. Occasionally a bone biopsy is required to establish a specific diagnosis but more importantly to exclude malignancy, particularly osteosarcoma.

The biochemical features of Paget's disease are those of increased skeletal turnover. They include an elevated serum level of alkaline phosphatase or bone-specific alkaline phosphatase and increased urinary resorption markers (N-telo-peptide and CTX).[4,95] With active polyostotic Paget's disease, the serum alkaline phosphatase may exceed the upper end of the reference range by 10-fold.

Treatment of Paget's Disease of the Bone

The decision to treat symptomatic patients with Paget's disease is based on several factors:

1. Pain from the bony involvement
2. Location: skull involvement with eighth cranial nerve entrapment causing hearing loss and headaches

Figure 31-9 Radiograph of a pelvis affected by Paget's disease showing concentric-type Paget's arthritis of the right hip. (From Merkow RL, Lane JM: Current concepts of Paget's disease of bone, *Orthop Clin North Am* 15:747-763, 1984.)

3. If plan for surgery on the affected bone: preoperative treatment to prevent hypercalcemia, if patient is immobile
4. Polyostic involvement, which increases the risk of fractures and heart failure

Pharmacotherapy may improve symptoms of bone pain if related to Paget's disease, but braces and other devices may also be needed. Treatment for asymptomatic patients is indicated when the involved bone has the potential for complication:

1. Weight-bearing bones (to prevent bowing)
2. Bones adjacent to a joint (to prevent advanced degenerative joint disease [DJD])
3. Spine (to prevent vertebral fractures and spinal stenosis)
4. Skull (to prevent hearing loss and headaches)

In addition, in asymptomatic patients with pagetic bone not at a concerning site, it is reasonable to consider therapy if the serum alkaline phosphatase is more than 2 to 4 times the upper limit of normal.

The mainstays of treatment for Paget's disease are the bone resorption inhibitors (i.e., bisphosphonates), which may be administered orally or intravenously. For Paget's disease, the total dosage of oral bisphosphonates (see Table 31-3) is much higher than that taken for osteoporosis (i.e., taken daily for 3 to 6 months), depending upon the agent selected. IV bisphosphonates are most often used in patients with refractory Paget's disease or those with contraindications to oral medications.

SUMMARY

Systemic bone disease (i.e., metabolic bone disease) encompasses a spectrum of medical conditions that may have a major effect on bone by differing mechanisms. Osteoporosis affects men and women at different rates and for various reasons, but the resulting outcome is similar. Osteoporosis is a focus of ongoing research for prevention of fractures through medications[98] as well as other modalities, with a goal of reduction of morbidity and mortality among the elderly. Hyperparathyroidism is another common systemic bone disease and is interrelated with osteoporosis as a risk factor for fractures if uncontrolled. Finally, although less common, PDB can lead to disability and fractures if unrecognized. This chapter highlights the importance of recognition as well as some basic management of these conditions.

PART B | Rehabilitation Intervention

HOLLIE KIRWAN, JENNIFER BESSIRE

OSTEOPOROSIS

It is estimated that 54 million Americans have osteoporosis or low bone mass and that more than 2 million osteoporosis-related fractures result in medical costs amounting to U.S. $17 billion. By 2025, annual fractures and costs are expected to increase to more than 3 million and U.S. $25 billion, respectively.[99] Typically patients referred to physical therapy are not referred with a primary diagnosis of osteoporosis. Referrals are more likely to be received for individuals who have sustained a fracture as a result of this underlying condition or who are referred for unrelated diagnoses. A knowledge of the impact and possible physical consequences of osteoporosis, and of ways of developing a treatment plan for patients who have this condition regardless of the referral diagnosis, is paramount. Nonvertebral fractures account for 73% of the reported fractures, with nontypical osteoporosis-related sites (i.e., pelvis and areas other than wrist, hip, or vertebra) accounting for 40% of fractures. With this in mind, physical therapists should focus treatment on all skeletal sites and avoid focusing on the spine and hip when treating patients with osteoporosis.

Osteoporosis can be defined as a disease characterized by low bone mass and structural deterioration of bone tissue, leading to bone fragility and increased risk of fracture (Figure 31-10).[100] A bone mineral density (BMD) test can be performed to clinically define osteoporosis or osteopenia (i.e., low bone mass) (Figure 31-11). The BMD refers to the relative fracture risk of a bone and the test used to classify bone health; the result is given as a T-score of the hip BMD.

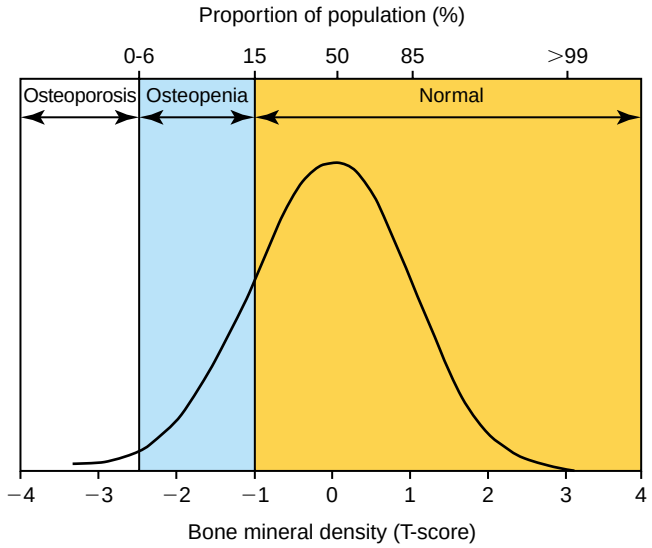

Figure 31-11 Normal distribution of BMD scores, represented as T-scores. Note that a score of −1 to −2.5 represents osteopenia, and a score of −2.5 or lower indicates osteoporosis. (Redrawn from Kanis JA: Osteoporosis III: diagnosis of osteoporosis and assessment of fracture risk, *Lancet* 359:1929-1936, 2002.)

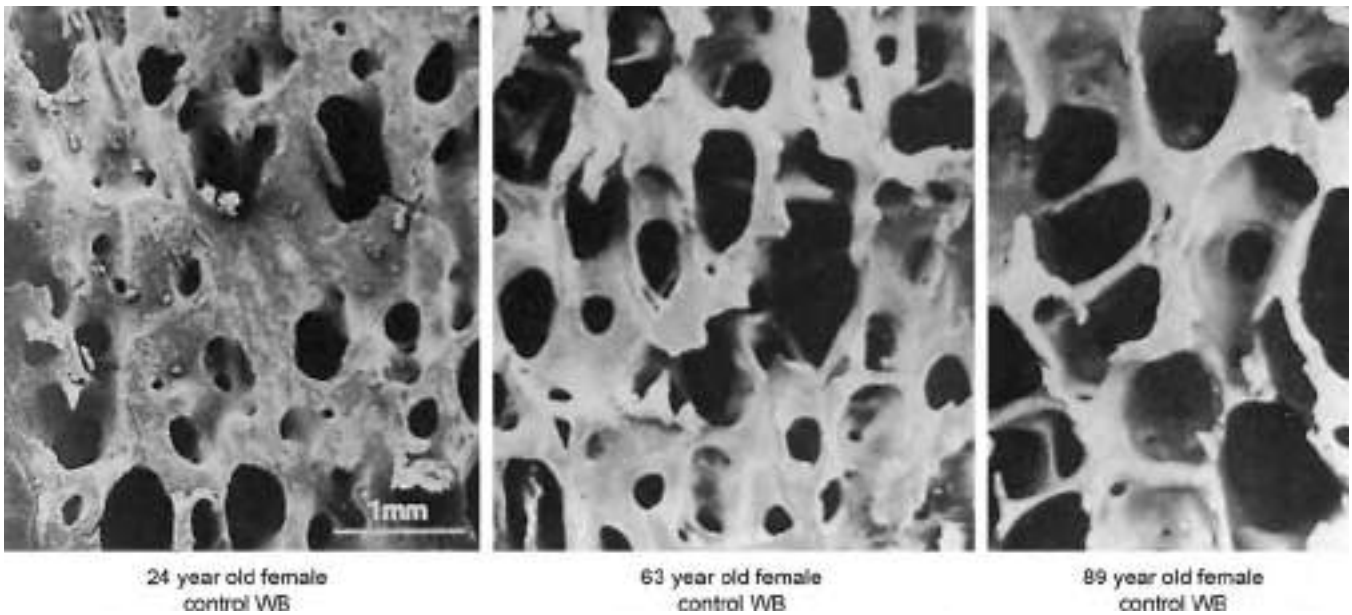

Figure 31-10 Age-related changes in apparent density and architecture of human trabecular bone from the lumbar spine. (Courtesy Marc D. Grynpas. In Buchwalter JA et al: *Orthopaedic basic science,* ed 2, Rosemont, 2000, American Academy of Orthopaedic Surgeons.)

From an epidemiological perspective, approximately 10 million individuals in the United States have osteoporosis, and an additional 34 million have osteopenia. One in two women and one in four men over age 50 will have an osteoporosis-related fracture at some time in their life.[101] This means that clinicians working with those over age 50 are very likely to have patients with osteoporosis or osteopenia, and these patients therefore are at greater risk of injury or impairment related to these disease processes. For these reasons, consideration of the patient's bone status is vital, regardless of the referral diagnosis.

With the high incidence of fracture rates in patients with osteoporosis, fractures are often the reason for their encounters with clinicians. Fractures of the hip, spine, wrist, arm, and leg may occur as a result of a fall. However, simple household tasks can result in vertebral fractures that can often go undiagnosed.[100] The primary symptom of these fractures, back pain, often is attributed to "arthritis" or is thought to be a normal part of aging. The most serious and debilitating fracture is a hip fracture, and these patients often are referred for rehabilitation after surgery.

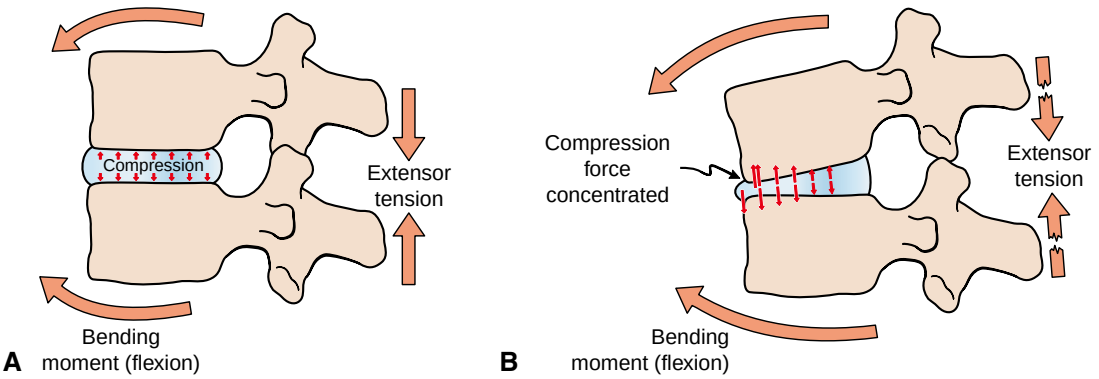
Clinicians must base their intervention not on the medical diagnosis, but on the resultant impairments and functional limitations that impact the patient that are found during their initial evaluation. Treatment of individuals with osteoporosis is no different. Therefore this section covers the past medical history, assessment, primary prevention, treatment of common impairments, effects of exercise on the skeleton, and kyphoplasty. The overriding objective for these patients is to improve functional ability and prevent fractures, which can lead to further significant declines in function. To this end, the goals of treatment include increasing strength, flexibility, and range of motion (ROM); improving balance (90% of hip fractures are the result of a fall)[102]; correcting posture when possible; modulating pain; and educating the patient about lifestyle adaptations.

Spinal Biomechanics

During upright standing in a person with normal spinal curvature, there is minimal spinal muscle involvement to maintain static equilibrium. However, if there is a change to the normal spinal curvature, such as that seen in patients with thoracic kyphosis, this muscle balance will be disrupted and cause alterations in the physiological loading of the spine as a consequence of the forward shift of body mass. Untreated vertebral fractures can result in increased kyphosis, which leads to changes in the postural position of the patient's cervical spine and head, bringing the center of mass further anterior to the spine (see Figure 31-2). This postural alteration can result in a vicious cycle, causing a further increase in kyphosis. The kyphosis compresses the lungs and abdominal organs, making breathing and even eating difficult. These postural changes may also lead to a decrease in upper extremity function, especially with reaching, whereas increases in cervical lordosis lead to decreased cervical flexibility and ultimately affect visual navigation of the environment.

Any assessment or intervention for patients with or at risk for osteoporosis must take into consideration spinal biomechanics and safety. Spinal flexion requires a balance between flexor and extensor forces (Figure 31-12) (*force* is the capacity to do work; *work* is force exerted over a distance).

Any force that falls anterior to the spine exerts a *flexion moment* (i.e., force acting at a distance perpendicular to a point) on the spine; any force that is posterior to the spine exerts an *extension moment* (Figure 31-13). Flexion moments include the *center of gravity* (i.e., the vertical displacement of the center of mass onto the ground). In older adults, this flexion moment often is increased because of the flexed posture they assume (see Figure 31-12, *B*). An increase in thoracic kyphosis (i.e., spinal flexion) increases the distance that the force acts on the spine and thus increases the flexion moment, leading to greater compression and shear forces on the spinal segments.



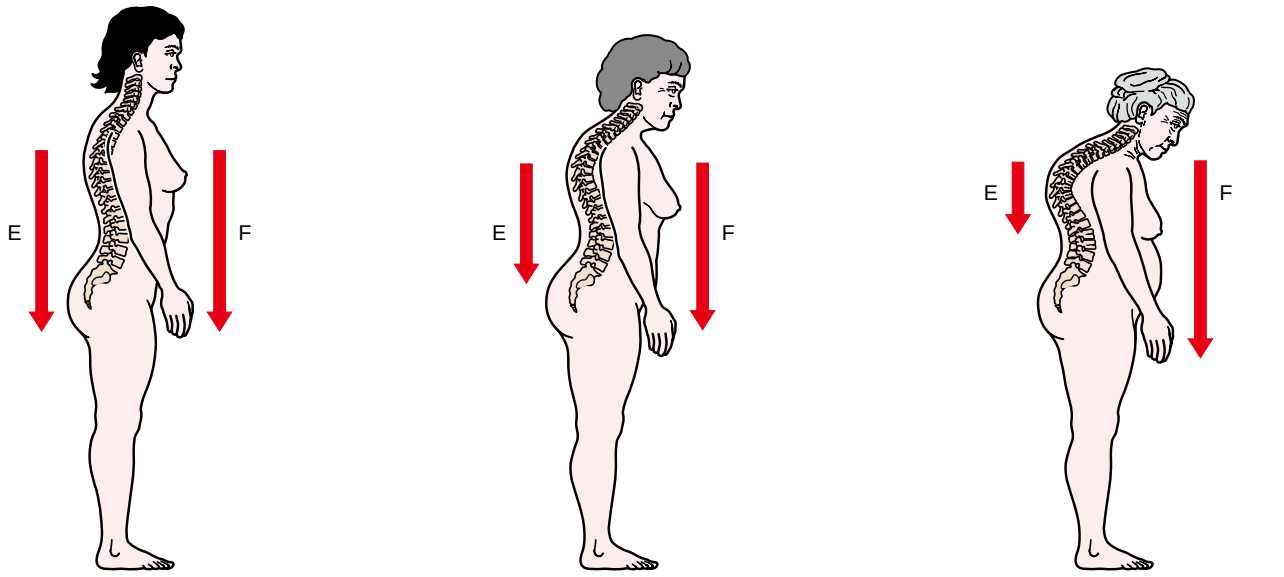


Figure 31-12 **A,** State of balance between flexors and extensors and the resulting biomechanics. **B,** State of increased flexor force and insufficient extensor force, resulting in compression on the anterior part of the vertebral body and the intervertebral disc. (Redrawn from Carlson JM: Clinical biomechanics of orthotic treatment of thoracic hyperkyphosis, *J Prosthet Orthot* 15: 31-35, 2003.)

Good Posture
Flexion moment = Extension moment

Increased Kyphosis
Flexion moment > Extension moment

Significantly Increased Kyphosis
Flexion moment >> Extension moment

Figure 31-13 Changes in flexor and extensor moments of the thoracic spine with progressive increases in thoracic kyphosis. As the kyphosis increases, the flexor moment increases. The increase in flexor moment requires an equally large extensor moment to reduce force through the anterior part of the vertebral bodies. *E,* Extensor moment; *F,* flexor moment.

Thoracic kyphosis can increase the risk of vertebral fractures and intervertebral disc degeneration, cause loss of spinal muscle strength, and result in degeneration of intervertebral ligaments.

The extensor muscles counteract the flexion moment. However, the back extensors and paraspinal musculature can often be compromised in patients with a kyphosis due to alterations in the length-tension relationships, moment arm lengths, and force vector orientations.[103] Patients with weak extensors will have difficulty counteracting the flexion and so the kyphosis remains or will gradually worsen unless treated appropriately.

Additional *stress* (i.e., a force exerted when one body or body part presses on, pulls on, pushes against, or tends to compress or twist another body or body part) or an increase in the flexor moment caused by asking these patients to participate in physical activities that increase flexion is **contraindicated** or requires a strong caution because these activities may increase the risk of anterior compression fractures and wedging of vertebral bodies. Flexion, therefore, is contraindicated in those with osteoporosis who have sustained a fracture and in those who have not had a fracture but have a BMD T-score of –2.5 or lower. Flexion is not recommended in those who show height loss and postural change but no current symptoms. Individuals who have not had a BMD test and who do not have signs or symptoms of osteoporosis can perform flexion, although clinicians should use discretion and appropriate judgment about which movements are safe. Spinal rotation and side bending are also cautioned against, although not as strongly as flexion, for the same groupings (Table 31-7).[104–106] These motions are not advised due to the compressive forces they place on the vertebral bodies. This can lead to a vertebral compression fracture, especially if the motions of flexion, rotation, and side bending are combined.

TABLE **31-7**

Contraindications to Spinal Flexion Based on Bone Mineral Density (BMD) Score

BMD Score	Spinal Flexion
T score of –2.5 or lower	Contraindicated
T score of –1 to –2.5	Not recommended; clinical judgment required
No BMD results available, but height loss, vertebral fracture, and kyphosis are present	Contraindicated

Clinical Note

Caution should be used when prescribing flexion movements or exercises to osteoporotic patients because of the increased risk of vertebral compression fractures leading to anterior wedging of the vertebral bodies.

The increased kyphosis must be counterbalanced by the back extensor muscles. However, if these muscles are too weak, they quickly fatigue while working to keep the spine extended. Postural adjustments associated with increased kyphosis include posterior tilt or translation of the pelvis, hip extension, knee flexion, and ankle dorsiflexion

to counter the anterior shift of the body mass.[107] Each of these adjustments will affect the biomechanical environment of the spine. Clinicians responsible for the rehabilitative management of patients with these types of problems must consider all these factors in designing a program to minimize kyphosis. The program must include education and counseling to make patients aware of the effects of inappropriate posture on their condition, bracing if appropriate, and improving the strength and endurance of the thoracic extensor and scapula retractor muscles.

Primary Prevention

The ability of the skeleton to respond to mechanical loading is greatest during childhood and decreases with age. Weight-bearing exercise when young has been found to have lasting effects on bone mass and structure following cessation of exercise.[108] **Peak bone mass** is defined as the highest level of bone mass achieved as a result of normal growth.[109] Once bone mass peaks during adolescence, it cannot be effectively altered during later years. However, the consequences of insufficient bone mass are not seen until old age, when levels become so low as to result in fractures. Consequently, osteoporosis is not a disease of old age, but a pediatric disease that does not manifest itself until old age.[110] Therefore, the target population for prevention should be premenarcheal and young premenopausal women and young boys. There is no cure for osteoporosis, so the most effective management is prevention. The goal of prevention is to maximize bone mass and BMD. (Although density is "the mass of a substance per unit volume," [Merriam-Webster] and mass is "a measure of the amount of a material," the terms *bone mass* and *bone mineral density* often are used interchangeably.) Addressing prevention through education of adolescents about bone density development and bone density risk behaviors is advocated by the International Osteoporosis Foundation.[111] They have called for a national effort to educate the youth about osteoporosis. This will allow adolescents to understand the importance of achieving and maintaining optimal peak bone mass and how to reduce the risk of osteoporosis in later life. However, several studies have reported on the lack of knowledge surrounding risk factors and preventative techniques in adolescent populations. One study investigating knowledge of bone health in female adolescents reported that the students performed poorly in osteoporosis knowledge pretests and this was improved following an educational in-service program.[112] Another study investigated gender differences in osteoporosis health beliefs and knowledge in a group of collegiate students and concluded that there are definite limitations in college student's knowledge and health beliefs associated with osteoporosis. Women had higher perceptions of threat of osteoporosis and less confidence in their ability to be physically active. The authors advised that education and prevention targeting men and women may be beneficial to offset the development of osteoporosis in later life.

Clinical Note

The goal for preventing osteoporosis is to maximize bone mass and bone mineral density (BMD); this must begin in adolescence.

Exactly when bone mass peaks is the subject of debate, the suggested age ranges from middle to late teens[113–115] to the 20s.[116–118] However, according to Huijbregts et al.,[104] by the time girls are 12 years old, they have already achieved 80% of their adult BMD, and by the time boys have reached age 19 to 20, they have acquired 95% of their peak bone mass. Regardless of when peak bone mass is reached, it generally is agreed that the key ages for laying down bone mass are 11 to 16 in girls and a few years later in boys.[119] Genetics accounts for 70% of the variation seen in peak bone mass. However, strong support exists for the effect of three environmental factors on bone mass: habitual physical exercise, nutrition, and reproductive hormone status.[120] With rapid skeletal model mineral acquisition occurring in adolescence, the exogenous factors that can help to optimize peak bone mass need to be precisely identified and characterized within the scope of primary prevention.[108]

Key Ages for Laying Down Bone Mass

- Girls: 11 to 16 years
- Boys: 13 to 20 years

Factors that Affect Bone Mass in Youth

- Physical activity
- Nutrition
- Reproductive hormone status
- Genetics

What are the roles of the various clinicians who focus on rehabilitation? A critical primary consideration is to educate patients and the public about the importance of exercise and appropriate nutrition for young children and adolescents. Research shows that in both children and adolescents, regular physical activity is directly related to increases in BMD[121–125] and to permanent increases in cross-sectional areas of trained skeletal regions.[126,127] Exercise during growth adds extra material to loaded sites to increase the quantity of bone present as displayed in Figure 31-14. Bone formation in response to loading occurs in a site-specific manner,

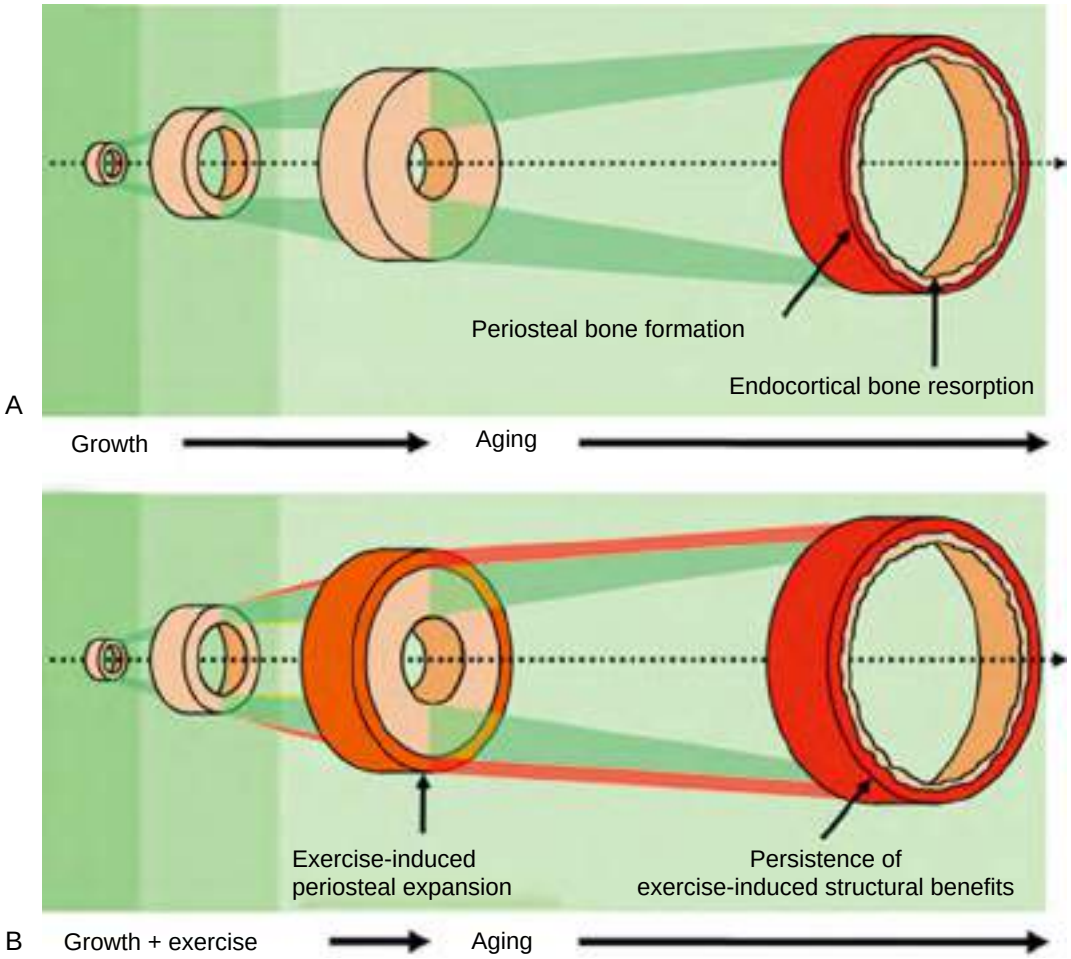

Figure 31-14 Bone structural adaptations associated with aging **(A)** and exercise **(B)**. **A,** Bone loss during aging occurs primarily via bone resorption on the endocortical surface. There is concomitant bone formation on the periosteal surface, which assists in maintaining bone structure, but this can be insufficient to maintain bone mass. **B,** Exercise during growth will facilitate periosteal bone formation, which optimizes bone structure. Bone loss during aging occurs from the inside out, so the enhanced structure achieved through exercise during growth has the potential to remain intact regardless of age-related changes to bone mass. (From Warden SJ, Fuchs RK: Exercise and bone health: optimizing bone structure during growth is key, but all is not in vain during ageing, *Br J Sports Med* 43:885-887, 2009.)

where the mechanical demands are highest. This leads to optimization of the skeletal structure, with greater bone material being positioned to resist external forces and load. This explains why new bone is preferentially laid down on the periosteal surface of loaded bones and why mechanical loading associated with weight-bearing activities generates large increases in bone strength without similar increases in bone quantity.[128] During early life, exercises that include high-impact activities and loads in multiple directions, such as gymnastics and basketball, are most beneficial. The only caveat is that the intensity of the exercise must not be so high as to cause the cessation of menses in females, which can lead to a decrease in BMD.

The female athlete triad has garnered more attention in recent years. It has been shown that up to 78% of high school varsity female athletes have one or more components of the triad.[129] The components of the triad are low energy availability with or without disordered eating, menstrual dysfunction, and low BMD, as displayed in Figure 31-15. Female athletes may present with one or more of the three triad components, and early intervention is essential to prevent progression to clinical eating disorders, amenorrhea, and osteoporosis. It has been reported that up to 62% of female collegiate level athletes have disordered eating, 66% of female athletes are amenorrhic, and 78% of recreational runners have had one or more irregular menstrual cycles when monitored over a 3-month period.[130] Low BMD was reported in 38% of amenorrhic adolescent athletes.[131] These three symptoms can lead to stress fractures caused by the premature bone loss and the low energy availability can negatively impact bone formation and increase bone resorption through suppression of metabolic and reproductive hormones. Bone stress injuries including stress reactions and stress fractures are more common in female athletes with menstrual irregularities or low BMD.[130]

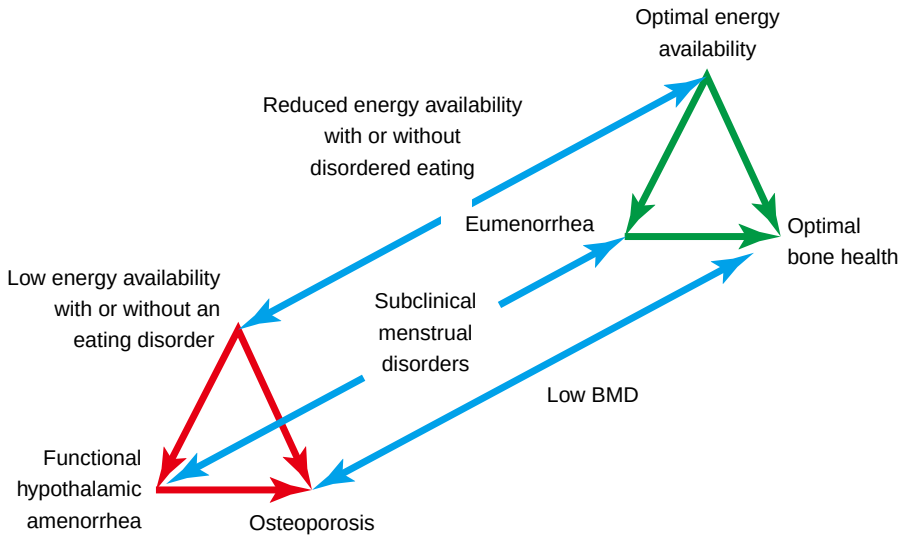

Figure 31-15 Spectra of female athlete triad. The three interrelated components are energy availability, menstrual status, and bone health. The availability of energy will affect menstrual status, and in turn menstrual status and energy availability will impact bone health. Optimal energy availability, eumenorrhea (normal menstruation), and optimal bone health will help the body to achieve optimal health and at the other end of the spectrum, the most severe presentation of the female athlete triad, which includes low energy availability, with or without disordered eating, functional hypothalamic amenorrhea, and osteoporosis. *BMD*, body mass density. (From De Souza MJ, Nattiv A, Joy E et al: 2014 Female athlete triad coalition consensus statement on treatment and return to play of the female athlete triad: 1st international conference held in San Francisco, California, May 2012 and 2nd International Conference held in Indianapolis, Indiana, May 2013, *Br J Sports Med* 48:289, 2014 adapted with permission from Nattiv A, Loucks AB, Manore MM et al: American College of Sports Medicine position stand. The female athlete triad, *Med Sci Sports Exerc* 39:1867-1882, 2007.)

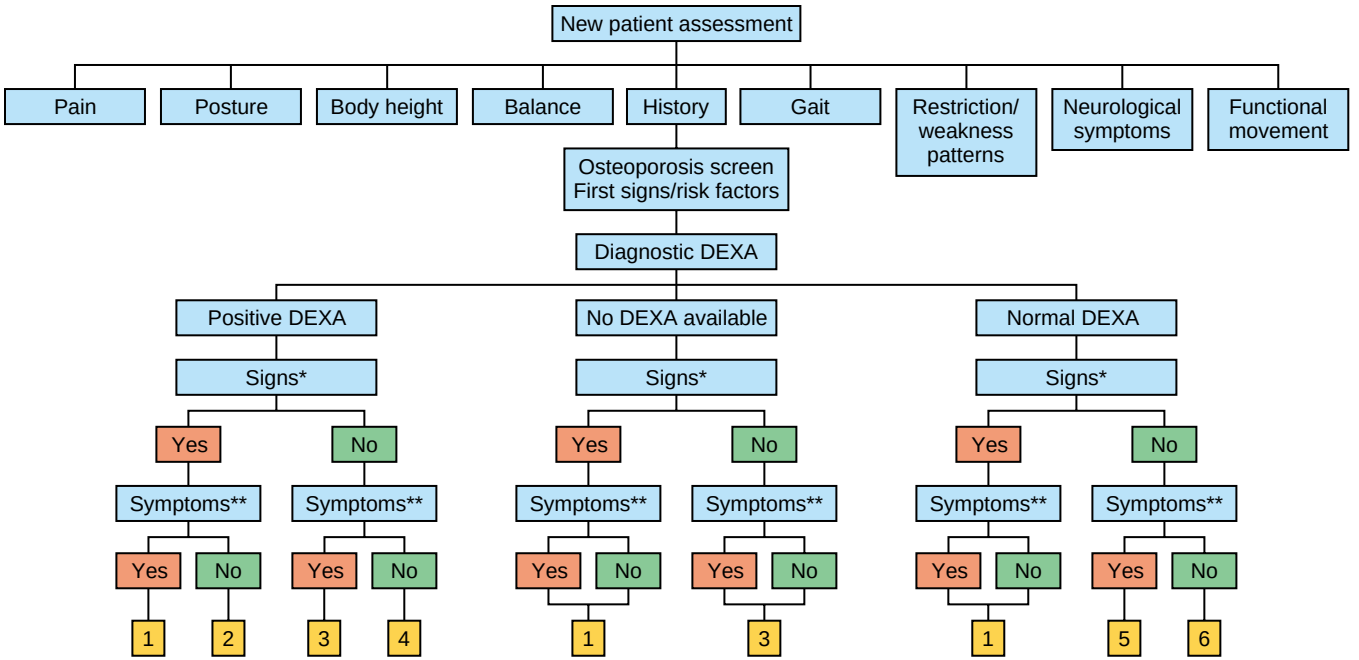
Female Athlete Triad

- Low energy availability with or without disordered eating
- Menstrual dysfunction
- Low bone mineral density (BMD)

Appropriate nutrition also is vital; regular exercise combined with a sufficient intake of calcium can increase bone mass in adolescents.[121,132] Exercise and diet from the age of 4 have been shown to influence BMD.[133]

Investigators found that in a free-living population, cohort levels of daily moderate to very vigorous physical activity were associated with hip size and density at 4 years of age and that those associations were more marked in children consuming more than the median daily intake of calcium.[133] The authors suggested this finding confirms the notion that adequate dietary intake of calcium may be necessary for optimal action of physical activity on bone development. In addition to calcium intake, a positive relationship exists between protein intake and bone mass gained during pubertal maturation.[113] Carbonated drinks are a significant risk factor for bone fractures, even after adjustments for age, weight, height, activity level, and total caloric intake in adults age 21 to 80.[134,135]



These nutritional factors can be discussed directly with children and adolescents and their parents, regardless of the reason the patient seeks therapy. Clinicians also should consider discussing the topic with any adult patient who has children or grandchildren. To be effective, education needs to be ongoing and aimed at various audiences. The settings and possibilities for education are many and varied.

Assessment of the Adult with Osteoporosis

Current and Past Medical History

Various factors that increase an individual's risk for osteoporosis were outlined in the previous section. Questions concerning these factors should be included in the past medical history form and discussed during the patient interview. Results of a BMD test are extremely helpful in guiding treatment. Clinicians also should keep in mind that a family history of a maternal hip fracture doubles the patient's risk for a hip fracture, regardless of current BMD levels.[126] Individuals with a vertebral compression fracture have a 15% higher mortality rate than those who do not experience fractures, and most compression fractures occur at T8-T12, L1, and L4.[100] Figure 31-16 presents a decision tree to help guide intervention.[136]

Examination. The objective examination can include tests and measures of height and weight, vision, cognition, posture, ROM, strength, flexibility, balance, gait, and sensation, depending on the specific diagnosis. All these factors have the potential to contribute to falls; the findings also provide a baseline measure before therapy is started and help guide the treatment plan. The following list is intended to guide the selection of specific tests and measures for patients with osteoporosis or to alert the clinician to factors to consider if these tests and measures are administered to individuals who may have osteoporosis or osteopenia but have been referred for an unrelated diagnosis. All measures should be as objective as possible.

Interventions

1. No spinal flexion, side bending, rotation. Monitor exercise program closely for safety, therapeutic intent, and effectiveness. Refer for further testing (e.g., x-ray, CT scan, MRI, Body Composition Scan [DEXA])
2. No spinal flexion, side bending, rotation. Monitor exercise program closely for safety, therapeutic intent, and effectiveness.
3. Extra caution with flexion, side bending, rotation. Teach movement with elongated spine to avoid compression. Monitor exercise program closely for safety, therapeutic intent, and effectiveness. Refer for further testing (e.g., x-ray, CT scan, MRI, Body Composition Scan [DEXA])
4. Extra caution with flexion, side bending, rotation. Monitor exercise program closely for safety, therapeutic intent, and effectiveness.
5. Exercise specific for condition. Monitor exercise program closely for safety, therapeutic intent, and effectiveness. Assess effectiveness and refer to physician if exercise worsens condition and/or no improvement seen.
6. Full flexibility exercises. Monitor exercise program closely for safety, therapeutic intent, and effectiveness. Teach movement with elongated spine to avoid compression and/or over-use syndromes.

Figure 31-16 Decision tree for improved screening of patients for osteoporosis. (Modified from Meeks SM: The role of the physical therapist in the recognition, assessment, and exercise intervention in persons with, or at risk for, osteoporosis, *Topics Geriatr Rehab* 21:42-56, 2005.)

Components of Examination for Osteoporosis

- Height and weight
- Vision
- Cognition
- Posture
- ROM
- Strength
- Flexibility
- Balance
- Gait
- Sensation

Height and Weight. Patients should be assessed standing without shoes. Regular measurement of height is important because loss of height is one of the first signs of osteoporosis. A loss greater than 6 cm (2.4 inches) in those over age 60 and greater than 4 cm (1.6 inches) in those under age 60 suggests a vertebral fracture.[137] The current measurement is compared with the patient's recall of his or her tallest height.

Vision. Poor vision or visual field deficits can contribute to falls. Patients should be instructed to track the clinician's finger in all directions without moving the head to check for visual field deficits.

Cognition. The **Beck Depression Inventory**[138] can alert the clinician to possible depression, which may lead to decreased social interaction and physical activity, which can contribute to falls. Checking for orientation to time, place, and year can alert the clinician to overall cognitive status; if decreased, the patient may have difficulty following directions or in performing a home exercise program.

Posture. A photograph of the patient taken from the side and front (after receiving signed consent) allows the clinician to educate the patient about posture and demonstrate changes between specific follow-up evaluations and sessions. For repeatability, the patient should wear the same clothes each time a photograph is taken. A flexicurve ruler can be used to measure the curves of the spine (http://www.umshp.org/pt/geritool). For cervical or thoracic deformity, the patient should be instructed to stand with the heels and buttocks against the wall, the head level, and the distance between the mastoid process and the wall should be measured in centimeters.[139] Posture in osteoporotic patients is classified into five types: normal, round back, hollow round back, lower acute kyphosis, and whole kyphosis.

Posture Types in Osteoporotic Patients

- Round back: thoracic kyphosis but maintains normal lumbar lordosis
- Hollow round back: thoracic kyphosis and increased lumbar lordosis
- Lower acute kyphosis: thoracic kyphosis and lumbar kyphosis
- Whole kyphosis: kyphosis of the entire spine

Range of Motion. Regardless of which joints need to be measured, precautions for spinal motion should be followed, depending on the patient's BMD test results and/or clinical presentation, as outlined previously under *Spinal Biomechanics*.

Strength. Key muscles include the trunk extensors, hip abductors (crucial to lateral balance control), and the gastrocsoleus complex (important for balance reactions). For very frail patients, the clinician must keep in mind that traditional manual muscle testing of the extremities requires stabilization at the trunk, which may be difficult or painful. For patients who can lie prone, trunk extensor endurance can be measured by placing a pillow under the pelvis and having the patient hold the sternum off a plinth for up to 20 seconds.[140] A 1 repetition maximum (1 RM) or 10 RM is another option for those who are not as frail. Trunk extensor endurance is more important than pure strength because these muscles are used for maintaining upright posture. Timed, loaded standing has been identified as a measure of combined trunk and arm endurance that is suitable for use in people with vertebral osteoporosis.[141] This test measures the time a person can stand while holding a 2-lb (1-kg) dumbbell in each hand with the arms held in 90° shoulder flexion, elbows extended and wrists in a neutral position.

Balance and Gait. A standardized assessment, such as the **Berg Balance Scale**,[142,143] **Tinetti Performance Oriented Mobility Assessment**,[144] **Activities-Specific Balance Scale**,[145] or **Dynamic Gait Index**,[146,147] can be used to determine the fall risk and specific activities that are difficult for the patient.

Sensation. Tests of sensation, especially of the feet, may reveal changes in perception that can contribute to falls. These could include sharp or blunt discrimination, tactile (detecting and localizing touch), temperature discrimination, proprioception, and two-point discrimination.

Functional Assessment. The **Osteoporosis Functional Disability Questionnaire**[148] can be used to establish the level of disability, which can aid goal setting. The **Osteoporosis Assessment Questionnaire—Physical Functioning (OPAQ-PF)** is a 15-item, patient-reported outcome measure developed to meet the requirements of evaluating osteoporosis treatment effectiveness. It captures the impact of osteoporosis on patients' ability to perform activities of daily living requiring physical function and was adapted from the OPAQ version 2.0.[149] This measure has been found to be suitable in detecting change in daily activities of physical function of osteoporosis patients, whether they have or have not sustained a recent fracture. Pain can be assessed with the **Visual Analog Scale**. Repeating these tests and measures during reassessments provides solid, objective documentation of the patient's progress and response to the intervention program.

Intervention

Physical therapy intervention will often focus on patient education, pain management, reducing risk of falls and fear of falling, and remodeling bone tissue. Intervention for patients who have sustained a hip fracture or Colles fracture of the wrist as a result of a fall will differ from those who have sustained vertebral fractures. Rehabilitation after a hip fracture or Colles fracture should address impairments in lower or upper extremity strength and endurance, disturbances in balance, and gait impairments. Additional emphasis should be placed on education aimed at preventing further falls and establishing an appropriate exercise program for the patient to follow after discharge from physical therapy.

How do clinicians know that weight-bearing exercises are effective for adults with osteoporosis? This knowledge is based on the substantial evidence that elite athletes and long-term exercisers have greater bone mass and BMD at sites that undergo mechanical loading during exercise than age-matched sedentary individuals.[150–152]

For example, runners age 50 to 72 have approximately 40% greater vertebral trabecular bone density than nonrunners.[151] Both male and female recreational and world-class weight lifters age 20 to 40 have 10% to 35% greater lumbar spine BMD[153–155] and vertebral trabecular bone density than controls.[156,157] Heinonen et al.[158] investigated the effects of high-impact training and detraining on femoral neck structure in a group of 98 premenopausal women by applying an 18-month high-impact exercise program which involved supervised 60-minute training sessions 3 times per week. Forty-nine women were assigned to the intervention, and 49 were instructed to maintain their normal level of activity. Results from DXA scans, which are used to diagnose and follow osteoporosis, revealed increased femoral neck strength in the intervention group after 18 months. At a 3.5-year follow-up point, the exercise-induced benefits had diminished. However, the exercise benefits for physical performance, measured by lower limb power generation, were maintained 3.5 years after intervention.

Reviews of the association between physical activity and the risk of osteoporotic fractures have shown that maintaining a physically active lifestyle reduces the risk of hip fracture, although most of the evidence is based on observational studies. Despite there being a lack of evidence from randomized controlled trials, there is evidence from cohort studies that suggests older adults should be encouraged to maintain a physically active lifestyle.[159] Whether this affects all osteoporotic fracture sites or just those at the hip remains unknown.

Based on the impairments uncovered, intervention for those who have sustained a vertebral fracture can be directed at reducing pain; improving posture, balance, strength, and flexibility and ROM; and patient education. Most of these interventions can be addressed by designing a comprehensive exercise program for the patient. A significant amount of research supports the use of weight-bearing and resistance exercise programs in older adults and those with osteoporosis to assist in preventing BMD loss, to improve balance and reduce the risk of falls.[160–165]

Principles of Exercise Intervention and Effects of Exercise on the Skeleton

Bone responds to force in a predictable manner described by Wolff's law. *Wolff's law states that every change in the form and function of a bone or in the function of the bone alone leads to changes in its internal architecture and in its external form.* Bone is deposited and resorbed in accordance with the stresses placed upon it. Wolff's law works not only through weight bearing through gravity (e.g., walking or running transmits forces through the limbs and results in increased BMD in the hip and lumbar spine) but also through the pull from tendons on bones that occurs when a muscle produces force. Hence increases in strength through weight training or muscle contractions that are not directly in a weight-bearing position or are in a gravity-reduced or gravity-eliminated position (e.g., supine scapular retraction) cause increased force on the bone and result in increases in bone modeling. However, this law works both ways; for example, in response to increased loads through weight training, the bone responds by increasing its mass. However, once the exercise is stopped, the bone responds again by decreasing its mass because the stress is no longer being applied. Therefore an exercise intervention program must be continuous for the effects to be maintained.

Nikander et al.[162] conducted a meta-analysis of the effect of long-term exercise on bone strength at different stages of life. Bone strength was measured by peripheral quantitative computer tomography-, magnetic resonance imaging (MRI)-, and DXA scan-based structural hip analysis. The intervention was composed of weight-bearing impact training, resistance or endurance training, or a combination of all three. The results demonstrated that there was a significant, albeit small, effect on lower extremity bone strength in prepubertal boys but no significant effect on prepubertal girls and premenopausal and postmenopausal women. However, the authors acknowledge that these disappointing results could be a consequence of the short duration and inadequate power of the trials.

The acronym of **FITTE** should be considered for all patients encountered. This means planning and progressing ***F****requency*, ***I****ntensity*, ***T****ime*, ***T****ype*, and ***E****njoyment*. The American College of Sports Medicine (ACSM) emphasizes the importance of strength training for older adults to assist in prevention of loss of muscle mass and bone density.[166]

American College of Sports Medicine Exercise Recommendations for Adults over the Age of 65 Years (or Adults with Chronic Conditions, such as Arthritis)[166]

- Do moderately intense aerobic exercise 30 minutes a day/5 times per week
  or
- Do vigorously intense aerobic exercise 20 minutes a day/3 times per week
  and
- Do 8 to 10 strengthening exercises, with 10 to 15 reps/exercise, 2 to 3 times per week
  and
- Have a physical activity plan

Any exercise must be intense enough to challenge the system to adapt based on Wolff's law but not so intense as to cause a fracture. In old age, the bones' responsiveness to mechanical loading has been reported to decline, peak strains and strain rates become lower, and the range of loading configurations is more limited.[136] Unfortunately, there is no research to call upon regarding dose-response relationships to exercise; therefore no easy method is available to make this determination except clinical judgment. The fracture point of any bone is determined by its current BMD, the forces applied to the bone, and the moment caused by that force (i.e., the location of the application of the force; e.g., 2.3 kg [5 lbs] in the hand creates a greater moment at the shoulder than 2.3 kg [5 lbs] at the elbow). An adult with good posture who has a normal BMD can perform exercises that increase the flexion force on the spine, such as abdominal crunches, without risk of vertebral fracture. This is because the moment arm is small (see Figure 31-13), and the force is at a level the normal bone can tolerate. However, if a patient has osteoporosis and presents with a significant kyphosis (see Figure 31-13), the same exercise could result in an anterior vertebral fracture. In this case, the moment is much larger and the bones lack the BMD to withstand this amount of force. Clinicians should be aware that the resultant forces on bone are those arising from muscle contraction and should consider the effect of positioning of the patient during exercise to maximize the forces on bone without causing injury to the bone.

The exercise intervention must also be specific to the anatomical site and varied so that the system continues to adapt and improve. If strengthening the back extensors is the goal, the clinician must ensure that the exercises prescribed specifically strengthen the extensors. In addition, the frequency and intensity of the exercise, as well as the manner in which the bone and muscle are used, must be varied so that they can adapt appropriately. For example, performing 10 repetitions of standing hip abduction against the resistance of light elastic bands or tubing 3 times a week for an entire month is not enough of a varied stimulus to achieve gains in bone or muscle. The intensity and/or frequency must be increased, and other exercises aimed at strengthening the same muscle must be incorporated into the treatment program. A meta-analysis showed that programs combining random or high-impact exercise with resistance training increased bone mass at the hip and lumbar spine.[161] High-impact activity alone only promoted increased hip bone density. A high-intensity multipurpose exercise program has also been found to have more beneficial effects, including BMD gains in the femoral neck and lumbar spine in addition to a reduced falls rate when compared with a low-intensity, low-frequency program.[167] The multipurpose exercise program included an aerobic warm-up, static and dynamic balance training, functional gymnastics, isometric strength training and stretching sequences, upper body strength exercises, and a home exercise program emphasizing strength and flexibility.

Basic Principles of Osteoporosis Exercise Training

- Intensity must be sufficient to challenge the system
- Exercise must be specific to the anatomical site
- Exercise must be varied so that the system can continue to adapt

Exercise in Postmenopausal Women and Osteoporosis

Many national and international organizations, such as the International Osteoporosis Foundation, advocate the use of physical activity or exercise for the prevention of bone loss, falls, and fractures. Considerations that must be taken into account when prescribing exercise to osteoporotic patients include how to safely modify exercises when mobility or posture is altered and will exercise increase the risk of falls or fractures.

Because women are much more likely to develop osteoporosis than men, most of the research on the effects of exercise in osteoporosis have included only women. In addition, much more research has been conducted on postmenopausal women than on postmenopausal women with osteoporosis. Studies have shown that structured exercise programs that use a combination of odd- and high-impact loading with resistance training significantly improve BMD in the femoral neck and lumbar spine in postmenopausal women.[168] High-impact loading refers to vertical jumps, rope jumps, and running. Odd-impact loading refers to aerobic and step classes, bounding activities, agility exercises, and games that require movement in directions to which the body is not accustomed. Weight-bearing exercises such as walking are important for BMD of the hips and lower extremities. In postmenopausal women, Nelson et al.[169] found a reduced loss of trabecular bone density in the lumbar spine after a 1-year walking program. In their study, Chow et al.[170] used a control group, an aerobic exercise group, and an aerobic exercise plus weight-training group. The two exercise

groups were followed 3 times a week for 1 year. At the end of the study, both groups demonstrated a 4% to 8% increase in bone mass, whereas the control group had a 1.1% loss. In addition to strength training, tai chi may improve coordination, equilibrium, and flexibility, and lead to fall reduction. Its effect on bone mass has been comparable to moderate-speed or slow walking exercises.[171] More evidence is required to confirm whether tai chi has a role in the prevention or treatment of osteoporosis.

A study by Bergstrom et al. included 121 women 45 to 65 years of age, with forearm fractures and a T-score of −1.0 to −3.0.[160] The women were separated into an exercise group and a control group. The exercise group completed 30 minutes of fast walking 3 times a week in addition to one or two sessions in a gym. The gym routine included a 5-minute warm-up, 25 minutes of strength work, 25 minutes of aerobic work, and 5 minutes of stretching. The women in the control group were not given any intervention but were free to participate in physical activity if they chose. BMD was measured at baseline and after 1 year of intervention. The total hip BMD in the exercise group increased 0.58% and in the control group decreased 0.36%. No significant effects of training were seen in the lumbar spine. These results indicate a small but positive effect of the exercise intervention on hip BMD in this group of postmenopausal women with low BMD. In a study involving postmenopausal women with osteoporosis, Krolner et al.[172] had women age 50 to 73 who had had a previous Colles' fracture participate in 8 months of aerobic exercise. The exercise group showed a 3.5% increase in lumbar BMD, whereas the control group, who performed no specific exercise program, showed a 2.5% decrease. Chow et al.[173] designed an exercise program to improve functional capacity and to provide social interaction through 30 minutes of aerobic exercise, such as dance or walking, and 30 minutes of strength training performed at low loads with high (10 to 30) repetitions. The results were compared with a control group of individuals who did not exercise and had no improvement in maximum oxygen volume (VO_2 max) from baseline testing and 2 years later. After 2 years of 3 times weekly exercise, the exercise group demonstrated significantly fewer vertebral fractures than the control group: 3 of 53 women in the exercise group suffered fractures, compared with 7 of 37 women in the control group.

Exercise has also been shown to be effective in the treatment of vertebral fractures and in increasing back extensor strength. Bennell et al.[168] investigated the efficacy of a physical therapy program incorporating manual therapy techniques, clinician-led exercises, and home exercises designed to reduce back pain, increase back extensor strength and lower limb muscle strength, and improve posture, trunk stability, and trunk mobility in adults with osteoporosis. There were 11 participants in the intervention group and 9 in the control group. Subjects were aged 53 to 90 years, and 17 were female. Participants had sustained at least one vertebral compression fracture between 3 months and 2 years previously. The intervention group attended 10 weekly sessions following a standardized progressive treatment protocol, which included postural taping, soft tissue massage, mobilizations, postural exercises, and resistance and weighted exercises. They were also given a home exercise program to follow, which included daily exercises for posture and ROM in addition to strength and control exercises to be performed 3 times a week. The control group did not receive any additional intervention or complete any home exercises during the 10-week study. Results demonstrated a significant reduction in pain during movement and at rest in addition to greater improvements in timed loaded standing, perceived change in back pain, and **Qualeffo physical function scores**. The Qualeffo is a quality of life questionnaire especially developed for patients with osteoporotic vertebral deformities.[174,175] Sinaki and Mikkelsen[105] studied women who had sustained a vertebral compression fracture. They found that resistance exercises to strengthen the back extensors led to a reduction in new fractures compared with controls, whereas exercises that strengthened the back flexors led to an increase in vertebral deformities.

An expert panel was formed by the International Osteoporosis Foundation and NOF with the mission of providing exercise recommendations for individuals with osteoporosis with no fracture history and individuals with a history of osteoporotic vertebral fracture. Their recommendations are shown in the accompanying textbox.

International Osteoporotic Association Exercise Prescription

For older adults with osteoporosis:

- Strongly recommend engagement in a multicomponent exercise program that includes resistance training in combination with balance training.
- Recommend that these individuals do not engage in aerobic exercise to the exclusion of resistance or balance training.

For older adults with osteoporotic vertebral fracture:

- Strongly recommend engagement in a multicomponent exercise program that includes resistance training in combination with balance training. Consultation with a physical therapist is advised to ensure safe and appropriate exercise.
- Recommend individuals do not engage in aerobic exercise to the exclusion of resistance or balance training.

Some of the most compelling research on the importance of back extensor strength was performed by Sinaki et al.[106] who performed a 10-year prospective study of the effects of back extensor strengthening on postmenopausal women. In their study, 65 women age 48 to 65 years who were healthy, nonsmoking, and Caucasian and who did not participate in HRT were randomized into a back exercise or control group. The exercise group wore a backpack containing weight equal to 30% of their

maximum isometric back extensor strength and lifted the weight 10 times while prone. This was performed daily, 5 days a week. The weight was increased, but not to more than 22.7 kg (50 lbs). Every 4 weeks, muscle strength and physical activity were assessed, and proper lifting and good posture were reviewed with the subjects. After 2 years, the exercise group discontinued the exercise, and the subjects were not monitored. Eight years later, the subjects were reevaluated; 27 of the exercise group and 23 of the control group returned. Follow-up testing revealed more vertebral fractures in the control group than in the exercise group (30% vs. 11% of subjects), a decrease in back extensor strength from baseline in both groups (16.5% in the exercise group and 27% in the controls), and significantly greater BMD of the spine in the exercise group. The author of this study acknowledged that the muscle resistance with a heavy backpack could be too strenuous for fragile women with osteoporosis. In this case, low-intensity back strengthening without a backpack can improve back extensor strength and quality of life.[176]

Clinical Note

Studies have shown that an increase in relative spinal extensor strength can lead to reduced thoracic kyphosis, fewer vertebral fractures, and less loss of height and anterior rib cage pain,[177–179] as well as to decreased pain, increased mobility, and overall improvement of quality of life.[180]

Key Points in the Treatment of Osteoporosis

- Exercise intervention in older adults with osteoporosis may not increase BMD, but it can slow age-related loss of BMD
- Flexion exercises are **contraindicated** in adults with osteoporosis and a low BMD score
- Strengthening of the back extensor muscles is critical
- Osteoporosis is a childhood disease that does not manifest until old age; *prevention is paramount*

Even in light of the convincing evidence of the positive effects of increased trunk extensor strength, implementing extensor strengthening can be difficult in older adults. It requires implementation of exercises that can increase axial stability without causing vertebral wedging or fracture. By the time they are seen for treatment, many of these patients have an increased thoracic kyphosis and a forward head posture that makes even lying supine difficult. These postural deviations, along with decreased shoulder flexibility and decreased cervical rotation, can also make lying prone difficult, if not impossible. If the patient cannot tolerate supine or prone lying, he or she may start in a seated position to perform back extension exercises and progress to prone. The supine position can be modified with pillows used as needed to support the flexed spine. Initial treatments may be as basic as emphasizing attempts at lying supine with slowly decreasing support as the spine gently lengthens and extends so that the patient can eventually lie with one or no pillows under the head. This may not be a possibility for some patients because of long-standing bony deformities. A comprehensive extension and postural reeducation program designed specifically for this population is presented in *Walk Tall!* by Sara Meeks.[181] The book includes diagrams for each exercise and is spiral bound, making it easy to follow. As aforementioned, sitting is also a good option if the patient cannot tolerate the supine position. However, the proprioceptive feedback from the plinth can help the patient maintain elongation of the spine, as opposed to tilting the head up, and also lets the person know how far forward the head and/or shoulders are. Once a comfortable, lengthened, and extended supine position has been achieved, gentle cervical and thoracic extension can be initiated through isometrics, such as pushing the back of the head and the shoulders into a plinth. Progressions from here include extending one leg along the surface of the plinth keeping the leg in alignment with the hip and pulling the toes toward the knee, extending the heel. This will assist in lengthening the quadratus lumborum and hip flexors while strengthening the quadriceps and ankle dorsiflexor muscles. This can be progressed to actively pushing the outstretched leg into the plinth, which will engage the hip extensors, lower erector spinae, and the ankle dorsiflexor muscles. The last two progressions not only assist in back alignment and strengthening, but will also improve hip alignment and strength.[136] Older adults who tend toward a flexed posture will likely have tight hip flexors, hamstrings, quadriceps, and calf muscles. These muscles all need to be stretched as the clinician works on gaining extension and length throughout the spine. The same difficulties in positioning need to be addressed to stretch the lower extremities as those addressed in working on spinal extension (e.g., supine with pillows under the head and progressing to fewer or no pillows). Positioning in side lying can be a good way for the clinician to stretch the quadriceps and hip flexors manually.

If the patient can tolerate lying prone, various extension exercises can be performed (Figure 31-17). These include arm and leg lifts, with the arms at the side, out to the side, or overhead. Combinations of arms only, legs only, or ipsilateral and contralateral arm and leg can all be used. Because these exercises can be difficult, the clinician should start with one extremity only and progress to alternating the same extremity. The last step in the progression should be extension of all four extremities together or alternating arm and leg extension, which can be difficult for patients to coordinate. For those who are familiar with yoga and have patients who practice it, poses such as the cobra and locust may be familiar (Figure 31-18). Patients are instructed to think of extending and

Figure 31-17 Upper back lift. This intermediate exercise strengthens the back muscles. **A,** The patient lies face down on the plinth with a pillow under the hips and lower part of the abdomen. A rolled towel may be used to cushion the forehead. Keeping the arms at the sides and the head in line with the neck and torso, the patient tightens the abdominal muscles. The individual must focus on keeping the shoulders down so that they do not shrug up toward the ears. **B,** The patient inhales and raises the head and chest a few inches off the plinth. Breathing normally, the patient holds this position for 5 seconds and then returns to the starting position. The patient rests for a few seconds and then repeats this exercise 5 to 10 times, as the person is able.

Figure 31-18 Yoga poses. **A,** Cobra pose. **B,** Locust pose.

lengthening through the extremities as they lift to promote elongation of the spine and to avoid compressing the back. However, Sinaki[182] discusses a case series to raise awareness of the effect of strenuous yoga flexion exercises on the spines of patients with osteoporosis or osteopenia. The case series described three females who were previously healthy, physically active, and had low BMD. These patients experienced new pain and fracture areas following participation in yoga flexion exercises. Clinicians should educate patients on the merits and dangers of poses involving flexion. Although yoga can be a beneficial exercise for improving balance, posture, and flexibility, some of the poses may exceed the biomechanical limits of the spine. In her paper, Sinaki explained that compressive forces of the spine during flexion exercises are increased in yoga because of the contraction of the spinal flexor muscles and the strain of the longitudinal ligaments of the spine in a position in which ability of the discs to absorb shock is reduced.[182]

Manual therapy can also be an effective treatment intervention to address back pain in adults with osteoporosis. Bautmans et al.[183] investigated thoracic spine mobilization in a group of 48 postmenopausal females with osteoporosis. The subjects were divided into a control group ($n = 19$) and an intervention group ($n = 29$). The intervention group participated in 18 sessions of spinal rehabilitation with a physical therapist. Sessions were designed to correct the posture of the thoracic spine by gentle mobilizations using manual techniques, taping, and exercises for postural correction. The control group did not receive physical therapy treatment until the conclusion of the study. Thoracic kyphosis was measured at baseline and after 3 months using a Spinal Mouse device, which is a handheld inclinometer connected to a computer that provided data on the inclination angles at each vertebral segment. Of the 21 subjects who completed the intervention, 15 attended more than 50% of the sessions. The results showed that thoracic kyphosis significantly improved in the intervention group. However, due to study design, it is not possible to determine which mechanism leads to thoracic kyphosis improvement. A further limitation was the relatively poor compliance to rehabilitation. The impact of manual mobilizations to the thoracic spine needs further investigation before recommendations can be made on whether it is beneficial to include the technique in treatment programs for osteoporotic patients with thoracic kyphosis.

Aquatic therapy has garnered more research attention in recent years. It can provide a useful alternative to land training in patients who have fear of falls, poor balance, pain, or lack of motivation. Arnold et al.[184] compared an aquatic exercise program with land exercise and a sedentary control in a group of 68 women with osteoporosis. The interventions were standardized for time and frequency, each lasting 50 minutes, 3 times a week for 20 weeks. The women in the control group were instructed to not change their activity level or participate in any new exercise programs for the 20-week period. Only one balance measure, the backward tandem walk, significantly improved in the aquatic exercise group compared with the land training group. Function

and quality of life did not significantly differ compared with the control group at follow-up testing. The authors concluded that the improvement in balance and global change suggested aquatic training could be a viable alternative for those who have difficulty exercising on land. A group in Brazil has investigated the benefits of high-intensity aquatic exercises on BMD, bone metabolism, and bone mass in postmenopausal women.[185,186] The intervention consisted of a 24-week aquatic program, lasting 50 minutes, 3 days per week. The control group was sedentary for the 24-week period. Measures were taken at baseline and after 24 weeks. The results of these studies showed a reduction in pain, number of falls, and an increase in physical fitness. Regarding effects on the skeleton, there was an attenuation of bone resorption and enhanced bone formation, which prevented a reduction in the BMD of the greater trochanter. In women with vertebral fractures, there was an incremental rise in BMD and T-score of the femoral head.

Compression Fractures

The primary goal of treatment for patients with vertebral fractures is the same for those without fractures: getting to a point where the patient can tolerate extension exercises. Initially, intervention is likely to focus on addressing pain, instructing the patient in proper body mechanics for transfers, and perhaps fitting the patient with a corset or lumbosacral orthosis.[187,188]

Fall Prevention

Because more than 90% of hip fractures occur as a direct result of a fall,[120] and two thirds of those who sustain a hip fracture do not return to their premorbid functional level,[189] a comprehensive treatment program for patients with osteopenia or osteoporosis must include interventions designed to prevent or reduce the likelihood of falling. Functional decline and fear of falling are severe threats to independence and quality of life in older individuals. Inactivity and low physical activity levels, reduced muscle strength, and hyperkyphosis all have been shown to be risk factors for falling and hip fracture.[102,190–196] Conversely, a large body of research has shown that higher physical activity levels and greater strength lower the risk of falling and subsequent fractures in both women and men. Clinicians can best address the risk of falling by stressing the importance of increased physical activity, even if the activity is not enough to increase strength in a very frail individual; they also can emphasize strengthening exercises for the muscle groups most likely to help improve balance, such as the hip abductors, hip extensors, and calf musculature, which are important in righting reactions. The most important elements of the exercise program are balance and strength training, and secondarily flexibility and endurance training.[197] A meta-analysis has shown that physically challenging balance training and a high amount and frequency of exercise are the components of the most successful programs in reducing falls.[198] Walking or resistance training alone may not have a significant effect on falls and if used for falls, prevention should be combined with some type of three-dimensional balance training.[164] Three-dimensional training is described as constant movement in a controlled, fluid, repetitive way through all three spatial planes and can include tai chi or dance. Clinicians should search for group or community programs in which patients can enroll for multicomponent exercise programs. This type of community and peer support may increase the likelihood of follow-through after discharge, as well as improve the patient's social interactions, which also makes carryover more probable. Clinicians must keep in mind that strengthening exercises need to be of sufficient intensity to achieve strength gains. Performing a 1-RM or a 10-RM test for lower extremity muscles can guide selection of the appropriate weight. Strength gains have been found in older adults with either increases in resistance or increases in repetitions.[199,200] Gains in functional abilities have also been found with regimens that vary from 1 to 3 times a week.[200]

Other areas that must be addressed to reduce the risk of falls include vision, ROM limitations, the home setting (e.g., lighting, throw rugs, small pets underfoot), cognition, a previous history of falling, which may lead to fear of falls, co-morbidities, provision of assistive devices, footwear, provision of hip protectors, and medication use.

Osteoporosis in Men

Osteoporosis has traditionally been thought of as a women's disease but in recent years, the idea that bone loss is an inevitable part of aging in men has stimulated more discussion of this issue. Men in their 50s do not experience the rapid loss of bone that women do in the time following menopause. Because men have larger skeletons, their bone loss starts later and progresses more slowly than in females. However, by the time men reach the age of 65 to 70, they lose bone mass at the same rate as women and the absorption of calcium, an essential nutrient for bone health, decreases in both males and females.[201] The NOF recommends men take part in weight-bearing exercises, such as hiking, jogging, brisk walking, racquet sports, basketball, or soccer for 30 minutes on most days of the week.[202] NOF also recommends muscle strengthening or resistance exercises, such as lifting weights, using elastic exercise bands, weight machines, or body weight exercises 2 to 3 times per week. Clinicians must remember when treating male patients that osteoporosis and fractures also occur in men and that investigation and treatment are needed alongside educating male patients on bone health measures.[203]

Risk Factors for Osteoporosis in Men

- Chronic diseases that affect the kidneys, lungs, stomach, and intestines or alter hormone levels
- Regular use of certain medications, such as immunosuppressive drugs
- Undiagnosed low testosterone levels
- Unhealthy lifestyle habits, such as excessive alcohol consumption, low calcium intake, and inadequate physical activity
- Age—older men are at greater risk
- Race—Caucasian men are at higher risk

Osteoporosis in the Young and Physically Disabled

Osteoporosis is often associated with older people, but it can affect children. In very young children, it can be caused by underlying diseases, such as osteogenesis imperfecta. In addition, in young people with complex disease or disability, the effects of medication and reduced mobility can lead to an increased risk of developing osteoporosis. Percutaneous endoscopic gastrostomy (PEG) feeding is sometimes used to supplement the diets of those at risk of developing aspirational pneumonia or with an inability to eat sufficient quantities of food, both of which can be common problems in young adults with complex care needs. Studies have shown that PEG feeding over time can result in malabsorption of nutritional components, such as calcium in the duodenum, which can lead to inadequate intake of crucial vitamins and minerals.[204,205] The reduced muscle activity and thus reduced physical activity seen in conditions such as cerebral palsy can lead to reduced bone size and reduced BMD. The effect of reduced physical activity levels was studied in a group of 38 subjects (under 40 years of age) with varying levels of physical disability.[206] Bone scans of the radius were performed using a bone sonometer. Results confirmed that immobility is associated with bone loss and that subjects who were PEG-fed were at a higher risk of diminished BMD. Clinicians should be cognizant of this when treating patients with complex physical disabilities, especially if teaching manual handling techniques to family or caregivers and when providing therapeutic exercise programs.

Postsurgical Management of Vertebral Fractures

Kyphoplasty

Although rehabilitation is not needed to help patients to recover from kyphoplasty, these individuals do benefit from treatment to address other issues related to the fracture. They may need to be seen for the same issues that a person without a fracture would require rehabilitation: abnormal posture (i.e., increased kyphosis), weakness of the back extensors and lower extremity muscles required for balance, fall prevention and balance training, and education about lifestyle modifications.

PAGET'S DISEASE OF BONE AND PRIMARY HYPERPARATHYROIDISM

Clinicians are extremely unlikely to see patients referred with either PDB or PHPT as a primary diagnosis. However, both conditions can result in osteopenia and osteoporosis and therefore are included to alert the clinician to other diagnoses that must be considered in the overall treatment of patients and to present some basic information about epidemiology, signs, and symptoms to facilitate proper diagnosis.

Paget's Disease of Bone (PDB)

PDB is the most common bone disorder after osteoporosis. It affects approximately 3% of people in the United States over age 50 and 10% of those over age 80; however, its incidence appears to be decreasing.[207] PDB is most common in the United Kingdom and in those of European descent. It is uncommon in Africans and Asians. This disease is often asymptomatic and is discovered incidentally through radiographs or an increase in serum alkaline phosphatase activity.[208] Bone pain is the most common symptom of the disease. It involves accelerated bone resorption followed by deposition of a dense and disorganized bone matrix.[209] Physical therapists may never see these patients because medical intervention (e.g., a course of bisphosphonates) is very effective in reducing the bone pain, and this reduction can last for years after cessation of the medication.[207]

Because of the structural weakness of pagetic bone, the most common complications are pain, structural deformity, and fracture. If a diagnosis of PDB has not been made in an individual presenting for rehabilitation, specific physical symptoms can alert the clinician to this diagnosis (see textbox in Part A, p 1116).

The bone pain reported by patients with PDB can be distinguished from pain caused by osteoarthritis because the pain increases with rest, with weight bearing, when the limbs are warm, and at night. It is continuous and reported to be a dull, boring pain.[207] Rehabilitation is aimed primarily at reducing pain through the use of acupuncture, transcutaneous electrical nerve stimulation, or other physical agents, aquatic exercise, or land-based exercises that do not put stress on the affected bone or bones.[210–212] Orthotic devices, such as walking aids, can help with specific problems, such as limb shortening, in addition to reducing pain caused by musculoskeletal changes and deformities.[212] Other potential rehabilitation interventions include bracing for structural abnormalities (e.g., bowing of the lower limb) in an attempt to realign the bones to provide for proper weight bearing; correction for leg length differences that may also result from bony deformities; and bracing for the spine in the case of spontaneous compression fractures resulting from unstable bone.

The brittleness of pagetic bone can lead to spontaneous fracture, and these occur most commonly in the femur, tibia, humerus, and forearm.[213] In the case of fracture resulting from PDB, healing is slow because of the altered mechanical structure of the bone itself. Nonunion of fractures in PDB has been reported to be as high as 40%, especially when the fracture involves the proximal femur.[214,215] In addition, increased weight bearing through the bone, which stimulates bone growth and remodeling in healthy individuals, is a less effective process in individuals with PDB. Osteoarthritis secondary to Paget's disease eventually may require a total joint replacement or tibial osteotomy. Exercise intervention for those requiring joint replacement should take into consideration other lesions or areas affected by the disease that may require modification of traditional intervention so as to not cause fracture at another site. In addition, as with fractures that are not treated surgically, rehabilitation will be extended because of the abnormalities of the bone structure.

The key point that clinicians should remember with individuals with PDB, whether they are being treated for complications of the disease or for other diagnoses, is that the bone remodeling process in the affected areas is abnormal and produces a weak bone structure that is susceptible to fracture. Treatment of those who have undergone orthopedic surgery to repair fractures will likely be extended compared with those with normal bone status.

Primary Hyperparathyroidism

The function of the parathyroid glands is to maintain serum calcium concentrations and to regulate bone metabolism. In PHPT, overproduction of PTH results in an increase in the release of calcium from the bones and into the blood. Hyperparathyroidism increases bone breakdown and replaces bone with fibrous tissue, resulting in generalized bone demineralization, resorption, and pathological fractures. Women are affected 2 to 3 times more often than men, and the average age at diagnosis is 55 years. Over 15 years, 60% of untreated asymptomatic patients will lose >10% of their bone density.[216] BMD loss is greater in cortical bone (e.g., the forearm) than in trabecular bone (e.g., the spine) or in mixed cortical and trabecular bone (e.g., the hip).

Other than bone pain, symptoms can include thirst, generalized weakness, osteoporosis, kidney stones, polyuria, and constipation. In its severest form, pathological fractures occur as a result of advanced osteoporosis. However, it is now extremely uncommon for the disease to progress to an advanced stage without being recognized during routine laboratory work.

For clinicians, the primary consideration in hyperparathyroidism is that osteoporosis at a relatively young age (i.e., approximately 55 years) should serve as a warning of the possibility of this condition.

CHAPTER 32

Muscle Disease and Dysfunction

SABRINA PAGANONI, ANNE-MARIE THOMAS, WALTER R. FRONTERA

MUSCULAR DYSTROPHIES

The muscular dystrophies comprise a hereditary group of disorders arising from various genetic defects that alter the structure and function of a range of muscle proteins (Table 32-1).

Dystrophinopathies: Duchenne's Muscular Dystrophy and Becker's Muscular Dystrophy

Genetics/Epidemiology

Duchenne's muscular dystrophy (DMD) and Becker's muscular dystrophy (BMD) share a defect in the muscle protein dystrophin and an X-linked recessive mode of inheritance.[1] DMD is characterized by severely reduced or absent dystrophin, whereas BMD involves a milder dystrophinopathy with decreased or altered dystrophin. Both conditions primarily affect young males. The incidence of DMD is 1 in 3500 male births worldwide, and the incidence of BMD is 5 in 100,000.[2]

Dystrophin is a key component of the sarcolemma of skeletal and cardiac muscles. A deficiency of dystrophin leads to muscle membrane instability during contraction and relaxation (Figure 32-1).

Clinical Features: Duchenne's Muscular Dystrophy

At birth, most boys with DMD appear normal and achieve the milestones of sitting and standing with little or only slight delay. Some affected boys, however, are hypotonic and weak at birth. Subsequently, affected individuals develop a waddling gait and a tendency to walk on the toes and fall. Between the ages of 2 and 6, children with DMD develop difficulties running, jumping, and climbing stairs. The disorder has a characteristic pattern of progressive weakness (i.e., worse in the proximal muscle groups, at least initially) and consequent functional decline. Proximal lower limb muscles, such as the hip extensors, usually are affected earlier than upper extremity and torso muscles; neck flexors are affected more than extensors, and progression is more rapid in the lower extremities than in the upper extremities. Relative preservation of function is seen in the ankle plantar flexors and invertors, levator ani, external anal sphincter, and cranial nerve–innervated muscles (except for the sternocleidomastoid muscle).[2] By age 2 to 6, most boys develop lumbar lordosis, have difficulties arising from the floor, and use the characteristic **Gower's maneuver** (Figure 32-2) to rise to a standing position.[2,3] By age 5 to 6, hypertrophy develops in certain muscle groups, especially the calves, quadriceps, gluteals, and deltoids. Initially, true hypertrophy of the calf muscle fibers occurs, but later pseudohypertrophy develops because muscle is largely replaced by fat and connective tissue (Figure 32-3).[3] By age 8, the child has difficulty with ambulation and climbing stairs, and by age 10, many patients depend on long leg braces to remain ambulatory; by age 12, most are wheelchair dependent. Bakker et al.[4] identified loss of hip extensor and ankle dorsiflexor strength as primary predictors of loss of ambulation.

Joint contractures and scoliosis occur frequently in DMD. By age 6 to 10, 70% of patients may have contractures of the iliotibial bands, hip flexors, and Achilles tendons. Ankle involvement can lead to toe walking. By age 8, most patients may also have contractures at the knee, elbow, and wrist extensors, which tend to worsen as more time is spent in the wheelchair. Scoliosis may be seen in up to 90% of wheelchair-bound patients with DMD. As paraspinal muscles weaken, kyphoscoliosis worsens. This can complicate activities of daily living (ADLs) and positioning in bed or a wheelchair, and it compounds respiratory impairment. Muscles that support ventilation usually are not significantly involved until the child becomes nonambulatory.[3] Weakness of ventilatory muscles, including the diaphragm and intercostals, is manifested by low maximum inspiratory and expiratory pressures and decreased vital capacity, forced vital capacity, and total lung capacity.[2] A restrictive defect results, with or without the previously mentioned scoliosis, and respiratory function becomes compromised.[5] Ventilatory muscle weakness can also contribute to atelectasis and reduced thoracic compliance. Diaphragmatic weakness can contribute to nocturnal hypoxemia, hypoventilation, and hypercapnic respiratory failure.[5] Without aggressive pulmonary management, respiratory insufficiency, with

TABLE **32-1**

Overview of the Muscular Dystrophies

Type	Mode of Inheritance/ Gene Location/Gene Product	Clinical Presentation	Associated Features	Diagnosis	Treatment
Duchenne's muscular dystrophy (DMD)	XR Xp21 Dystrophin	• Onset: ages 2-6 yr • Delayed milestones • Progressive weakness of "girdle" muscles • Calf pseudohypertrophy • Inability to walk after age 12 yr • Joint contractures • Scoliosis	• Respiratory failure in 2nd to 3rd decade • Cardiomyopathy • Impaired intellectual function • Gastroparesis	• Clinical • Increased CK • DNA analysis • In some cases, EMG and muscle biopsy	• Pharmacological: steroids • Rehabilitative: PT/ OT, ROM, contracture management, assistive devices, weight control, ambulation, seating, bracing • Pulmonary: assisted ventilation • Surgical: contracture release, spinal stabilization for scoliosis
Becker's muscular dystrophy (BMD)	XR Xp21 Dystrophin	• Onset: variable, but still ambulatory after age 15 yr • Progressive weakness of girdle muscles • Calf pseudohypertrophy • Respiratory failure after 4th decade	• Cardiomyopathy • Impaired intellectual function	• As in DMD	• As in DMD
Facioscapulohumeral muscular dystrophy (FSHD)	AD 4q35	• Onset: 1st to 5th decade • Slowly progressive weakness of the face, shoulder girdle and scapular stabilizers, core and pelvic girdle muscles, tibialis anterior	• Pain in the neck, shoulders, posterior chest, lower back • Sensorineural hearing loss and retinal abnormalities in infantile-onset FSHD • Weakness of muscles of ventilation and cardiomyopathy possible in rare cases	• Clinical • CK: normal/ slightly elevated • EMG: myopathic • Muscle bx: myopathic changes • DNA analysis is gold standard for diagnosis	• Pharmacological: none • Rehabilitation: PT, OT, bracing, pain management • Surgical: scapular stabilization

(Continued)

TABLE **32-1**

Overview of the Muscular Dystrophies—cont'd

Type	Mode of Inheritance/ Gene Location/Gene Product	Clinical Presentation	Associated Features	Diagnosis	Treatment
Emery-Dreifuss muscular dystrophy (EDMD)	XR Xq28 Emerin AD 1q11 Lamin A/C Mutations in other genes have been identified in selected individuals with an EDMD clinical phenotype	• Triad **1.** Early contractures **2.** Slowly progressive muscle weakness in humeroperoneal distribution **3.** Cardiac abnormalities	• Sudden death from cardiac conduction defects • Gene mutations may manifest as isolated cardiomyopathy	• Clinical • CK: normal/ slightly increased • ECG: conduction abnormalities and arrhythmias • EDX: myopathic • DNA analysis	• Pharmacological: none • Cardiac evaluation, may require pacemaker and or implanted defibrillator • Rehabilitation: contracture management • Surgical: contracture release
Limb-girdle muscular dystrophy	Multiple	• Onset: childhood to adulthood • Slowly progressive muscle weakness in pelvic girdle and shoulder girdle • Cardiac abnormalities (10%) • Onset: late childhood to adolescence	• Respiratory insufficiency	• Clinical, family history • CK: elevated • EDX: myopathic • Muscle bx: necrosis and regeneration, variable fiber size, increased connective tissue • DNA analysis	• Pharmacological: ?Creatine monohydrate • Cardiac monitoring • Rehabilitation: PT, OT to maintain mobility, minimize contractures, provide assistive devices • Ventilatory support
Myotonic muscular dystrophy	AD 19q13 Myotonic dystrophy Protein kinase	• Onset: any age • Slowly progressive muscle weakness in face, distal limb • Percussion myotonia	• Cataracts, cardiac abnormalities, respiratory abnormalities, gastrointestinal abnormalities, CNS abnormalities, endocrine abnormalities	• Clinical • EDX: myotonic discharges • Muscle bx: myopathic • DNA analysis	• Pharmacological: medications for myotonia • Rehabilitation: PT, OT for contracture management, assistive devices, modification of ADLs

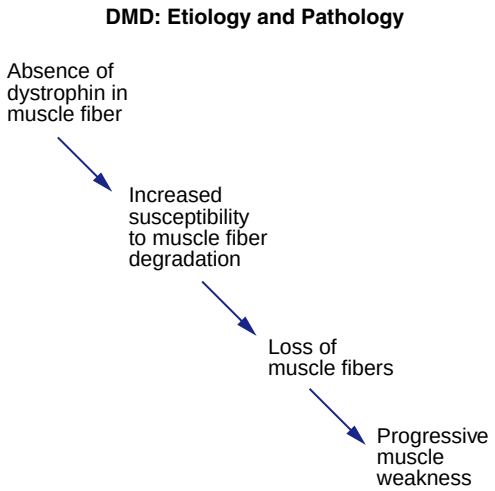

Figure 32-1 Dystrophin dysfunction.

or without pneumonia, may result in death by age 20.[6] The age at which vital capacity falls below 1 L has been reported to be a strong marker of mortality, with a 5-year survival rate of 8%.[7,8]

Dystrophin is also a component of cardiac muscle, smooth muscle, and brain. Therefore the heart, gastrointestinal (GI) tract, and central nervous system (CNS) may manifest abnormalities. Up to 90% of patients with DMD may show characteristic electrocardiographic abnormalities consisting of tall R waves and deep, narrow Q waves in leads I, aV_L, V_5, and V_6, attributable to fibrosis in the posterobasal left ventricle.[2,9] Other patients may show conduction defects, arrhythmias, sinus tachycardia, or cardiomyopathy.[2,9] Up to 40% of patients with DMD may succumb to cardiomyopathy if they also have ventilatory failure and pulmonary hypertension.[2] GI tract manifestations can include vomiting, abdominal pain, and distention caused by acute gastric dilation.[2,9] CNS involvement may include a lower IQ (i.e., below 70-75) in approximately 20% to 30% of patients.[2,9] Bresolin et al.[10] found the mean IQ of patients with DMD to be 82.

Fractures occur in approximately 20% of DMD patients.[11] They can be caused by falls resulting from unsteady gait or by osteoporosis related to disuse in wheelchair-bound patients, and steroid treatment.[3]

Clinical Features: Becker's Muscular Dystrophy

Patients with BMD show a pattern of muscle weakness and atrophy similar to that seen in DMD. Some key differences include a later onset of clinical manifestations (usually after age 5) and the preservation of ambulatory capacity past age 15.[2,3] Unlike with DMD, early in the course of BMD the patient is able to run, hop, lift the head off the bed, and get up from the floor without using Gower's maneuver.[3] Of patients with DMD, 50% may be symptomatic by age 10 and 90% are by age 20.[2] Clinical phenotype can be quite variable even within affected families. Approximately 50% of patients becomes nonambulatory by the fourth decade.[3] Ventilatory muscle failure usually does not occur until after the fourth decade.[2] Cardiac abnormalities are similar to those seen in DMD.[2,9] Some patients actually manifest only with cardiomyopathy or, with other milder disease phenotypes such as myalgias or asymptomatic elevation in creatine kinase (CK) levels.

Diagnosis of Duchenne's and Becker's Muscular Dystrophies

The presenting clinical features contribute to the diagnosis of DMD and BMD. Laboratory evaluation shows markedly elevated CK levels. In DMD, CK may be elevated as much as 50 to 100 times above normal very early in the course of the disease. It usually peaks by age 3 and falls by approximately 20% each year as a result of muscle loss.[2] In BMD, CK may by elevated 25 to 200 times above normal during the first 10 years of life. Currently, in the appropriate clinical context, the diagnosis is confirmed with genetic testing with no need to perform muscle biopsy or electromyography (EMG).[12] The dystrophin gene, located on chromosome Xp21, is a large gene including 79 exons. The large size of the gene probably accounts for the high spontaneous mutation rate. One third of cases appears as de novo (i.e., first time) mutations. Dystrophin gene analysis can identify large deletions in the majority of patients with dystrophinopathy.[2] The deletions seen in BMD result from in-frame mutations that allow for production of some dystrophin, whereas out-of-frame mutations in DMD result in nearly total loss of dystrophin.[2,9] Duplications and point mutations are responsible for about 5% and 15% of cases, respectively.

EMG may be helpful if there is no family history and in mild forms of BMD, when the differential diagnosis is broader (Table 32-2).[13] Motor and nerve conduction studies usually are normal except in extremely affected muscles, which may show a decrease in the amplitude of the compound motor action potential (CMAP), probably because of the reduction in muscle size.[14] Needle EMG findings show typical myopathic features (see Table 32-2).[13] Muscle biopsy findings for DMD and BMD include necrosis, regeneration, fiber splitting, abnormal fiber size variation, endomysial and perimysial proliferation of connective tissue, and internalized nuclei.[15] Eventually, muscle fibers are replaced by connective tissue and subsequently by adipose tissue.[15] Immunochemistry on muscle tissue shows reduced or absent dystrophin in BMD and DMD, respectively.

Treatment of Duchenne's and Becker's Muscular Dystrophies

The management of muscular dystrophies requires a multidisciplinary, multimodality approach to allow the patient and family the greatest quality of life (Figure 32-4).

Pharmacology. Current standard of care includes treatment with prednisone at a dosage of 0.75 mg/kg/day.[12]

Figure 32-2 A boy with Duchenne's muscular dystrophy showing the typical Gower's maneuver while rising from the floor. (From Rimon DL, Connor MJ, Pyeritz RE, et al: *Emery and Rimoin's principles and practice of medical genetics,* ed 7, Waltham, MA, 2013, Academic Press/Elsevier. Courtesy of Richard S. Finkel, Director of the Neuromuscular Program, The Children's Hospital of Philadelphia.)

This recommendation is based on multiple clinical trials showing slower rates of deterioration and improved function in boys treated with prednisone.[16] Deflazacort (0.9 or 1.2 mg/kg/day), a prednisone derivative with similar effects (not approved by the U.S. Food and Drug Administration [FDA] but used in Europe), produces similar benefits, possibly with fewer side effects such as less weight gain.[2,16,17] Additional controlled trials have confirmed the benefits of prednisone and deflazacort in prolonging ambulation and maintaining pulmonary function.[18]

No clear guideline exists about the best time to initiate corticosteroid treatment.[12] Corticosteroids are generally started between ages 4 and 8, during the plateau phase before clear decline in muscle strength develops.[19] Common side effects, which may limit the dose of steroids, include irritability, weight gain, cushingoid appearance, GI complaints, skin rash, glucose intolerance, hypertension, cataracts, and increased risk for fractures.[16] The patient should be monitored for these side effects, especially with long-term corticosteroid use.[16]

Alternative agents that have been considered to slow disease progression include oxandrolone, an anabolic steroid, as well as creatine and other supplements. Controlled studies of these compounds, however, have failed to show

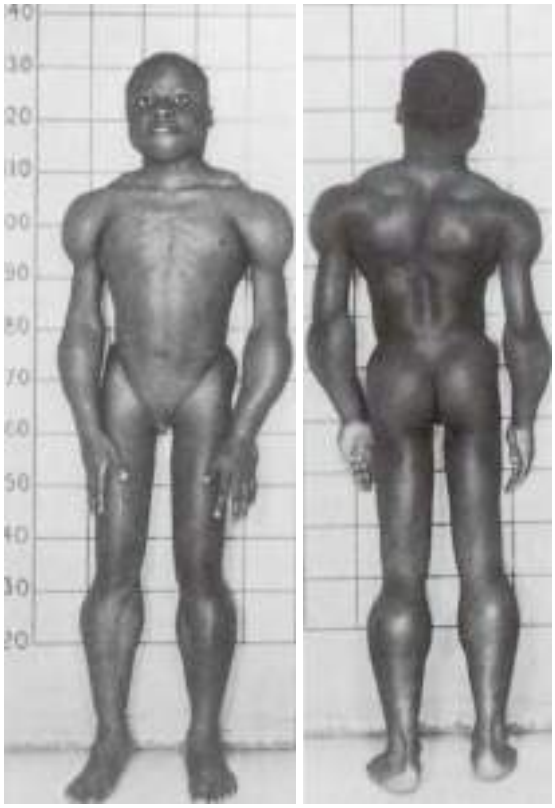

Figure 32-3 Pattern of muscle hypertrophy in Duchenne's muscular dystrophy. (From Emery AEH, Muntoni F: *Duchenne muscular dystrophy,* ed 3, p 31, New York, 2003, Oxford University Press.)

any benefit.[12] More recently, large international efforts have been conducted to improve the design of clinical trials for dystrophinopathies.[20] These efforts are the result of collaboration between multiple stakeholders,[20,21] including patients and their families, who recently developed the first-ever patient-initiated guidance for industry and the FDA to help accelerate development of potential treatments for DMD.[22] An area of focus of these efforts has been the development of biomarkers and more sensitive outcome measures to support the drug development process.[23] These studies led to the validation of the 6-minute walk test (6MWT) as the primary endpoint for clinical trials in ambulatory DMD[24,25] and suggested that the minimal clinically important difference for the 6MWT in DMD boys was about 30 meters. The 6MWT is now included as the primary endpoint in pharmacological trials of novel compounds to slow the progression of DMD.[26,27]

Another important area of current pharmacological research in DMD is how to best manage cardiomyopathy. Recent evidence supports the use of angiotensin-converting enzyme (ACE) inhibitors for the treatment of cardiomyopathy associated with DMD before clinical signs of abnormal heart function develop, although the exact timing and pharmacological agent is still an area of active investigation.[28]

Rehabilitation. Rehabilitation offers multiple approaches in the management of myopathies, as described by Hicks[29] (Table 32-3) and reviewed by Bushby et al.[28]

TABLE **32-2**

Electrodiagnostic Findings in Selected Myopathies

Parameter	Muscular Dystrophy	Congenital	Metabolic	Inflammatory
DL	Normal	Normal	Normal	Normal
NCV	Normal	Normal	Normal	Normal
SNAP amplitude	Normal	Normal	Normal	Normal
CMAP amplitude	Normal*	Normal*	Normal*	Normal*
MUAP analysis	Small-duration, low-amplitude, polyphasic MUAPs†	Either normal or small-duration, low-amplitude, polyphasic MUAPs depending on the specific disease	Either normal or small-duration, low-amplitude, polyphasic MUAPs depending on the specific disease	Small-duration, low-amplitude, polyphasic MUAPs†
Recruitment pattern	Early‡	Either normal or early depending on the specific disease	Either normal or early depending on the specific disease	Early‡
Fibrillation and PSWs	Yes	In some such as myotubular myopathy	In some such as acid maltase deficiency	Yes
Myotonia	In some such as myotonic dystrophy	In some such as myotubular myopathy	In some such as acid maltase deficiency	No

DL, Distal latency; *NCV,* nerve conduction velocity; *SNAP,* sensory nerve action potential; *CMAP,* compound muscle action potential; *MUAP,* motor unit action potential; *PSWs,* positive sharp waves.

*CMAP amplitude may be reduced in long-standing advanced disease.

† In long-standing advanced disease, a few large-duration polyphasic MUAPs may be seen.

‡ In long-standing advanced disease, fast-firing MUAPs may be seen.

TABLE **32-3**

Rehabilitation Approaches to the Treatment of Myopathies

Approach	Comments
Patient evaluation	
Initial assessment	Needed to assess impairments, stage of illness, and overall disease activity and damage and to gauge responses to therapy
Function	Needed to assess ability to perform physical tasks, interact psychosocially, and communicate to establish level of disability and to follow outcomes of treatment strategies
Quality of life	Needed to assess overall satisfaction with life activities and make treatment recommendations to improve it
Exercise	
Range of motion and stretching	Needed to preserve, maintain, and increase joint motion
Gentle toning exercises	May be used to maintain muscle strength Avoid overwork, high-resistance and eccentric exercises
Aerobic	Needed to maintain aerobic capacity and improve overall functional level
Recreational	Recommended to improve quality of life and provide socialization and informal exercise
Adaptive thinking	
Educational strategies	Instruction in energy conservation and compliance with exercise is essential
Assistive devices	Assistive devices can raise the individual's functional level from requiring the assistance of a person to independence with assistive devices
Heat and cold	Heat is used to increase collagen extensibility before tight joints are stretched Cold is useful for reducing pain and muscle spasm
Orthoses	Short leg bracing is used to compensate for quadriceps and ankle dorsiflexion weakness Long leg braces may be used to assist with ambulation in select patients

Adapted from Hicks JE: Role of rehabilitation in the management of myopathies, *Curr Opin Rheumatol* 10:551, 1998.

Boys with DMD or BMD should be encouraged to lead active, normal lives during the early stages of the disease, before the onset of difficulties with ambulation. Rehabilitation interventions in DMD focus on prolonging ambulation, preventing or slowing deformities such as joint contractures and scoliosis, and preserving respiratory function. In addition to psychological benefits,[30] the goal of rehabilitation is the highest quality of life for the patient and family. This is accomplished through weight control, passive and active exercises, use of orthoses and assistive devices, and selected surgical interventions.[3]

Preventing obesity is essential for optimal function in patients with DMD. Increased weight can result in greater difficulty with ambulation or elevation activities, such as rising from a chair. Weight control can be accomplished through diet regulation, monitoring weight at every medical visit, and patient and family education

TABLE 32-4

Prevention of Deformities in Duchenne's Muscular Dystrophy

Intervention	Timing	Comment
Achilles tendon stretching	As soon as possible	Typically already at diagnosis
Night splints	If loss of range of motion is ≥20°	Commonly a few years after diagnosis
Hip stretching	When contractures are detected	Common toward late phases of ambulation
Iliotibial band stretching	When contractures are detected	May occur during late phases of ambulation
Knee stretching	When contractures are detected	Rarely needed; may be found in children with asymmetrical ankle contractures

From Emery AEH, Muntoni F: *Duchenne muscular dystrophy,* ed 3, p 210, New York, 2003, Oxford University Press.

about the importance of weight control in maintaining function. Weight control becomes particularly difficult in patients using a wheelchair.

Passive stretching exercises should be started early to prevent or reduce joint contractures; parents should be trained to carry out these daily stretching exercises.[28] Specific recommendations have been made regarding when to begin stretching various muscle groups (Table 32-4).[3] Night splints (**ankle–foot orthosis [AFO]**) can be effective in delaying heel cord tightness and should be prescribed when the ankles cannot be dorsiflexed beyond neutral.[3] Passive stretching combined with the use of night splints has been reported to be more effective than stretching alone.[31]

Long leg orthoses can be used to possibly prolong ambulation, but patient compliance is variable because of the discomfort associated with wearing these braces. Once independent ambulation is lost, the patient may use a standing frame (Figure 32-5, *A*). The upright posture provides stretching in lower extremity joints and psychological benefits associated with standing. In a long-term retrospective study, Vignos et al.[32] described an effective contracture management regimen that included daily passive stretching of the hamstrings and Achilles tendons, prescribed standing and walking, Achilles tenotomy, posterior tibial tendon transfer, and **knee–ankle–foot orthoses (KAFOs)**. This regimen allowed patients with DMD to continue ambulating to a mean age of 13.6 years. With orthoses they were able to stand for an additional 2 years.

A lightweight plastic or polypropylene knee–ankle foot orthosis (KAFO) with an ischial supporting lip can be considered in early stages to support ambulation (Figure 32-5, *B*). An Achilles tenotomy, performed percutaneously, may be considered to correct an equinovarus deformity and thus allow proper fitting of the orthosis, although no consensus exists on the timing and type of surgical procedures to prolong ambulation in DMD and recommendations for surgery should be based on individual circumstances.[28] A program has been described involving fabrication of the orthosis 1 week before the

Figure 32-5 **A,** Standing frame. **B** and **C,** Examples of children standing in knee–ankle–foot orthosis (KAFO). (**A** from Goodman CC, Fuller KS: *Pathology: implications for the physical therapist,* ed 4, St. Louis, 2015, Saunders. **B** from Dubowitz V: Deformities in Duchenne dystrophy, *Neuromuscul Disord* 20:282, 2010. **C** from Herring JA: *Tachdjian's pediatric orthopaedics: from the Texas Scottish Rite Hospital for Children,* ed 5, Philadelphia, 2014, Saunders.)

tenotomy, fitting of the night splint in the operating room, and standing in the KAFOs by the next day.[3] The child is progressed over the next 1 to 1.5 weeks to independent ambulation. Important predictors of loss of ambulation in DMD include loss of hip extensor and ankle dorsiflexor strength.[4]

Scoliosis can be limited or delayed by prolongation of ambulation.[30] Correct seating posture and thoracic orthoses help with comfort, although they cannot prevent the eventual development of scoliosis. The use of custom-molded, lightweight, thoracolumbar orthoses is recommended in patients with DMD who have a curvature greater than 30°.[3] The brace should be worn whenever the patient is seated. An orthopedic surgeon should evaluate patients with DMD who have scoliosis.

Limited evidence on the role of different types of exercise in DMD/BMD is available.[28,33] However, a few general recommendations can be made based on both preclinical and limited clinical studies.[28]

Submaximal, aerobic exercise is encouraged for as long as possible.[28] Swimming makes exercises easier to perform, and young boys with dystrophinopathy are encouraged to engage in gentle, aerobic, community-based recreational activities. During periods of illness or injury, when bed rest may be required, the patient is at risk for disuse atrophy. As soon as the illness allows, return to submaximum aerobic exercise is recommended to minimize the effects of immobilization and deconditioning.[34] Submaximum functional strengthening activities such as gentle toning exercises in the swimming pool and during recreation-based activities are allowed. Light resistance training early on in the disease course is allowed. High-resistance strength training and eccentric exercise, however, are not beneficial in DMD/BMD and should be avoided because of concerns about contraction-induced muscle injury.[28] Muscle pain, delayed-onset muscle soreness, and excessive fatigue interfering with normal activities postexercise should be avoided because they may represent signs of exercise-induced muscle damage.

Clinical Note

Muscle pain, delayed-onset muscle soreness, and excessive fatigue should be avoided during exercise in patients with DMD and BMD because it is a sign of exercise-induced muscle damage.

Respiratory failure caused by progressive weakness of the muscles of ventilation accounts for 90% of the morbidity and mortality in DMD. Respiratory function should be monitored frequently in patients with a neuromuscular disorder (NMD) (Table 32-5),[5] because these diseases produce well-recognized signs and symptoms of hypoventilation (Table 32-6). Respiratory muscle exercises do not prevent the eventual decline in pulmonary function. Influenza and pneumococcal vaccinations are recommended.

Guidelines have been published regarding the use of mechanical noninvasive positive-pressure ventilation (and, when appropriate, continuous invasive ventilation) in chronic neuromuscular diseases, including DMD.[28,35–37] For patients with an impaired cough, a mechanical insufflator-exsufflator (MIE) can be beneficial for clearing secretions.[28,38]

TABLE 32-5

Available Tools for Monitoring and Management of Ventilation in Patients with Neuromuscular Disease

Evaluation	Intervention
History, physical examination/ anthropometrics	Nutritional consultation and guidance on positioning
MIP/MEP	Annual influenza vaccine Chest physiotherapy
PFT (if older than age 5-6 yr)	Respiratory muscle exercises
Polysomnography/sleep oximetry	Insufflator-exsufflator (MIE)
Arterial blood gases	NIV

MIP/MEP, Maximal inspiratory pressure/maximal expiratory pressure; *PFT,* pulmonary function test; *MIE,* mechanical insufflator-exsufflator; *NIV,* noninvasive ventilation.

Signs and Symptoms of Hypoventilation in Neuromuscular Disease

Signs	Symptoms
Vital signs • Tachypnea **Respiratory** • Use of accessory chest and abdominal muscles • Paradoxical breathing pattern • Diminished chest excursion	**Constitutional** • Generalized fatigue • Weakness **Pulmonary** • Dyspnea • Orthopnea • Secretion/retention **Central nervous system** • Early morning headaches • Daytime hypersomnolence • Mood disturbances **Sleep** • Restless sleep • Nightmares • Enuresis • Frequent arousals

Modified from Perrin C, Unterborn JN, Ambrosio CD, Hill NS: Pulmonary complications of chronic neuromuscular diseases and their management, *Muscle Nerve* 29:15, 2004.

Indications for Noninvasive Positive-Pressure Ventilation in Chronic Neuromuscular Disease

- Symptoms of hypoventilation, such as fatigue, dyspnea, and morning headaches, OR one of the following physiological criteria:
  - Baseline SpO_2 < 95% and/or blood or end-tidal carbon dioxide (CO_2) >45 mm Hg while awake
  - Oxygen saturation < 88% for > 5 consecutive minutes on nocturnal oximetry
  - For progressive neuromuscular disease, a maximum inspiratory pressure (MIP) <60 cm H_2O or a forced vital capacity <50% predicted

SpO_2, Peripheral capillary oxygen saturation; *CO_2*, carbon dioxide; *H_2O*, water.

Modified from Perrin C, Unterborn JN, Ambrosio CD, Hill NS: Pulmonary complications of chronic neuromuscular diseases and their management, *Muscle Nerve* 29:20, 2004.

Surgical Care. Early release of contractures has not been found to be beneficial and is not recommended.[3] In addition to the Achilles tenotomy described previously for correcting an equinovarus deformity, a small percentage of patients with DMD may be considered for release of hip flexion or iliotibial band contractures to allow proper fitting of KAFOs[28]; however, there is no consensus on the use of these procedures.[28] Spinal surgery for scoliosis is recommended when the curvature is greater than 30° and has shown a tendency to deteriorate,[3] especially when the patient starts the pubertal growth spurt. The patient should have a forced vital capacity greater than 25% to 35% of the predicted value before undergoing the procedure. The goals of spinal fusion include prevention of further deformity, pain control, and improved quality of life, as well as slowing of the rate of respiratory decline.[28]

Facioscapulohumeral Muscular Dystrophy

Genetics/Epidemiology

Facioscapulohumeral muscular dystrophy (FSHD) is the third most common muscular dystrophy after DMD and myotonic dystrophy. The onset usually occurs in childhood or young adulthood (range, age 3 to 44), although later onset has been described.[39] The prevalence of FSHD is variable, ranging from 1 in 20,000 to 1 in 455,000, depending on the geographical region.[39,40] The disorder has an autosomal dominant pattern of inheritance linked to chromosome 4q35.[1,41]

Clinical Features

Patients with FSHD usually present in the first to fifth decades with a characteristic pattern of facial muscle weakness. This leads to the appearance of an expressionless face with a decreased ability to smile, whistle, or fully close the eyes because of weakness in the orbicularis oris and orbicularis oculi muscles. The onset usually is insidious. The disorder is slowly progressive and can vary in the location and severity of the weakness.[1,42] Shoulder girdle weakness may also be noted at presentation.[42] Patients with an earlier onset of symptoms may be more severely affected.[42]

The patient complains of difficulty with activities that require arm elevation, such as combing the hair. Scapular stabilizers are affected in a specific distribution. The serratus anterior, rhomboid, and middle trapezius muscles are characteristically affected early, while the deltoids usually remain strong. This peculiar pattern of weakness leads to scapular winging and a trapezius "hump," with the scapulae laterally deviating on attempted shoulder forward flexion. When the patient attempts to abduct the shoulders, the scapulae ride high (are elevated), interfering with the movement and often restricting shoulder range of motion, preventing the patient from being able to raise the arms overhead despite strong deltoids. Manual stabilization of the shoulder blades, which can be easily performed during examination, allows the patient to increase range of motion when attempting elevation through shoulder abduction. The humeral muscles (i.e., biceps and triceps) are often affected, with sparing of the forearm muscles; this gives the arms a "Popeye" appearance. The sternocostal head of the pectoralis major is also characteristically affected with resulting inversion of the anterior axillary folds which become horizontal. These weaknesses can be asymmetrical.

Lower abdominal muscles can be involved leading to a positive **Beevor sign** with the navel moving up when the patient attempts to flex the neck while supine. In the lower limbs, the tibialis anterior muscle may be affected with possible presence of a foot drop.[42] Prolonged weakness in the ankles may lead to contractures. Gait may be normal initially but often progresses to a waddling gait with hyperlordosis as a result of weakness of the pelvic girdle muscles.

Symptoms usually progress in a descending, stepwise pattern, although clinical presentation can be quite variable. Life expectancy is normal. Only 20% to 25% of patients progress to requiring a wheelchair for mobility.[1,42] Ventilatory muscle weakness that leads to respiratory failure has been reported in rare cases.[43] Cardiac involvement is also rare. Hearing loss and retinal abnormalities are associated with infantile-onset FSHD and requires close monitoring in children with FSHD.

Associated features include pain in the neck, shoulder, posterior chest, and lower back. This pain is musculoskeletal in etiology and is caused by muscle imbalance and strain. It generally responds well to conservative treatment, including physical therapy and bracing.

Diagnosis

CK usually is normal or mildly elevated. EMG shows a typical myopathic pattern in affected muscles. A muscle biopsy shows variation in muscle fiber size, isolated necrotic fibers, and increased connective tissue but is not usually needed because the diagnosis can be confirmed with genetic testing. The genetic basis of FSHD is complex and has been clarified in recent years, with genetic testing now being widely available. From 90% to

95% of affected individuals carry a contracted number of copies of a 3.3-kb DNA repeat unit known as D4Z4 at position q35 on one chromosome 4 (below a threshold of 11 repeats). There is a well-demonstrated correlation between the size of the D4Z4 repeat unit and disease severity.[44] Individuals carrying this genetic mutation are characterized as having FSHD1 or D4Z4 "contraction-dependent" FSHD. The remaining 5% to 10% of cases is "contraction-independent" FSHD, or FSHD2. FSHD2 is not associated with D4Z4 contraction but is characterized by hypomethylation of both 4q35 D4Z4 regions.[45] The genetics of FSHD is still an active area of research, and current studies are likely to clarify genotype–phenotype correlation in the near future.

Treatment

Pharmacology. No effective pharmacological treatments are available for FSHD. A randomized, double-blind, placebo-controlled trial of albuterol in patients with FSHD showed no improvement in global strength or in function and is not currently considered standard of care.[40,46]

Rehabilitation. Rehabilitation plays an important role in patients with FSHD. Features of FSHD amenable to rehabilitative interventions include footdrop, pain, and mobility deficits. A lightweight AFO may be beneficial for footdrop to improve gait and safety. Assistive devices ranging from straight canes to motorized wheelchairs may be needed, depending on the severity of the mobility deficit. For many patients, pain maybe the most debilitating feature of FSHD and is a result of muscle imbalance and fatigue of muscles that support ADLs.[2,47] As an example, shoulder girdle muscles are differentially affected, and patients tend to overuse certain muscles to compensate during activities such as reaching overhead or combing hair. In addition to pharmacological management of pain using nonsteroidal anti-inflammatory agents and acetaminophen, rehabilitation using stretching, light strengthening exercises of the least affected muscles, and bracing to correct postural abnormalities can often have a significant effect on symptoms. Lumbosacral orthoses can help stabilize core muscles and reduce pain associated with hyperlordotic posture. Figure-of-eight bracing may help relieve shoulder pain.

The role of exercise in FSHD has been evaluated in a large randomized trial as well as smaller case series and pilot studies. Based on the limited available evidence, it seems that in moderate-intensity strength training and/or aerobic training in patients with FSHD does not cause harm; however, the evidence is insufficient to establish that exercise offers benefit with respect to muscle strength.[48] A recent study of both aerobic exercise and cognitive-behavioral therapy demonstrated that either intervention can have a significant impact on chronic fatigue, a highly prevalent symptom in this patient population.[49] Therefore it is possible that exercise may be helpful to improve quality of life and overall function.

Surgical Care. Scapular winging may be amenable to surgical fixation of the scapula to the thorax for stabilization.[50] Scapulocostal fixation can afford more than 20° to 30° additional movement, which may improve the patient's ability to lift or carry objects and may help control shoulder pain. Rare complications include brachial plexopathy and frozen shoulder.[51] Unfortunately, the effects may be temporary, and any benefit must be weighed against the risks of surgery and the necessary postoperative immobilization.[39]

Emery-Dreifuss Muscular Dystrophy

Genetics/Epidemiology

Emery-Dreifuss muscular dystrophy (EDMD) is an inherited disorder that is generally caused by either mutations in the *STA* gene, which codes for the key nuclear protein emerin (X-linked EMD) or the *LMNA* gene, which codes for lamins A and C in autosomal dominant EMD.[52] The *STA* gene maps to chromosome Xq28, and the *LMNA* gene, to chromosome 1q21.[53] The X-linked form affects males, but females may present with isolated cardiomyopathy and therefore require cardiac evaluation.[54] The autosomal dominant form affects males and females equally.[54] The underlying pathophysiology is unknown. Mutations in the genes coding for emerin or lamin A/C may be associated with an EDMD phenotype or manifest as isolated cardiomyopathy or other patterns of weakness such as a limb girdle pattern of involvement. In addition, mutations in other genes have recently been reported to be associated with an EDMD phenotype in some individuals who tested negative for mutations in the emerin or lamin A/C genes, highlighting the complexity of the genetics of muscular dystrophy.

Clinical Features

EDMD is characterized by a triad of clinical features: (1) early contractures in the elbows, Achilles tendon, and posterior cervical spinal muscles; (2) slowly progressive muscle weakness, which begins in a humeroperoneal distribution; and (3) cardiac abnormalities such as cardiomyopathy and conduction defects.[55] The muscle weakness and contractures usually present before the cardiac abnormalities. Contractures may precede muscle weakness, are especially common at the elbows and heel cords,[56] and can worsen during the adolescent growth spurt. Late complications of the weakness can include lumbar lordosis and spinal rigidity.

The cardiac abnormalities include conduction defects, atrial and ventricular arrhythmias, and/or dilated cardiomyopathy.[54,55,57–62] In an extensive review, arrhythmias were noted in 92% of patients after age 30, and heart failure was seen in 64% after age 50.[63] The risk of sudden death can be as high as a 46% in patients with EDMD, because many patients are symptom free.[55,58,60,63]

Diagnosis

The diagnosis is based mostly on clinical findings. DNA analysis[59] can confirm the diagnosis.

Treatment

No specific pharmacological therapies are available for EDMD. All patients should have a comprehensive cardiac evaluation and regular follow-up to identify arrhythmias that may be amenable to pacemaker or defibrillator implantation; unfortunately, this is no guarantee that sudden death will be prevented.[63] Anticoagulation may be needed for individuals with atrial flutter or fibrillation or atrial standstill to prevent disabling embolic strokes.[59,60] Diuretics and ACE inhibitors may be beneficial in patients with significant ventricular dysfunction.

Rehabilitative interventions should seek to maintain function and mobility. The contractures usually are not preventable but may be minimized with stretching exercises. Achilles tenotomy may be required to correct an equinus deformity of the foot, and a rigid, hyperextended neck may be improved by orthopedic intervention.

Limb-Girdle Muscular Dystrophies

Genetics/Epidemiology

The limb-girdle muscular dystrophies (LGMDs) constitute a genetically heterogeneous group of disorders with an autosomal dominant (LGMD 1) or autosomal recessive (LGMD 2) mode of inheritance.[1,64] Further alphabetical classification of the LGMDs (e.g., LGMD 1A, LGMD 1B) is based on the underlying genetic mutation and is in constant development as knowledge about these disorders continues to increase. The clinical and laboratory features of the LGMDs are nonspecific; however, some subtypes are characterized by specific findings such as presence of cardiomyopathy, which can help direct genetic testing. The prevalence is approximately 8.1 in 1 million inhabitants.[65] The affected genes code for various muscle proteins associated with sarcolemma, nuclear membrane, contractile apparatus, and enzymatic functions.[66] The exact underlying pathophysiology is unknown.

Clinical Features

Patients with LGMD can present at any age from childhood to adulthood. Common features include preferential proximal lower limb and pelvic girdle weakness, with upper limb weakness and scapular winging occurring later.[66] The weakness is slowly progressive, and some patients become wheelchair users. Facial and extraocular muscles usually are spared. Severe diaphragmatic weakness can result in chronic alveolar hypoventilation and respiratory failure. Elbow, Achilles tendon, and hip flexion contractures may occur in certain subtypes.[64] Cardiac abnormalities have been noted to occur in some LGMDs.[67] In one review of 97 patients with LGMD, 10% were found to have clinically relevant cardiac abnormalities, including conduction defects and dilated cardiomyopathy.[68,69] The wide variability in the clinical findings among the subtypes was extensively described by an international workshop on the LGMDs.[64]

Diagnosis

The diagnosis of LGMD requires a complete physical examination and history, including as complete a family history as possible to identify inheritance patterns. CK levels can be markedly elevated. Genetic analysis and muscle biopsy are important to make the diagnosis and to rule out other myopathies that may present with a limb-girdle distribution of weakness. Muscle biopsy usually reveals necrosis and regeneration, increased internalized nuclei, marked variability of fiber size, increased fibrous and adipose tissue, and fiber hypertrophy.[70] Biopsy may also show many lobulated and moth-eaten fibers.[71]

Treatment

No pharmacological treatment is available for LGMD. Cardiac monitoring throughout the disease is recommended.[66] In the more severe cases, especially when the patient uses a wheelchair for ambulation, respiratory failure may need to be addressed with ventilatory support devices.[37] Rehabilitative efforts should focus on maintaining mobility and minimizing contractures. Stretching exercises are important for maintaining joint range of motion, and AFOs may help compensate for distal lower extremity weakness. The patient's functional status should be monitored closely and can be a more sensitive indicator of disease progression than manual muscle testing.[72]

Myotonic Dystrophy

Genetics/Epidemiology

Myotonic dystrophy type 1 (DM1) is the most common of a heterogeneous group of myotonic disorders. It has an autosomal dominant mode of inheritance mapped to chromosome 19q13,[53] which codes for the myotonic dystrophy protein kinase (DMPK).[73] DM1 is caused by expansion of a trinucleotide repeat. The severity of the myopathy correlates with the size of the repeat, which is unstable and expands from one generation to the next, accounting for anticipation within families. The incidence of myotonic dystrophy is approximately 13.5 in 100,000 live births, and the prevalence is 3 to 5 per 100,000.[14]

Clinical Features

The muscle weakness of DM1 can begin at any age, including the neonatal period (congenital DM1, the most severe form). It is slowly progressive and manifested predominately in the muscles of the face, jaw, and distal (more than proximal) limbs.[73] Frontal baldness, ptosis, and atrophy in the temporalis and masseter muscles result in a characteristic "hatchet-faced" appearance. Dysarthria and dysphagia can result from pharyngeal and lingual muscle weakness. Patients with DM1 often do not report myotonia. **Myotonia** is a delayed relaxation of a contracted muscle that the patient may describe as stiffness and is most often present in the hands. Myotonia can often be easily detected on examination. Action myotonia

can be observed as delayed relaxation of the fingers after a forceful hand grip. Percussion myotonia can be elicited by percussion of certain muscle groups such as the thenar eminence or the wrist/finger extensor muscle group in the posterior forearm. It is lessened by repeated activation of the muscle (**warm-up phenomenon**).

Many other systems are involved in DM1; therefore this disease is considered a systemic disorder (Table 32-7).[73] A related disorder is **type 2 myotonic dystrophy (DM2)**, or **proximal myotonic myopathy (PROMM)**. It is also autosomal dominant and shows multisystem involvement (e.g., cataracts, hypogonadism, diabetes mellitus, cardiac conduction defects). Important differences include gene mapping to chromosome 3q, later onset of symptoms, more proximal weakness, minimal or clinically absent myotonia, and higher prevalence of pain in the arms and legs that is not necessarily related to myotonic stiffness.[73]

Diagnosis

The diagnosis is based on a careful history, including family history, physical examination, and commercially available DNA analysis. CK levels may be normal or slightly elevated. Needle EMG shows myotonic discharges with a characteristic pattern of waxing and waning of the frequency and amplitude.[14] A muscle biopsy usually is not needed to make the diagnosis.[73]

Treatment

There are no treatments to improve muscle strength or modify the disease course. Myotonia, if clinically significant and disabling, can be controlled with medications such as mexiletine, and phenytoin. Electrocardiography (ECG) should be monitored frequently when prescribing these medications because of the presence of cardiac conduction defects and arrhythmias in many patients.

Rehabilitation interventions can be important for managing the musculoskeletal complaints. The systemic nature of the disease requires a multidisciplinary approach with many specialists involved to monitor the cardiac, respiratory, endocrine, psychological, and ophthalmological manifestations of the disease (Table 32-8). Distal lower limb weakness or footdrop can be treated with lightweight orthoses, and neck muscle weakness may require a cervical collar or head support. Assistive devices such as canes and

TABLE 32-7

Systemic Involvement in Myotonic Dystrophy

System	Principal Involvement
Smooth muscle	Reduced gastrointestinal motility, constipation, pseudo-obstruction
Heart	Cardiomyopathy and conduction defects, such as heart block, atrial arrhythmias; sudden cardiac death may occur
Lungs	Hypoventilation from and diaphragmatic involvement; sleep apnea; aspiration pneumonia secondary to dysphagia
Brain	Behavioral and cognitive abnormalities common in DM1 and most severe in congenital DM1
Endocrine system	Testicular tubular atrophy; impotence; infertility; diabetes mellitus; hypothyroidism
Eye	Cataracts, ptosis
Skin	Premature balding

Modified from Engel AG, Franzini-Armstrong C, editors: *Myology*, ed 3, vol 2, p 1044, New York, 2004, McGraw-Hill.

TABLE 32-8

Management of Myotonic Dystrophy

Problem	Management
Cardiopulmonary	
Arrhythmias and other heart conduction defects	Regular electrocardiograms and echocardiograms; drug management as appropriate for specific arrhythmia; pacemaker/implanted defibrillator if conduction defect severe or episodes of significant heart block; avoid aggravation by antimyotonic drugs
Hypoventilation	Consider assisted nocturnal ventilation (CPAP, BiPAP)
Central Nervous System	
Somnolence (sleepiness)	Exclude hypoventilation as cause; consider use of modafinil if severe
Depression and behavioral abnormalities	Pharmacological treatment
Gastrointestinal	
Swallowing difficulty	Dysphagia diet and compensatory strategies; feeding tubes may be considered
Constipation	Pharmacological treatment with stool softeners
Endocrine	
Diabetes mellitus type 2	Periodic monitoring of blood glucose and Hb A_{1c}
Other endocrine problems	Periodic monitoring of TSH; endocrine evaluation for infertility/impotence/testicular atrophy if clinically indicated
Ophthalmic	
Cataract	Periodic ophthalmological examination
Surgery and Anesthesia	
	Patients at higher risk for complications from general anesthesia and neuromuscular blocking agents

CPAP, Continuous positive airway pressure; *BiPAP*, bilevel positive airway pressure; *TSH*, thyroid-stimulating hormone; *Hb A_{1c}*, glycated hemoglobin.

Modified from Engel AG, Franzini-Armstrong C, editors: *Myology*, ed 3, vol 2, p 1070, New York, 2004, McGraw-Hill.

walkers may prolong mobility. In severe cases, wheelchairs may be prescribed, especially for long distances or outdoor use. Most patients with DM1 remain ambulatory.[73] Dysphagia may be amenable to compensatory strategies to help minimize the risk of aspiration. Feeding tubes may be used with severe dysphagia. Warm-up exercises may result in improved speech production.[45] Pilot studies of moderate resistance and endurance exercise suggested that exercise may be used to maintain function, cardiopulmonary fitness, and quality of life in this patient population, but there is still insufficient evidence of benefit on muscle strength.[74–76]

CONGENITAL MYOPATHIES

The congenital myopathies constitute a heterogeneous group of nonprogressive or slowly progressive muscle disorders that usually present in the neonatal period, although later onset has been described. They are not considered muscular dystrophies because they lack dystrophic changes, such as muscle fiber necrosis and replacement by connective tissue, on muscle biopsy. Rather, congenital myopathies are characterized by distinctive nonprogressive histopathology findings that differ based on the underlying molecular defect. Congenital myopathies share certain clinical features. Usually they present in infancy as generalized weakness and hypotonia (e.g., "floppy baby"). Affected infants may have delayed motor milestones and decreased muscle bulk. Various dysmorphic features may be present depending on the specific myopathy.[77] Some congenital myopathies may present later in childhood or even adulthood. Although these myopathies were historically considered nonprogressive disorders, a clinical characteristic that helped differentiate them from the muscular dystrophies, it is now accepted that some progression of weakness may occur.

Laboratory findings usually include a normal or minimally elevated CK level, which can help distinguish these disorders from the muscular dystrophies. Motor and sensory nerve conduction studies are normal, and needle EMG findings usually are normal or show small, polyphasic motor unit potentials.[14] Myotubular/centronucelar myopathy may have abnormal spontaneous activity on needle EMG (see Table 32-2).

Management options include a multidisciplinary approach to maximize the patient's function and quality of life (Table 32-9). These strategies are highly individualized and depend on the specific clinical presentation, because the degree of weakness, activity limitation, and participation restriction may be quite variable among individuals. As with many other NMDs, coordination of care among different specialists is important because patients may have complex medical needs requiring integration between health care professionals and community resources. Areas of priority include prevention and management of musculoskeletal complications (e.g., scoliosis, contractures, pain) and monitoring of hypoventilation resulting from diaphragmatic weakness.

Some of the better-defined congenital myopathies are discussed in more detail in the following sections; these include central core myopathy, nemaline myopathy, and myotubular/centronuclear myopathy.

Central Core Myopathy

Central core myopathy is a genetic disorder with an autosomal dominant mode of inheritance caused by mutations in the ryanodine receptor gene *(RYR1)*.[78] These receptors mediate calcium release from the sarcoplasmic reticulum. The resultant defect in skeletal muscle is thought to be related to abnormalities in calcium ion (Ca^{2+}) regulation.[79] Of note, mutations in *RYR1* are also responsible for familial malignant hyperthermia, which is a potentially fatal inherited disorder usually associated with certain general anesthetics and the drug succinylcholine, resulting in accelerated metabolism in skeletal muscle. Therefore patients with central core myopathy are at higher risk for malignant hyperthermia. One needs to avoid certain anesthetic and neuromuscular blocking agents during anesthesia to minimize the risk of this life-threatening complication. Patients and their families should be aware of the potential for malignant hyperthermia and need to wear medical alert bracelets.

Most patients present at birth or in early childhood with hypotonia, decreased muscle bulk, slender frame, and symmetrical weakness. The degree of weakness can vary even within families and predominantly affects the proximal muscles of the lower limbs, but the face and neck can also be involved.[77] Ptosis (drooping of an eyelid) is not seen, a feature that helps distinguish central core myopathy from nemaline myopathy and myotubular/centronuclear myopathy. Motor milestones are delayed, but most patients are able to walk by age 3 to 4.[77] Muscle weakness may be stable or slowly progressive. Other frequent features include kyphoscoliosis, pes cavus or pes planus, and congenital dislocation of the hip.[77] There are no CNS abnormalities. Mild weakness of the diaphragm with nocturnal hypoventilation may be seen.

Muscle biopsy shows characteristic structural alterations within the center of type 1 muscle fibers known as cores. These cores are single, centrally located, and circular.[77]

Pilot studies have suggested that salbutamol or albuterol may be beneficial for improving muscle strength and functional abilities.[80,81] Larger prospective, randomized, double-blind, placebo-controlled trials are needed to confirm these findings. Lower limb weakness can be treated with appropriate orthotic devices (see Table 32-9).

TABLE 32-9

Management of Patients with Congenital Myopathies

Problem	Referral	Possible Interventions
Skeletal muscle involvement Hypotonia Weakness Contractures	Physical therapy and occupational therapy	Submaximum aerobic exercise program and gentle toning Active and passive stretching Standing frame Orthoses/splinting (upper and lower limbs) Enhance mobility (walking frames or wheelchair)
Respiratory muscle involvement Nocturnal hypoxia	Physical therapy Lung function tests Sleep study	Chest physiotherapy to clear secretions Nocturnal assisted ventilation
Bulbar involvement Feeding and swallowing difficulties Failure to thrive Excessive drooling	Speech pathologist Dietitian Gastroenterologist	Speech therapy Modified barium swallow Caloric supplementation/thickened feed Feeding tubes Anticholinergic medications
Developmental or psychosocial delay	Occupational therapy Physical therapy Speech pathology Psychologist Developmental physician	Advice about appropriate intervention/liaise with local services Developmental stimulation Home programs Reassessment if deterioration occurs
Scoliosis	Physiotherapy Orthopedic surgeon	Baseline assessment, including spinal radiographs Monitoring of degree of curve Bracing Corrective surgery
Foot deformities	Physical therapy Orthopedic surgeon	Splinting/serial casting Corrective surgery
Cardiac involvement; conduction defects; cardiomyopathy	Cardiologist	Electrocardiogram, Holter monitor, cardiac echocardiogram Medication if indicated
Inability to perform activities of daily living (ADLs); inability to achieve independence with bathing, toileting, dressing, feeding; difficulties with access; handwriting difficulties	Occupational therapy Community nurse	Aids for individual ADLs Wheelchair assessment Home nursing assistance Home visit and modifications School visit and modifications Typing and computer programs Car modifications Liaise with local services
Family support	Social work Muscular Dystrophy Association Government assistance agencies	Disability allowance/pension Caregivers' allowance Support groups Financial assistance with equipment and home modifications Transport and travel assistance
Planning future pregnancies	Genetic counselor	Genetic counseling
Planning surgery	Consult with anesthetist Respiratory physician	Malignant hyperthermia precautions Lung function tests and physiotherapy before surgery
Planning future employment	Vocational counseling service Occupational therapy	Planning school studies Vocational planning Work experience Training, work placement and support
Coordination of care	Pediatrician or subspecialist with an interest Neurologist, geneticist, or rehabilitation specialist	Contact with general practitioner by telephone Liaise with local services Copy of all correspondence to key personnel Arrange case conferences when necessary Determine timing of respiratory, orthopedic, and palliative interventions

Modified from Engel AG, Franzini-Armstrong C, editors: *Myology,* ed 3, vol 2, pp 1521-1522, New York, 2004, McGraw-Hill.

Nemaline Myopathy

Nemaline myopathy is a heterogeneous congenital disorder with an autosomal dominant, recessive, or sporadic mode of inheritance. The disease is caused by mutations in genes that code for proteins that are responsible for the development and function of the Z-disks, including actin, troponin, nebulin, and tropomyosin.[82–88] Patients are classified according to age of onset and clinical severity.[77,89,90] The disease may present as three phenotypes: a severe infantile form, a mild nonprogressive or slowly progressive form with onset in childhood, or a mild adult-onset form.

The most severe phenotype is the infantile onset. Infants often have difficulty with sucking and swallowing and consequently have feeding problems. This form is usually fatal in the first year of life. Mechanical ventilation and feeding tubes may be considered. Contractures and skeletal deformities may develop in these infants.[77]

The most common phenotype is the childhood-onset subtype. This form is characterized by mild, diffuse hypotonia and weakness. Weakness is static or slowly progressive. Gait is often waddling with hyperlordosis. The disease is commonly associated with facial dysmorphic features (i.e., narrow face, high-arched palate) and skeletal abnormalities (e.g., kyphoscoliosis). Facial weakness is common, and ptosis may occasionally be present.

The adult-onset form is not associated with skeletal abnormalities or dysmorphic facies (facial abnormalities). It is characterized by mild diffuse weakness. Ptosis and head drop may be present.

Muscle biopsy reveals characteristic threadlike structures (rods) that consist of Z-disk protein material.[77,91,92] It should be noted that rods are not specific for nemaline myopathy and have been associated with other disorders.[93,94] A predominance of type I fibers muscle fibers is also noted.

No specific pharmacological treatment is available. Rehabilitation should focus on maintaining function and preventing deconditioning through mild exercise and physical therapy. Scoliosis should be monitored and treated. Long periods of immobilization can lead to disuse atrophy with worsening weakness and therefore should be avoided. Pulmonary infections require rapid, aggressive treatment, and breathing function should be monitored regularly for hypoventilation.[95,96] Nocturnal noninvasive assisted ventilation may be needed (see Table 32-9).[97]

Myotubular/Centronuclear Myopathy

Myotubular/centronuclear myopathy is a heterogenous congenital disorder with distinct modes of inheritance. The disease can be X-linked, mapped to chromosome Xq28 at a locus coding for myotubularin. Alternatively, it can have an autosomal dominant or recessive mode of inheritance associated with mutations in the gene coding for dynamin-2.

In the X-linked form, affected males present at birth with severe hypotonia, weakness, feeding difficulties, respiratory distress, bilateral ptosis, limited eye movements, and absent tendon reflexes.[77] Associated features include pectus carinatum ("pigeon chest") and hip and knee contractures.[77] Prognosis is poor, and death usually occurs from pulmonary complications.

The autosomal forms mostly present in early childhood or occasionally early adulthood.[77] Affected children have mild generalized hypotonia and weakness. Gait is waddling and hyperlordotic. As in nemaline myopathy, facial dysmorphic features are often present. In addition, ptosis and ophthalmoparesis (paralysis of one or more of the muscles moving the eye) are common.[77] Muscle biopsy shows myonuclei in the center of the muscle fibers. Treatment for these congenital myopathies requires a multidisciplinary approach that includes various specialties (see Table 32-9). Many interventions are nonspecific and depend on the particular impairment.

INFLAMMATORY MYOPATHIES

Polymyositis and Dermatomyositis

Polymyositis (PM) and dermatomyositis (DM) are idiopathic inflammatory disorders.[98] PM usually presents in those older than age 20, whereas DM has a bimodal age distribution, occurring either in childhood or in adulthood. The female-to-male ratio is approximately 2:1.[99] The underlying etiology remains unknown.[100,101]

Clinical Presentation

Both PM and DM present with a progressive, symmetrical, proximal (i.e., more than distal) pattern of muscle weakness. Patients may report difficulty rising from a seated position or difficulty with overhead activities such as brushing the hair. Muscle pain and tenderness affect approximately one third of these patients and involve the upper limbs more commonly than the lower limbs. Later in the course of the disease, neck, swallowing, and respiratory muscles may become affected, resulting in aspiration pneumonia and respiratory failure.[102] Arthralgia (joint pain) may occur in as many as 50% of patients with PM.[98]

DM is also associated with characteristic erythematous skin lesions, predominantly in the periorbital, perioral, malar, anterior neck, chest, and extensor surfaces of joints.[98] The periorbital rash usually is violaceous (violet) or heliotrope (lilac) in color. **Gottron's rash** is a violaceous, raised, scaly rash over the knuckles. As the disease progresses, scaling, pigmentation, and depigmentation can occur in the area of the rash. The rash sometimes appears before the muscle weakness.[98]

PM and DM are associated with abnormalities in the cardiac and pulmonary systems and may be associated with certain malignancies and connective tissue disorders.[98,103] Cardiomyopathy, pericarditis, left ventricular diastolic dysfunction, atrial arrhythmias, and conduction defects are the most common cardiac abnormalities.[102,104–107]

Interstitial lung disease (ILD) occurs in approximately 30% of patients with PM or DM.[102,108,109] It tends to be more severe and more refractory to corticosteroid treatment in DM.[110] Signs and symptoms suggesting ILD include fever, nonproductive cough, dyspnea, hypoxemia, and lung infiltrates. These signs and symptoms may even precede the skin or muscle abnormalities.[102,111] Patients with PM or DM may have a connective tissue disease, such as rheumatoid arthritis, systemic lupus erythematous, scleroderma, or Sjögren's syndrome. Population-based cohort studies suggest an association with malignancy.[112] Ovarian cancer and lung cancer appear to be more closely associated with DM, and lung cancer and non-Hodgkin's lymphoma are associated with PM.[112] Vasculitis that affects the GI tract may also be seen, especially in children.

Diagnosis

Comprehensive history and physical examination, CK level, EMG, and muscle biopsy findings form the basis of the diagnosis of PM and DM.[113] CK, aldolase, lactate dehydrogenase (LDH), and aspartate aminotransferase (AST) levels all can be elevated with muscle damage. CK levels can be elevated fivefold to fiftyfold in PM and DM. However, in some patients with DM, CK levels may be only mildly elevated, especially in childhood DM and in patients with slow and insidious-onset DM.[98] The erythrocyte sedimentation rate (ESR) usually is normal or mildly elevated and does not accurately reflect disease activity or correlate with the severity of weakness.[98] Antinuclear antibodies may be found in approximately 50% of patients with myositis. Anti-Jo-1 antibodies may be seen in PM more often than in DM and may be associated with ILD.[114] The usefulness of the antinuclear antibody test is limited, because a negative or low titer does not exclude the diagnosis.[98]

On electrodiagnostic testing, sensory and motor nerve conduction studies usually are normal. Needle EMG findings can include positive sharp waves (PSWs) and fibrillation potentials on needle insertion, which suggests muscle membrane instability. This abnormal insertional activity is a good indicator of active disease and may be seen in more than 80% of patients with PM or DM.[115] In chronic disease with significant tissue loss, the PSWs and fibrillation potentials may be decreased; this also may occur after treatment, with resultant stabilization of the muscle membrane.[115] EMG also reveals a decrease in the duration and amplitude of motor unit potentials, reflecting the diminished number of muscle fibers in the motor unit. Increased polyphasia may be seen, reflecting asynchrony in the electrical activity of the remaining fibers as well as early motor unit recruitment. It should be noted that active disease can be present in scattered areas; therefore sufficient time is needed to assess multiple areas of multiple muscles to collect adequate information. Proximal, distal, and paraspinal muscles should be examined. Muscle biopsy findings include necrosis, regeneration, variation in fiber diameter, proliferation of connective tissue, and collections of inflammatory cells.[98]

Treatment

Corticosteroids are an effective first-line treatment in most patients with DM or PM.[98,116] Adults usually require 30 to 40 mg a day initially. In more severe disease, adults may require 1 to 1.5 mg/kg/day, and children may need 1 to 2 mg/kg/day in divided doses. The steroid is given until the serum CK normalizes, which usually takes 6 to 12 weeks. It is then gradually tapered over several months until a maintenance dose is reached in 4 to 6 months.[98] A gradual decline in serum CK usually indicates a favorable response. Improvement in strength can lag behind the normalization of CK levels. Steroid myopathy (discussed later) is a possible complication of long-term use of prednisone. Other side effects of steroids include hypertension, glucose intolerance, weight gain, GI upset, insomnia, mood swings, acne, a cushingoid appearance, cataracts, glaucoma, and osteoporosis. Strategies to minimize these side effects include alternate-day dosing, vitamin D and calcium supplementation, control of food intake, and antacids.

Additional pharmacological agents such as methotrexate should be considered in severe cases.[98] Additional therapies may include azathioprine, cyclosporine, mycophenolate mofetil, cyclophosphamide, intravenous immunoglobulins, or plasma exchange.[98] Refractory ILD may respond to cyclospine[110] or to cyclophosphamide alone or in combination with corticosteroids.[109]

Rehabilitation interventions should focus on maintaining function and maximizing quality of life.[29] Exercises to maintain joint range of motion and flexibility are essential for preventing contractures and should be initiated early in the course of PM or DM. As with other myopathic disorders, assistive devices and mobility aids may become necessary as function declines. Until the 1990s, patients with inflammatory myopathies were asked to not exercise because there was a concern that exercise may exacerbate inflammation. Recent studies, however, have reported that moderate, submaximum aerobic exercise in patients with PM and DM does not result in worsening muscle damage. An aerobic exercise program may actually improve aerobic capacity and overall function.

Outcome of Polymyositis and Dermatomyositis

The outcome in PM and DM is determined by multiple factors. A poor outcome is more likely with older age at presentation; severe disease; delay in diagnosis and treatment; significant cardiac, pulmonary, or GI symptoms; malignancy; and antisynthetase or anti-SRP autoantibodies levels.[103] In one study, 105 patients with DM or PM were reported to have a significantly poorer quality of life than the healthy population as measured by the Short-Form 36-Item Health Status Survey (SF-36); the mortality rate was approximately 14%.[117] In another study the 10-year survival rates were

TABLE 32-10

89.4% for PM and 86.4% for DM, and cardiac muscle involvement was the main predictor of death ($p < 0.01$) (Table 32-10).[118]

METABOLIC MYOPATHIES

The metabolic myopathies constitute a heterogeneous group of disorders caused by genetic defects that compromise muscle energy production. The hydrolysis of adenosine triphosphate (ATP) to adenosine diphosphate (ADP) generates the energy needed for muscle contractions. ATP is used and replenished by key metabolic processes, which require proper functioning of multiple enzymes. Enzyme dysfunction can result in an inadequate supply of ATP. Some important metabolic pathways use glycogen as substrate. At least 14 enzyme defects that affect glycogen synthesis, glycogenolysis, and glycolysis have been described (Figure 32-6).[119] Other metabolic myopathies affect lipid metabolism. The following sections discuss some of the more common metabolic disorders that result in myopathies, including myophosphorylase deficiency, phosphofructokinase (PFK) deficiency, debrancher enzyme deficiency, and acid maltase deficiency (Table 32-11).

Myophosphorylase Deficiency (McArdle's Disease)

During early exercise, energy production in muscles predominantly depends on the metabolism of carbohydrates. Myophosphorylase is the enzyme that initiates the metabolism of glycogen. Myophosphorylase deficiency (also known as glycogenosis type V or McArdle's disease) impedes glycogenolysis in muscles, resulting in low exercise tolerance. This deficiency is the most common disorder of carbohydrate metabolism, with a prevalence of approximately 1 in 100,000.[119] It has an autosomal recessive mode of inheritance.

The onset usually occurs in childhood or young adulthood. Affected individuals report muscle aches and inability to keep up with peers during play. Most patients are diagnosed by early adulthood. Exercise intolerance is most evident during short bursts of high-intensity activity, such as lifting weights and sprinting, or during sustained moderate intensity activity, such as swimming and jogging. This intolerance can present as myalgia, muscle stiffness, weakness, or early fatigue. Rest usually relieves it. Patients can experience a **"second wind" phenomenon**, which consists of renewed ability to sustain exercise after about 10 minutes of exercise-induced myalgias or cramps. This phenomenon is the result of mobilization of blood-borne glucose. Patients usually are asymptomatic between attacks, and most adapt well and do not lead sedentary lives.[120] Fixed, proximal (greater than distal) weakness can occur in approximately one third of patients, especially older patients.[119,121] A serious complication is muscle necrosis with myoglobinuria and acute renal failure. This can occur in as many as 15% of patients with McArdle's disease.[122–124] Tea-colored urine usually is one of the first clues to myoglobinuria and should spark an aggressive workup.

Diagnosis

Diagnosis of McArdle's disease includes a careful history, including a family history, CK level determination (CK levels are always elevated), EMG (usually normal), forearm exercise test, muscle biopsy, and genetic analysis. In the forearm exercise test, serial lactate and ammonia serum levels are measured after 1 minute of forearm exercise. Both should increase threefold to fourfold. A rise in ammonia, but not lactate, levels points to a disorder

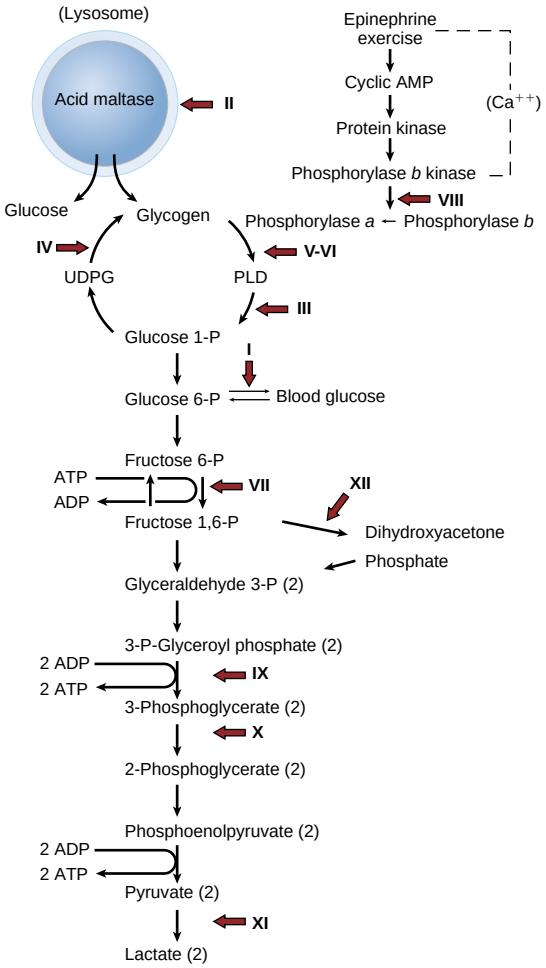

Figure 32-6 Schematic of glycogen metabolism and glycolysis. Roman numerals denote muscle glycogenoses caused by defects in the following enzymes: I, glucose-6-phosphatase; II, acid maltase; III, debranching enzyme; IV, branching enzyme; V, muscle phosphorylase; VI, liver phosphorylase; VII, phosphofructokinase; VIII, phosphorylase b kinase; IX, phosphoglycerate kinase; X, phosphoglycerate mutase; XI, lactate dehydrogenase; XII, aldolase. (Adapted from Dimauro S, Miranda AF, Sakoda S et al: Metabolic myopathies, *Am J Med Genet* 25:635-651,1986.)

of carbohydrate metabolism. Muscle biopsy may reveal nonspecific myopathic changes as well as subsarcolemmal and intermyofibrillar deposits of glycogen that appear as vacuoles. Immunostaining for myophosphorylase and biochemical assays of enzyme activity can be performed on muscle tissue to confirm the diagnosis. Genetic testing for McArdle's disease is now available, obviating the need for muscle biopsy.[125]

Treatment

Dietary changes have been explored in McArdle's disease. Low-dose creatine supplementation has shown modest benefits in a small number of patients.[126] A small, randomized, controlled study suggested that sucrose ingestion before exercise could improve exercise tolerance.[127] A high-carbohydrate diet and vitamin B_6 supplementation may also help.[128] However, none of these interventions has been confirmed as beneficial, and research is ongoing into what, if any, dietary intervention can ameliorate McArdle's disease.[129]

Certain exercise recommendations may prove useful. Patients should avoid intense weight lifting exercises or maximum aerobic activities such as sprinting. On the other hand, mild-to-moderate exercise may help prevent deconditioning and maintain aerobic fitness. When engaging in exercise, patients should try to leverage the second wind phenomenon by doing a low-intensity warm-up for 10 minutes to promote transition to the second wind before ramping up the exercise.

Phosphofructokinase (PFK) Deficiency

PFK deficiency (also known as glycogenosis type VII or Tarui's disease) has an autosomal recessive mode of inheritance. Clinically, PFK deficiency is similar to McArdle's disease but is less common and less likely to cause myoglobinuria. In addition, the second wind phenomenon does not occur.[119] Jaundice, reflecting hemolytic anemia, and gouty arthritis can further distinguish PFK deficiency from McArdle's disease and result from PFK deficiency in erythrocytes.[130,131]

Diagnosis

CK levels are usually elevated, whereas EMG results are generally normal. Forearm exercise test results in a normal increase in ammonia but blunted rise in lactic acid. Muscle biopsy shows abnormal accumulation of glycogen. PFK immunostaining and enzyme activity in muscle are abnormal.[132] Molecular genetic analysis can provide a definitive diagnosis of PFK deficiency.

Treatment

No specific treatment is available for PFK deficiency. A high-protein diet has been suggested, but its efficacy has not been proved. Unlike in McArdle's disease, glucose or sucrose supplementation before exercise is not effective because it does not bypass the metabolic defect. As previously mentioned, the second wind phenomenon is absent.

Debrancher Deficiency

Debrancher deficiency (DD) (also known as glycogenosis type III, Cori-Forbes disease, or amylo-1,6-glucosidase deficiency) is a genetic disorder of glycogen metabolism that mostly affects the liver and muscle. It has an autosomal recessive mode of inheritance mapped to chromosome 1p21.[133] During normal glycogenolysis, the peripheral chains of glycogen are shortened to a length of four glucosyl units. Further metabolism of glycogen requires the debrancher enzyme to remove these chain remnants. Debrancher enzyme deficiency results in a buildup of glycogen remnant in muscle and liver, leading to myopathy and hepatomegaly.[134]

TABLE **32-11**

Metabolic Myopathies Associated with Carbohydrate Metabolism

Glycogenosis/Pattern of Inheritance	Abnormal Enzyme	Clinical Presentation	Diagnosis	Forearm Exercise Test	Treatment
Type V McArdle's disease	Myophosphorylase	Childhood onset Exercise intolerance Myalgias Myoglobinuria (15%)	Increased CK Muscle biopsy DNA analysis	Abnormal	Leverage "second wind" phenomenon Avoid high-intensity exercise
Type VII Tarui's disease	Phosphofructokinase	Exercise intolerance Myalgias Hemolytic anemia arthralgias	Increased CK Muscle biopsy DNA analysis	Abnormal	No specific treatment
Type III Cori-Forbes disease	Debranching enzyme	Exercise intolerance Muscle weakness Cardiomyopathy Hepatomegaly	Increased CK	Abnormal	? High-protein diet
Type II Pompe's disease	α-Glucosidase	Muscle weakness Three variants with different severity: infantile-, childhood-, adult-onset	Increased CK Muscle biopsy Abnormal EMG Dried blood test, followed by DNA confirmation if screening test is positive	Normal	Enzyme replacement

CK, Creatine kinase; *DNA,* deoxyribonucleic acid; *EMG,* electromyography.

DD usually presents in young adulthood. The progression can be variable. As in McArdle's disease and PFK deficiency, many patients with DD complain of exercise intolerance, but some do not.[135] The distal portions of the upper and lower limbs are more commonly affected than the proximal muscles, and myoglobinuria and cramps are much less frequent. A more generalized weakness can include the respiratory muscles and can manifest as respiratory failure.[135,136] Other clinical manifestations usually include hepatomegaly, hypoglycemia, hyperlipidemia, growth retardation, and cardiomyopathy.[137]

Diagnosis

The serum CK usually is elevated in patients with DD. Nerve conduction velocities usually are normal. EMG reveals myopathic features with muscle membrane irritability.[14] No rise in lactate is seen with the forearm exercise test. Cardiac testing may show left ventricular or biventricular hypertrophy. Muscle biopsy reveals glycogen-containing vacuoles in the subsarcolemmal and intermyofibrillar areas. The skin, liver, myocardium, and peripheral nerves may also show glycogen deposits.[119]

Treatment

A high-protein diet during the day, with a high-protein snack at night, has been reported to be beneficial.[135,138,139] The recommended distribution on nutrients is 45% carbohydrates, 25% protein, and 30% fat.[138] In severe cases, liver transplantation may be necessary. Cardiac status should be monitored regularly.

Acid Maltase Deficiency

Acid maltase deficiency (also known as alpha-glucosidase deficiency, glycogenosis type II, or Pompe disease) is a genetic disorder with an autosomal recessive mode of inheritance mapped to chromosome 17q21-23. It results from a deficiency of the lysosomal enzyme acid alpha-1,4-glucosidase, which is required to release glucose from maltose (a disaccharide), oligosaccharides, and glycogen. The enzyme deficiency results in a buildup of glycogen in cardiac and skeletal muscle and the liver. Infantile, childhood, and adult forms have been described.

The infantile form is characterized by hypotonia, cardiomyopathy, hepatomegaly, and rapidly progressive generalized skeletal muscle weakness that starts within months of birth.[140] This is further complicated by feeding and respiratory problems. Without treatment, death usually occurs within 2 years as a result of cardiac or pulmonary failure. The heart, liver, and tongue often are enlarged because of glycogen deposits.

The childhood-onset variant is characterized by slowly progressive muscle weakness and delayed motor milestones. The weakness occurs mostly in the proximal muscles and respiratory muscles; cardiac muscle usually is spared. The adult-onset variant is characterized by the onset of myopathy after age 20. It is slowly progressive and mostly affects the proximal limb and trunk musculature. Respiratory failure may be the initial presentation in approximately one third of cases.[140,141] Obstructive sleep apnea also has been reported in association with macroglossia and tongue weakness.[142] Liver and cardiac enlargement usually is absent in the adult variant.

Diagnosis

Enzyme activity can be assayed in muscle fibers, leukocytes, fibroblasts, and urine.[140] However, false-negative results can occur on the leukocyte assay. Currently, the most sensitive screening test is spot analysis of alpha-glucosidase activity on dried blood.[143] If the dried blood test is positive, confirmatory genetic analysis is performed to finalize the diagnosis. Serum CK levels are always elevated in the early-onset forms but may be normal in adult-onset disease. On electrodiagnostic testing, motor and sensory nerve conduction tests are normal. Needle EMG is characterized by the presence of muscle membrane irritability, including myotonic discharges without clinical myotonia.[14] Motor unit action potentials are small and short and recruit early. Muscle biopsy reveals a vacuolar myopathy in all variants.[140] Cardiac tests may reveal left ventricular hypertrophy and electrocardiographic abnormalities such as left axis deviation, short PR interval, inverted T waves, and large-amplitude QRS complexes.[144] Pulmonary function testing usually reveals a restrictive pattern as a result of diaphragmatic muscle weakness.

Treatment

In the past, no specific treatment existed for Pompe disease. Recently intravenous recombinant acid α-glucosidase (rhGAA) enzyme replacement has become available, revolutionizing the management of Pompe disease.[145] Initially, treatment was approved for patients with the infantile variant. Replacement therapy has now been approved by the FDA in the United States for all variants of Pompe disease.[146,147] The impact of replacement therapy on disease course, survival, and function in the three variants is an active area of research.[147,148]

ENDOCRINE MYOPATHIES

Endocrine disorders frequently manifest with muscular impairment. The features of endocrine myopathies most amenable to rehabilitation intervention include muscle weakness and atrophy. Exercises, orthoses, or assistive devices may be necessary, depending on the severity of the deficits.

The following sections discuss corticosteroid myopathy and the myopathies associated with thyroid abnormalities.

Steroid Myopathy

Steroid myopathy is the most common endocrine myopathy. It may result from excessive endogenous (Cushing's syndrome) or exogenous steroids. Exogenous sources are more common; the incidence is approximately 2.4% to 21% of patients treated with chronic steroids and the risk increases with use of high-dose steroids. Women may be as much as twice as vulnerable as men, and fluorinated corticosteroids (e.g., dexamethasone, beclomethasone, and triamcinolone) are more commonly implicated than nonfluorinated corticosteroids.[149] The severity of the myopathy may also depend on the treatment duration, dosage,[150] and treatment regimen.

Clinical Presentation

Patients with steroid myopathy usually describe an insidious onset of proximal muscle weakness and atrophy, with greater involvement of the lower limbs than the upper limbs. The weakness can develop over weeks to years.

Diagnosis

Laboratory findings usually include normal CK. Muscle biopsy usually shows preferential atrophy of type II fibers. Motor and sensory nerve conduction studies are expected to be normal, because the peripheral nerves are not affected. Needle EMG is also normal.

Treatment

Treatment options include stopping the steroid, switching to alternate-day dosing, reducing the dose, or switching from a fluorinated steroid to an equivalent dose of a nonfluorinated steroid.[149] Endogenous steroid excess is best treated with removal of any glucocorticoid-excreting tumors.[149] The patient may not experience full recovery for several months.

Physical therapy, including strength training exercises, is important for helping the patient overcome the weakness and prevent further muscle wasting that may result from inactivity.

Hyperthyroidism

Varying degrees of weakness may occur in as many as 82% of thyrotoxic patients, and females are affected more frequently than males. The weakness usually is present by the end of the fifth decade, and the incidence appears to correlate with the duration of hyperthyroidism.[149] The pathogenesis is thought to be related to enhanced muscle protein catabolism with increased muscle amino acid release in response to stimulation by the elevated thyroxine (T_4).[151]

Clinical Presentation

The weakness seen in hyperthyroidism is mostly proximal, resulting in difficulty rising from a sitting position or performing overhead activities. It can be associated with muscle atrophy and may be much more severe than the atrophy would suggest. The patient may complain of fatigue, myalgia, and exercise intolerance. Respiratory muscle involvement can be present.[149] Bulbar involvement can result in dysphagia and dysphonia.[115] Tendon reflexes usually are normal or brisk.

Diagnosis

Laboratory testing in primary hyperthyroidism reveals elevated triiodothyronine (T_3) and T_4 and a low thyroid-stimulating hormone (TSH). CK levels usually are normal. Motor and sensory nerve conduction studies are normal.[115] Needle EMG is usually normal, although fasciculations may be present.

Treatment

The myopathy usually improves with treatment of the underlying hyperthyroidism and return to a euthyroid state. It may take several months for strength to improve and even longer for normal muscle bulk to return. Active exercises with physical and occupational therapists can delay or even prevent the development of disuse atrophy. In more severe cases, assistive devices may be required.

Hypothyroidism

The primary myopathic clinical features associated with hypothyroidism are proximal muscle weakness, stiffness, fatigue, and slowed movements. A delay in the relaxation of deep tendon reflexes may also be seen.[149] **Myoedema** refers to painless mounting of muscle tissue and occurs in response to tapping or pinching of the muscle. It can occur in as many as one third of patients with hypothyroidism but is not specific for this disorder.[149] A prospective cohort study in adults newly diagnosed with thyroid disease revealed that neuromuscular complaints were present in 79% of those with hypothyroidism; 38% had clinical weakness in one or more muscle groups on manual muscle testing, 42% had signs of sensorimotor axonal neuropathy, and 29% had carpal tunnel syndrome.[152]

The serum CK usually is elevated, up to 100 times normal, but does not correlate with weakness; it typically normalizes after treatment of symptomatic patients. With primary hypothyroidism, T_3 and T_4 are depressed, whereas TSH is elevated. Nerve conduction studies and needle EMG usually are normal.[115] Myoedema is electrically silent. As in hyperthyroidism, treatment of the underlying thyroid dysfunction significantly improves the clinical findings, and active exercise prevents further weakness from disuse.

TOXIC MYOPATHIES

Table 32-12 summarizes some of the more common toxins that can cause myopathy. Alcoholic myopathy is discussed in more detail.

TABLE 32-12

Toxic Myopathies Secondary to Medications or Toxins

Myopathy	Medication/Toxin	Clinical Features	Laboratory Findings
Necrotizing	Statins, clofibrate, gemfibrozil Alcohol abuse	Painful proximal myopathy	Increased creatine kinase EMG with muscle membrane irritability Possible myoglobinuria
Hypokalemic	Diuretics Laxatives Alcohol abuse Amphotericin B	Acute-onset weakness Myalgias	Increased creatine kinase Possible myoglobinuria Hypokalemia
Inflammatory	D-Penicillamine Interferon-α	Proximal muscle pain and weakness	Increased creatine kinase EMG with muscle membrane irritability Possible myoglobinuria
Mitochondrial	Zidovudine	Proximal muscle pain and weakness	Normal or increased creatine kinase EMG may be normal or show myopathic units
Focal	Heroin Diazepam Lidocaine	Local pain, swelling Contracture of affected muscle	Normal or increased creatine kinase
Antimicrotubular	Colchicine Vincristine	Proximal muscle weakness Mild peripheral neuropathy	Increased creatine kinase

EMG, Electromyography.

Alcoholic Myopathy

Alcohol can cause neuropathy as well as myopathy. The recognized forms of alcoholic myopathy are acute necrotizing myopathy, hypokalemic myopathy, chronic alcoholic myopathy, and cardiomyopathy.

Acute necrotizing myopathy usually occurs in chronic alcoholics or after particularly heavy bouts of drinking. The patient can present with a weak, swollen, painful, tender limb, which commonly is mistaken for thrombophlebitis.[2] In most cases cessation of alcohol intake results in a full recovery within 2 weeks; severe cases may result in myoglobinuria and acute renal failure.[153] Acute hypokalemic myopathy manifests as isolated acute muscle weakness that evolves over days and is reversible with potassium repletion.[2,154] Chronic alcoholic myopathy may occur in up to two thirds of chronic alcoholics and typically evolves over weeks to months to affect the shoulders and hips equally.[153] Treatment must include alcohol cessation, and even then residual weakness may be present. In severe cases, the patient may require assistive devices and orthoses to maintain function.

SUMMARY

Myopathies constitute a heterogeneous group of disorders with a wide range of etiologies and features. These muscle disorders can be hereditary or acquired. Myopathies can be categorized as muscular dystrophies or as congenital, inflammatory, metabolic, endocrine, or toxic myopathies. A common presenting feature is proximal (greater than distal) weakness. Age of onset, rate of progression, and involvement of other organ systems vary greatly depending on the specific myopathy. Traditionally, diagnosis of muscle disease has relied on a combination of clinical assessment, electrodiagnostic testing and muscle histopathology. Genetic testing has already become commercially available for many hereditary myopathies. Knowledge about the genetics of muscle disease is rapidly accumulating, and it is conceivable that in the near future, genomics techniques such as exome analysis and next-generation sequencing will allow molecular diagnosis for most, if not all, hereditary myopathies. Treatment is supportive. Rehabilitation, with its multidisciplinary approach, is vital to enhance function and quality of life.

CHAPTER 33

Fibromyalgia, Myofascial Pain Syndrome, and Related Conditions

MELISSA COLBERT, JOANNE BORG-STEIN

Clinicians often encounter patients with a chief complaint of pain or more specifically "muscle pain." It may be regional or diffuse and may be associated with a constellation of other symptoms. When the pain is not explained by soft tissue damage or a clearly defined inflammatory process, patients may be given a diagnosis of **fibromyalgia (FM)** or **myofascial pain syndrome (MPS)**. The purpose of this chapter is to delineate what constitutes these conditions and how they are most appropriately managed.

FM is a disorder defined by pain that is both chronic (i.e., at least 3 months' duration) and widespread, often affecting both sides of the body, above and below the waist. In addition to pain, it is characterized by a constellation of other symptoms, which may include fatigue (almost always), unrefreshing sleep, cognitive dysfunction, mood disturbance, and a variety of somatic symptoms.[1,2]

MPS is a condition in which pain originates from **myofascial trigger points (MTrPs)** in the skeletal muscle, either alone or in combination with other pain generators. MTrPs are discrete areas of focal tenderness in muscle that are characterized by hypersensitive, palpable taut bands of muscle that are painful to palpation. Manual pressure over these points reproduces the patient's presenting pain symptoms and refers pain in characteristic patterns. Some clinicians prefer the designation *regional soft tissue pain* as a term that encompasses pain and localized tenderness not only in muscle but also in contiguous soft tissues, such as ligaments and tendons.[3,4]

There is certainly overlap between FM and MPS, and their distinction remains a topic of debate among clinicians.[5] However, in contrast to FM, MPS is focal (i.e., one particular site) and does not necessarily contain multiple pain generators or somatic symptoms. Furthermore, MPS specifically involves the presence of a taut band, which may or may not be present in a patient with FM.[4] Therefore, understanding these two conditions as discrete entities has significant clinical utility both in terms of approach and treatment.

EPIDEMIOLOGY

FM is present in up to 8% of the population, with similar prevalence among varied countries, cultures, and ethnic groups. It encompasses all ages, including childhood, with increasing prevalence up to age 65. Although FM does have a female predominance, the female to male ratio is now thought to be close to 2:1, which is similar to other chronic pain conditions.[6,7] In addition to female sex, risk factors for widespread pain include increasing age (up to 65 years), low socioeconomic status, high pain severity, previous disabling episode, and somatic symptoms (i.e., physical symptoms but no obvious physical condition present).[1]

A growing body of evidence strongly suggests the presence of genetic risk factors in FM. First-degree relatives of patients with FM are more than 8 times more likely to have FM and other chronic pain.[8] In fact, Arnold's 2013 genome-wide linkage analysis of 116 American families demonstrated that siblings of those with FM have a 13.6-fold greater risk of developing FM compared with the general population. Chromosome 17 was shown to contain a single region that was clearly linked to FM in this population ($P<0.001$).[6,9] Genes affecting several receptors, proteins, and plasma cytokine levels are also implicated in FM.[7,10,11]

MPS has a high prevalence among individuals with regional pain complaints. The prevalence varies, from 21% of patients seen in a general orthopedic clinic, to 30% of patients with regional pain in a general medical clinic, to as high as 85% to 90% of patients presenting to specialty pain management centers. Women and men are affected equally.[12–14]

CLINICAL PRESENTATION

Patients with FM will often state "I hurt all over all the time," or "It feels like I always have the flu." Symptoms consist of diffuse, multifocal pain that waxes and wanes and is often migratory in nature, touch hurts or is tender, dysesthesias (i.e., unpleasant sensation when touched) and

paresthesias (i.e., abnormal sensation, burning, tingling), fatigue and sleep disturbance, memory and attention difficulties, mood disturbance, and stiffness upon waking. Symptoms suggestive of sensory hyperresponsiveness, such as sensitivity to bright lights, loud noises, odors, and visceral symptoms, are also often present.[7] Associated conditions, such as migraines, tension headaches, irritable bowel syndrome, tinnitus, restless leg syndrome, and temporomandibular jaw pain, are common.[1,7,15]

The physical examination of a patient with FM should include a thorough medical, neurological, and musculoskeletal examination and will often, but not always, be notable for diffuse soft tissue tenderness, including ligaments and paraspinal muscles. If tenderness is present over only the interphalangeal joints, one should consider a systemic autoimmune disorder. Examination findings for the joints and nervous system are normal, despite commonly reported symptoms of numbness and a swollen feeling in the joints. Range of motion of the cervical and lumbar spine may be slightly restricted due to pain.[1,16]

The characteristic symptoms of MPS may begin after a discrete trauma or injury or may have an insidious onset. Patients note localized or regional deep aching sensations, which can vary from mild to severe.[17] The MTrPs of each muscle have their own characteristic referred pain pattern; therefore the pain distribution can aid in identification of which muscle may contain the MTrP (Figure 33-1).[18] Associated autonomic dysfunction frequently occurs, including abnormal sweating, lacrimation dermal flushing, and vasomotor and temperature changes.[19] Cervical myofascial pain may be associated with neurotological symptoms, including imbalance, dizziness, and tinnitus.[20] Functional complaints include decreased work tolerance, impaired muscle coordination, stiff joints, fatigue, and weakness. Other associated symptoms may include regional paresthesias or numbness, blurred vision, twitches, and trembling. Later stages may be compounded by sleep disturbance and mood changes.[21–23]

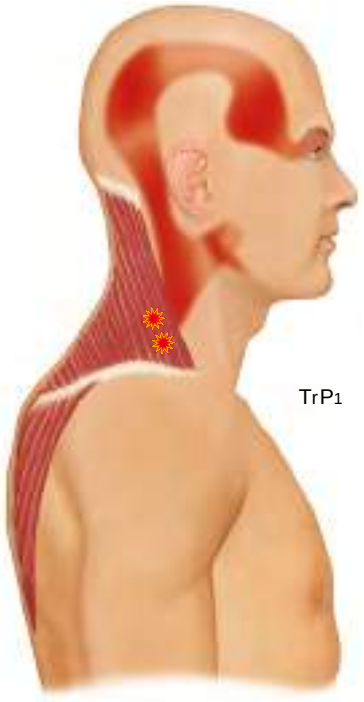

Figure 33-1 Referred pain pattern from a trigger point in the upper trapezius muscle. (Adapted from Simon DG, *Travell JG, Simons LS: Travell & Simon's myofascial pain and dysfunction: the trigger point manual*, ed 2, p 279, Baltimore, 1999, Williams & Wilkins, 1999.)

The physical examination of a patient with MPS also begins with a careful medical, neurological, and musculoskeletal examination. Posture, biomechanics, and joint function should be analyzed to identify any underlying factors that may have contributed to the development of the local or regional pain. An active MTrP is typically associated with painful, restricted range of motion. The trigger point should be identified by gentle palpation perpendicular to the direction of the muscle fibers. The examiner should detect a ropelike nodularity within the taut band of muscle. Palpation of this area is exquisitely painful and reproduces the patient's local and referred pain pattern.[21,24]

DIAGNOSTIC STUDIES

Laboratory workup should be normal in both FM and MPS, unless concurrent disease is present. Studies include complete blood count (CBC), basic metabolic panel (BMP), thyroid function tests, vitamin D, erythrocyte sedimentation rate (ESR), and C-reactive protein (CRP), as well as possibly creatinine kinase (CK), iron studies, vitamin B_{12}, and liver transaminases. It is advised to avoid antinuclear antibody (ANA) and rheumatoid factor (RF) unless signs and symptoms are suggestive of an autoimmune disorder because 13% of healthy adults are positive for ANA at a titer of 1:80.[1,6] Diagnostic imaging may reveal coincidental osteoarthritis or discogenic changes. The treating clinician must determine the relevance of these findings based on the specific clinical scenario.[1,21]

Studies currently being investigated as potential tools to better define the scientific underpinnings of FM and or MPS include microdialysis, ultrasound, magnetic resonance elastography, electromyography (EMG), and small fiber nerve biopsy.[5,25,26]

DIAGNOSTIC CRITERIA

According to the 2010 American College of Rheumatology preliminary diagnostic criteria for FM, a patient must have a combination of widespread pain and somatic symptoms to receive the diagnosis[2] (Box 33-1). Somatic symptoms include but are not limited to fatigue, headache, pain and/or cramps in abdomen, numbness

BOX 33-1

Diagnostic Criteria for Fibromyalgia

WIDESPREAD PAIN INDEX (WPI)

Score 0-19, 1 point for each location

Pain in any of the following areas in the last week?

Shoulder girdle (left)	Neck	Upper arm (left)	Upper leg (left)	Hip (left)
Shoulder girdle (right)	Upper back	Upper arm (right)	Upper leg (right)	Hip (right)
Jaw (left)	Chest	Lower arm (left)	Lower leg (left)	Lower back
Jaw (right)	Abdomen	Lower arm (right)	Lower leg (right)	

SYMPTOM SEVERITY SCALE (SSS) SCORE

Score 0-12, severity of specific symptoms (0-9) + general somatic symptoms (0-3)

Severity of each of the following symptoms over the last week?

- Fatigue
- Waking unrefreshed
- Cognitive symptoms

  0 = no problem
  1 = slight/mild/intermittent
  2 = moderate/frequent
  3 = severe/pervasive/continuous

Number of general somatic symptoms (0 = none, 1 = few, 2 = moderate, 3 = many)

FOR A DIAGNOSIS OF FIBROMYALGIA, A PATIENT MUST HAVE THE FOLLOWING:

- WPI of at least 7 + SSS of at least 5
  OR
- WPI of at least 3 + SSS of at least 9

Data from Wolfe F, Clauw DJ, Fitzcharles M et al: The American College of Rheumatology preliminary diagnostic criteria for fibromyalgia and measurement of symptom severity, *Arthritis Care Res* 62:600-610, 2010.

and/or tingling, dizziness, depression, constipation, nausea, constipation, diarrhea, dry mouth, itching, tinnitus, rash, sun sensitivity, and frequent or painful urination.[2]

MPS, in contrast, is not yet defined by specific criterion. However, in practice the presence of a taut band that, when palpated, reproduces the patient's pain, is adequate to direct treatment.[4,21]

DIFFERENTIAL DIAGNOSIS

In clinical practice the presentations of MPS and FM may overlap. The differential diagnosis is broad. Certain critical questions may be useful for distinguishing contributing factors and can help the clinician develop an appropriate and specific treatment plan.

Differential Diagnosis Should Include but Not Be Limited to the Following Conditions:

- **Joint disorders**: zygapophyseal joint disorder, osteoarthritis, loss of normal joint motion
- **Inflammatory disorders**: polymyositis, polymyalgia rheumatica, rheumatoid arthritis
- **Neurological disorders**: radiculopathy, entrapment neuropathy, metabolic myopathy
- **Regional soft tissue disorders**: bursitis, epicondylitis, tendonitis, cumulative trauma
- **Discogenic disorders**: degenerative disc disease, annular tears, protrusion, herniation
- **Visceral referred pain**: gastrointestinal, cardiac, pulmonary, renal
- **Mechanical stresses**: postural dysfunction, scoliosis, leg length discrepancy
- **Nutritional, metabolic, and endocrine conditions**: deficiency in vitamins B_1, B_{12}, and/or folic acid; alcoholic and toxic myopathy; iron, calcium, or magnesium deficiency; hypothyroidism
- **Psychological disorders**: depression, anxiety, disordered sleep
- **Infectious diseases**: viral illness, chronic hepatitis, bacterial or viral myositis
- **Fibromyalgia or myofascial pain syndrome**

Critical Questions for Development of a Treatment Plan

- Is there regional myofascial pain with trigger points present?
- Is the myofascial pain the primary pain generator or are there other coexisting or underlying structural diagnoses?
- Is there a nutritional, metabolic, psychological, visceral, or inflammatory disorder that may contribute to or cause the myofascial pain or regional muscle pain?
- Is there widespread pain and other associated symptoms?

PATHOPHYSIOLOGY OF FIBROMYALGIA AND MYOFASCIAL PAIN SYNDROME

MPS and FM are situated within a continuum of clinical disorders, with regional, peripherally generated pain (MPS) on one end and widespread, centrally mediated pain (FM) on the other. Both share pathophysiological mechanisms and may coexist in a patient. Although the following discussion is organized by neuroanatomical location, these processes are interrelated and should be considered in an integrated fashion.

Motor End Plate

An important finding in the pathophysiology of myofascial pain is a pathological increase in the release of acetylcholine (Ach) by the nerve terminal of an abnormal motor end plate under resting conditions, an event supported by electrodiagnostic evidence.[21,27,28] This abnormality is considered the primary dysfunction in the integrated hypothesis proposed by Simons et al.[18]

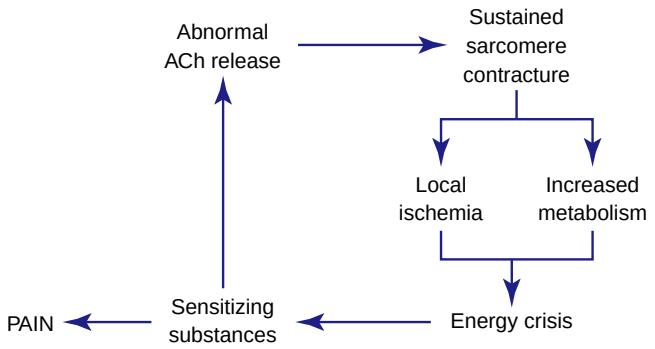

Figure 33-2 Simon's positive feedback loop. *ACh*, acetylcholine. (Modified from Simons DG, Travell JG, Simons LS: *Myofascial pain and dysfunction: the trigger point manual*, vol 1, *Upper half of body*, ed 2, p 71, Baltimore, 1999, Williams & Wilkins.)

and Mense et al.,[24] which postulates a **positive feedback loop** (Figure 33-2).

The concept of the abnormal motor end plate has been supported by electrodiagnostic studies, which have demonstrated end plate noise (EPN) significantly more frequently in MTrPs than in the same end plate zone outside the MTrP.[28,29] Because EPN is characteristic, but not diagnostic, of MTrPs, the significance of these findings is still a matter of debate. Increased EPN has been seen in response to many types of mechanical and chemical stimulation of the end plate structure and does not appear to be specific to myofascial pain.[30,31] However, greater EPN in painful versus latent MTrPs has been demonstrated.[21]

Muscle Fiber

Some researchers hypothesize that increased release of Ach may result in sustained depolarization of the postjunctional membrane of the muscle fiber and produce sustained sarcomere shortening and contracture.[32] Simons referred to this maximally contracted sarcomere in the region of the motor end plate as a **contraction knot** (Figure 33-3).[18] Compelling histological support for this phenomenon is found in canine models of MTrPs: longitudinal sections of dog trigger points demonstrate this sarcomere shortening, and cross sections of dog and human MTrPs strongly suggest it as well.[33,34]

One consequence of chronically sustained sarcomere shortening may be greatly increased local energy consumption and reduction of local circulation, a combination that produces local ischemia and hypoxia.[32] The sustained tension of muscle fibers in the taut band produces an enthesopathy at the myotendinous junction that can be identified as an attachment MTrP. Muscle stretching techniques are effective because they equalize sarcomere length throughout the affected muscle fibers and break the feedback cycle.

Localized muscle ischemias stimulate the release of neurovasoreactive substances, such as prostaglandins, bradykinin, serotonin, and histamine, which sensitize afferent nerve fibers in muscle. These sensitized fibers may account for local muscle tenderness.[24,32]

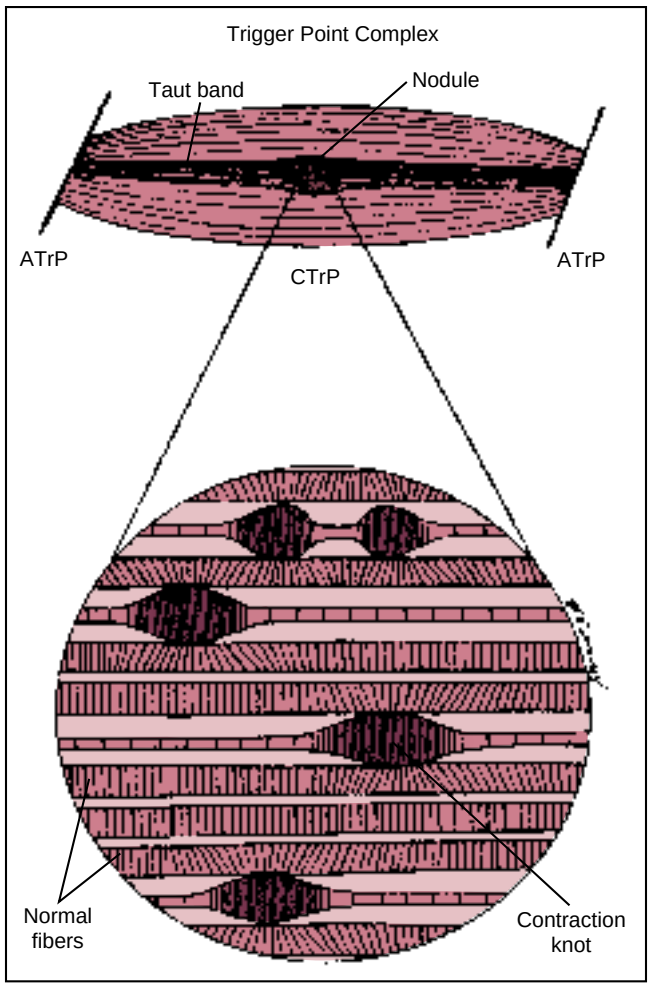

Figure 33-3 Simon's contraction knot. *ATrP*, attachment trigger point; *CTrP*, central trigger point. (From Simons DE, Travell JG, Simons LS: *Myofascial pain and dysfunction: the trigger point manual*, vol 1, *Upper half of body*, ed 2, Philadelphia, 1999, Williams & Wilkins.)

Central Mechanisms: Spinal and Supraspinal

The local twitch response seen with palpation of MTrPs causes a brief polyphasic, high-amplitude contraction. This response is mediated through the spinal cord, and an intact spinal reflex arc is necessary for this response to occur.[21] In contrast, referred pain associated with MTrPs arises from central convergence and facilitation. Experimental data have shown that under pathological conditions, convergent connections from deep afferent nociceptors to dorsal horn neurons are facilitated and amplified in the spinal cord.[21,24,35] Referral to adjacent myotomes occurs as a result of the spreading and arborization (collection of branches) of first-order, afferent neuronal axons to neighboring spinal segments.[21]

The pathophysiology of longstanding regional pain (chronic MPS) or persistent widespread pain associated with somatic symptoms and mood and sleep disturbances (FM) can be understood by examining the phenomenon known as "**centralized pain**." In a centralized pain state, patients actually feel more pain than normal controls, based on the level of nociceptive input.[36,37] This is thought to be due to signal amplification and decreased pain inhibition in one or more pain centers in the central nervous system (CNS).[6,7,32,38,39]

This state of CNS pain amplification and defective pain inhibition is likely multifactorial. Potential mechanisms include increased excitability in second order dorsal horn neurons due to neuroplasticity, degeneration of C fiber terminals, death of inhibitory neurons, and/or expansion of the pool of excitatory neurons.[39] More specifically, centralized pain is likely influenced by excitatory neurotransmitters, such as substance P, *N*-methyl-D-aspartate, glutamate, nitric oxide, as well as inhibitory neurotransmitters, such as serotonin, norepinepherine, and γ-aminobutyric acid (GABA). It is well known that altered levels of these neurotransmitters are associated with sleep, mood, and cognition imbalances and may explain why centrally acting analgesics can address these symptoms in addition to pain.[7,39]

Functional, chemical, and structural brain imaging have further characterized the cortical and/or subcortical augmentation of pain processing in FM. Functional magnetic resonance imaging (fMRI) studies have revealed augmented sensitivity to painful pressure (in association with other variables, such as depression and catastrophizing), decreased opioid receptor binding, decreased concentration of neurotransmitters, enhanced intrinsic network connectivity, and decreased regional gray matter in patients with FM. Areas of specific interest include the cingulate cortex, insula, and dorsolateral prefrontal cortex.[37,39–41]

TREATMENT OF FIBROMYALGIA AND MYOFASCIAL PAIN SYNDROME

The following discussion refers to the management of FM and MPS. Much of the research has been done on one or both of these overlapping patient populations. Where clinically relevant, techniques specific to either FM or MPS are noted.

Educational Approach

Treatment should integrate pharmacological and nonpharmacological approaches and, in the setting of chronic, widespread pain, should be multimodal and interdisciplinary. In order to actively engage patients as participants in the process, clinicians should proceed as follows:

1. **Make a firm diagnosis** of FM and/or MPS based on its own characteristics; rule out or identify overlap with potential conditions as listed in the Differential Diagnoses section.
2. **Educate the patient** about the condition. In simple language, explain the role of the CNS in chronic pain and that the condition is nondegenerative.
3. **Demonstrate an attitude of understanding and empathy**; this is crucial for success in management. Never imply that symptoms are "all in your head."
4. **Inquire about aggravating factors** that vary from patient to patient and necessitate individualized management. Some of these aggravating factors may include poor nutrition, poor ergonomics at home or work, poor postural habits, and environmental factors.
5. **Provide an overview of multidisciplinary treatment strategies** and encourage the patient to read information from the Arthritis Foundation.
6. **Recognize and address significant psychosocial factors**, such as depression, anxiety, mental stress (at home or work), and poor coping skills. Explain how they act as aggravating factors regardless of their origin. The physician can use a written questionnaire or interview skills to help identify psychological factors. A minority of patients require referral to a psychiatrist for management of more severe psychiatric disease.
7. **Identify and address any sleep disturbance** through education on normalizing sleep patterns with appropriate sleep hygiene.
8. **Encourage and prescribe a cardiovascular fitness program**. When appropriate, recommend physical therapy for management of regional musculoskeletal disorders and development of a home exercise program. Reassure the patient that even with careful, incremental increases in activity, pain may be worse at first.
9. **Promote behavioral modification** through education, including cognitive behavioral concepts.[15]
10. **Promote stress reduction** through mind-body techniques.

Pharmacological Management

Because of the considerable clinical overlap among MPS and centralized pain disorders, such as FM, chronic tension headache, and temporomandibular dysfunction, agents that are beneficial in one syndrome may be useful in another. In the absence of consistent, controlled data specifically examining drug efficacy in each disorder, clinicians often generalize from these associated disorders. *The goal of pharmacological therapy is improvement in function by addressing mood, sleep, and pain.* A general rule with medications in this population: start low, go slow, and tailor toward the predominant symptom.

Nonsteroidal Anti-inflammatory Drugs

Minimal literature evaluating the use of nonsteroidal anti-inflammatory drugs (NSAIDs) for chronic pain is available. Several studies have found that NSAIDs may

have a small benefit in the management of pain in FM if they are used in combination with alprazolam, amitriptyline, or cyclobenzaprine.[42–44] Topical diclofenac may be beneficial for pain reduction in MPS.[45] Despite limited evidence, NSAIDs continue to be popular among patients. A study by Wolfe et al.[46] found that patients with FM considered NSAIDs more effective than acetaminophen for pain management.

Tramadol and Other Opioids

Tramadol is an opioid agonist that also inhibits the reuptake of serotonin and norepinephrine in the dorsal horn. There are no published, controlled trials on the use of tramadol for the treatment of myofascial pain, and limited data in support of its use in FM.[4,7,47] In fact, there is increasing evidence demonstrating that any opioids may do more harm than good in this patient population. Significant adverse affects include addiction, tolerance, and opioid-induced hyperalgesia.[7] There is no evidence to support the use of stronger opioids in FM or MPS.

Antidepressants

Numerous systematic reviews of randomized controlled trials (RCTs) have shown antidepressants to be somewhat effective for the treatment of FM, and an increasing number of studies support their role in MPS.[4,6,7,48] Tricyclic antidepressants (e.g., amitriptyline) have been shown to reduce pain in FM and other pain disorders, including MPS.[4,6,49] Selective serotonin reuptake inhibitors (SSRIs) have been documented in FM for improving pain, sleep, and a global sense of well-being and tend to be most effective when mood is the dominant symptom. Studies support the use of dual reuptake inhibitors (serotonin and norepinephrine inhibitors) in the treatment of FM for pain, sleep, depression, and fatigue.[6,7] Evidence supports the use of amitriptyline, fluoxetine, paroxetine, venlafaxine, and milnacipram.[6,7]

Muscle Relaxants

Tizanidine is an α2-adrenergic agonist that acts centrally at the level of the spinal cord to inhibit spinal polysynaptic pathways and to reduce the release of aspartate, glutamate, and substance P and may be effective in MPS, specifically in reducing pain and disability, as well as improving sleep.[4,50,51]

Anticonvulsants

Several RCTs involving pregabalin (a mixed neurotransmitter inhibitor including glutamate) have demonstrated reduction of pain, disturbed sleep, anxiety, and fatigue compared with placebo.[6,7,52] There is less evidence to support the use of gabapentin (a GABA agonist); however, it is frequently prescribed due to its generic status, lending to greater affordability. Both tend to be better tolerated when most or all of the dose is given at bedtime.[6]

Other Agents

Other pharmaceuticals with potential benefit include low-dose naltrexone in FM and lidocaine patches in MPS; however, both require further study.[4,7]

Nonpharmacological Management

Exercise

Aerobic training and stretching exercises form the basis of treatment for FM and MPS, respectively. The goal of exercise in these populations is decreased pain and increased function (e.g., community, activities of daily living, societal or professional).[4]

For patients with FM, aerobic exercise (e.g., walking, warm water swimming, biking, Nordic walking) that starts at low intensity and progresses over a number of weeks to moderate intensity has shown significant benefit in level of function, as well as pain, mood, and overall quality of life.[53–55] Emerging evidence also indicates that warm aqua therapy decreased pain symptoms in FM, and the effect may be beneficial beyond 20 weeks.[56,57]

The exercise prescription should employ a *"start low, go slow"* approach with an eventual goal of at least 20 minutes of aerobic exercise 2 to 3 times per week.[6,58] It may include walking with a step counter and gradually increasing steps per day in 1000 steps per day increments up to at least 5000 steps per day above baseline.[59] For patients with significant functional limitations, a physical therapy and/or occupational therapy prescription is appropriate because guided physical training may reduce falls and is associated with decreased severity of symptoms.[60]

The exercise prescription for patients with centralized pain states should prioritize aerobic exercises and initially avoid isometric or eccentric muscle work because these may cause CNS hyperexcitation.[61] Some patients with FM may eventually be able to tolerate and will benefit from moderate to high intensity resistance training or moderate strength training.[62,63]

The benefits of exercise in chronic pain are well described.[54] However, patients frequently fail to follow through with suggested regimens or discontinue exercise before seeing a benefit. This may be influenced by the fact that lower thresholds of centralized pain lead to a narrower therapeutic window in this patient population.[61,64] Challenges with patient adherence may explain, but not justify, the infrequency with which physicians provide these patients with an exercise prescription.[55]

For patients with MPS, stretching addresses the muscle tightness and shortening that are closely associated with pain and permits gradual restoration of normal activity. Gentle, sustained stretching throughout the available range of motion is an effective approach.[54] Once muscle pain has decreased and range of motion has been restored, exercise to improve muscle strength and endurance should be instituted to maximize functional outcome. Aerobic exercise should also be included as part of

an overall musculoskeletal and cardiovascular fitness program to prevent recurrence.[65]

Importance of Exercise for Myofascial Pain

Exercise is one of the most important aspects of the rehabilitation and management of FM and MPS.[66] The benefits of exercise include:

- Optimization of joint and soft tissue flexibility
- Improved functional status
- Improved mood
- Improved self-efficacy
- Reduction of pain

Postural, Mechanical, and Ergonomic Modifications

Although standard clinical practice and conventional wisdom include efforts to correct postural and ergonomic abnormalities, this approach in treating muscle pain is mainly supported by indirect evidence.[4] A study by Komiyama et al.[67] combined postural training and behavioral therapy in the treatment of myofascial oral pain and found that the subjects receiving the combination therapy were able to regain free, unassisted mouth opening earlier than those treated with behavioral therapy alone; however, the differences in outcome were clinically minor.

The occupational medicine literature provides evidence that injuries are more common when workers are subjected to greater loads and have undesirable postures during work.[68] Occupational MTrPs are theorized to occur as the result of repetitive microtrauma and myofascial shortening. Correction of awkward postures is a standard part of treatment of these disorders, but further long-term efficacy studies are needed.[69]

Stress Reduction

Stress reduction interventions include cognitive behavioral therapy (CBT) and mind-body techniques, such as mindfulness-based stress reduction, yoga, tai chi, and biofeedback. These are often successfully incorporated into chronic pain rehabilitation programs. CBT serves to challenge negative and unhelpful thinking patterns and may enhance the effects of other interventions. There is strong evidence showing its effectiveness in FM in one-on-one, group, or internet settings.[6,7] Mind-body therapies are supported by moderate evidence. A 2010 New England Journal of Medicine RCT showed significant benefit in physical and mental well-being as well as symptoms in patients with FM versus controls at 12 and 24 weeks after a twice weekly, 12-week tai chi class.[70]

Few studies have specifically addressed the efficacy of these techniques for MPS; however, psychological stress has been associated with an increased number of MTrPs.[4]

Acupuncture

Acupuncture is effective for the treatment of MPS.[4] In fact, a remarkably close relationship has been described between acupuncture points and MTrPs; however, specific treatment protocols have yet to be developed.[71]

Evidence supporting the efficacy of acupuncture in FM is mixed. A Cochrane database review of nine trials concluded that the evidence in support of acupuncture in FM was low to moderate.[72] Many of the studies failed to show a significant difference between sham and traditional acupuncture. Interestingly, a 2013 double blinded RCT by Harte et al.[73] demonstrated significant differences in response to sham acupuncture in patients with high pain sensitivity (HPS) and elevated posterior insular glutamate versus those with low pain sensitivity (LPS). The LPS patients had a reduced clinical response to sham acupuncture when compared with those with HPS; however, both treatment groups showed similar and significant responses to traditional acupuncture. Due to these differences in evoked pain sensitivity, further study is certainly required and should take into account the potential analgesic response in some patients but not others to sham acupuncture.[73]

Questions that need to be answered in future RCTs include the true benefit of acupuncture in centralized pain states (which may require differentiating between low and high pain threshold populations), duration of benefit, optimum techniques, and value of booster treatments.

Massage, Electrotherapies, and Ultrasound

Massage combined with stretching exercises has been shown to be effective in reducing the number and intensity of MTrPs.[74,75] Hernandez-Reif et al.[76] found that massage therapy was effective in reducing pain, increasing serotonin and dopamine levels, and reducing symptoms associated with chronic low back pain. Studies validating the use of massage for treatment of myofascial pain are limited, however, and further inquiry is warranted.

Electrotherapies for myofascial pain include transcutaneous electrical nerve stimulation (TENS), electrical muscle stimulation (EMS), electrical twitch-obtaining intramuscular stimulation (ETOIMS), and frequency-modulated neural stimulation (FREMS) therapies. TENS has been shown to be helpful in MPS for several weeks post treatment, whereas the effect of FREMS may persist beyond 3 months.[4,77] Further study is required to determine the efficacy of EMS and ETOIMS in these disorders.

Ultrasound uses alternating compression and rarefaction of sound waves to improve tissue pliability, circulation, and metabolism via the transmission of thermal and mechanical energy. It may be beneficial in MPS alone or in combination with heat and NSAIDs.[4] Trials demonstrating clear efficacy in FM are limited.[7]

Needling Therapy for Myofascial Pain

MTrPs are the hallmark of MPS. Patients with more generalized pain, such as FM, may also have MTrPs. These local areas of painful, shortened muscle can be treated with needling therapy.

It should be noted, however, that stretching and exercise are the mainstays of myofascial pain and that dry needling and trigger point injection (TPI) therapy should be reserved to supplement or augment these exercises.[65] When MTrP needling is used as the primary therapy, patients are at risk of becoming dependent on this treatment for pain relief. Educating patients about the effectiveness of manual stretching techniques and instructing them in these techniques empower patients to self-manage their symptoms effectively. As pain relief and function increase, the patient resumes normal activity, which further helps to inactivate MTrPs. Optimum results are obtained when injections are preceded and immediately followed by manual MTrP release techniques, with the patient learning how to follow a continuing home program.[78]

When needling therapy proves necessary for initiating therapy or for addressing a recalcitrant MFTrP, a series of treatments should be started and the patient should be informed that this treatment has a limited role in the long-term management of myofascial pain. Often, three consecutive weekly visits for dry needling or TPI are recommended for chronic myofascial pain; the patient is reassessed after the third visit to evaluate the efficacy of the injections and to determine whether further injections are necessary. Patients should be informed about potential post-injection soreness, which is expected to resolve.

MTrP therapy may involve the use of dry needling (no medication) or the use of short- or long-acting anesthetics, steroids, or botulinum toxin. A number of techniques may be used, such as slow search,[79] fast in–fast out, superficial dry needling, intramuscular stimulation, twitch-obtaining intramuscular stimulation, and needling and infiltration with preinjection blocks. Several theories have been proposed regarding the mechanism of action of injections for myofascial pain.

Dry needling of MTrPs with acupuncture needles provides as much pain relief as injection of lidocaine but may cause more postinjection soreness.[80] The effectiveness of dry needling depends on the needle eliciting local twitch responses.[81–85] Presumably, the needle mechanically disrupts and terminates the dysfunctional activity of involved motor end plates, with or without injection. TPIs also target the MTrP, with injection of medication after local twitch response is obtained. Longer acting anesthetics (e.g., bupivicane) are more myotoxic and do not show a proven increase in MTrP pain relief over short-acting anesthetic (e.g. lidocaine). The effectiveness of injection steroids in MTrPs is controversial and without a clear evidence of benefit.[4]

In a systematic review article on needling therapies for MTrPs, Cummings and White[86] concluded that based on current medical evidence, the "nature of the injected substance makes no difference to the outcome and that wet needling is not therapeutically superior to dry needling." This is certainly an area in which continued research is needed.

Hong's fast in–fast out technique[80] elicits local twitch responses more quickly than other techniques and presumably reduces needle trauma to muscle fibers from the twitch movement. Baldry et al.[87] recommend superficial dry needling, which they speculate may inactivate MTrPs through stimulation of cutaneous A delta fibers. A study by Chu,[88] based on the work of Gunn,[89] reported a technique in which neurogenically evoked muscle twitches relieved myofascial-type pain. The needling and infiltration technique described by Fischer and Imamura,[90] who used a preinjection block, permits more thorough injection of the trigger point and taut band region with reportedly less patient discomfort.

All of these techniques rely on accurate identification of MTrPs by means of palpation. No definitive evidence indicates that one technique is superior to another in long-term outcome. As Cummings and White[86] remarked, "Because no technique is better than any other, we recommend that the method safest and most comfortable for the patient should be used." Very slim acupuncture needles may have the advantage of minimizing tissue trauma and allowing the practitioner to needle four to six trigger points at one session.

Botulinum Toxin

Botulinum toxin type A (Botox) is FDA approved for treatment of chronic daily headache, and has off-label use in chronic MPSs.[91–93] Both peripheral and central mechanisms may explain the apparent efficacy of botulinum toxin in the treatment of chronic muscle pain. First, blockade of Ach release at the neuromuscular junction reduces muscle hyperactivity, which, in turn, may reduce local ischemia. Second, if, as theorized, trigger points are sustained by excessive release of Ach and sarcomere shortening, botulinum toxin may disrupt the abnormal neurophysiology of the trigger point. Evidence also has been found of retrograde uptake of botulinum toxin into the spinal cord and nucleus raphe, structures that modulate expression of neurotransmitters important in pain perception (e.g., substance P, enkephalins).[94] In addition, Botox inhibits neurotransmitter release from primary sensory neurons in the rat formalin model. Through this mechanism, Botox inhibits peripheral sensitization in these models, which leads to an indirect reduction in central sensitization.[95]

Study results on the use of Botox in myofascial pain are mixed. In fact, a 2012 review by Gerwin on the utility of Botox highlights the variability in study design and numerous pitfalls of studies to date.[96] Therefore, further inquiry with controlled trials is warranted to facilitate the development of appropriate guidelines on its use in myofascial pain.

FUNCTIONAL OUTCOMES IN FIBROMYALGIA AND MYOFASCIAL PAIN SYNDROME

Outcome studies of FM and MPS and their treatments are few. Neither population has increased mortality. In one study of pain, disability, and psychological functioning in chronic low back pain subgroups, patients with low back pain of myofascial origin had outcomes similar to or slightly worse than those with disc herniation, as measured by several standardized questionnaires on pain and disability.[97] Patients with myofascial pain have less accurate beliefs about their pain symptoms, express more dissatisfaction with physician efforts to treat their pain, and report receiving little information from their physicians.[98] A 1998 study by Heikkila et al.[99] investigated the outcome from a multidisciplinary rehabilitation program for patients with whiplash and myofascial pain. After the rehabilitation period, 49% of patients had improved their coping skills for managing chronic pain, and this figure rose to 63% after 2 years. In addition, 46% of patients had increased their life satisfaction. The myofascial pain group also reduced their sick leave time.[99]

In a national six-center longitudinal study, Wolfe et al.[100] determined the intermediate and long-term outcomes of FM in patients seen in rheumatology centers that have a special interest in the syndrome. Although functional disability worsened slightly and health satisfaction improved slightly, measures of pain, global severity, fatigue, sleep disturbance, anxiety, depression, and health status were markedly abnormal at the initiation of the study and were essentially unchanged over the study period.

Poor prognostic factors for chronic widespread pain include behaviors of learned helplessness, poor coping skills, catastrophizing, and a fear that movement will worsen the pain. Most patients with FM have chronic, persistent symptoms; however, most will continue to work (10% to 15% are disabled). Duration of time without a diagnosis adversely affects outcome.[1]

SUMMARY

"Muscle pain" is a common clinical complaint among patients who seek care for musculoskeletal disorders. The clinical presentation covers a spectrum ranging from focal or regional complaints to more widespread pain. Nevertheless, treatment paradigms overlap and are guided by the following major principles[53,101]:

1. Be a sympathetic provider.
2. Make an accurate diagnosis of FM and/or MPS.
3. Educate all patients about the diagnosis and encourage autonomy and self-management.
4. Treat the CNS dysfunction with a balanced, evidence-based approach.
5. Incorporate CBT and mind–body techniques (e.g., meditation, tai chi) to manage chronic pain.
6. Engage all patients with chronic symptoms in a comprehensive exercise and functional restoration program.
7. Treat any associated symptoms (e.g. sleep, mood, headache, bowel, fatigue) or refer the patient to the appropriate provider.
8. Identify and treat any peripheral pain generators (e.g., tendonitis, bursitis, radiculopathy) to reduce the peripheral nociceptive input to the CNS.
9. Judiciously offer needling techniques for local trigger points or other peripheral pain generators to reduce pain and facilitate rehabilitation.

CHAPTER 34

Musculoskeletal Bone and Soft Tissue Tumors

ODION BINITIE, CHRISTINE ALVERO, G. DOUGLAS LETSON

INTRODUCTION

The management of musculoskeletal tumors requires a multidisciplinary team from the time of diagnosis through medical treatment, recovery, and rehabilitation. Physical and occupational therapists are an integral part of that team. The optimal goal is to treat the condition conservatively if appropriate and, if not, to resect the malignant tumor and preserve a functional limb. However, there are instances in which an amputation is the only surgical option. Limb-preserving surgery allows patients to retain their limb, allowing for close-to-normal function, ambulation, and appearance. In the pediatric patient, limb-preserving surgeries have to factor in the residual expected growth of the child. Technologies are available that can lengthen the endoprosthesis noninvasively, allowing the limb to "grow" along with the child, without the need for additional surgeries.

Postoperative rehabilitation following any oncologic surgery is one of the most important factors that affects the overall outcome of these patients, and it is even more critical in limb-preserving surgeries. Numerous studies have reported that with standard of care chemotherapy and surgical resection of the tumor with wide margins, limb-preserving surgery, compared with an amputation, results in no difference in local recurrence or overall survival in patients with sarcomas.[1–4]

A sarcoma is a malignant tumor of the mesenchymal cells. In the United States, sarcomas account for about 1% of all cancers diagnosed in adults annually and for about 12% in pediatric patients. About 14,000 new sarcomas are estimated to be diagnosed each year in the United States.[5] Most sarcomas are treated with a combination of chemotherapy, surgical resection of the tumor, and sometimes radiation. Soft tissue sarcomas usually can be resected and the limb preserved; however, in cases in which the tumor also involves the bone, a bony resection and replacement may be necessary. Amputation is sometimes performed for soft tissue sarcomas if a residual function limb cannot be maintained, because of involvement of the neurovascular structures.

COMMON BONE TUMORS

Common Bone Tumors

- Osteosarcoma
- Ewing sarcoma
- Chondrosarcoma

Osteosarcoma

Although **osteosarcoma** is the most common malignant bone tumor in pediatric patients and adults, it is rare, representing less than 1% of cancers diagnosed in the United States.[6] Its highest incidence is in the second decade of life; however, it does have a bimodal distribution, with the second peak occurring in the seventh and eighth decades. There is an incidence of approximately 5.6 per million children younger than 15 years of age.[7] It can occur in any bone in the body, with the most common sites being the distal femur and proximal tibia near the knee and the proximal humerus (Figure 34-1).

The usual presenting signs are pain in the limb that worsens with activity or that occurs at night, swelling, or a mass. X-rays and magnetic resonance imaging (MRI) scans of the limb are used for the initial evaluation. A definitive diagnosis is based on a tissue biopsy. The lungs are the most common site of metastasis (i.e., spread of cancer), with other bones being second; therefore, imaging of the lungs as well as a whole body bone scan are performed to evaluate for metastatic disease. The standard treatment for osteosarcoma is neoadjuvant chemotherapy, followed by resection of the tumor (Figure 34-2) with wide margins and additional adjuvant chemotherapy. Multiple studies have reported no difference in overall survival of patients treated with amputation versus limb-preservation surgery.[1–4] The 5-year survival rate of patients with primary osteosarcoma is 60% to 70%.[8] Most patients can be treated with limb-preservation surgery

Figure 34-1 **A**, X-ray showing a distal femur osteosarcoma in a 25-year-old. **B**, Sagittal view of a magnetic resonance imaging of the tumor.

Figure 34-2 Intraoperative view of the lateral approach to the femur with the implanted endoprosthesis.

and reconstruction with either an endoprosthesis or an allograft (Figure 34-3). A minority of patients are unsuitable for limb salvage due to extent of the tumor or the desire for high function over cosmesis. Such patients may be treated with an amputation or a rotationplasty. These patients have satisfactory functional and psychological outcomes.[9]

Ewing Sarcoma

Ewing sarcoma is the second most common primary malignancy of bone in young patients. The annual incidence is 2 to 3 per million in the United States. Most patients affected are younger than 21 years of age.[10] Similar to patients with osteosarcoma, patients typically present with pain and sometimes an associated soft tissue mass. Patients

Figure 34-3 Lateral x-ray of the extremity following reconstruction.

Figure 34-4 Ewing sarcoma of the humerus. Note the mottled areas of rarefaction and subperiosteal reaction. (From Herring JA: *Tachdjian's pediatric orthopaedics*, ed 4, Philadelphia, 2008, Saunders/Elsevier.)

may sometimes present with fever, weight loss, fatigue, and other nonspecific symptoms. The initial workup involves x-rays and advanced imaging of the extremity, as well as a biopsy of the tumor (Figure 34-4). Evaluating for the presence of metastases, with the lung being the most common site, completes staging. Ewing sarcoma is also treated with chemotherapy and surgery. Similar to osteosarcoma, limb salvage can be performed in most patients with Ewing sarcoma in an extremity. Radiation is sometimes used in large unresectable tumors, especially those in the pelvis. The 5-year survival for Ewing sarcoma is about 65% to 75%.[11]

Chondrosarcoma

Chondrosarcoma is a malignant bone tumor typically diagnosed in adults. These tumors have low-, intermediate-, and high-grade variants. The high-grade tumors tend to present with pain and are rapidly fulminant (a process that occurs suddenly and severely, to the point of lethality); however, the lower grade tumors may

Figure 34-5 Chondrosarcoma. Prominent dense calcification in large neoplastic mass. (From Eisenberg RL, Johnson NM: *Comprehensive radiographic pathology*, ed 4, St. Louis, 2007, Mosby/Elsevier.)

have a slow progression, with a long-standing history of pain, mild swelling, and difficulty with activities.[12] Chondrosarcoma is rare in children and adolescents and is more common in patients in their third through seventh decades.

Like most malignant bone tumors, patients may present with pain. Diagnosis is made with imaging and tissue biopsy (Figure 34-5). These are important in the grading of these tumors, which is a large determinant of prognosis. The prognosis for patients with low- and intermediate-grade tumors is better than that for those with high-grade tumors. The primary treatment of chondrosarcoma is surgery. Chemotherapy and radiation do not play significant roles in the management of this sarcoma.

ANATOMIC CONSIDERATIONS

Distal Femur

This location is the most common site of malignant bone tumors. A distal femoral resection and endoprosthetic reconstruction is one of the more common procedures performed for these tumors (see Figures 34-2 and 34-3). To obtain a good outcome with any limb-preservation procedure, the preservation of blood supply and neural function in the limb is critical. Several approaches have been described for a distal femoral resection—medial, lateral, or anterior, with all sharing the preservation of the popliteal vessels and the tibial and common peroneal nerves. The most common endoprostheses is a rotating hinged prosthesis, allowing the sacrifice of all the stabilizing ligaments about the knee, both cruciates and the collateral ligaments. The extensor mechanism is preserved. An advantage of the lateral approach over the anterior or medial approach is the lack of disruption of the quadriceps, which is thought to allow for quicker recovery. Patients commonly require some form of bracing, typically a knee immobilizer for several weeks until strength in the quadriceps has returned. However, with resection of the distal femur and some portion of the quadriceps, strength is reduced compared with that of the contralateral limb. Gait training, strengthening, and range of motion are critical to the recovery. Cementation of the endoprosthesis allows for immediate full weight bearing. A press-fit endoprosthesis, which requires bone on-growth onto the stem of the endoprosthesis, requires a period of partial weight bearing until there is evidence of on-growth on radiographs.

Rehabilitation

Although the distal femur replacement does include a total knee replacement, the rehabilitation of this surgery is quite different than a total knee arthroplasty (see Figures 34-2 and 34-3) (Tables 34-1 to 34-4). The physical therapist will need to communicate with the surgeon to discuss the exact surgical approach and the amount of resection. Whether or not the quadriceps muscles have been disrupted or simply moved aside during surgery will create different time frames for returning strength. Regardless of the method of surgical intervention, the patient will be in a knee immobilizer after surgery because of the quadriceps weakness. The purpose of this brace is not to restrict range of motion but simply to support the knee. The patient is prone to knee buckling, and subsequent falls may occur as a result of this initial weakness. The brace is to be worn at all times when out of bed and when performing any mobility activity, transfers, or ambulation. The brace may be removed once the patient is able to perform a straight leg raise without an extensor lag.

Proximal Tibia

The proximal tibia is the second common site of malignant bone tumors and provides its own set of complexities given the anatomy of the tibia and the insertion of the extensor mechanism (Figure 34-6). The preservation of the extensor mechanism is critical in the functioning of the knee after reconstruction. The utilization of a medial gastrocnemius muscle flap allows for soft tissues coverage over the proximal tibia endoprosthesis, reducing the risk of wound breakdown and infection; it also aids in the reattachment of the patellar tendon. The endoprosthesis requires replacement of the distal femoral articular surface (Figure 34-7). A rotating hinge knee replacement is usually used for this, similar to a distal femoral replacement. Following a proximal tibial resection and reconstruction, patients are kept immobilized for at least 6 weeks to allow for healing of the muscle flap and extensor mechanism (Figure 34-8). Range-of-motion exercises do not begin until after that 6-week period. Patients typically have an extensor lag of up to 15° because of the reconstruction (Figure 34-9).

TABLE **34-1**

Lower Extremity Limb Rehabilitation After Surgery: Phase I—Acute Phase (Rehabilitation in the Hospital)

Surgery	Estimated Length of Stay	Rehabilitation Focus	Occupational Therapy Consult	Rehabilitation Sessions: Postoperative Day 1	Rehabilitation Sessions: Remainder of Hospital Stay	Discharge Disposition
Distal femur replacement	3 days	• Mobility • Gait training • Stair training (if needed) • Initial ROM • Initial strengthening • Use of knee immobilizer	• Not unless determined by physical therapist that it is needed	• Physical therapy evaluation • Transfer training, bed mobility, gait training—all with immobilizer in place • Start of isometric exercises (glute sets, quad sets), ankle pumps, active assistive heel slides • **Goals:** out of bed, begin ambulation using an assistive device, sitting in chair for several hours, begin ROM, discharge planning	• Therapy sessions daily (twice daily if possible) • Daily improvements in mobility, transfers, ambulation, range of motion • Exercises: hip abduction/adduction, isometric hamstring sets, straight leg raise in immobilizer • Use of the knee immobilizer (taking on/off) • Caregiver training for mobility	• Dependent on resources available at home • Most likely home discharge with home physical therapy
Proximal tibia replacement	2-3 days	• Mobility • Gait training • Stair training (if needed) • Initial strengthening • Use of knee immobilizer	• Not unless determined by therapist that it is needed	• Physical therapy evaluation • Transfer training, bed mobility, gait training—all with immobilizer in place • Start of isometric exercises (glute sets, quad sets), ankle pumps • **Goals:** out of bed, begin ambulation using an assistive device, sitting in chair for several hours, discharge planning	• Therapy sessions daily (twice daily if possible) • Daily improvements in mobility, transfers, ambulation • Exercises: hip abduction/adduction, isometric hamstring sets, straight leg raise in immobilizer • Use of the knee immobilizer (taking on/off) • Caregiver training for mobility	• Dependent on resources available at home • Most likely home discharge with home physical therapy

Proximal femur replacement	3-4 days	• Mobility • Gait training • Stair training (if needed) • Initial strengthening • Education on hip precautions	• Yes, occupational therapy will need to work with the patient on self-care activities while maintaining hip precautions	• Physical therapy evaluation • Transfer training, bed mobility, gait training—all while maintain hip precautions • Start of isometric exercises (glute sets, quad sets), ankle pumps • Education on hip precautions • **Goals:** out of bed, begin ambulation using an assistive device, sitting in chair for several hours, discharge planning	• Therapy sessions daily (twice daily if possible) • Daily improvements in mobility, transfers, ambulation • Exercises: isometric hip abduction/adduction, heel slides • Review of hip precautions • Caregiver training for mobility	• Dependent on resources available at home • Although many will return to home, many others will require a skilled nursing facility or inpatient rehabilitation facility first
Total femur replacement	5-7 days	• Mobility • Gait training • Stair training (if needed) • Initial strengthening • Initial ROM • Education on hip precautions • Education on use of knee immobilizer	• Yes, occupational therapy will need to work with the patient on self-care activities while maintaining hip precautions	• Physical therapy evaluation • Transfer training, bed mobility, gait training—all while maintain hip precautions and wearing the knee immobilizer • Start of isometric exercises (gluteal sets, quadriceps sets), ankle pumps, active assistive heel slides • Education on hip precautions • Education on knee immobilizer • **Goals:** out of bed, begin ambulation using an assistive device, sitting in chair for several hours, discharge planning; begin ROM if pain is controlled	• Therapy sessions daily (twice daily if possible) • Daily improvements in mobility, transfers, ambulation, ROM • Exercises: isometric hip abduction/adduction, active assistive heel slides • Review of hip precautions	• Placement in a skilled nursing facility or preferably inpatient rehabilitation facility

ROM, Range of motion.

TABLE **34-2**

Lower Extremity Limb Rehabilitation After Surgery: Phase II—Subacute Phase (May Take Place in a Rehabilitation Facility, Home, or Outpatient Setting)

Surgery	Time Frame	Rehabilitation Goals	Rehabilitation Sessions	Pearls
Distal femur replacement	8-12 weeks	• Progression of ambulation to least restrictive assistive device (or none at all) • Progression to least dependent living situation • Normalized gait pattern • ROM to 120° knee flexion • Return of strength, discontinuation of knee immobilizer	• Begin with gentle AAROM and quad strengthening • PROM may be too aggressive and is not needed • Mobility and gait training • Balance activities	• ROM may return slowly. This is expected; this procedure is not a total knee replacement. • Patient is high risk for falls due to quadriceps weakness. A fall can result in a torn quadriceps tendon. Take the use of the knee immobilizer seriously.
Proximal tibia replacement	6 weeks	• Progression of ambulation to least restrictive assistive device • Progression to least dependent living situation • Quadriceps strengthening in knee immobilizer	• Mobility and gait training • Balance activities • Exercise focused on quadriceps strength	• No knee flexion is allowed. Even minimal ROM (knee flexion) can cause the stitches to break and will cause disruption of the patellar tendon. • Patient may not be involved in skilled PT services throughout this time period. They are often able to continue with a home program.
Proximal femur replacement	12 weeks	• Progression of ambulation to least restrictive assistive device • Progression to least dependent living situation • Normalized gait pattern	• Mobility and gait training • Balance activities	• These patients may need limits set to prevent them from becoming too aggressive in their rehabilitation. Return to recreational activities will come, just not in the first 12 weeks. • Hip precautions are in place for minimum of 3 months.
Total femur replacement	12 weeks	• Progression of ambulation to least restrictive assistive device • Progression to least dependent living situation • ROM to 120° knee flexion • Return of strength, possible discontinuation of knee immobilizer	• Begin with gentle AAROM and quadriceps strengthening • PROM may be too aggressive and is not needed • Mobility and gait training • Balance activities	• ROM may return slowly. This is expected; this procedure is not a total knee replacement. • Patient is high risk for falls due to quadriceps weakness. A fall can result in a torn quad tendon or even hip dislocation. Take the use of the knee immobilizer seriously. • Hip precautions are in place for minimum of 3 months but typically longer after this surgery.

ROM, Range of motion; *AAROM*, active assisted range of motion; *PROM*, passive range of motion; *PT*, physical therapy.

TABLE **34-3**

Lower Extremity Limb Rehabilitation After Surgery: Phase III—Long Term

Surgery	Time Frame	Rehabilitation Goals	Rehabilitation Sessions	Pearls
Distal femur replacement	Up to 6 months after surgery	• Return of strength • Return to recreational activities	• Simulation of motions/activities that the patient would like to return to performing (e.g., golf, hiking)	• Gait speed, oxygen consumption, and strength will be reduced compared with normal controls.[18]
Proximal tibia replacement	Begins 6 weeks after surgery and can extend through 1 year	• Progression of ambulation without assistive device • Return of strength • Return of ROM (knee flexion) to 120° • Eventual return to recreational activities	• AAROM and gentle PROM for knee flexion • Progressive strengthening, gait training, stair training, balance activities • Simulation of motions/activities that the patient would like to return to performing (e.g., golf, hiking)	• This is the most critical point in the rehabilitation of this patient. • Progression of ROM will be *slow*. This is expected. • Full ROM can be attained!
Proximal femur replacement	Up to 6 months after surgery	• Return of strength • Return to recreational activities	• Simulation of motions/activities that the patient would like to return to performing (e.g., golf, hiking)	• Abductor weakness can be a chronic weakness
Total femur replacement	6 months to 1 year after surgery	• Progression of ambulation without assistive device • Return of strength • Return of ROM (knee flexion) to 120° • Eventual return to recreational activities (these will be limited)	• Similar to distal femur and proximal femur	• In the pediatric population, it is quite possible for the patient to return to near-prior functional levels.

ROM, Range of motion; *AAROM,* active assisted range of motion; *PROM,* passive range of motion.

Rehabilitation

Early range of motion, even minimal knee flexion, can cause the sutures used to repair the patellar tendon to break, thereby disrupting the integrity of the extensor mechanism. Only after the 6-week time frame can range-of-motion activities begin, with the patient regaining range of motion through time, effort, and dedication to rehabilitation (see Tables 34-1 to 34-4). These patients return to a high level of function with proper follow-through physical therapy. Patients with a proximal tibia replacement are able to return to an efficient gait and active lifestyle after the surgery and subsequent rehabilitation.[13,14]

Clinical Note

- Maintaining the knee in full extension after a proximal tibial replacement, for at least 6 weeks, is important to allow for healing of the extensor mechanism.

Proximal Femur

Function after a resection of a proximal femur bone sarcoma (Figures 34-10 and 34-11) is affected by the preservation of the muscles that insert onto the femur. A posterior

TABLE **34-4**

Lower Extremity Limb-Preservation Surgeries: Quick Tips

Surgical Procedure	Precautions/Restrictions	Bracing	Weight Bearing
Distal femur replacement	None	Knee immobilizer; can be removed when patient can perform a straight leg raise without extensor lag	As tolerated (cemented) Press fit; partial weight bearing
Proximal tibia replacement	No knee flexion for 6 weeks	Knee immobilizer; remains in place for 6 weeks	As tolerated (cemented) Press fit; partial weight bearing
Proximal femur replacement	Hip precautions	None	As tolerated (cemented) Press fit; partial weight bearing
Total femur replacement	Hip precautions	Knee immobilizer; can be removed when patient can perform a straight leg raise without extensor lag	As tolerated (cemented) Press fit; partial weight bearing

Figure 34-6 **A**, X-ray of a proximal tibia with an osteosarcoma in a 14-year-old girl. **B**, Magnetic resonance image of the same osteosarcoma.

approach to the hip is the most common surgical approach. Patients usually have a Trendelenburg gait postoperatively. Techniques have been described to aid in the reattachment of these muscles onto the endoprosthesis[15]; however, because of the number of muscular attachments resected, there is commonly residual functional weakness, especially of the abductor muscles. Greater strength deficits and reduced range of motion should be expected in these patients compared with patients undergoing total hip arthroplasties.[13] A bipolar hip component is usually used to reduce the added risk of dislocation of a total hip replacement.

Rehabilitation

The rehabilitation of a proximal femoral replacement is very similar to (and follows the guidelines of) that for a hip replacement that a physical therapist may see in a general orthopedic practice (see Tables 34-1 to 34-4). Typically, the posterior approach to the hip is used; thus,

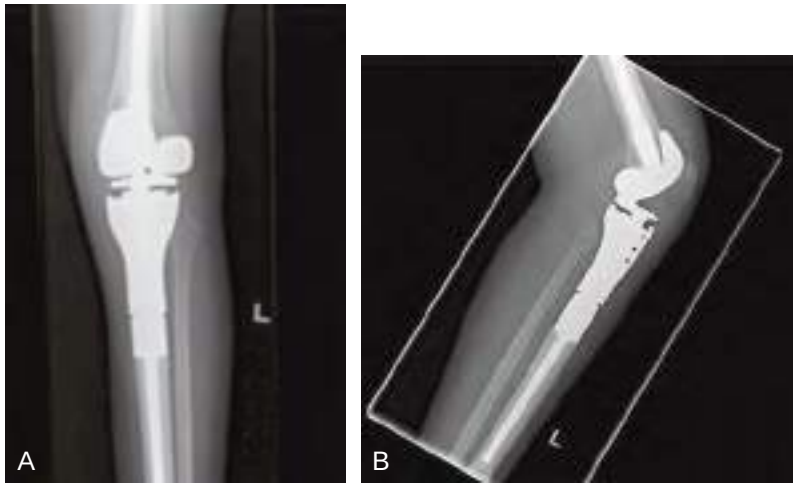

Figure 34-7 X-rays showing a proximal tibial replacement along with a total knee arthroplasty. **A**, Anterior view. **B**, Lateral view.

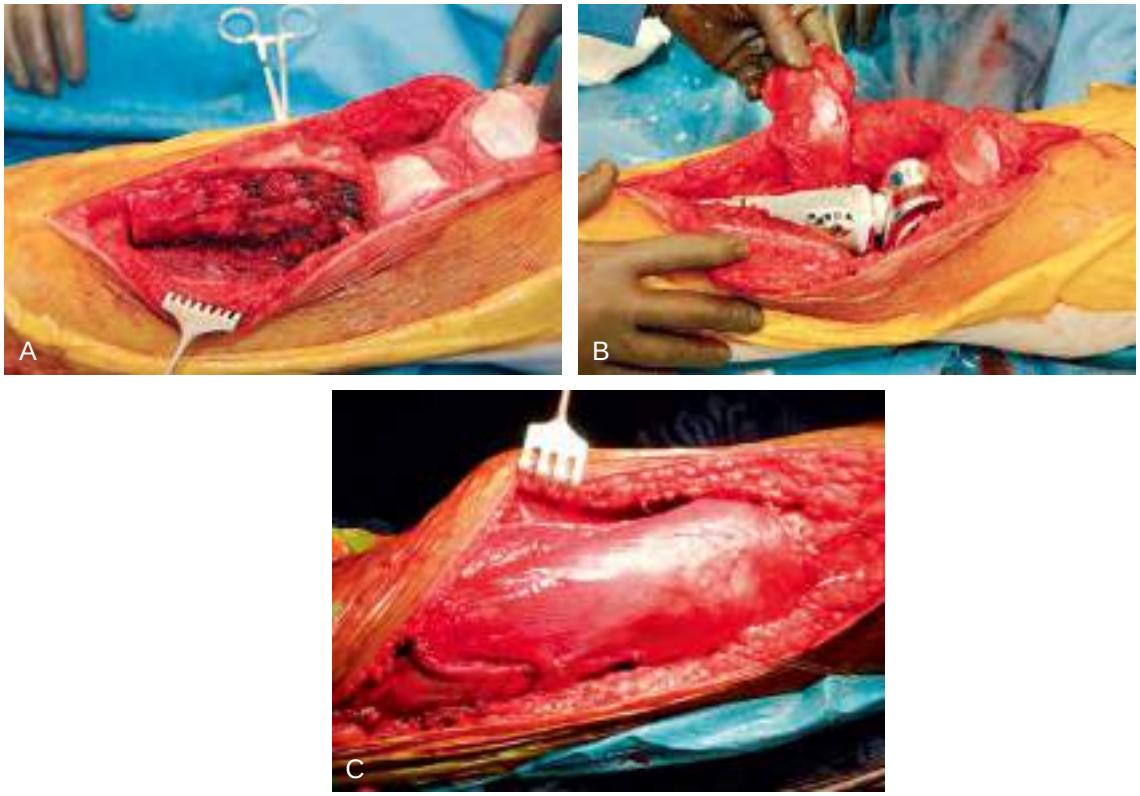

Figure 34-8 **A**, Resection of a proximal tibia sarcoma with the patella and extensor mechanism preserved. **B**, Medial gastrocnemius rotation flap in the surgeon's hand. **C**, After flap closure, showing coverage of the endoprosthesis.

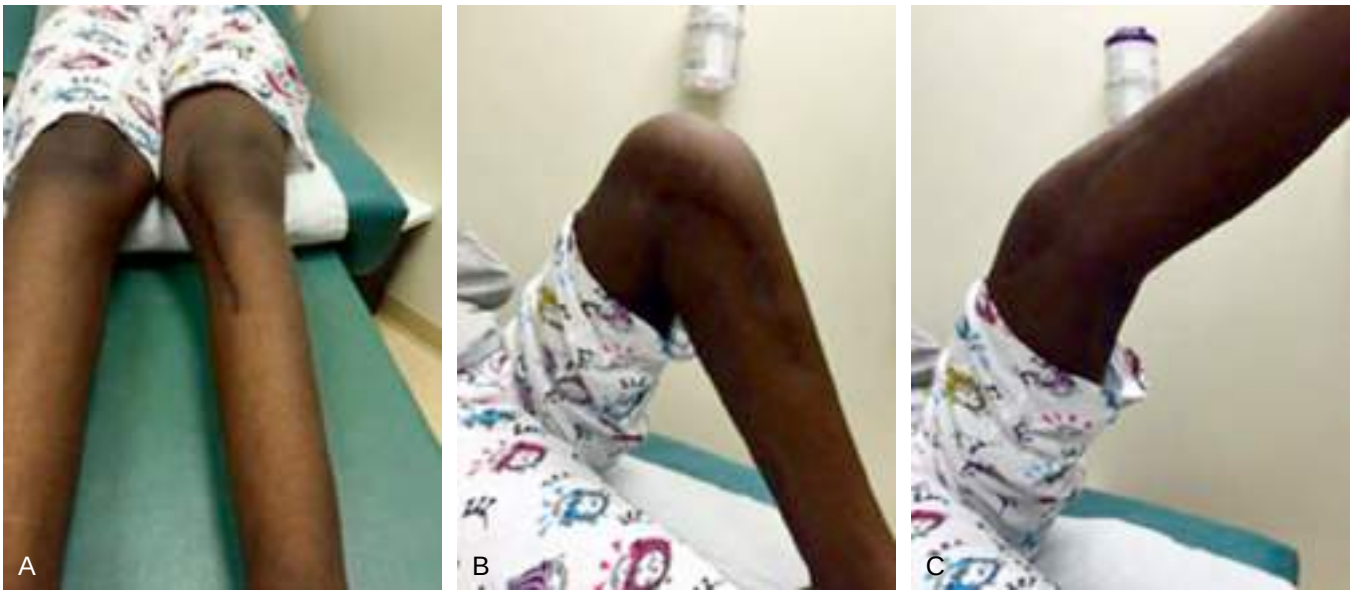

Figure 34-9 Active knee range of motion 1 year after surgery. **A**, Extension. **B**, Flexion. **C**, Quadriceps lag.

posterior hip surgery precautions must be maintained during the rehabilitation phase. These precautions include no hip flexion past 90°, no hip medial (internal) rotation, and no hip adduction past midline. In a typical proximal femoral replacement, it takes at least 3 months to regain strength in order to maintain the integrity of the hip joint and therefore, the clinician must take these precautions into account when treating the patient. With most proximal femur replacements, the patient will bear weight as tolerated on the operative lower extremity, because these are typically cemented endoprostheses. It is essential that the physical therapist communicate with the surgeon regarding the amount of femur that was removed. Although this surgery is termed proximal, it can

Figure 34-10 Magnetic resonance imaging scan of an osteosarcoma of the proximal femur in a 22-year-old.

Figure 34-11 Postoperative x-ray images of hip replacement prosthesis.

actually involve a large portion of the femur. Functional outcomes for the patient are largely determined by the amount of femur replaced. In general, these patients return to a high level of function (Figure 34-12). Patients with a proximal femur replacement are able to return to an efficient gait and active lifestyle after the surgery and subsequent rehabilitation.[13,15]

Posterior Hip Postsurgical Precautions

- No hip flexion past 90°
- No hip medial (internal) rotation
- No hip adduction past the midline

Total Femur Replacement

A total femur replacement is used for diaphyseal tumors that extend proximally to the lesser trochanter and distally to the distal diaphyseal-metaphyseal junction of the tumor. It is unique in that it is composed of a total hip replacement and a total knee replacement (see Figure 34-18). This patient will need extensive education by both the surgeon and physical therapist to establish realistic expectations with regard to functional outcomes (see Tables 34-1 to 34-4).[16,17] A great deal of strength is lost and will never be fully recovered. Thus, the patient will likely always require the use of an assistive device for ambulation. The patient will be required to follow hip precautions, just as those with a proximal femur replacement do, with the caveat that the patient will likely be required to follow these for life or, at a minimum, for much longer than the patient who has undergone the proximal femur replacement only (see Table 34-4). The strength deficits that will be experienced will likely be too great to ever prevent dislocation if the joint is placed in certain positions. A knee immobilizer will be used, just as it is used for the distal femur replacement. The patient should expect that the brace will be in place for a longer period of time compared with the distal femur replacement. As with the distal femur replacement, the patient can discontinue the use of the brace when he or she can perform a straight leg raise without an extensor lag.

Figure 34-12 Active hip range of motion 2 months postoperatively after surgery for an osteosarcoma.

Clinical Note

- Patients with a total femur replacement will need to maintain posterior hip precautions for life or, at a minimum, much longer than the patient who has undergone only a proximal femur replacement.

Distal Tibia

The distal tibia is a rare site for malignant bone tumors (Figure 34-13). Resection and limb salvage is an option; however, there are complications associated with allograft or endoprosthesis. Range of motion is reduced, making high-impact activities difficult. Below-the-knee amputation is often the best oncologic and functional option in these patients.[12]

Proximal Humerus

Similar to the proximal femur, the preservation and reattachment of any of the rotator cuff muscles, pectoralis, or latissimus dorsi muscles leads to improvement in function postoperatively (Figure 34-14). However, it is common for a large portion of the rotator cuff to be resected along with the tumor. Given this, expectations for range of motion and strength are limited postoperatively. The therapist is indispensable in working to achieve satisfactory results.

Rehabilitation

The proximal humeral replacement is quite different than a general orthopedic shoulder replacement, and the associated outcomes are also very different (Tables 34-5 to 34-8). A hemiarthroplasty is usually performed to

Figure 34-13 Radiographs are essential in evaluating leg pain in an athlete because rare surprises such as these tumors may be discovered. **A**, Radiograph of stress fracture through a benign cartilage tumor of the tibia in a 9-year-old soccer player. **B**, Radiograph of an aneurysmal bone cyst of the fibula in a 7-year-old child. **C**, Radiograph of an osteosarcoma of the distal tibia in an active 16-year-old boy. TABLE **34-5**

Upper Extremity Limb Rehabilitation After Surgery: Phase I—Acute Phase (Rehabilitation in the Hospital)

Surgery	Estimated Length of Stay	Rehabilitation Focus	Occupational Therapy Consult	Rehabilitation Sessions: Postoperative Day 1	Rehabilitation Sessions: Remainder of Hospital Stay	Discharge Disposition
Proximal humerus replacement	2-3 days	• Initial ROM of elbow, wrist, fingers • Use of shoulder immobilizer	• Yes, in many hospitals, occupational therapists will solely be responsible for these patients	• Occupational therapy evaluation (physical therapy evaluation if needed) • Transfer training, bed mobility with shoulder immobilizer in place • Start of AROM of elbow, wrist, fingers, pendulum exercise • Education in use of the shoulder immobilizer • Education on NWB status of the upper extremity • **Goals:** out of bed, sitting in chair for several hours, begin ROM, discharge planning	• Occupational therapy for one-armed techniques for bathing, dressing, and other self-care activities • Physical therapy involvement if the patient was using an assistive device for ambulation before admission	• Discharge home with an independent home program to continue for 6 weeks
Distal humerus replacement	1-3 days	• Initial ROM of entire upper extremity	• Yes, in many hospitals, occupational therapists will solely be responsible for these patients	• Occupational therapy evaluation (physical therapy evaluation if needed) • Start of AROM of shoulder, elbow, wrist, fingers • Use of shoulder immobilizer for comfort only • **Goals:** out of bed, sitting in chair for several hours, begin ROM, discharge planning	• Progress ROM of elbow joint	• Discharge home with an independent home program or with outpatient therapy
Total humerus replacement	2-3 days	• Initial ROM of elbow, wrist, fingers • Use of shoulder immobilizer	• Yes, in many hospitals, occupational therapists will solely be responsible for these patients	• Occupational therapy evaluation (physical therapy evaluation if needed) • Transfer training, bed mobility with shoulder immobilizer in place • Start of AROM of elbow, wrist, fingers, pendulum exercise • Education in use of the shoulder immobilizer • Education on NWB status of the upper extremity • **Goals:** out of bed, sitting in chair for several hours, begin ROM of elbow, discharge planning	• Occupational therapy for one-armed techniques for bathing, dressing, and other self-care activities • Physical therapy involvement if the patient was using an assistive device for ambulation before admission • Progress elbow ROM	• Discharge home with an independent home program to continue for 6 weeks

ROM, Range of motion; *AROM,* active range of motion; *NWB,* non–weight bearing.

TABLE 34-6

Upper Extremity Limb Rehabilitation After Surgery: Phase II—Subacute Phase (May Take Place in a Rehabilitation Facility, Home, or Outpatient Setting)

Surgery	Time Frame	Rehabilitation Goals	Rehabilitation Sessions	Pearls
Proximal humerus replacement	6 weeks	• Full elbow, wrist, finger ROM	• Patient will likely be performing a program to include AROM to the elbow, wrist, fingers, shoulder pendulums	• The patient will remain in the shoulder immobilizer during this time with no shoulder ROM. • Beginning ROM too early will result in lack of scar tissue, which is needed for shoulder stability.
Distal humerus replacement	6-12 weeks	• Full ROM • Full strength • Return to full function	• Beginning with AROM and progression to resistive range of motion	
Total humerus replacement	6 weeks	• Full ROM of elbow, wrist, fingers • Full strength of elbow, wrist, fingers	• Beginning with AROM and progression to resistive range of motion of the elbow, wrist, and fingers only	• The patient will remain in the shoulder immobilizer during this time with no shoulder ROM. • Beginning ROM too early will result in lack of scar tissue, which is needed for shoulder stability.

ROM, Range of motion; *AROM,* active range of motion.

TABLE 34-7

Upper Extremity Limb Rehabilitation After Surgery: Phase III—Long Term

Surgery	Time Frame	Rehabilitation Goals	Rehabilitation Sessions	Pearls
Proximal humerus replacement Total humerus replacement	4-6 months after surgery	• 9° shoulder flexion • Functional use of upper extremity for feeding, grooming, dressing, etc.	• Gentle and relatively pain-free activities • AAROM to the shoulder; PROM not needed • Progression to strengthening activities for the shoulder • Self-care training with use of surgical extremity	• Reliance on scar tissue to maintain shoulder integrity and prevention of subluxation is needed. Aggressive ROM will break the scar tissue, causing instability. • Exercises should continue for life. Regression of attained ROM will occur if the exercises are discontinued.

AAROM, Active assisted range of motion; *PROM,* passive range of motion; *ROM,* range of motion.

TABLE 34-8

Upper Extremity Limb-Preservation Surgeries: Quick Tips

Surgical Procedure	Precautions/Restrictions	Bracing	Weight Bearing
Proximal humerus replacement	No shoulder range of motion for 6 weeks	Shoulder immobilizer at all times	Partial weight bearing
Distal humerus replacement		Shoulder sling for comfort only	Partial weight bearing
Total humerus replacement	No shoulder range of motion for 6 weeks	Shoulder immobilizer at all times	Partial weight bearing

decrease the risk of instability and dislocation. Given the extent of the surgical resection usually performed in oncologic surgery, the patient will require immobilization for 6 weeks and specialized rehabilitation. Patients should expect to have significant deficits to their functional abilities after this surgery, which is often the only option other than an amputation. Therefore, limited range of motion, strength, and function are all acceptable outcomes of surgery. Long-term goals should include full elbow, wrist, and finger range of motion and strength, as well as active shoulder flexion and abduction to from 60° to 90°. Some of the most prevalent long-term effects include subluxation or instability.

Clinical Note—Caution!

- Upper limb replacement surgery for bone tumors prevents weight bearing (i.e., with crutches or a walker) through the upper limb, until strength has been regained.

Elbow and Forearm

The elbow and forearm are rare sites of malignant tumors (Figure 34-15). Wide resection of the proximal radius or distal ulna can be performed without reconstruction or by the creation of a one-bone forearm by fusion. For the distal humerus or proximal ulna, resection and reconstruction with either an allograft-prosthetic composite (APC) or an endoprosthesis with a total elbow reconstruction can provide favorable outcomes.[18] For tumors of the distal radius, allograft with wrist arthrodesis or an osteoarticular allograft are used after limb-preservation procedures.

Rehabilitation

The distal humeral replacement is a surgery involving a portion of the distal humerus along with an elbow replacement. The results from this procedure are very positive, and the patient is likely to return to full prior level of function, with weight-lifting restrictions (see

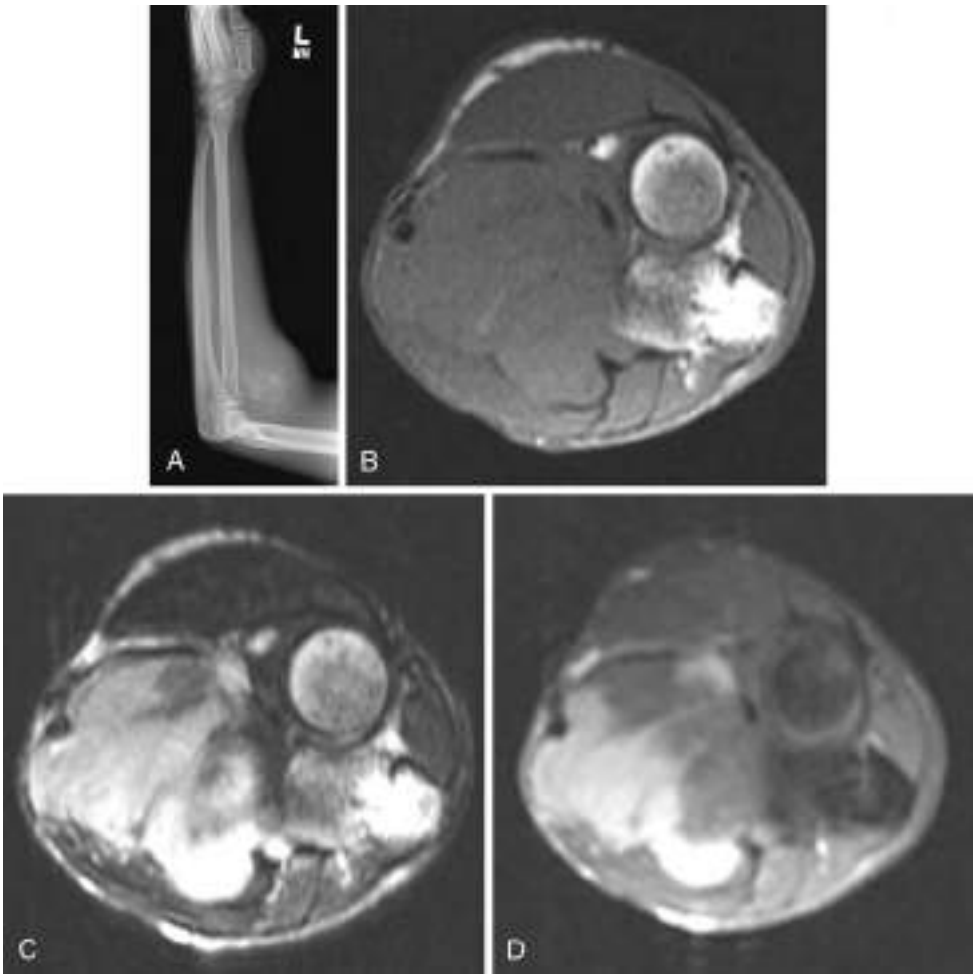

Figure 34-15 Synovial sarcoma in a 24-year-old man. **A**, Lateral radiograph of the left elbow shows a calcified soft tissue mass in the antecubital fossa. **B**, T1-weighted (T1WI) axial magnetic resonance imaging study shows a lobulated isointense soft tissue tumor. **C**, Fat-suppressed T2-weighted (T2WI) axial study with a mildly heterogeneous hyperintense soft tissue tumor with areas of low signal due to intratumoral calcification. **D**, Postcontrast fat-suppressed T1WI axial study shows heterogeneous enhancement of tumor. (From Silverman PM: *Oncologic imaging: a multidisciplinary approach*, Philadelphia, 2012, Saunders/Elsevier.)

Figure 34-16 **A**, Magnetic resonance imaging scan of the pelvis with a chondrosarcoma involving the ilium and the periacetabular region. **B**, X-ray showing endoprosthetic reconstruction and a total hip arthroplasty after a type II resection.

Tables 34-5 to 34-8). This patient will have few other restrictions and will immediately be allowed to begin fully participating in the rehabilitation process. In contrast to the proximal humeral replacement, this procedure allows for immediate weight bearing through the extremity, as well as immediate elbow range of motion and strengthening.

Total Humeral Replacement

The patient with a total humeral replacement will have components of both a proximal and distal humeral replacement, which includes a total elbow replacement. The patient will have similar restrictions to a proximal humeral endoprosthesis—the shoulder must remain immobilized for 6 weeks postoperatively, and weight bearing through the surgical extremity is not allowed (see Tables 34-5 to 34-8). Patients should expect to have significant deficits in their functional abilities after this surgery, which is often the only option other than an amputation. Therefore, limited range of motion, strength, and function are all acceptable outcomes. Long-term goals should include full elbow, wrist, and finger range of motion and strength, as well as active shoulder flexion and abduction from 60° to 90°.

Clinical Note—Caution!

- Patients who have had a proximal humeral replacement for bone tumors depend on scar tissue to maintain shoulder integrity so any range of motion or stretching activities must be done with extreme caution.

Pelvis

Resection of the pelvis can be broadly categorized into internal hemipelvectomies (resection) and external hemipelvectomies (amputation). The factors that determine limb salvage of a pelvic tumor are the neurovascular structures in the pelvis, the femoral vessels, and adequacy of tissue coverage. After an internal hemipelvectomy, reconstruction may be performed or the limb may be left flail. There are several reconstruction options, including allograft, APC, endoprosthesis (Figure 34-16), and arthrodesis. The Enneking classification[19] of internal hemipelvectomy classifies the resection based on the part of the pelvis resected (Table 34-9). The resection type determines the

TABLE **34-9**

Enneking Classification and Reconstruction for Internal Hemipelvectomy[19]

Type	Resection	Reconstruction Options
I	Part or all of the ilium	No reconstruction or sacroiliac fusion with allograft
II	Periacetabular region	Acetabular allograft-prosthetic composite with total hip arthroplasty, iliofemoral arthrodesis, endoprosthesis, or suspension of the femur with no reconstruction (flail limb)
III	Ischiopubic area	No reconstruction
IV	Pelvis with extension into the sacrum	Similar to type II

reconstruction. Type I may be reconstructed should there be pelvic discontinuity with a fusion from the remaining ilium to the sacrum. Type II resections involve the acetabulum and are the most challenging for reconstruction. APCs, iliofemoral arthrodesis, or endoprosthetic reconstructions may be used, with all having high levels of postoperative morbidities.[20–22] Type III resections typically do not require reconstruction.

Depending on the type of pelvic resection, the abductors, adductors, lateral (external) rotators, and hip flexors may be resected and/or removed during the dissection. This leads to limited strength and function of those muscle groups. With normal knee and ankle function, patients are able to ambulate. However, a Trendelenburg gait, a potential leg length discrepancy, and altered mechanics affect ambulation postoperatively (Figure 34-17).

Rehabilitation

For these major surgeries, it is essential that the physical therapist have excellent communication with the surgeon and, if possible, access to postoperative x-rays. Rehabilitation is highly dependent on what portions of the pelvis are resected and how the reconstruction is completed. These patients may be amputees with an external hemipelvectomy, or they may be treated similar to a patient who has undergone total hip arthroplasty, with more strict hip precautions if the resection is a type II. Overall, functional outcome will depend greatly on what was resected and what type of reconstruction, if any, was performed (see Figure 34-16). Patients having an external hemipelvectomy may be fitted for a prosthesis if they are mobile enough; however, given the extensive nature of the amputation, the use of the prosthesis is very challenging, and most patients do not opt for this.

PEDIATRIC PATIENTS

Additional challenges exist with regard to limb preservation in a growing child with a tumor in the extremity, especially the lower extremity; this is because of the expected continued growth of that limb. Endoprosthesis technology has improved from invasive lengthening techniques to noninvasive methods. Currently, several endoprostheses can be gradually lengthened as the child grows. An external revolving magnet slowly lengthens a screw mechanism inside the endoprosthesis (Figure 34-18). The limb is lengthened a few millimeters at a time, typically on a monthly basis (Figure 34-19). Studies have reported good outcomes and patient satisfaction with these techniques.[23,24] In instances in which the child is very young and a large leg length discrepancy is expected, an amputation or rotationplasty may be another viable option.

AMPUTATIONS

When limb salvage cannot be performed or following the failure of a limb-preservation procedure, an amputation may be necessary. Techniques are similar to those used for amputations performed for other diagnoses; however, the primary goal in the presence of cancer is for wide resection of the tumor, so residual limbs may be shorter. The level of the amputation correlates with the amount of energy expenditure when ambulating and walking speed.[25–27] One study compared energy cost during gait in patients with osteosarcoma of the distal femur who underwent an amputation with patients with a distal femoral replacement. Amputees had slower free-walking velocity, higher oxygen consumption per meter traveled, and lower percent maximum aerobic capacity.[28]

Figure 34-17 Flexion and abduction images of a 23-year-old male who underwent a resection and endoprosthetic reconstruction for an osteosarcoma of the pelvis.

Figure 34-18 X-rays showing a total femur expandable endoprosthesis as it has been lengthened over a 3-year period.

Figure 34-19 A child undergoing a lengthening of a Stanmore noninvasive endoprosthesis with the limb in an external magnet.

Transfemoral amputations lead to an increase in energy expenditure during ambulation. The length of the residual limb affects the prosthetic fit; residual limbs shorter than 5 cm (2 inches) behave functionally as hip disarticulations.[12] A "fish-mouth" incision is typically used. A medial adductor myodesis (i.e., suturing the muscle to the bone) is important to improved adduction power and prevent lateral drift in the prosthetic socket.

Transtibial amputations are a durable option for tumors of the distal tibia, foot, and ankle. The length of the residual limb affects prosthesis fitting and control.

Hip disarticulation is performed for tumors of the proximal femur when limb salvage is not an option. Patients can ambulate with a prosthesis, although they can be cumbersome and require a lot of energy expenditure.[12]

Shoulder disarticulation and forequarter amputations are used when the tumor involves the shoulder girdle and/or proximal humerus and limb salvage and reconstruction or arthrodesis is not a viable option. A forequarter amputation involves resection of the scapula, clavicle, and entire arm. Rotation flaps are typically used for closure. The loss of the shoulder contour does make clothes wearing difficult, and static shoulder pads are sometimes used. Occupation therapy is critical for these patients to help them learn to use their one remaining upper extremity.

Rehabilitation

Regardless of the reason for an amputation (e.g., cancer, infection, trauma), from a physical therapy aspect, the amputee will be treated the same. The patient will have varying needs and expectations, with a prosthesis depending on the size of the residual limb (Figure 34-20). Positioning is an important focus of physical therapy and depends on the portion of the limb that has been amputated (Table 34-10). The patient should be fitted with a shrinker (Figure 34-21) and residual limb (Figure 34-22) protector as soon as possible after surgery (Table 34-11). One of the most important areas to focus on with any amputee is the psychosocial component that comes with this type of surgery—no matter how well prepared the individual may be before surgery. Phantom pains and sensations are real and should be acknowledged; furthermore, the individual should be shown techniques to address these feelings. In an oncology setting, an amputation is rarely an emergency procedure, and the patient has usually had at least a few weeks to begin to process the upcoming surgery and its implications. The hospital's social workers and/or psychologists may be able to lend assistance with the psychosocial component of these surgeries. They also may be accustomed to the extremity lacking in function and do extremely well after surgery.

Figure 34-20 A 24-year-old with transtibial amputation, after a local recurrence following a proximal tibial osteosarcoma resection, ambulating with a prosthesis.

TABLE **34-10**

Rehabilitation of the Amputee: Acute Phase

Surgery	Estimated Length of Stay	Rehabilitation Focus	Occupational Therapy Consult	Rehabilitation Sessions: Postoperative Day 1	Rehabilitation Sessions: Remainder of Hospital Stay	Discharge Disposition
Transfemoral	2-3 days	• Mobility • Gait training • Stair training (if needed) • Initial ROM • Initial strengthening	• Not unless determined by physical therapist that it is needed	• Physical therapy evaluation • Transfer training, bed mobility, gait training with walker, balance activities • Education on fall risks/fall prevention • Education on proper positioning (hip extension, time spent in prone position), risks for flexion contractures	• Therapy sessions daily • Progression to crutches if appropriate • Daily improvements in mobility, transfers, ambulation, ROM • Start of AROM of the hip • Fitting of shrinker and limb protector	• Dependent on resources at home • Most likely home discharge with home physical therapy (patients will continue this until ready for prosthesis fitting)
Transtibial	2-3 days	• Mobility • Gait training • Stair training (if needed) • Initial ROM • Initial strengthening	• Not unless determined by physical therapist that it is needed	• Physical therapy evaluation • Transfer training, bed mobility, gait training with walker, balance activities • Education on fall risks/fall prevention • Education on proper positioning (knee extension), risks for flexion contractures	• Therapy sessions daily • Progression to crutches if appropriate • Daily improvements in mobility, transfers, ambulation, ROM • Start of AROM of the hip • Fitting of shrinker and limb protector	• Dependent on resources at home • Most likely home discharge with home physical therapy (patients will continue this until ready for prosthesis fitting)
Above elbow	2-3 days	• Initial ROM • Initial strengthening • One-armed functional activities	• Yes, in many hospitals, occupational therapists will be solely responsible for these patients	• Occupational therapy evaluation • AROM of the shoulder • One-armed activities	• Occupational therapy sessions daily • Daily improvements in ROM and strength • Functional tasks with the use of one upper extremity • Fitting of shrinker and limb protector	• Dependent on resources at home • Most likely home discharge with home occupational therapy (patients will continue this until ready for prosthesis fitting)
Below elbow	2-3 days	• Initial ROM • Initial strengthening • One-armed functional activities	• Yes, in many hospitals, occupational therapists will be solely responsible for these patients	• Occupational therapy evaluation • AROM of the shoulder and elbow • One-armed activities • Encouragement of elbow extension positioning	• Occupational therapy sessions daily • Daily improvements in range of motion and strength • Functional tasks with the use of one upper extremity • Fitting of shrinker and limb protector	• Dependent on resources at home • Most likely home discharge with home occupational therapy (patients will continue this until ready for prosthesis fitting)

ROM, Range of motion; *AROM,* active range of motion.

Figure 34-22 Residual limb protector. **A**, POP-PY (postoperative protector with pylon) System. **B**, POP (postoperative protector). (Image courtesy of Fillauer LLC, Chattanooga, TN.)

If possible, the patient should see the prosthetist before surgery to discuss options for a prosthesis and the patient should try to speak directly to other amputees to visualize what is to come and ask questions of those who have experienced this surgery firsthand. The patient, prosthetist, physical therapist, and occupational therapist should all discuss the available options and what will functionally make the most sense after surgery.

TABLE **34-11**

Rehabilitation of the Amputee: Final Phase

Surgery	Time Frame	Rehabilitation Goals	Rehabilitation Sessions	Pearls
Transfemoral Transtibial Hip disarticulation Formal hemipelvectomy	• To begin 6 weeks after surgery	• Ambulation with prosthesis using least restrictive device (or no device) • Independent with negotiating stairs with prosthesis • Independent in placing and removing the prosthesis • Independent in skin care	• Gait training, balance activities • Education on fall risks/fall prevention, getting off floor after a fall	• Not all patients will opt for or be appropriate for a prosthesis. • Transfemoral patients will ambulate 43% slower and use 89% more energy than individuals with both limbs. • Transtibial patients will ambulate 36% slower and use 40% more energy than individuals with both limbs.
Above elbow Below elbow Shoulder disarticulation Forequarter amputation	• To begin 6 weeks after surgery	• Independent in use of the prosthesis for functional activities • Independent in placing and removing the prosthesis • Independent in skin care	• Occupational therapy evaluation • AROM of the shoulder • One-armed activities	• An occupational therapist typically works with these patients in conjunction with the prosthesis. • Not all patients will opt for or be appropriate for a prosthesis. • From 70% to 80% of patients with below-the-elbow amputation are able to successfully use a prosthesis.

  biomechanics of, 737–738
  classification of, 738
  electromyographic (EMG) activity, 719
  epidemiology of, 737–738
  functions of, 717
  intercondylar notch, narrow, 737
  mechanisms of injury, 737*b*
  physical examination of, 729*f*
  primary restraint, 717–718
  reconstruction of
    goals after, 750
    grafts, 749
    loss of motion, 750
    postoperative management of, 749–752, 752*b*
  rehabilitation of, 745–752, 749*b*, 750*b*
    closed kinetic chain exercise, 721, 746–747
    criterion-based milestones for progression, 750*t*
    grafts for, 748
    nonoperative treatment, 746–747, 747*b*
    open kinetic chain exercise, 721, 746–747
    postoperative management, 749–752
    research on, 721
    surgical treatment, 747–749, 748*f*
  specific tests of, 727–729
    anterior drawer test, 727–729
    Lachman's test, 727, 729*f*
    pivot shift test, 729
  strain on, 721, 722*t*
  swelling associated with, 726
Anterior dislocations, 200–202
Anterior drawer test, 727–729
Anterior interosseous nerve syndrome (AINS), 897, 898*t*
Anterior lumbar interbody fusion (ALIF), for lumbar disc disease, 598–599
Anterior oblique ligament (AOL), 290–291
Anticonvulsants, 1169
Anxiety, temporomandibular disorders and, 132–134
AOL. *See* Anterior oblique ligament (AOL)
Apley's scratch test, 269
Apophyseal injuries, of the knee, 1055
Apophyseal joint syndrome, 78
Apprehension test, 674
APTA. *See* American Physical Therapy Association (APTA)
Aquatic therapy, for total hip arthroplasty, 708
Arch taping, 870*f*
Arcuate ligament, 716
Arnold-Chiari type II malformation, 1030*f*
AROM. *See* Active range of motion (AROM)

Arthralgia, temporomandibular joint, 122

Arthritic shoulder
  contractures existence, 270
  diagnostic modalities, 270–272
    arthrography, 271, 271*f*
    computed tomography, 271, 272*f*
    magnetic resonance imaging, 271–272, 272*f*
    other modalities, 272, 273*t*
    plain radiographs, 270–271
  evaluation of, 267–270
    history, 267–268
    inspection, 268
    manual muscle testing, 269
    palpation, 268
    physical examination, 268–270
    range of motion, 268–269
    strength testing, 269–270
Arthritis
  osteoarthritis. *See* Osteoarthritis
  prevalence of, 1072
  rheumatoid. *See* Rheumatoid arthritis (RA)
Arthrodesis, 301
Arthrogenic muscle inhibition, 852–853
Arthrogenous temporomandibular disorders
  exercises for, 138
  manual therapy for, 145
Arthrography, 271
Arthrogryposis multiplex congenita (AMC), 1005–1010
  ankle-foot orthoses for, 1007
  assistive devices, 1009–1010, 1009*f*
  classification of, 1005
  clinical manifestations of, 1007
  clinical presentation of, 1005, 1006*f*
  definition of, 1005
  diagnosis of, 1005–1006
  epidemiology of, 1005
  etiology of, 1005
  foot deformities in, 1006*f*, 1007
  hip dislocation associated with, 1006*f*
  impairments associated with, 1007, 1007*b*
  incidence of, 1005
  knee extension splints, 1008–1009
  knee surgery in, 1007
  lower extremity findings, 1005, 1006*f*
  management of, 1007
  neurogenic form of, 1006*f*
  pathophysiology of, 1005
  prognosis for, 1005–1006
  rehabilitation for, 1007–1010
  taloequinovarus in, 1007
  thoracolumbar scoliosis associated with, 1007, 1008*f*
  upper extremity, clinical findings, 1005, 1006*f*
  with Velcro band, 1008*f*
Arthrokinematic control, of joint, 209–210
Arthrokinematic mobility test, 627, 627*f*
  for loose sacroiliac joint, 631
  for stiff sacroiliac joint, 630, 630*f*
Arthrometer, KT1000, 731, 732*f*
Arthroscopic arthrolysis, 337–338
Arthroscopically assisted microdiscectomy (AMD), for lumbar disc disease, 597, 597*f*
Arthroscopy
  brachial plexus injuries treated with, 1025
  for meniscal tears, 778
Articular cartilage
  anatomy of, 266
  degeneration of, 806
  injuries to, 774–797
  lesions, 787–795
    diagnostic imaging for, 788, 788*f*
    history-taking in, 788
    nonoperative management for, 788–789
    physical examination for, 788
    surgical management for, 789–795
      abrasion arthroplasty, 789
      autologous chondrocyte transplantation, 792–795, 793*f*, 794*b*, 794*f*
      microfracture, 789–791, 790*b*, 790*f*
      mosaicplasty, 791–792, 791*f*, 792*f*
Articular system
  passive integrity of, 460–463, 461*f*
  tests for, 460
Articular system impairment, 613
  fixated sacroiliac joint, 630, 631*f*
  loose sacroiliac joint, 630–631
Articular system impairment *(Continued)*
  painful sacroiliac joint, 628–630
  stiff sacroiliac joint, 630, 630*f*
Articular vectors, 455, 456*t*
ASLR test. *See* Active straight-leg raise (ASLR) test
Assessment, 614–615
  of "person", 617*t*
Associative phase, in motor control training, of low back pain, 535
Athletic pubalgia, 667–669, 667*b*, 668*b*
Atlantoaxial joint
  Down syndrome-related instability of, 1016
    precautionary measures for, 1017*b*
    soft neurological signs of, 1017*b*
  hypomobility, 92*t*

Red-yellow-black color classification system, 33
Referred pain
  cervical spine, description of, 78*f*, 82, 84*t*
  low back, 564
  patellofemoral, 814
Reflex sympathetic dystrophy, 830
Regan-Morrey classification, 298*f*
Rehabilitation
  for abrasion arthroplasty, 789
  acute care, for total hip arthroplasty, 701–705
  adherence to, 15–16
  after hip arthroscopy, 678–680
  after total knee arthroplasty, 836–837
    goals of, 840*b*
  of amputations, 1191–1193, 1192*t*, 1193*t*
  of ankle injuries, 851–880, 852*f*
  of anterior cruciate ligament injuries
    closed kinetic chain exercise, 721
    criterion-based milestones for progression, 750*t*
    early postoperative phase, 751, 751*b*
    guidelines for progression of, 743–745, 744*b*
    immediate postoperative phase, 751, 751*b*
    intermediate postoperative phase, 751, 751*b*
    late postoperative phase, 751, 752*b*
    open kinetic chain exercise, 721
    preoperative phase, 750, 750*b*
    research on, 721
    transitional postoperative phase, 752, 752*b*
  of arthrogryposis multiplex congenita, 1007–1010
  in autologous chondrocyte transplantation, 793–794, 794*b*
  of Becker's muscular dystrophy, 1143–1147, 1144*t*
  of brachial plexus injuries, 1025–1026, 1026*f*
  of cervical spine, after surgery, 592, 592*t*
  of congenital muscular torticollis, 1020–1021, 1020*f*
  contraindications to, 703*b*
  of distal femur, 1177, 1178*t*, 1180*t*, 1181*t*, 1182*t*
  of distal phalanx fractures, 352*t*
  of distal radial fractures, 418–421, 418*f*
  of Down syndrome, 1017–1018
  of Duchenne's muscular dystrophy, 1143–1147, 1144*t*
  of elbow, 1188–1189
  of facioscapulohumeral muscular dystrophy, 1148
  of foot injuries, 851–880, 852*f*
  of frozen shoulder, 171
  of hip fractures, 684
  home care

Rehabilitation *(Continued)*
for total hip arthroplasty, 706, 706*b*
for total knee arthroplasty, 842, 842*t*
inpatient, in extended care facility, 705–706
knee, lateral and posterolateral corner injuries, 758–761
of leg injuries, 851–880, 852*f*
of mallet finger, 393–394
of medial collateral ligament injuries, 757–758
of metacarpal fractures, 362–365, 362*t*, 363*t*
of microfracture, 790–791, 790*b*
for mosaicplasty, 792
of multiple-ligament knee injuries, 761–762
of myelomeningocele, 1032–1034
of osteoarthritis, 1076–1086
of osteogenesis imperfecta, 1012–1014
outpatient
for total hip arthroplasty, 706–708, 707*t*
for total knee arthroplasty, 842–844, 843*f*, 843*t*
patient education, motivation, compliance, and adherence to, 1–24
of pelvis, 1190
post-acute care inpatient, for total knee arthroplasty, 842, 842*t*
for posterior cruciate ligament injuries, 752–757, 755*b*
closed kinetic chain exercise, 753
goals of, 755, 755*b*
nonoperative management, 753
open kinetic chain exercise, 753
phase I, 756, 756*b*
phase II, 756, 756*b*
phase III, 756, 756*b*
phase IV, 756, 756*b*
phase V, 757, 757*b*
precautions after isolated, 756*b*
surgical treatment for, 753–755
postoperative
acute care, for total knee arthroplasty, 838–842, 839*t*, 840*f*, 841*b*
for meniscal repair, 785–786, 785*t*
preoperative
for total hip arthroplasty, 700–701
for total knee arthroplasty, 837, 837*t*
principles of specificity related to, 209*b*
of proximal femur, 1182–1184
of proximal humeral fractures, 176
of proximal humerus, 1185–1188
of proximal interphalangeal joint dislocation, 374*t*
of proximal tibia, 1181
of rheumatoid arthritis, 1094–1096
of scaphoid fractures, 421
of scapholunate dissociation, 421–422
of spinal deformities, 609–610, 610*t*
of thoracic spine, after surgery, 595, 595*t*
Relapse stage, of transtheoretical model, 5*t*, 7–8
Relatedness, 4
Release, Align, Connect (or control), and Move (RACM), 633, 635*t*
Release technique, for left external oblique (EO), 647*f*
Release with awareness, 635–636, 637*f*
Remodeling, 913
Remove, in triple R strategy, 977*t*
Remplissage procedure, 204–207, 208*f*
Repair, 952
Repetitive pinching task, 947*t*
Repetitive strain injuries (RSIs), 940
nutrition and healing, 974–978, 974*b*
nutritional management in patients with, 975–978, 975*b*, 976*t*, 977*t*, 978*b*
principles for recovery, 977*b*
"triple R" strategy for nutritional recovery in, 977*t*
Repetitive stress pathology, 938–1004, 993*b*
bone, 913–937
summary of, 933
Repetitive stress shin pain, differential diagnosis of, 856*t*
Repetitive tasks
hypersensitivity and spinal cord neuroplasticity associated with, 947*t*, 955*f*, 957–958, 958*t*
peripheral nerve trauma associated with, 956
Repetitive treadmill running to load supraspinatus muscle, 947*t*
Replace, in triple R strategy, 977*t*
Research Diagnostic Criteria for Temporomandibular Disorders, 121
Reset exercise criteria, 468*b*
Residual limb protector, 1193*f*
Restore, in triple R strategy, 977*t*
RET gene, 1111–1112
Reticular layer, of dermis, 25
Retraining at stereognosis, examples of, 983*f*
Reverse total shoulder replacement prosthesis, 277, 277*f*
Revision total hip arthroplasty, 694–695
complications of, 695*t*
indications for, 695*b*
Rheumatoid arthritis (RA), 126, 267, 1086–1097
aerobic exercise programs for, 1092
ambulatory aids, 1095–1096
American College of Rheumatology classification, 1089*t*
articular changes in, 1093–1094
case study of, 1096–1097
in children, classification of, 1089*b*
clinical features of, 1075*t*
elbow, 301, 302*f*
energy conservation techniques in, 1096, 1096*b*
epidemiology of, 1086–1089
exercise in, 1090*t*, 1092–1093, 1094–1095
fatigue associated with, 1088, 1092–1093
features of, 1088*b*
in feet, 1088*f*
incidence of, 1086
interventions for, 1094*t*
joint commonly affected, 1087–1088, 1087*f*, 1088*f*
juvenile, 130*f*, 1088–1089
pauciarticular, 1089
polyarticular, 1089
systemic, 1089
in lower extremity, 1087–1088, 1088*f*
management of, 1072–1100
in metacarpophalangeal joints, 1087–1088, 1087*f*
muscle weakness associated with, 1090–1092
orthoses for, 1095, 1095*f*
pain associated with, 1089–1090
pathology of, 1075*t*
pathophysiology of, 1086–1089
rehabilitation for, 1094–1096
signs and symptoms of, 1089–1094, 1089*b*
in spine, 1087–1088
splints for, 1095
stiffness associated with, 1089–1090
strength training for, 1090–1092
ulnar deviation associated with, 1087*f*
Rhomboid fossa, 160–161
Rhomboid ligament, 160–161
Rhomboids, 231*t*
Rhythmic stabilization exercise, 209–210
Ribs
checking the mobility of, 222, 223*f*
fractures, 1043*t*
"Righting" reflex, 21
Risedronate, 1107, 1108*t*
Risk assessment and prediction tool (RAPT), 841
for hip or knee arthroplasty, 701, 702*f*
Rolando's fracture, 361–362
Rotator cuff, 657*b*
anatomy, 240–244, 241*f*
concavity compression, 244, 244*f*
definition of, 244
degeneration, 248, 250*f*
etiology, 246–247
full thickness, 253
function, 244–246, 245*b*
injuries, 247–253, 260
muscles, 240–241, 240*b*, 241*f*, 242, 244*b*
partial thickness, 250–251, 253
repair surgery, 240*b*
goal of, 262
tendinopathy, 248–249
treatment of, 248*b*
undersurface, internal impingement, 247*f*
Rotator cuff degeneration and dysfunction, 193–199
surgical treatment of, 198–199
Rotator cuff disease, 240
Rotator cuff footprint, 240–241
Rotator cuff injuries, 180
Rotator cuff pathology, 240–265
clinical presentation of, 253–259
diagnostic imaging, 258–259
patient history, 253–255
physical examination, 255–258
diagnosis of, 259*t*
Rotator cuff pathology *(Continued)*
sensitivity and specificity of diagnostic tests, 259*t*
treatment of, 259–263
nonoperative management, 260–262
operative management, 262
operative *vs.* nonoperative management, 259–260
postoperative management, 262–263
Rotator cuff tears, 245, 249–253, 251*f*
aging in, 246
arthropathy, 251, 253
general treatment of, 252–253
management of, 252–253
natural history of, 251–252
Rotator interval, 182–183
RSC ligament. *See* Radioscaphocapitate (RSC) ligament
RSIs. *See* Repetitive strain injuries (RSIs)
Rugger Jersey finger, 346

S

Sacroiliac joint (SIJ)
active mobility test for, 621*f*, 622*f*, 623*f*
arthropathy of, 564
axial pain and, 564
case report of, 623–626
differentiating features of, 628*t*
fixated, 630, 631*f*
injections for, 579
laxity of, 630–631
loose, 630–631
painful, 628–630
active straight leg raise test for, 628–629
passive accessory mobility testing of, 627*f*
poorly controlled
excessively compressed, 631
insufficiently compressed, 631–632
reliability of, mobility test for, 622*t*
stiff, 630, 630*f*
trunk muscles and, 525*f*
Saltatory conduction, 427
Salter-Harris fracture classification, 1045–1046, 1046*b*, 1047*f*
Salter-Harris fractures, of distal fibula, 1055
Saphenous nerve, 905, 907*f*
SB-Charité prosthesis, for lumbar disc disease, 600, 601*f*
Scalenus anterior syndrome, 888*f*
Scaphoid fractures, 406–410
anatomy of, 406–407
blood supply, 408*f*
in children and adolescent, 1043*t*, 1050, 1050*b*, 1050*f*
classification of, 407–408, 407*b*
computed tomography of, 408
diagnosis of, 408
Herbert classification system for, 408
medical treatment of, 408–410
nonunion of, 409–410, 410*f*
percutaneous compression screw fixation, 409*f*
radiographic of, 408, 409*f*
rehabilitation of, 421
Russe classification system for, 407
Scaphoid shift test, 416
Scapholunate advanced collapse, 414
Scapholunate dissociation, 414–417
anatomy of, 414–415
arthrography of, 416
classification of, 415
diagnosis of, 415–416, 416*f*, 417*f*
general considerations, 414
medical treatment of, 416–417
rehabilitation of, 421–422
repair of, 416–417
scaphoid shift test, 416
scaphotrapeziotrapezoid fusion, 417
STT joint fusion, 422*f*
Scaphotrapeziotrapezoid fusion, 417
Scaption, 159
Scapula, 189*f*, 190, 242
control exercises for, 209
dyskinesia of, 158, 189
muscles controlling the movement of, 244*b*
muscles that attach and stabilize the, 243*f*
position of, 195, 196*f*
retraining of, 99–100, 100*f*
orientation and position, 99–100, 100*f*
stabilizer muscle, 100
stabilizers of, 226

Scapular anti-tilt or dumping, 197–198, 198*f*
Scapular control exercise, 203–204, 203*f*, 209, 226
Scapular control muscles, 190
Scapular force couple, 189*f*, 214
Scapular fractures, 172–174
  acromion, 172, 172*f*
  classification of, 172
  clinical evaluation of, 172
  coracoid, 172, 173*f*
  "floating shoulder", 173–174, 174*f*
  glenoid fractures, 172, 173*f*
  mechanism of injury, 173
  neck, 172, 174*f*
  nonsurgical treatment of, 172–173
  treatment of, 172–173
Scapular functional movement exercises, 195, 197*f*
Scapular plane elevation, 159
Scapular winging, 270, 1148
Scapulohumeral dysfunction, 210
Scapulohumeral periarthritis, 169
Scapulohumeral rhythm, 159, 160*f*, 226
  reverse, 257*f*
Scapulothoracic articulation, 158
Scapulothoracic region, inspection of, 256
Scar management, 50, 50*b*
Scar mobilization, 50
Scheuermann's kyphosis, 1062
Schwann cells, 955
Sciatic nerve
  entrapment of, 687, 900*t*
  injury to, 684, 900–901, 900*t*
Scissoring, 357
Scoliosis, 605
  adolescent idiopathic, 605, 606*f*
  adult idiopathic, 606*f*
  in arthrogryposis multiplex congenita, 1007, 1008*f*
  in Down syndrome, 1018
  in Duchenne's muscular dystrophy, 1138–1141, 1146
  in spina bifida, 1029–1030
  treatment for, 605*b*
Screening task, 441–442, 616, 644, 644*f*
SDT. *See* Self-determination theory (SDT)
Seated trunk rotation, 446–448, 448*f*, 449*f*
Second metacarpal fractures, 362*t*
Secondary anterior (external) impingement, 194
Secondary impingement, 249
SEF. *See* Somatosensory evoked field (SEF)
Segmental dysfunction
  manual therapy for, 504
  phase transition in, 507
  signs and symptoms of, 507*t*
Segond's fracture, 733
Selective estrogen receptor modulators, 1109
Selective serotonin reuptake inhibitors (SSRIs), 1169
Self-actualization, 4
Self-determination theory (SDT), 3–4
Self-efficacy, 17–18, 17*b*
Self-motivation, 10–11
Self-stack and breathe, 459
Self-traction stretch, 213*f*
Sensorial dimension, of patient's experiences, 617*t*
Sensorimotor retraining program, 977*t*, 985–986, 991*f*, 992*b*
Sensory discrimination training, 982*f*
Sensory nerve injury, 906–907, 907*f*
Sensory training (Braille), in focal hand dystonia, 981, 985–986
Serosanguineous fluid, 31
Serotonin, 951*t*
Serous exudate, 31
Serratus anterior, 231*t*
  exercises for, 216, 217*f*
Sesamoid stress fractures, 932
Sesamoiditis, 877–878
Sever's disease, 863, 863*f*, 1055–1056, 1056*f*
SF-36 (36- item medical outcomes study short-form health survey), 709
Shaking out the arm, 221, 222*f*
Sharp debridement, 45, 45*t*
Shin splints, 856, 856*t*
Short arc exercises, 228
Shortwave diathermy, for temporomandibular disorders, 147
Shoulder, 188
  anatomy of, 158
  anterior dislocations of, 200–202
Shoulder *(Continued)*
  dislocations of, 199–203
    treatment for, 203–204
  "floating", 173–174, 174*f*
  fractures of, 172–180
  frozen, 169–172
    clinical presentation of, 170–172
    definition by British Elbow and Shoulder Society (BESS), 170*t*
    phases of, 170*t*, 171*f*
    rehabilitation of, 171
    treatment of, 171–172
    types of, 170*t*

Renegade:
Adjective
‘Having rejected tradition: Unconventional.’
Merriam-Webster Dictionary

Acquiescence to tyranny is the death of the spirit

You may be 38 years old, as I happen to be. And one day, some great opportunity stands before you and calls you to stand up for some great principle, some great issue, some great cause. And you refuse to do it because you are afraid … You refuse to do it because you want to live longer … You're afraid that you will lose your job, or you are afraid that you will be criticised or that you will lose your popularity, or you're afraid that somebody will stab you, or shoot at you or bomb your house; so you refuse to take the stand.

Well, you may go on and live until you are 90, but you're just as dead at 38 as you would be at 90. And the cessation of breathing in your life is but the belated announcement of an earlier death of the spirit.

Martin Luther King

How the few control the many and always have – the many do whatever they're told

'Forward, the Light Brigade!'
Was there a man dismayed?
Not though the soldier knew
Someone had blundered.
Theirs not to make reply,
Theirs not to reason why,
Theirs but to do and die.
Into the valley of Death
Rode the six hundred.

Cannon to right of them,
Cannon to left of them,
Cannon in front of them
Volleyed and thundered;
Stormed at with shot and shell,
Boldly they rode and well,
Into the jaws of Death,
Into the mouth of hell
Rode the six hundred

Alfred Lord Tennyson (1809-1892)

The mist is lifting slowly
I can see the way ahead
And I've left behind the empty streets
That once inspired my life
And the strength of the emotion
Is like thunder in the air
'Cos the promise that we made each other
Haunts me to the end

The secret of your beauty
And the mystery of your soul
I've been searching for in everyone I meet
And the times I've been mistaken
It's impossible to say
And the grass is growing
Underneath our feet

The words that I remember
From my childhood still are true
That there's none so blind
As those who will not see
And to those who lack the courage
And say it's dangerous to try
Well they just don't know
That love eternal will not be denied

I know you're out there somewhere
Somewhere, somewhere
I know you're out there somewhere

Somewhere you can hear my voice
I know I'll find you somehow
Somehow, somehow
I know I'll find you somehow
And somehow I'll return again to you

The Moody Blues

Are you a gutless wonder - or a Renegade Mind?

Monuments put from pen to paper,
Turns me into a gutless wonder,
And if you tolerate this,
Then your children will be next.
Gravity keeps my head down,
Or is it maybe shame ...

Manic Street Preachers

Rise like lions after slumber
In unvanquishable number.
Shake your chains to earth like dew
Which in sleep have fallen on you.
Ye are many – they are few.

Percy Shelley

CHAPTER ONE

I'm thinking' – Oh, but *are* you?

Think for yourself and let others enjoy the privilege of doing so too
Voltaire

French-born philosopher, mathematician and scientist René Descartes became famous for his statement in Latin in the 17th century which translates into English as: 'I think, therefore I am.'

On the face of it that is true. Thought reflects perception and perception leads to both behaviour and self-identity. In that sense 'we' are what we think. But who or what is doing the thinking and is thinking the only route to perception? Clearly, as we shall see, 'we' are not always the source of 'our' perception, indeed with regard to humanity as a whole this is rarely the case; and thinking is far from the only means of perception. Thought is the village idiot compared with other expressions of consciousness that we all have the potential to access and tap into. This has to be true when we *are* those other expressions of consciousness which are infinite in nature. We have forgotten this, or, more to the point, been manipulated to forget.

These are not just the esoteric musings of the navel. The whole foundation of human control and oppression is control of perception. Once perception is hijacked then so is behaviour which is dictated by perception. Collective perception becomes collective behaviour and collective behaviour is what we call human society. Perception is all and those behind human control know that which is

why perception is the target 24/7 of the psychopathic manipulators that I call the Global Cult. They know that if they dictate perception they will dictate behaviour and collectively dictate the nature of human society. They are further aware that perception is formed from information received and if they control the circulation of information they will to a vast extent direct human behaviour. Censorship of information and opinion has become globally Nazi-like in recent years and never more blatantly than since the illusory 'virus pandemic' was triggered out of China in 2019 and across the world in 2020. Why have billions submitted to house arrest and accepted fascistic societies in a way they would have never believed possible? Those controlling the information spewing from government, mainstream media and Silicon Valley (all controlled by the same Global Cult networks) told them they were in danger from a 'deadly virus' and only by submitting to house arrest and conceding their most basic of freedoms could they and their families be protected. This monumental and provable lie became the *perception* of the billions and therefore the *behaviour* of the billions. In those few words you have the whole structure and modus operandi of human control. Fear is a perception – **F**alse **E**motion **A**ppearing **R**eal – and fear is the currency of control. In short … get them by the balls (or give them the impression that you have) and their hearts and minds will follow. Nothing grips the dangly bits and freezes the rear-end more comprehensively than fear.

World number 1

There are two 'worlds' in what appears to be one 'world' and the prime difference between them is knowledge. First we have the mass of human society in which the population is maintained in coldly-calculated ignorance through control of information and the 'education' (indoctrination) system. That's all you really need to control to enslave billions in a perceptual delusion in which what are perceived to be *their* thoughts and opinions are ever-repeated mantras that the system has been downloading all their lives through 'education', media, science, medicine, politics and academia

in which the personnel and advocates are themselves overwhelmingly the perceptual products of the same repetition. Teachers and academics in general are processed by the same programming machine as everyone else, but unlike the great majority they never leave the 'education' program. It gripped them as students and continues to grip them as programmers of subsequent generations of students. The programmed become the programmers – the programmed programmers. The same can largely be said for scientists, doctors and politicians and not least because as the American writer Upton Sinclair said: 'It is difficult to get a man to understand something when his salary depends upon his not understanding it.' If your career and income depend on thinking the way the system demands then you will – bar a few free-minded exceptions – concede your mind to the Perceptual Mainframe that I call the Postage Stamp Consensus. This is a tiny band of perceived knowledge and possibility 'taught' (downloaded) in the schools and universities, pounded out by the mainstream media and on which all government policy is founded. Try thinking, and especially speaking and acting, outside of the 'box' of consensus and see what that does for your career in the Mainstream Everything which bullies, harasses, intimidates and ridicules the population into compliance. Here we have the simple structure which enslaves most of humanity in a perceptual prison cell for an entire lifetime and I'll go deeper into this process shortly. Most of what humanity is taught as fact is nothing more than programmed belief. American science fiction author Frank Herbert was right when he said: 'Belief can be manipulated. Only knowledge is dangerous.' In the 'Covid' age belief is promoted and knowledge is censored. It was always so, but never to the extreme of today.

World number 2

A 'number 2' is slang for 'doing a poo' and how appropriate that is when this other 'world' is doing just that on humanity every minute of every day. World number 2 is a global network of secret societies and semi-secret groups dictating the direction of society via

governments, corporations and authorities of every kind. I have spent more than 30 years uncovering and exposing this network that I call the Global Cult and knowing its agenda is what has made my books so accurate in predicting current and past events. Secret societies are secret for a reason. They want to keep their hoarded knowledge to themselves and their chosen initiates and to hide it from the population which they seek through ignorance to control and subdue. The whole foundation of the division between World 1 and World 2 is *knowledge*. What number 1 knows number 2 must not. Knowledge they have worked so hard to keep secret includes (a) the agenda to enslave humanity in a centrally-controlled global dictatorship, and (b) the nature of reality and life itself. The latter (b) must be suppressed to allow the former (a) to prevail as I shall be explaining. The way the Cult manipulates and interacts with the population can be likened to a spider's web. The 'spider' sits at the centre in the shadows and imposes its will through the web with each strand represented in World number 2 by a secret society, satanic or semi-secret group, and in World number 1 – the world of the seen – by governments, agencies of government, law enforcement, corporations, the banking system, media conglomerates and Silicon Valley (Fig 1 overleaf). The spider and the web connect and coordinate all these organisations to pursue the same global outcome while the population sees them as individual entities working randomly and independently. At the level of the web governments *are* the banking system *are* the corporations *are* the media *are* Silicon Valley *are* the World Health Organization working from their inner cores as one unit. Apparently unconnected countries, corporations, institutions, organisations and people are on the *same team* pursuing the same global outcome. Strands in the web immediately around the spider are the most secretive and exclusive secret societies and their membership is emphatically restricted to the Cult inner-circle emerging through the generations from particular bloodlines for reasons I will come to. At the core of the core you would get them in a single room. That's how many people are dictating the direction of human society and its transformation

through the ‘Covid’ hoax and other means. As the web expands out from the spider we meet the secret societies that many people will be aware of – the Freemasons, Knights Templar, Knights of Malta, Opus Dei, the inner sanctum of the Jesuit Order, and such like. Note how many are connected to the Church of Rome and there is a reason for that. The Roman Church was established as a revamp, a rebranding, of the relocated ‘Church’ of Babylon and the Cult imposing global tyranny today can be tracked back to Babylon and Sumer in what is now Iraq.

Figure 1: The global web through which the few control the many. (Image Neil Hague.)

Inner levels of the web operate in the unseen away from the public eye and then we have what I call the cusp organisations located at the point where the hidden meets the seen. They include a series of satellite organisations answering to a secret society founded in London in the late 19th century called the Round Table and among them are the Royal Institute of International Affairs (UK, founded in 1920); Council on Foreign Relations (US, 1921); Bilderberg Group (worldwide, 1954); Trilateral Commission (US/worldwide, 1972); and the Club of Rome (worldwide, 1968) which was created to exploit environmental concerns to justify the centralisation of global power to ‘save the planet’. The Club of Rome instigated with others the human-caused climate change hoax which has led to all the ‘green

new deals' demanding that very centralisation of control. Cusp organisations, which include endless 'think tanks' all over the world, are designed to coordinate a single global policy between political and business leaders, intelligence personnel, media organisations and anyone who can influence the direction of policy in their own sphere of operation. Major players and regular attenders will know what is happening – or some of it – while others come and go and are kept overwhelmingly in the dark about the big picture. I refer to these cusp groupings as semi-secret in that they can be publicly identified, but what goes on at the inner-core is kept very much 'in house' even from most of their members and participants through a fiercely-imposed system of compartmentalisation. Only let them know what they need to know to serve your interests and no more. The structure of secret societies serves as a perfect example of this principle. Most Freemasons never get higher than the bottom three levels of 'degree' (degree of knowledge) when there are 33 official degrees of the Scottish Rite. Initiates only qualify for the next higher 'compartment' or degree if those at that level choose to allow them. Knowledge can be carefully assigned only to those considered 'safe'. I went to my local Freemason's lodge a few years ago when they were having an 'open day' to show how cuddly they were and when I chatted to some of them I was astonished at how little the rank and file knew even about the most ubiquitous symbols they use. The mushroom technique – keep them in the dark and feed them bullshit – applies to most people in the web as well as the population as a whole. Sub-divisions of the web mirror in theme and structure transnational corporations which have a headquarters somewhere in the world dictating to all their subsidiaries in different countries. Subsidiaries operate in their methodology and branding to the same centrally-dictated plan and policy in pursuit of particular ends. The Cult web functions in the same way. Each country has its own web as a subsidiary of the global one. They consist of networks of secret societies, semi-secret groups and bloodline families and their job is to impose the will of the spider and the global web in their particular country. Subsidiary networks control and manipulate the national political system, finance, corporations, media, medicine, etc. to

ensure that they follow the globally-dictated Cult agenda. These networks were the means through which the 'Covid' hoax could be played out with almost every country responding in the same way.

The 'Yessir' pyramid

Compartmentalisation is the key to understanding how a tiny few can dictate the lives of billions when combined with a top-down sequence of imposition and acquiescence. The inner core of the Cult sits at the peak of the pyramidal hierarchy of human society (Fig 2 overleaf). It imposes its will – its agenda for the world – on the level immediately below which acquiesces to that imposition. This level then imposes the Cult will on the level below them which acquiesces and imposes on the next level. Very quickly we meet levels in the hierarchy that have no idea there even is a Cult, but the sequence of imposition and acquiescence continues down the pyramid in just the same way. 'I don't know why we are doing this but the order came from "on-high" and so we better just do it.' Alfred Lord Tennyson said of the cannon fodder levels in his poem *The Charge of the Light Brigade*: 'Theirs not to reason why; theirs but to do and die.' The next line says that 'into the valley of death rode the six hundred' and they died because they obeyed without question what their perceived 'superiors' told them to do. In the same way the population capitulated to 'Covid'. The whole hierarchical pyramid functions like this to allow the very few to direct the enormous many. Eventually imposition-acquiescence-imposition-acquiescence comes down to the mass of the population at the foot of the pyramid. If they acquiesce to those levels of the hierarchy imposing on them (governments/law enforcement/doctors/media) a circuit is completed between the population and the handful of super-psychopaths in the Cult inner core at the top of the pyramid. Without a circuit-breaking refusal to obey, the sequence of imposition and acquiescence allows a staggeringly few people to impose their will upon the entirety of humankind. We are looking at the very sequence that has subjugated billions since the start of 2020. Our freedom has not been taken from us. Humanity has given it

away. Fascists do not impose fascism because there are not enough of them. Fascism is imposed by the population acquiescing to fascism. Put another way allowing their perceptions to be programmed to the extent that leads to the population giving their freedom away by giving their perceptions – their mind – away. If this circuit is not broken by humanity ceasing to cooperate with their own enslavement then nothing can change. For that to happen people have to critically think and see through the lies and window dressing and then summon the backbone to act upon what they see. The Cult spends its days working to stop either happening and its methodology is systematic and highly detailed, but it can be overcome and that is what this book is all about.

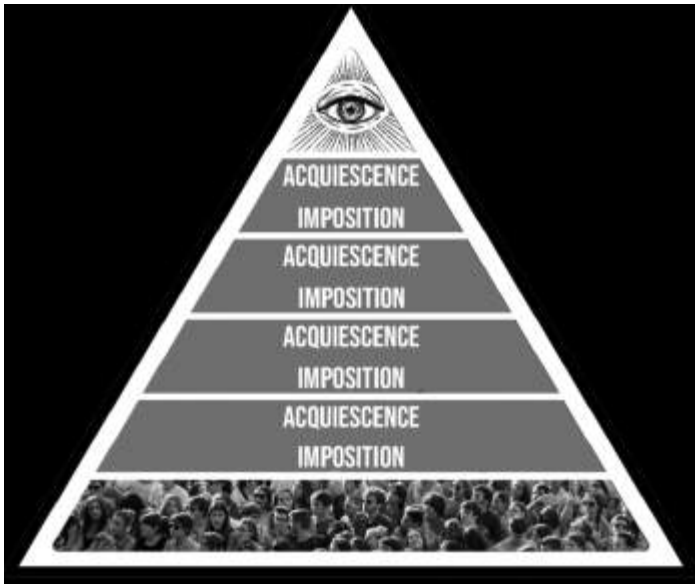

Figure 2: The simple sequence of imposition and compliance that allows a handful of people at the peak of the pyramid to dictate the lives of billions.

The Life Program

Okay, back to world number 1 or the world of the 'masses'. Observe the process of what we call 'life' and it is a perceptual download from cradle to grave. The Cult has created a global structure in which perception can be programmed and the program continually topped-up with what appears to be constant confirmation that the program is indeed true reality. The important word here is 'appears'.

This is the structure, the fly-trap, the Postage Stamp Consensus or Perceptual Mainframe, which represents that incredibly narrow band of perceived possibility delivered by the 'education' system, mainstream media, science and medicine. From the earliest age the download begins with parents who have themselves succumbed to the very programming their children are about to go through. Most parents don't do this out of malevolence and mostly it is quite the opposite. They do what they believe is best for their children and that is what the program has told them is best. Within three or four years comes the major transition from parental programming to full-blown state (Cult) programming in school, college and university where perceptually-programmed teachers and academics pass on their programming to the next generations. Teachers who resist are soon marginalised and their careers ended while children who resist are called a problem child for whom Ritalin may need to be prescribed. A few years after entering the 'world' children are under the control of authority figures representing the state telling them when they have to be there, when they can leave and when they can speak, eat, even go to the toilet. This is calculated preparation for a lifetime of obeying authority in all its forms. Reflex-action fear of authority is instilled by authority from the start. Children soon learn the carrot and stick consequences of obeying or defying authority which is underpinned daily for the rest of their life. Fortunately I daydreamed through this crap and never obeyed authority simply because it told me to. This approach to my alleged 'betters' continues to this day. There can be consequences of pursuing open-minded freedom in a world of closed-minded conformity. I spent a lot of time in school corridors after being ejected from the classroom for not taking some of it seriously and now I spend a lot of time being ejected from Facebook, YouTube and Twitter. But I can tell you that being true to yourself and not compromising your self-respect is far more exhilarating than bowing to authority for authority's sake. You don't have to be a sheep to the shepherd (authority) and the sheep dog (fear of not obeying authority).

The perceptual download continues throughout the formative years in school, college and university while script-reading 'teachers', 'academics' 'scientists', 'doctors' and 'journalists' insist that ongoing generations must be as programmed as they are. Accept the program or you will not pass your 'exams' which confirm your 'degree' of programming. It is tragic to think that many parents pressure their offspring to work hard at school to download the program and qualify for the next stage at college and university. The late, great, American comedian George Carlin said: 'Here's a bumper sticker I'd like to see: We are proud parents of a child who has resisted his teachers' attempts to break his spirit and bend him to the will of his corporate masters.' Well, the best of luck finding many of those, George. Then comes the moment to leave the formal programming years in academia and enter the 'adult' world of work. There you meet others in your chosen or prescribed arena who went through the same Postage Stamp Consensus program before you did. There is therefore overwhelming agreement between almost everyone on the basic foundations of Postage Stamp reality and the rejection, even contempt, of the few who have a mind of their own and are prepared to use it. This has two major effects. Firstly, the consensus confirms to the programmed that their download is really how things are. I mean, everyone knows that, right? Secondly, the arrogance and ignorance of Postage Stamp adherents ensure that anyone questioning the program will have unpleasant consequences for seeking their own truth and not picking their perceptions from the shelf marked: 'Things you must believe without question and if you don't you're a dangerous lunatic conspiracy theorist and a harebrained nutter'.

Every government, agency and corporation is founded on the same Postage Stamp prison cell and you can see why so many people believe the same thing while calling it their own 'opinion'. Fusion of governments and corporations in pursuit of the same agenda was the definition of fascism described by Italian dictator Benito Mussolini. The pressure to conform to perceptual norms downloaded for a lifetime is incessant and infiltrates society right

down to family groups that become censors and condemners of their own 'black sheep' for not, ironically, being sheep. We have seen an explosion of that in the 'Covid' era. Cult-owned global media unleashes its propaganda all day every day in support of the Postage Stamp and targets with abuse and ridicule anyone in the public eye who won't bend their mind to the will of the tyranny. Any response to this is denied (certainly in my case). They don't want to give a platform to expose official lies. Cult-owned-and-created Internet giants like Facebook, Google, YouTube and Twitter delete you for having an unapproved opinion. Facebook boasts that its AI censors delete 97-percent of 'hate speech' before anyone even reports it. Much of that 'hate speech' will simply be an opinion that Facebook and its masters don't want people to see. Such perceptual oppression is widely known as fascism. Even Facebook executive Benny Thomas, a 'CEO Global Planning Lead', said in comments secretly recorded by investigative journalism operation Project Veritas that Facebook is 'too powerful' and should be broken up:

I mean, no king in history has been the ruler of two billion people, but Mark Zuckerberg is … And he's 36. That's too much for a 36-year-old ... You should not have power over two billion people. I just think that's wrong.

Thomas said Facebook-owned platforms like Instagram, Oculus, and WhatsApp needed to be separate companies. 'It's too much power when they're all one together'. That's the way the Cult likes it, however. We have an executive of a Cult organisation in Benny Thomas that doesn't know there is a Cult such is the compartmentalisation. Thomas said that Facebook and Google 'are no longer companies, they're countries'. Actually they are more powerful than countries on the basis that if you control information you control perception and control human society.

I love my oppressor

Another expression of this psychological trickery is for those who realise they are being pressured into compliance to eventually

convince themselves to believe the official narratives to protect their self-respect from accepting the truth that they have succumbed to meek and subservient compliance. Such people become some of the most vehement defenders of the system. You can see them everywhere screaming abuse at those who prefer to think for themselves and by doing so reminding the compliers of their own capitulation to conformity. 'You are talking dangerous nonsense you Covidiot!!' Are you trying to convince me or yourself? It is a potent form of Stockholm syndrome which is defined as: 'A psychological condition that occurs when a victim of abuse identifies and attaches, or bonds, positively with their abuser.' An example is hostages bonding and even 'falling in love' with their kidnappers. The syndrome has been observed in domestic violence, abused children, concentration camp inmates, prisoners of war and many and various Satanic cults. These are some traits of Stockholm syndrome listed at goodtherapy.org:

- Positive regard towards perpetrators of abuse or captor [see 'Covid'].
- Failure to cooperate with police and other government authorities when it comes to holding perpetrators of abuse or kidnapping accountable [or in the case of 'Covid' cooperating with the police to enforce and defend their captors' demands].
- Little or no effort to escape [see 'Covid'].
- Belief in the goodness of the perpetrators or kidnappers [see 'Covid'].
- Appeasement of captors. This is a manipulative strategy for maintaining one's safety. As victims get rewarded – perhaps with less abuse or even with life itself – their appeasing behaviours are reinforced [see 'Covid'].
- Learned helplessness. This can be akin to 'if you can't beat 'em, join 'em'. As the victims fail to escape the abuse or captivity, they may start giving up and soon realize it's just easier for everyone if they acquiesce all their power to their captors [see 'Covid'].

- Feelings of pity toward the abusers, believing they are actually victims themselves. Because of this, victims may go on a crusade or mission to 'save' [protect] their abuser [see the venom unleashed on those challenging the official 'Covid' narrative].
- Unwillingness to learn to detach from their perpetrators and heal. In essence, victims may tend to be less loyal to themselves than to their abuser [*definitely* see 'Covid'].

Ponder on those traits and compare them with the behaviour of great swathes of the global population who have defended governments and authorities which have spent every minute destroying their lives and livelihoods and those of their children and grandchildren since early 2020 with fascistic lockdowns, house arrest and employment deletion to 'protect' them from a 'deadly virus' that their abusers' perceptually created to bring about this very outcome. We are looking at mass Stockholm syndrome. All those that agree to concede their freedom will believe those perceptions are originating in their own independent 'mind' when in fact by conceding their reality to Stockholm syndrome they have by definition conceded any independence of mind. Listen to the 'opinions' of the acquiescing masses in this 'Covid' era and what gushes forth is the repetition of the official version of everything delivered unprocessed, unfiltered and unquestioned. The whole programming dynamic works this way. I must be free because I'm told that I am and so I think that I am.

You can see what I mean with the chapter theme of 'I'm thinking – Oh, but *are* you?' The great majority are not thinking, let alone for themselves. They are repeating what authority has told them to believe which allows them to be controlled. Weaving through this mentality is the fear that the 'conspiracy theorists' are right and this again explains the often hysterical abuse that ensues when you dare to contest the official narrative of anything. Denial is the mechanism of hiding from yourself what you don't want to be true. Telling people what they want to hear is easy, but it's an infinitely greater challenge to tell them what they would rather not be happening.

One is akin to pushing against an open door while the other is met with vehement resistance no matter what the scale of evidence. I don't want it to be true so I'll convince myself that it's not. Examples are everywhere from the denial that a partner is cheating despite all the signs to the reflex-action rejection of any idea that world events in which country after country act in exactly the same way are centrally coordinated. To accept the latter is to accept that a force of unspeakable evil is working to destroy your life and the lives of your children with nothing too horrific to achieve that end. Who the heck wants that to be true? But if we don't face reality the end is duly achieved and the consequences are far worse and ongoing than breaking through the walls of denial today with the courage to make a stand against tyranny.

Connect the dots – but how?

A crucial aspect of perceptual programming is to portray a world in which everything is random and almost nothing is connected to anything else. Randomness cannot be coordinated by its very nature and once you perceive events as random the idea they could be connected is waved away as the rantings of the tinfoil-hat brigade. You can't plan and coordinate random you idiot! No, you can't, but you can hide the coldly-calculated and long-planned behind the *illusion* of randomness. A foundation manifestation of the Renegade Mind is to scan reality for patterns that connect the apparently random and turn pixels and dots into pictures. This is the way I work and have done so for more than 30 years. You look for similarities in people, modus operandi and desired outcomes and slowly, then ever quicker, the picture forms. For instance: There would seem to be no connection between the 'Covid pandemic' hoax and the human-caused global-warming hoax and yet they are masks (appropriately) on the same face seeking the same outcome. Those pushing the global warming myth through the Club of Rome and other Cult agencies are driving the lies about 'Covid' – Bill Gates is an obvious one, but they are endless. Why would the same people be involved in both when they are clearly not connected? Oh, but they

are. Common themes with personnel are matched by common goals. The 'solutions' to both 'problems' are centralisation of global power to impose the will of the few on the many to 'save' humanity from 'Covid' and save the planet from an 'existential threat' (we need 'zero Covid' and 'zero carbon emissions'). These, in turn, connect with the 'dot' of globalisation which was coined to describe the centralisation of global power in every area of life through incessant political and corporate expansion, trading blocks and superstates like the European Union. If you are the few and you want to control the many you have to centralise power and decision-making. The more you centralise power the more power the few at the centre will have over the many; and the more that power is centralised the more power those at the centre have to centralise even quicker. The momentum of centralisation gets faster and faster which is exactly the process we have witnessed. In this way the hoaxed 'pandemic' and the fakery of human-caused global warming serve the interests of globalisation and the seizure of global power in the hands of the Cult inner-circle which is behind 'Covid', 'climate change' *and* globalisation. At this point random 'dots' become a clear and obvious picture or pattern.

Klaus Schwab, the classic Bond villain who founded the Cult's Gates-funded World Economic Forum, published a book in 2020, *The Great Reset*, in which he used the 'problem' of 'Covid' to justify a total transformation of human society to 'save' humanity from 'climate change'. Schwab said: 'The pandemic represents a rare but narrow window of opportunity to reflect, reimagine, and reset our world.' What he didn't mention is that the Cult he serves is behind both hoaxes as I show in my book *The Answer*. He and the Cult don't have to reimagine the world. They know precisely what they want and that's why they destroyed human society with 'Covid' to 'build back better' in their grand design. Their job is not to imagine, but to get humanity to imagine and agree with their plans while believing it's all random. It must be pure coincidence that 'The Great Reset' has long been the Cult's code name for the global imposition of fascism and replaced previous code-names of the 'New World

Order' used by Cult frontmen like Father George Bush and the 'New Order of the Ages' which emerged from Freemasonry and much older secret societies. New Order of the Ages appears on the reverse of the Great Seal of the United States as 'Novus ordo seclorum' underneath the Cult symbol used since way back of the pyramid and all seeing-eye (Fig 3). The pyramid is the hierarchy of human control headed by the illuminated eye that symbolises the force behind the Cult which I will expose in later chapters. The term 'Annuit Coeptis' translates as 'He favours our undertaking'. We are told the 'He' is the Christian god, but 'He' is not as I will be explaining.

Figure 3: The all-seeing eye of the Cult 'god' on the Freemason-designed Great Seal of the United States and also on the dollar bill.

Having you on

Two major Cult techniques of perceptual manipulation that relate to all this are what I have called since the 1990s Problem-Reaction-Solution (PRS) and the Totalitarian Tiptoe (TT). They can be uncovered by the inquiring mind with a simple question: Who benefits? The answer usually identifies the perpetrators of a given action or happening through the concept of 'he who most benefits from a crime is the one most likely to have committed it'. The Latin 'Cue bono?' – Who benefits? – is widely attributed to the Roman orator and statesman Marcus Tullius Cicero. No wonder it goes back so far when the concept has been relevant to human behaviour since

history was recorded. Problem-Reaction-Solution is the technique used to manipulate us every day by covertly creating a problem (or the illusion of one) and offering the solution to the problem (or the illusion of one). In the first phase you create the problem and blame someone or something else for why it has happened. This may relate to a financial collapse, terrorist attack, war, global warming or pandemic, anything in fact that will allow you to impose the 'solution' to change society in the way you desire at that time. The 'problem' doesn't have to be real. PRS is manipulation of perception and all you need is the population to believe the problem is real. Human-caused global warming and the 'Covid pandemic' only have to be *perceived* to be real for the population to accept the 'solutions' of authority. I refer to this technique as NO-Problem-Reaction-Solution. Billions did not meekly accept house arrest from early 2020 because there was a real deadly 'Covid pandemic' but because they perceived – believed – that to be the case. The antidote to Problem-Reaction-Solution is to ask who benefits from the proposed solution. Invariably it will be anyone who wants to justify more control through deletion of freedom and centralisation of power and decision-making.

The two world wars were Problem-Reaction-Solutions that transformed and realigned global society. Both were manipulated into being by the Cult as I have detailed in books since the mid-1990s. They dramatically centralised global power, especially World War Two, which led to the United Nations and other global bodies thanks to the overt and covert manipulations of the Rockefeller family and other Cult bloodlines like the Rothschilds. The UN is a stalking horse for full-blown world government that I will come to shortly. The land on which the UN building stands in New York was donated by the Rockefellers and the same Cult family was behind Big Pharma scalpel and drug 'medicine' and the creation of the World Health Organization as part of the UN. They have been stalwarts of the eugenics movement and funded Hitler's race-purity expert' Ernst Rudin. The human-caused global warming hoax has been orchestrated by the Club of Rome through the UN which is

manufacturing both the 'problem' through its Intergovernmental Panel on Climate Change and imposing the 'solution' through its Agenda 21 and Agenda 2030 which demand the total centralisation of global power to 'save the world' from a climate hoax the United Nations is itself perpetrating. What a small world the Cult can be seen to be particularly among the inner circles. The bedfellow of Problem-Reaction-Solution is the Totalitarian Tiptoe which became the Totalitarian Sprint in 2020. The technique is fashioned to hide the carefully-coordinated behind the cover of apparently random events. You start the sequence at 'A' and you know you are heading for 'Z'. You don't want people to know that and each step on the journey is presented as a random happening while all the steps strung together lead in the same direction. The speed may have quickened dramatically in recent times, but you can still see the incremental approach of the Tiptoe in the case of 'Covid' as each new imposition takes us deeper into fascism. Tell people they have to do this or that to get back to 'normal', then this and this and this. With each new demand adding to the ones that went before the population's freedom is deleted until it disappears. The spider wraps its web around the flies more comprehensively with each new diktat. I'll highlight this in more detail when I get to the 'Covid' hoax and how it has been pulled off. Another prime example of the Totalitarian Tiptoe is how the Cult-created European Union went from a 'free-trade zone' to a centralised bureaucratic dictatorship through the Tiptoe of incremental centralisation of power until nations became mere administrative units for Cult-owned dark suits in Brussels.

The antidote to ignorance is knowledge which the Cult seeks vehemently to deny us, but despite the systematic censorship to that end the Renegade Mind can overcome this by vociferously seeking out the facts no matter the impediments put in the way. There is also a method of thinking and perceiving – *knowing* – that doesn't even need names, dates, place-type facts to identify the patterns that reveal the story. I'll get to that in the final chapter. All you need to know about the manipulation of human society and to what end is still out there – *at the time of writing* – in the form of books, videos

and websites for those that really want to breach the walls of programmed perception. To access this knowledge requires the abandonment of the mainstream media as a source of information in the awareness that this is owned and controlled by the Cult and therefore promotes mass perceptions that suit the Cult. Mainstream media lies all day, every day. That is its function and very reason for being. Where it does tell the truth, here and there, is only because the truth and the Cult agenda very occasionally coincide. If you look for fact and insight to the BBC, CNN and virtually all the rest of them you are asking to be conned and perceptually programmed.

Know the outcome and you'll see the journey

Events seem random when you have no idea where the world is being taken. Once you do the random becomes the carefully planned. Know the outcome and you'll see the journey is a phrase I have been using for a long time to give context to daily happenings that appear unconnected. Does a problem, or illusion of a problem, trigger a proposed 'solution' that further drives society in the direction of the outcome? Invariably the answer will be yes and the random – *abracadabra* – becomes the clearly coordinated. So what is this outcome that unlocks the door to a massively expanded understanding of daily events? I will summarise its major aspects – the fine detail is in my other books – and those new to this information will see that the world they thought they were living in is a very different place. The foundation of the Cult agenda is the incessant centralisation of power and all such centralisation is ultimately in pursuit of Cult control on a global level. I have described for a long time the planned world structure of top-down dictatorship as the Hunger Games Society. The term obviously comes from the movie series which portrayed a world in which a few living in military-protected hi-tech luxury were the overlords of a population condemned to abject poverty in isolated 'sectors' that were not allowed to interact. 'Covid' lockdowns and travel bans anyone? The 'Hunger Games' pyramid of structural control has the inner circle of the Cult at the top with pretty much the entire

population at the bottom under their control through dependency for survival on the Cult. The whole structure is planned to be protected and enforced by a military-police state (Fig 4).

Here you have the reason for the global lockdowns of the fake pandemic to coldly destroy independent incomes and livelihoods and make everyone dependent on the 'state' (the Cult that controls the 'states'). I have warned in my books for many years about the plan to introduce a 'guaranteed income' – a barely survivable pittance – designed to impose dependency when employment was destroyed by AI technology and now even more comprehensively at great speed by the 'Covid' scam. Once the pandemic was played and lockdown consequences began to delete independent income the authorities began to talk right on cue about the need for a guaranteed income and a 'Great Reset'. Guaranteed income will be presented as benevolent governments seeking to help a desperate people – desperate as a direct result of actions of the same governments. The truth is that such payments are a trap. You will only get them if you do exactly what the authorities demand including mass vaccination (genetic manipulation). We have seen this theme already in Australia where those dependent on government benefits have them reduced if parents don't agree to have their children vaccinated according to an insane health-destroying government-dictated schedule. Calculated economic collapse applies to governments as well as people. The Cult wants rid of countries through the creation of a world state with countries broken up into regions ruled by a world government and super states like the European Union. Countries must be bankrupted, too, to this end and it's being achieved by the trillions in 'rescue packages' and furlough payments, trillions in lost taxation, and money-no-object spending on 'Covid' including constant all-medium advertising (programming) which has made the media dependent on government for much of its income. The day of reckoning is coming – as planned – for government spending and given that it has been made possible by printing money and not by production/taxation there is inflation on the way that has the

potential to wipe out monetary value. In that case there will be no need for the Cult to steal your money. It just won't be worth anything (see the German Weimar Republic before the Nazis took over). Many have been okay with lockdowns while getting a percentage of their income from so-called furlough payments without having to work. Those payments are dependent, however, on people having at least a theoretical job with a business considered non-essential and ordered to close. As these business go under because they are closed by lockdown after lockdown the furlough stops and it will for everyone eventually. Then what? The 'then what?' is precisely the idea.

Figure 4: The Hunger Games Society structure I have long warned was planned and now the 'Covid' hoax has made it possible. This is the real reason for lockdowns.

Hired hands

Between the Hunger Games Cult elite and the dependent population is planned to be a vicious military-police state (a fusion of the two into one force). This has been in the making for a long time with police looking ever more like the military and carrying weapons to match. The pandemic scam has seen this process accelerate so fast as

lockdown house arrest is brutally enforced by carefully recruited fascist minds and gormless system-servers. The police and military are planned to merge into a centrally-directed world army in a global structure headed by a world government which wouldn't be elected even by the election fixes now in place. The world army is not planned even to be human and instead wars would be fought, primarily against the population, using robot technology controlled by artificial intelligence. I have been warning about this for decades and now militaries around the world are being transformed by this very AI technology. The global regime that I describe is a particular form of fascism known as a technocracy in which decisions are not made by clueless and co-opted politicians but by unelected technocrats – scientists, engineers, technologists and bureaucrats. Cult-owned-and-controlled Silicon Valley giants are examples of technocracy and they already have far more power to direct world events than governments. They are with their censorship *selecting* governments. I know that some are calling the 'Great Reset' a Marxist communist takeover, but fascism and Marxism are different labels for the same tyranny. Tell those who lived in fascist Germany and Stalinist Russia that there was a difference in the way their freedom was deleted and their lives controlled. I could call it a fascist technocracy or a Marxist technocracy and they would be equally accurate. The Hunger Games society with its world government structure would oversee a world army, world central bank and single world cashless currency imposing its will on a microchipped population (Fig 5). Scan its different elements and see how the illusory pandemic is forcing society in this very direction at great speed. Leaders of 23 countries and the World Health Organization (WHO) backed the idea in March, 2021, of a global treaty for 'international cooperation' in 'health emergencies' and nations should 'come together as a global community for peaceful cooperation that extends beyond this crisis'. Cut the Orwellian bullshit and this means another step towards global government. The plan includes a cashless digital money system that I first warned about in 1993. Right at the start of 'Covid' the deeply corrupt Tedros

Adhanom Ghebreyesus, the crooked and merely gofer 'head' of the World Health Organization, said it was possible to catch the 'virus' by touching cash and it was better to use cashless means. The claim was ridiculous nonsense and like the whole 'Covid' mind-trick it was nothing to do with 'health' and everything to do with pushing every aspect of the Cult agenda. As a result of the Tedros lie the use of cash has plummeted. The Cult script involves a single world digital currency that would eventually be technologically embedded in the body. China is a massive global centre for the Cult and if you watch what is happening there you will know what is planned for everywhere. The Chinese government is developing a digital currency which would allow fines to be deducted immediately via AI for anyone caught on camera breaking its fantastic list of laws and the money is going to be programmable with an expiry date to ensure that no one can accrue wealth except the Cult and its operatives.

Figure 5: The structure of global control the Cult has been working towards for so long and this has been enormously advanced by the 'Covid' illusion.

Serfdom is so smart

The Cult plan is far wider, extreme, and more comprehensive than even most conspiracy researchers appreciate and I will come to the true depths of deceit and control in the chapters 'Who controls the

Cult?' and 'Escaping Wetiko'. Even the world that we know is crazy enough. We are being deluged with ever more sophisticated and controlling technology under the heading of 'smart'. We have smart televisions, smart meters, smart cards, smart cars, smart driving, smart roads, smart pills, smart patches, smart watches, smart skin, smart borders, smart pavements, smart streets, smart cities, smart communities, smart environments, smart growth, smart planet ... smart *everything* around us. Smart technologies and methods of operation are designed to interlock to create a global Smart Grid connecting the entirety of human society including human minds to create a centrally-dictated 'hive' mind. 'Smart cities' is code for densely-occupied megacities of total surveillance and control through AI. Ever more destructive frequency communication systems like 5G have been rolled out without any official testing for health and psychological effects (colossal). 5G/6G/7G systems are needed to run the Smart Grid and each one becomes more destructive of body and mind. Deleting independent income is crucial to forcing people into these AI-policed prisons by ending private property ownership (except for the Cult elite). The Cult's Great Reset now openly foresees a global society in which no one will own any possessions and everything will be rented while the Cult would own literally everything under the guise of government and corporations. The aim has been to use the lockdowns to destroy sources of income on a mass scale and when the people are destitute and in unrepayable amounts of debt (problem) Cult assets come forward with the pledge to write-off debt in return for handing over all property and possessions (solution). Everything – literally everything including people – would be connected to the Internet via AI. I was warning years ago about the coming Internet of Things (IoT) in which all devices and technology from your car to your fridge would be plugged into the Internet and controlled by AI. Now we are already there with much more to come. The next stage is the Internet of Everything (IoE) which is planned to include the connection of AI to the human brain and body to replace the human mind with a centrally-controlled AI mind. Instead of perceptions

being manipulated through control of information and censorship those perceptions would come direct from the Cult through AI. What do you think? You think whatever AI decides that you think. In human terms there would be no individual 'think' any longer. Too incredible? The ravings of a lunatic? Not at all. Cult-owned crazies in Silicon Valley have been telling us the plan for years without explaining the real motivation and calculated implications. These include Google executive and 'futurist' Ray Kurzweil who highlights the year 2030 for when this would be underway. He said:

Our thinking ... will be a hybrid of biological and non-biological thinking ... humans will be able to extend their limitations and 'think in the cloud' ... We're going to put gateways to the cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations.

As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

The sales-pitch of Kurzweil and Cult-owned Silicon Valley is that this would make us 'super-human' when the real aim is to make us post-human and no longer 'human' in the sense that we have come to know. The entire global population would be connected to AI and become the centrally-controlled 'hive-mind' of externally-delivered perceptions. The Smart Grid being installed to impose the Cult's will on the world is being constructed to allow particular locations – even one location – to control the whole global system. From these prime control centres, which absolutely include China and Israel, anything connected to the Internet would be switched on or off and manipulated at will. Energy systems could be cut, communication via the Internet taken down, computer-controlled driverless autonomous vehicles driven off the road, medical devices switched off, the potential is limitless given how much AI and Internet connections now run human society. We have seen nothing yet if we allow this to continue. Autonomous vehicle makers are working with law enforcement to produce cars designed to automatically pull over if they detect a police or emergency vehicle flashing from up to 100 feet away. At a police stop the car would be unlocked and the

window rolled down automatically. Vehicles would only take you where the computer (the state) allowed. The end of petrol vehicles and speed limiters on all new cars in the UK and EU from 2022 are steps leading to electric computerised transport over which ultimately you have no control. The picture is far bigger even than the Cult global network or web and that will become clear when I get to the nature of the 'spider'. There is a connection between all these happenings and the instigation of DNA-manipulating 'vaccines' (which aren't 'vaccines') justified by the 'Covid' hoax. That connection is the unfolding plan to transform the human body from a biological to a synthetic biological state and this is why synthetic biology is such a fast-emerging discipline of mainstream science. 'Covid vaccines' are infusing self-replicating synthetic genetic material into the cells to cumulatively take us on the Totalitarian Tiptoe from Human 1.0 to the synthetic biological Human 2.0 which will be physically and perceptually attached to the Smart Grid to one hundred percent control every thought, perception and deed. Humanity needs to wake up and *fast*.

This is the barest explanation of where the 'outcome' is planned to go but it's enough to see the journey happening all around us. Those new to this information will already see 'Covid' in a whole new context. I will add much more detail as we go along, but for the minutiae evidence see my mega-works, *The Answer, The Trigger* and *Everything You Need to Know But Have Never Been Told*.

Now – how does a Renegade Mind see the 'world'?

CHAPTER TWO

Renegade Perception

It is one thing to be clever and another to be wise
George R.R. Martin

A simple definition of the difference between a programmed mind and a Renegade Mind would be that one sees only dots while the other connects them to see the picture. Reading reality with accuracy requires the observer to (a) know the planned outcome and (b) realise that everything, but *everything*, is connected.

The entirety of infinite reality is connected – that's its very nature – and with human society an expression of infinite reality the same must apply. Simple cause and effect is a connection. The effect is triggered by the cause and the effect then becomes the cause of another effect. Nothing happens in isolation because it *can't*. Life in whatever reality is simple choice and consequence. We make choices and these lead to consequences. If we don't like the consequences we can make different choices and get different consequences which lead to other choices and consequences. The choice and the consequence are not only connected they are indivisible. You can't have one without the other as an old song goes. A few cannot control the world unless those being controlled allow that to happen – cause and effect, choice and consequence. Control – who has it and who doesn't – is a two-way process, a symbiotic relationship, involving the controller and controlled. 'They took my freedom away!!' Well, yes, but you also gave it to them. Humanity is

subjected to mass control because humanity has acquiesced to that control. This is all cause and effect and literally a case of give and take. In the same way world events of every kind are connected and the Cult works incessantly to sell the illusion of the random and coincidental to maintain the essential (to them) perception of dots that hide the picture. Renegade Minds know this and constantly scan the world for patterns of connection. This is absolutely pivotal in understanding the happenings in the world and without that perspective clarity is impossible. First you know the planned outcome and then you identify the steps on the journey – the day-by-day apparently random which, when connected in relation to the outcome, no longer appear as individual events, but as the proverbial *chain* of events leading in the same direction. I'll give you some examples:

Political puppet show

We are told to believe that politics is 'adversarial' in that different parties with different beliefs engage in an endless tussle for power. There may have been some truth in that up to a point – and only a point – but today divisions between 'different' parties are rhetorical not ideological. Even the rhetorical is fusing into one-speak as the parties eject any remaining free thinkers while others succumb to the ever-gathering intimidation of anyone with the 'wrong' opinion. The Cult is not a new phenomenon and can be traced back thousands of years as my books have documented. Its intergenerational initiates have been manipulating events with increasing effect the more that global power has been centralised. In ancient times the Cult secured control through the system of monarchy in which 'special' bloodlines (of which more later) demanded the right to rule as kings and queens simply by birthright and by vanquishing others who claimed the same birthright. There came a time, however, when people had matured enough to see the unfairness of such tyranny and demanded a say in who governed them. Note the word – *governed* them. Not served them – *governed* them, hence government defined as 'the political direction and control exercised over the

actions of the members, citizens, or inhabitants of communities, societies, and states; direction of the affairs of a state, community, etc.' Governments exercise control over rather than serve just like the monarchies before them. Bizarrely there are still countries like the United Kingdom which are ruled by a monarch *and* a government that officially answers to the monarch. The UK head of state and that of Commonwealth countries such as Canada, Australia and New Zealand is 'selected' by who in a *single family* had unprotected sex with whom and in what order. Pinch me it can't be true. Ouch! Shit, it is. The demise of monarchies in most countries offered a potential vacuum in which some form of free and fair society could arise and the Cult had that base covered. Monarchies had served its interests but they couldn't continue in the face of such widespread opposition and, anyway, replacing a 'royal' dictatorship that people could see with a dictatorship 'of the people' hiding behind the concept of 'democracy' presented far greater manipulative possibilities and ways of hiding coordinated tyranny behind the illusion of 'freedom'.

Democracy is quite wrongly defined as government selected by the population. This is not the case at all. It is government selected by *some* of the population (and then only in theory). This 'some' doesn't even have to be the majority as we have seen so often in first-past-the-post elections in which the so-called majority party wins fewer votes than the 'losing' parties combined. Democracy can give total power to a party in government from a minority of the votes cast. It's a sleight of hand to sell tyranny as freedom. Seventy-four million Trump-supporting Americans didn't vote for the 'Democratic' Party of Joe Biden in the distinctly dodgy election in 2020 and yet far from acknowledging the wishes and feelings of that great percentage of American society the Cult-owned Biden government set out from day one to destroy them and their right to a voice and opinion. Empty shell Biden and his Cult handlers said they were doing this to 'protect democracy'. Such is the level of lunacy and sickness to which politics has descended. Connect the dots and relate them to the desired outcome – a world government run by self-appointed technocrats and no longer even elected

politicians. While operating through its political agents in government the Cult is at the same time encouraging public distain for politicians by putting idiots and incompetents in theoretical power on the road to deleting them. The idea is to instil a public reaction that says of the technocrats: 'Well, they couldn't do any worse than the pathetic politicians.' It's all about controlling perception and Renegade Minds can see through that while programmed minds cannot when they are ignorant of both the planned outcome and the manipulation techniques employed to secure that end. This knowledge can be learned, however, and fast if people choose to get informed.

Politics may at first sight appear very difficult to control from a central point. I mean look at the 'different' parties and how would you be able to oversee them all and their constituent parts? In truth, it's very straightforward because of their structure. We are back to the pyramid of imposition and acquiescence. Organisations are structured in the same way as the system as a whole. Political parties are not open forums of free expression. They are hierarchies. I was a national spokesman for the British Green Party which claimed to be a different kind of politics in which influence and power was devolved; but I can tell you from direct experience – and it's far worse now – that Green parties are run as hierarchies like all the others however much they may try to hide that fact or kid themselves that it's not true. A very few at the top of all political parties are directing policy and personnel. They decide if you are elevated in the party or serve as a government minister and to do that you have to be a yes man or woman. Look at all the maverick political thinkers who never ascended the greasy pole. If you want to progress within the party or reach 'high-office' you need to fall into line and conform. Exceptions to this are rare indeed. Should you want to run for parliament or Congress you have to persuade the local or state level of the party to select you and for that you need to play the game as dictated by the hierarchy. If you secure election and wish to progress within the greater structure you need to go on conforming to what is acceptable to those running the hierarchy

from the peak of the pyramid. Political parties are perceptual gulags and the very fact that there are party 'Whips' appointed to 'whip' politicians into voting the way the hierarchy demands exposes the ridiculous idea that politicians are elected to serve the people they are supposed to represent. Cult operatives and manipulation has long seized control of major parties that have any chance of forming a government and at least most of those that haven't. A new party forms and the Cult goes to work to infiltrate and direct. This has reached such a level today that you see video compilations of 'leaders' of all parties whether Democrats, Republicans, Conservative, Labour and Green parroting the same Cult mantra of 'Build Back Better' and the 'Great Reset' which are straight off the Cult song-sheet to describe the transformation of global society in response to the Cult-instigated hoaxes of the 'Covid pandemic' and human-caused 'climate change'. To see Caroline Lucas, the Green Party MP that I knew when I was in the party in the 1980s, speaking in support of plans proposed by Cult operative Klaus Schwab representing the billionaire global elite is a real head-shaker.

Many parties – one master

The party system is another mind-trick and was instigated to change the nature of the dictatorship by swapping 'royalty' for dark suits that people believed – though now ever less so – represented their interests. Understanding this trick is to realise that a single force (the Cult) controls all parties either directly in terms of the major ones or through manipulation of perception and ideology with others. You don't need to manipulate Green parties to demand your transformation of society in the name of 'climate change' when they are obsessed with the lie that this is essential to 'save the planet'. You just give them a platform and away they go serving your interests while believing they are being environmentally virtuous. America's political structure is a perfect blueprint for how the two or multi-party system is really a one-party state. The Republican Party is controlled from one step back in the shadows by a group made up of billionaires and their gofers known as neoconservatives or Neocons.

I have exposed them in fine detail in my books and they were the driving force behind the policies of the imbecilic presidency of Boy George Bush which included 9/11 (see *The Trigger* for a comprehensive demolition of the official story), the subsequent 'war on terror' (war *of* terror) and the invasions of Afghanistan and Iraq. The latter was a No-Problem-Reaction-Solution based on claims by Cult operatives, including Bush and British Prime Minister Tony Blair, about Saddam Hussein's 'weapons of mass destruction' which did not exist as war criminals Bush and Blair well knew.

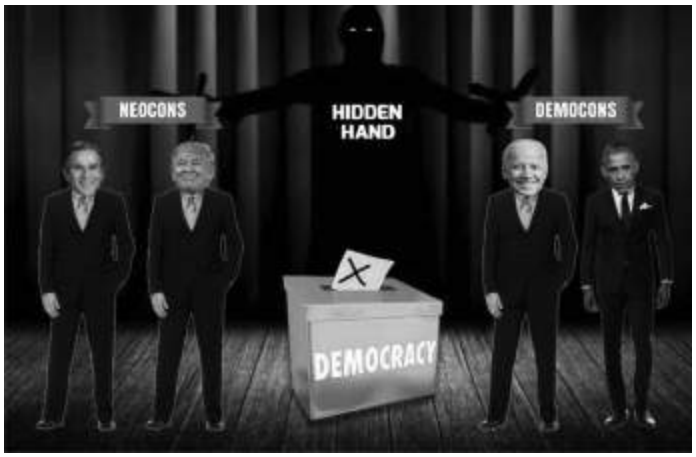

Figure 6: Different front people, different parties – same control system.

The Democratic Party has its own 'Neocon' group controlling from the background which I call the 'Democons' and here's the penny-drop – the Neocons and Democons answer to the same masters one step further back into the shadows (Fig 6). At that level of the Cult the Republican and Democrat parties are controlled by the same people and no matter which is in power the Cult is in power. This is how it works in almost every country and certainly in Britain with Conservative, Labour, Liberal Democrat and Green parties now all on the same page whatever the rhetoric may be in their feeble attempts to appear different. Neocons operated at the time of Bush through a think tank called The Project for the New American Century which in September, 2000, published a document entitled *Rebuilding America's Defenses: Strategies, Forces, and Resources*

For a New Century demanding that America fight 'multiple, simultaneous major theatre wars' as a 'core mission' to force regime-change in countries including Iraq, Libya and Syria. Neocons arranged for Bush ('Republican') and Blair ('Labour Party') to front-up the invasion of Iraq and when they departed the Democons orchestrated the targeting of Libya and Syria through Barack Obama ('Democrat') and British Prime Minister David Cameron ('Conservative Party'). We have 'different' parties and 'different' people, but the same unfolding script. The more the Cult has seized the reigns of parties and personnel the more their policies have transparently pursued the same agenda to the point where the fascist 'Covid' impositions of the Conservative junta of Jackboot Johnson in Britain were opposed by the Labour Party because they were not fascist enough. The Labour Party is likened to the US Democrats while the Conservative Party is akin to a British version of the Republicans and on both sides of the Atlantic they all speak the same language and support the direction demanded by the Cult although some more enthusiastically than others. It's a similar story in country after country because it's all centrally controlled. Oh, but what about Trump? I'll come to him shortly. Political 'choice' in the 'party' system goes like this: You vote for Party A and they get into government. You don't like what they do so next time you vote for Party B and they get into government. You don't like what they do when it's pretty much the same as Party A and why wouldn't that be with both controlled by the same force? Given that only two, sometimes three, parties have any chance of forming a government to get rid of Party B that you don't like you have to vote again for Party A which … you don't like. This, ladies and gentlemen, is what they call 'democracy' which we are told – wrongly – is a term interchangeable with 'freedom'.

The cult of cults

At this point I need to introduce a major expression of the Global Cult known as Sabbatian-Frankism. Sabbatian is also spelt as Sabbatean. I will summarise here. I have published major exposés

and detailed background in other works. Sabbatian-Frankism combines the names of two frauds posing as 'Jewish' men, Sabbatai Zevi (1626-1676), a rabbi, black magician and occultist who proclaimed he was the Jewish messiah; and Jacob Frank (1726-1791), the Polish 'Jew', black magician and occultist who said he was the reincarnation of 'messiah' Zevi and biblical patriarch Jacob. They worked across two centuries to establish the Sabbatian-Frankist cult that plays a major, indeed central, role in the manipulation of human society by the Global Cult which has its origins much further back in history than Sabbatai Zevi. I should emphasise two points here in response to the shrill voices that will scream 'anti-Semitism': (1) Sabbatian-Frankists are NOT Jewish and only pose as such to hide their cult behind a Jewish façade; and (2) my information about this cult has come from Jewish sources who have long realised that their society and community has been infiltrated and taken over by interloper Sabbatian-Frankists. Infiltration has been the foundation technique of Sabbatian-Frankism from its official origin in the 17th century. Zevi's Sabbatian sect attracted a massive following described as the biggest messianic movement in Jewish history, spreading as far as Africa and Asia, and he promised a return for the Jews to the 'Promised Land' of Israel. Sabbatianism was not Judaism but an inversion of everything that mainstream Judaism stood for. So much so that this sinister cult would have a feast day when Judaism had a fast day and whatever was forbidden in Judaism the Sabbatians were encouraged and even commanded to do. This included incest and what would be today called Satanism. Members were forbidden to marry outside the sect and there was a system of keeping their children ignorant of what they were part of until they were old enough to be trusted not to unknowingly reveal anything to outsiders. The same system is employed to this day by the Global Cult in general which Sabbatian-Frankism has enormously influenced and now largely controls.

Zevi and his Sabbatians suffered a setback with the intervention by the Sultan of the Islamic Ottoman Empire in the Middle East and what is now the Republic of Turkey where Zevi was located. The

Sultan gave him the choice of proving his 'divinity', converting to Islam or facing torture and death. Funnily enough Zevi chose to convert or at least appear to. Some of his supporters were disillusioned and drifted away, but many did not with 300 families also converting – only in theory – to Islam. They continued behind this Islamic smokescreen to follow the goals, rules and rituals of Sabbatianism and became known as 'crypto-Jews' or the 'Dönmeh' which means 'to turn'. This is rather ironic because they didn't 'turn' and instead hid behind a fake Islamic persona. The process of appearing to be one thing while being very much another would become the calling card of Sabbatianism especially after Zevi's death and the arrival of the Satanist Jacob Frank in the 18th century when the cult became Sabbatian-Frankism and plumbed still new depths of depravity and infiltration which included – still includes – human sacrifice and sex with children. Wherever Sabbatians go paedophilia and Satanism follow and is it really a surprise that Hollywood is so infested with child abuse and Satanism when it was established by Sabbatian-Frankists and is still controlled by them? Hollywood has been one of the prime vehicles for global perceptual programming and manipulation. How many believe the version of 'history' portrayed in movies when it is a travesty and inversion (again) of the truth? Rabbi Marvin Antelman describes Frankism in his book, *To Eliminate the Opiate*, as 'a movement of complete evil' while Jewish professor Gershom Scholem said of Frank in *The Messianic Idea in Judaism*: 'In all his actions [he was] a truly corrupt and degenerate individual ... one of the most frightening phenomena in the whole of Jewish history.' Frank was excommunicated by traditional rabbis, as was Zevi, but Frank was undeterred and enjoyed vital support from the House of Rothschild, the infamous banking dynasty whose inner-core are Sabbatian-Frankists and not Jews. Infiltration of the Roman Church and Vatican was instigated by Frank with many Dönmeh 'turning' again to convert to Roman Catholicism with a view to hijacking the reins of power. This was the ever-repeating modus operandi and continues to be so. Pose as an advocate of the religion, culture or country that you want to control and then

manipulate your people into the positions of authority and influence largely as advisers, administrators and Svengalis for those that appear to be in power. They did this with Judaism, Christianity (Christian Zionism is part of this), Islam and other religions and nations until Sabbatian-Frankism spanned the world as it does today.

Sabbatian Saudis and the terror network

One expression of the Sabbatian-Frankist Dönmeh within Islam is the ruling family of Saudi Arabia, the House of Saud, through which came the vile distortion of Islam known as Wahhabism. This is the violent creed followed by terrorist groups like Al-Qaeda and ISIS or Islamic State. Wahhabism is the hand-chopping, head-chopping 'religion' of Saudi Arabia which is used to keep the people in a constant state of fear so the interloper House of Saud can continue to rule. Al-Qaeda and Islamic State were lavishly funded by the House of Saud while being created and directed by the Sabbatian-Frankist network in the United States that operates through the Pentagon, CIA and the government in general of whichever 'party'. The front man for the establishment of Wahhabism in the middle of the 18th century was a Sabbatian-Frankist 'crypto-Jew' posing as Islamic called Muhammad ibn Abd al-Wahhab. His daughter would marry the son of Muhammad bin Saud who established the first Saudi state before his death in 1765 with support from the British Empire. Bin Saud's successors would establish modern Saudi Arabia in league with the British and Americans in 1932 which allowed them to seize control of Islam's major shrines in Mecca and Medina. They have dictated the direction of Sunni Islam ever since while Iran is the major centre of the Shiite version and here we have the source of at least the public conflict between them. The Sabbatian network has used its Wahhabi extremists to carry out Problem-Reaction-Solution terrorist attacks in the name of 'Al-Qaeda' and 'Islamic State' to justify a devastating 'war on terror', ever-increasing surveillance of the population and to terrify people into compliance. Another insight of the Renegade Mind is the streetwise understanding that

just because a country, location or people are attacked doesn't mean that those apparently representing that country, location or people are not behind the attackers. Often they are *orchestrating* the attacks because of the societal changes that can be then justified in the name of 'saving the population from terrorists'.

I show in great detail in *The Trigger* how Sabbatian-Frankists were the real perpetrators of 9/11 and not '19 Arab hijackers' who were blamed for what happened. Observe what was justified in the name of 9/11 alone in terms of Middle East invasions, mass surveillance and control that fulfilled the demands of the Project for the New American Century document published by the Sabbatian Neocons. What appear to be enemies are on the deep inside players on the same Sabbatian team. Israel and Arab 'royal' dictatorships are all ruled by Sabbatians and the recent peace agreements between Israel and Saudi Arabia, the United Arab Emirates (UAE) and others are only making formal what has always been the case behind the scenes. Palestinians who have been subjected to grotesque tyranny since Israel was bombed and terrorised into existence in 1948 have never stood a chance. Sabbatian-Frankists have controlled Israel (so the constant theme of violence and war which Sabbatians love) and they have controlled the Arab countries that Palestinians have looked to for real support that never comes. 'Royal families' of the Arab world in Saudi Arabia, Bahrain, UAE, etc., are all Sabbatians with allegiance to the aims of the cult and not what is best for their Arabic populations. They have stolen the oil and financial resources from their people by false claims to be 'royal dynasties' with a genetic right to rule and by employing vicious militaries to impose their will.

Satanic 'illumination'

The Satanist Jacob Frank formed an alliance in 1773 with two other Sabbatians, Mayer Amschel Rothschild (1744-1812), founder of the Rothschild banking dynasty, and Jesuit-educated fraudulent Jew, Adam Weishaupt, and this led to the formation of the Bavarian Illuminati, firstly under another name, in 1776. The Illuminati would

be the manipulating force behind the French Revolution (1789-1799) and was also involved in the American Revolution (1775-1783) before and after the Illuminati's official creation. Weishaupt would later become (in public) a Protestant Christian in archetypal Sabbatian style. I read that his name can be decoded as Adam-Weishaupt or 'the first man to lead those who know'. He wasn't a leader in the sense that he was a subordinate, but he did lead those below him in a crusade of transforming human society that still continues today. The theme was confirmed as early as 1785 when a horseman courier called Lanz was reported to be struck by lighting and extensive Illuminati documents were found in his saddlebags. They made the link to Weishaupt and detailed the plan for world takeover. Current events with 'Covid' fascism have been in the making for a very long time. Jacob Frank was jailed for 13 years by the Catholic Inquisition after his arrest in 1760 and on his release he headed for Frankfurt, Germany, home city and headquarters of the House of Rothschild where the alliance was struck with Mayer Amschel Rothschild and Weishaupt. Rothschild arranged for Frank to be given the title of Baron and he became a wealthy nobleman with a big following of Jews in Germany, the Austro-Hungarian Empire and other European countries. Most of them would have believed he was on their side.

The name 'Illuminati' came from the Zohar which is a body of works in the Jewish mystical 'bible' called the Kabbalah. 'Zohar' is the foundation of Sabbatian-Frankist belief and in Hebrew 'Zohar' means 'splendour', 'radiance', 'illuminated', and so we have 'Illuminati'. They claim to be the 'Illuminated Ones' from their knowledge systematically hidden from the human population and passed on through generations of carefully-chosen initiates in the global secret society network or Cult. Hidden knowledge includes an awareness of the Cult agenda for the world and the nature of our collective reality that I will explore later. Cult 'illumination' is symbolised by the torch held by the Statue of Liberty which was gifted to New York by French Freemasons in Paris who knew exactly what it represents. 'Liberty' symbolises the goddess worshipped in

Babylon as Queen Semiramis or Ishtar. The significance of this will become clear. Notice again the ubiquitous theme of inversion with the Statue of 'Liberty' really symbolising mass control (Fig 7). A mirror-image statute stands on an island in the River Seine in Paris from where New York Liberty originated (Fig 8). A large replica of the Liberty flame stands on top of the Pont de l'Alma tunnel in Paris where Princess Diana died in a Cult ritual described in *The Biggest Secret*. Lucifer 'the light bringer' is related to all this (and much more as we'll see) and 'Lucifer' is a central figure in Sabbatian-Frankism and its associated Satanism. Sabbatians reject the Jewish Torah, or Pentateuch, the 'five books of Moses' in the Old Testament known as Genesis, Exodus, Leviticus, Numbers, and Deuteronomy which are claimed by Judaism and Christianity to have been dictated by 'God' to Moses on Mount Sinai. Sabbatians say these do not apply to them and they seek to replace them with the Zohar to absorb Judaism and its followers into their inversion which is an expression of a much greater global inversion. They want to delete all religions and force humanity to worship a one-world religion – Sabbatian Satanism that also includes worship of the Earth goddess. Satanic themes are being more and more introduced into mainstream society and while Christianity is currently the foremost target for destruction the others are planned to follow.

Figure 7: The Cult goddess of Babylon disguised as the Statue of Liberty holding the flame of Lucifer the 'light bringer'.

Figure 8: Liberty's mirror image in Paris where the New York version originated.

Marx brothers

Rabbi Marvin Antelman connects the Illuminati to the Jacobins in *To Eliminate the Opiate* and Jacobins were the force behind the French Revolution. He links both to the Bund der Gerechten, or League of the Just, which was the network that inflicted communism/Marxism on the world. Antelman wrote:

> The original inner circle of the Bund der Gerechten consisted of born Catholics, Protestants and Jews [Sabbatian-Frankist infiltrators], and those representatives of respective subdivisions formulated schemes for the ultimate destruction of their faiths. The heretical Catholics laid plans which they felt would take a century or more for the ultimate destruction of the church; the apostate Jews for the ultimate destruction of the Jewish religion.

Sabbatian-created communism connects into this anti-religion agenda in that communism does not allow for the free practice of religion. The Sabbatian 'Bund' became the International Communist Party and Communist League and in 1848 'Marxism' was born with the Communist Manifesto of Sabbatian assets Karl Marx and Friedrich Engels. It is absolutely no coincidence that Marxism, just a different name for fascist and other centrally-controlled tyrannies, is being imposed worldwide as a result of the 'Covid' hoax and nor that Marxist/fascist China was the place where the hoax originated. The reason for this will become very clear in the chapter 'Covid: The calculated catastrophe'. The so-called 'Woke' mentality has hijacked

traditional beliefs of the political left and replaced them with far-right make-believe 'social justice' better known as Marxism. Woke will, however, be swallowed by its own perceived 'revolution' which is really the work of billionaires and billionaire corporations feigning being 'Woke'. Marxism is being touted by Wokers as a replacement for 'capitalism' when we don't have 'capitalism'. We have cartelism in which the market is stitched up by the very Cult billionaires and corporations bankrolling Woke. Billionaires love Marxism which keeps the people in servitude while they control from the top. Terminally naïve Wokers think they are 'changing the world' when it's the Cult that is doing the changing and when they have played their vital part and become surplus to requirements they, too, will be targeted. The Illuminati-Jacobins were behind the period known as 'The Terror' in the French Revolution in 1793 and 1794 when Jacobin Maximillian de Robespierre and his Orwellian 'Committee of Public Safety' killed 17,000 'enemies of the Revolution' who had once been 'friends of the Revolution'. Karl Marx (1818-1883), whose Sabbatian creed of Marxism has cost the lives of at least 100 million people, is a hero once again to Wokers who have been systematically kept ignorant of real history by their 'education' programming. As a result they now promote a Sabbatian 'Marxist' abomination destined at some point to consume them. Rabbi Antelman, who spent decades researching the Sabbatian plot, said of the League of the Just and Karl Marx:

> Contrary to popular opinion Karl Marx did not originate the Communist Manifesto. He was paid for his services by the League of the Just, which was known in its country of origin, Germany, as the Bund der Geaechteten.

Antelman said the text attributed to Marx was the work of other people and Marx 'was only repeating what others already said'. Marx was 'a hired hack – lackey of the wealthy Illuminists'. Marx famously said that religion was the 'opium of the people' (part of the Sabbatian plan to demonise religion) and Antelman called his books, *To Eliminate the Opiate*. Marx was born Jewish, but his family converted to Christianity (Sabbatian modus operandi) and he

attacked Jews, not least in his book, *A World Without Jews*. In doing so he supported the Sabbatian plan to destroy traditional Jewishness and Judaism which we are clearly seeing today with the vindictive targeting of orthodox Jews by the Sabbatian government of Israel over 'Covid' laws. I don't follow any religion and it has done much damage to the world over centuries and acted as a perceptual straightjacket. Renegade Minds, however, are always asking *why* something is being done. It doesn't matter if they agree or disagree with what is happening – *why* is it happening is the question. The 'why?' can be answered with regard to religion in that religions create interacting communities of believers when the Cult wants to dismantle all discourse, unity and interaction (see 'Covid' lockdowns) and the ultimate goal is to delete all religions for a one-world religion of Cult Satanism worshipping their 'god' of which more later. We see the same 'why?' with gun control in America. I don't have guns and don't want them, but why is the Cult seeking to disarm the population at the same time that law enforcement agencies are armed to their molars and why has every tyrant in history sought to disarm people before launching the final takeover? They include Hitler, Stalin, Pol Pot and Mao who followed confiscation with violent seizing of power. You know it's a Cult agenda by the people who immediately race to the microphones to exploit dead people in multiple shootings. Ultra-Zionist Cult lackey Senator Chuck Schumer was straight on the case after ten people were killed in Boulder, Colorado in March, 2121. Simple rule … if Schumer wants it the Cult wants it and the same with his ultra-Zionist mate the wild-eyed Senator Adam Schiff. At the same time they were calling for the disarmament of Americans, many of whom live a long way from a police response, Schumer, Schiff and the rest of these pampered clowns were sitting on Capitol Hill behind a razor-wired security fence protected by thousands of armed troops in addition to their own armed bodyguards. Mom and pop in an isolated home? They're just potential mass shooters.

Zion Mainframe

Sabbatian-Frankists and most importantly the Rothschilds were behind the creation of 'Zionism', a political movement that demanded a Jewish homeland in Israel as promised by Sabbatai Zevi. The very symbol of Israel comes from the German meaning of the name Rothschild. Dynasty founder Mayer Amschel Rothschild changed the family name from Bauer to Rothschild, or 'Red-Shield' in German, in deference to the six-pointed 'Star of David' hexagram displayed on the family's home in Frankfurt. The symbol later appeared on the flag of Israel after the Rothschilds were centrally involved in its creation. Hexagrams are not a uniquely Jewish symbol and are widely used in occult ('hidden') networks often as a symbol for Saturn (see my other books for why). Neither are Zionism and Jewishness interchangeable. Zionism is a political movement and philosophy and not a 'race' or a people. Many Jews oppose Zionism and many non-Jews, including US President Joe Biden, call themselves Zionists as does Israel-centric Donald Trump. America's support for the Israel government is pretty much a gimme with ultra-Zionist billionaires and corporations providing fantastic and dominant funding for both political parties. Former Congresswoman Cynthia McKinney has told how she was approached immediately she ran for office to 'sign the pledge' to Israel and confirm that she would always vote in that country's best interests. All American politicians are approached in this way. Anyone who refuses will get no support or funding from the enormous and all-powerful Zionist lobby that includes organisations like mega-lobby group AIPAC, the American Israel Public Affairs Committee. Trump's biggest funder was ultra-Zionist casino and media billionaire Sheldon Adelson while major funders of the Democratic Party include ultra-Zionist George Soros and ultra-Zionist financial and media mogul, Haim Saban. Some may reel back at the suggestion that Soros is an Israel-firster (Sabbatian-controlled Israel-firster), but Renegade Minds watch the actions not the words and everywhere Soros donates his billions the Sabbatian agenda benefits. In the spirit of Sabbatian inversion Soros pledged $1 billion for a new university network to promote 'liberal values and tackle intolerance'. He made the announcement during his annual speech

at the Cult-owned World Economic Forum in Davos, Switzerland, in January, 2020, after his 'harsh criticism' of 'authoritarian rulers' around the world. You can only laugh at such brazen mendacity. How *he* doesn't laugh is the mystery. Translated from the Orwellian 'liberal values and tackle intolerance' means teaching non-white people to hate white people and for white people to loathe themselves for being born white. The reason for that will become clear.

The 'Anti-Semitism' fraud

Zionists support the Jewish homeland in the land of Palestine which has been the Sabbatian-Rothschild goal for so long, but not for the benefit of Jews. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. This is nothing more than a Sabbatian protection racket to stop legitimate investigation and exposure of their agendas and activities. The official definition of 'anti-Semitism' has more recently been expanded to include criticism of Zionism – a *political movement* – and this was done to further stop exposure of Sabbatian infiltrators who created Zionism as we know it today in the 19th century. Renegade Minds will talk about these subjects when they know the shit that will come their way. People must decide if they want to know the truth or just cower in the corner in fear of what others will say. Sabbatians have been trying to label me as 'anti-Semitic' since the 1990s as I have uncovered more and more about their background and agendas. Useless, gutless, fraudulent 'journalists' then just repeat the smears without question and on the day I was writing this section a pair of unquestioning repeaters called Ben Quinn and Archie Bland (how appropriate) outright called me an 'anti-Semite' in the establishment propaganda sheet, the London *Guardian*, with no supporting evidence. The

Sabbatian Anti-Semitism Industry said so and who are they to question that? They wouldn't dare. Ironically 'Semitic' refers to a group of languages in the Middle East that are almost entirely Arabic. 'Anti-Semitism' becomes 'anti-Arab' which if the consequences of this misunderstanding were not so grave would be hilarious. Don't bother telling Quinn and Bland. I don't want to confuse them, bless 'em. One reason I am dubbed 'anti-Semitic' is that I wrote in the 1990s that Jewish operatives (Sabbatians) were heavily involved in the Russian Revolution when Sabbatians overthrew the Romanov dynasty. This apparently made me 'anti-Semitic'. Oh, really? Here is a section from *The Trigger*:

British journalist Robert Wilton confirmed these themes in his 1920 book *The Last Days of the Romanovs* when he studied official documents from the Russian government to identify the members of the Bolshevik ruling elite between 1917 and 1919. The Central Committee included 41 Jews among 62 members; the Council of the People's Commissars had 17 Jews out of 22 members; and 458 of the 556 most important Bolshevik positions between 1918 and 1919 were occupied by Jewish people. Only 17 were Russian. Then there were the 23 Jews among the 36 members of the vicious Cheka Soviet secret police established in 1917 who would soon appear all across the country.

Professor Robert Service of Oxford University, an expert on 20th century Russian history, found evidence that ['Jewish'] Leon Trotsky had sought to make sure that Jews were enrolled in the Red Army and were disproportionately represented in the Soviet civil bureaucracy that included the Cheka which performed mass arrests, imprisonment and executions of 'enemies of the people'. A US State Department Decimal File (861.00/5339) dated November 13th, 1918, names [Rothschild banking agent in America] Jacob Schiff and a list of ultra-Zionists as funders of the Russian Revolution leading to claims of a 'Jewish plot', but the key point missed by all is they were not 'Jews' – they were Sabbatian-Frankists.

Britain's Winston Churchill made the same error by mistake or otherwise. He wrote in a 1920 edition of the *Illustrated Sunday Herald* that those behind the Russian revolution were part of a 'worldwide conspiracy for the overthrow of civilisation and for the reconstitution of society on the basis of arrested development, of envious malevolence, and impossible equality' (see 'Woke' today because that has been created by the same network). Churchill said there was no need to exaggerate the part played in the creation of Bolshevism and in the actual bringing about of the Russian

Revolution 'by these international and for the most part atheistical Jews' ['atheistical Jews' = Sabbatians]. Churchill said it is certainly a very great one and probably outweighs all others: 'With the notable exception of Lenin, the majority of the leading figures are Jews.' He went on to describe, knowingly or not, the Sabbatian modus operandi of placing puppet leaders nominally in power while they control from the background:

> Moreover, the principal inspiration and driving power comes from the Jewish leaders. Thus Tchitcherin, a pure Russian, is eclipsed by his nominal subordinate, Litvinoff, and the influence of Russians like Bukharin or Lunacharski cannot be compared with the power of Trotsky, or of Zinovieff, the Dictator of the Red Citadel (Petrograd), or of Krassin or Radek – all Jews. In the Soviet institutions the predominance of Jews is even more astonishing. And the prominent, if not indeed the principal, part in the system of terrorism applied by the Extraordinary Commissions for Combatting Counter-Revolution has been taken by Jews, and in some notable cases by Jewesses.

What I said about seriously disproportionate involvement in the Russian Revolution by Jewish 'revolutionaries' (Sabbatians) is provable fact, but truth is no defence against the Sabbatian Anti-Semitism Industry, its repeater parrots like Quinn and Bland, and the now breathtaking network of so-called 'Woke' 'anti-hate' groups with interlocking leaderships and funding which have the role of discrediting and silencing anyone who gets too close to exposing the Sabbatians. We have seen 'truth is no defence' confirmed in legal judgements with the Saskatchewan Human Rights Commission in Canada decreeing this: 'Truthful statements can be presented in a manner that would meet the definition of hate speech, and not all truthful statements must be free from restriction.' Most 'anti-hate' activists, who are themselves consumed by hatred, are too stupid and ignorant of the world to know how they are being used. They are far too far up their own virtue-signalling arses and it's far too dark for them to see anything.

The 'revolution' game

The background and methods of the 'Russian' Revolution are straight from the Sabbatian playbook seen in the French Revolution

and endless others around the world that appear to start as a revolution of the people against tyrannical rule and end up with a regime change to more tyrannical rule overtly or covertly. Wars, terror attacks and regime overthrows follow the Sabbatian cult through history with its agents creating them as Problem-Reaction-Solutions to remove opposition on the road to world domination. Sabbatian dots connect the Rothschilds with the Illuminati, Jacobins of the French Revolution, the 'Bund' or League of the Just, the International Communist Party, Communist League and the Communist Manifesto of Karl Marx and Friedrich Engels that would lead to the Rothschild-funded Russian Revolution. The sequence comes under the heading of 'creative destruction' when you advance to your global goal by continually destroying the status quo to install a new status quo which you then also destroy. The two world wars come to mind. With each new status quo you move closer to your planned outcome. Wars and mass murder are to Sabbatians a collective blood sacrifice ritual. They are obsessed with death for many reasons and one is that death is an inversion of life. Satanists and Sabbatians are obsessed with death and often target churches and churchyards for their rituals. Inversion-obsessed Sabbatians explain the use of inverted symbolism including the *inverted* pentagram and *inverted* cross. The inversion of the cross has been related to targeting Christianity, but the cross was a religious symbol long before Christianity and its inversion is a statement about the Sabbatian mentality and goals more than any single religion.

Sabbatians operating in Germany were behind the rise of the occult-obsessed Nazis and the subsequent Jewish exodus from Germany and Europe to Palestine and the United States after World War Two. The Rothschild dynasty was at the forefront of this both as political manipulators and by funding the operation. Why would Sabbatians help to orchestrate the horrors inflicted on Jews by the Nazis and by Stalin after they organised the Russian Revolution? Sabbatians hate Jews and their religion, that's why. They pose as Jews and secure positions of control within Jewish society and play the 'anti-Semitism' card to protect themselves from exposure

through a global network of organisations answering to the Sabbatian-created-and-controlled globe-spanning intelligence network that involves a stunning web of military-intelligence operatives and operations for a tiny country of just nine million. Among them are Jewish assets who are not Sabbatians but have been convinced by them that what they are doing is for the good of Israel and the Jewish community to protect them from what they have been programmed since childhood to believe is a Jew-hating hostile world. The Jewish community is just a highly convenient cover to hide the true nature of Sabbatians. Anyone getting close to exposing their game is accused by Sabbatian place-people and gofers of 'anti-Semitism' and claiming that all Jews are part of a plot to take over the world. I am not saying that. I am saying that Sabbatians – the *real* Jew-haters – have infiltrated the Jewish community to use them both as a cover and an 'anti-Semitic' defence against exposure. Thus we have the Anti-Semitism Industry targeted researchers in this way and most Jewish people think this is justified and genuine. They don't know that their 'Jewish' leaders and institutions of state, intelligence and military are not controlled by Jews at all, but cultists and stooges of Sabbatian-Frankism. I once added my name to a pro-Jewish freedom petition online and the next time I looked my name was gone and text had been added to the petition blurb to attack me as an 'anti-Semite' such is the scale of perceptual programming.

Moving on America

I tell the story in *The Trigger* and a chapter called 'Atlantic Crossing' how particularly after Israel was established the Sabbatians moved in on the United States and eventually grasped control of government administration, the political system via both Democrats and Republicans, the intelligence community like the CIA and National Security Agency (NSA), the Pentagon and mass media. Through this seriously compartmentalised network Sabbatians and their operatives in Mossad, Israeli Defense Forces (IDF) and US agencies pulled off 9/11 and blamed it on 19 'Al-Qaeda hijackers' dominated by men from, or connected to, Sabbatian-ruled Saudi

Arabia. The '19' were not even on the planes let alone flew those big passenger jets into buildings while being largely incompetent at piloting one-engine light aircraft. 'Hijacker' Hani Hanjour who is said to have flown American Airlines Flight 77 into the Pentagon with a turn and manoeuvre most professional pilots said they would have struggled to do was banned from renting a small plane by instructors at the Freeway Airport in Bowie, Maryland, just *six weeks* earlier on the grounds that he was an incompetent pilot. The Jewish population of the world is just 0.2 percent with even that almost entirely concentrated in Israel (75 percent Jewish) and the United States (around two percent). This two percent and globally 0.2 percent refers to *Jewish* people and not Sabbatian interlopers who are a fraction of that fraction. What a sobering thought when you think of the fantastic influence on world affairs of tiny Israel and that the Project for the New America Century (PNAC) which laid out the blueprint in September, 2000, for America's war on terror and regime change wars in Iraq, Libya and Syria was founded and dominated by Sabbatians known as 'Neocons'. The document conceded that this plan would not be supported politically or publicly without a major attack on American soil and a Problem-Reaction-Solution excuse to send troops to war across the Middle East. Sabbatian Neocons said:

> ... [The] process of transformation ... [war and regime change] ... is likely to be a long one, absent some catastrophic and catalysing event – like a new Pearl Harbor.

Four months later many of those who produced that document came to power with their inane puppet George Bush from the long-time Sabbatian Bush family. They included Sabbatian Dick Cheney who was officially vice-president, but really de-facto president for the entirety of the 'Bush' government. Nine months after the 'Bush' inauguration came what Bush called at the time 'the Pearl Harbor of the 21st century' and with typical Sabbatian timing and symbolism 2001 was the 60th anniversary of the attack in 1941 by the Japanese Air Force on Pearl Harbor, Hawaii, which allowed President Franklin Delano Roosevelt to take the United States into a Sabbatian-

instigated Second World War that he said in his election campaign that he never would. The evidence is overwhelming that Roosevelt and his military and intelligence networks knew the attack was coming and did nothing to stop it, but they did make sure that America's most essential naval ships were not in Hawaii at the time. Three thousand Americans died in the Pearl Harbor attacks as they did on September 11th. By the 9/11 year of 2001 Sabbatians had widely infiltrated the US government, military and intelligence operations and used their compartmentalised assets to pull off the 'Al-Qaeda' attacks. If you read *The Trigger* it will blow your mind to see the utterly staggering concentration of 'Jewish' operatives (Sabbatian infiltrators) in essential positions of political, security, legal, law enforcement, financial and business power before, during, and after the attacks to make them happen, carry them out, and then cover their tracks – and I do mean *staggering* when you think of that 0.2 percent of the world population and two percent of Americans which are Jewish while Sabbatian infiltrators are a fraction of that. A central foundation of the 9/11 conspiracy was the hijacking of government, military, Air Force and intelligence computer systems in real time through 'back-door' access made possible by Israeli (Sabbatian) 'cyber security' software. Sabbatian-controlled Israel is on the way to rivalling Silicon Valley for domination of cyberspace and is becoming the dominant force in cyber-security which gives them access to entire computer systems and their passcodes across the world. Then add to this that Zionists head (officially) Silicon Valley giants like Google (Larry Page and Sergey Brin), Google-owned YouTube (Susan Wojcicki), Facebook (Mark Zuckerberg and Sheryl Sandberg), and Apple (Chairman Arthur D. Levinson), and that ultra-Zionist hedge fund billionaire Paul Singer has a $1 billion stake in Twitter which is only nominally headed by 'CEO' pothead Jack Dorsey. As cable news host Tucker Carlson said of Dorsey: 'There used to be debate in the medical community whether dropping a ton of acid had permanent effects and I think that debate has now ended.' Carlson made the comment after Dorsey told a hearing on Capitol Hill (if you cut through his bullshit) that he

believed in free speech so long as he got to decide what you can hear and see. These 'big names' of Silicon Valley are only front men and women for the Global Cult, not least the Sabbatians, who are the true controllers of these corporations. Does anyone still wonder why these same people and companies have been ferociously censoring and banning people (like me) for exposing any aspect of the Cult agenda and especially the truth about the 'Covid' hoax which Sabbatians have orchestrated?

The Jeffrey Epstein paedophile ring was a Sabbatian operation. He was officially 'Jewish' but he was a Sabbatian and women abused by the ring have told me about the high number of 'Jewish' people involved. The Epstein horror has Sabbatian written all over it and matches perfectly their modus operandi and obsession with sex and ritual. Epstein was running a Sabbatian blackmail ring in which famous people with political and other influence were provided with young girls for sex while everything was being filmed and recorded on hidden cameras and microphones at his New York house, Caribbean island and other properties. Epstein survivors have described this surveillance system to me and some have gone public. Once the famous politician or other figure knew he or she was on video they tended to do whatever they were told. Here we go again …when you've got them by the balls their hearts and minds will follow. Sabbatians use this blackmail technique on a wide scale across the world to entrap politicians and others they need to act as demanded. Epstein's private plane, the infamous 'Lolita Express', had many well-known passengers including Bill Clinton while Bill Gates has flown on an Epstein plane and met with him four years after Epstein had been jailed for paedophilia. They subsequently met many times at Epstein's home in New York according to a witness who was there. Epstein's infamous side-kick was Ghislaine Maxwell, daughter of Mossad agent and ultra-Zionist mega-crooked British businessman, Bob Maxwell, who at one time owned the *Daily Mirror* newspaper. Maxwell was murdered at sea on his boat in 1991 by Sabbatian-controlled Mossad when he became a liability with his

business empire collapsing as a former Mossad operative has confirmed (see *The Trigger*).

Money, money, money, funny money …

Before I come to the Sabbatian connection with the last three US presidents I will lay out the crucial importance to Sabbatians of controlling banking and finance. Sabbatian Mayer Amschel Rothschild set out to dominate this arena in his family's quest for total global control. What is freedom? It is, in effect, choice. The more choices you have the freer you are and the fewer your choices the more you are enslaved. In the global structure created over centuries by Sabbatians the biggest decider and restrictor of choice is … money. Across the world if you ask people what they would like to do with their lives and why they are not doing that they will reply 'I don't have the money'. This is the idea. A global elite of multi-billionaires are described as 'greedy' and that is true on one level; but control of money – who has it and who doesn't – is not primarily about greed. It's about control. Sabbatians have seized ever more control of finance and sucked the wealth of the world out of the hands of the population. We talk now, after all, about the 'One-percent' and even then the wealthiest are a lot fewer even than that. This has been made possible by a money scam so outrageous and so vast it could rightly be called the scam of scams founded on creating 'money' out of nothing and 'loaning' that with interest to the population. Money out of nothing is called 'credit'. Sabbatians have asserted control over governments and banking ever more completely through the centuries and secured financial laws that allow banks to lend hugely more than they have on deposit in a confidence trick known as fractional reserve lending. Imagine if you could lend money that doesn't exist and charge the recipient interest for doing so. You would end up in jail. Bankers by contrast end up in mansions, private jets, Malibu and Monaco.

Banks are only required to keep a fraction of their deposits and wealth in their vaults and they are allowed to lend 'money' they don't have called 'credit. Go into a bank for a loan and if you succeed

the banker will not move any real wealth into your account. They will type into your account the amount of the agreed 'loan' – say £100,000. This is not wealth that really exists; it is non-existent, fresh-air, created-out-of-nothing 'credit' which has never, does not, and will never exist except in theory. Credit is backed by nothing except wind and only has buying power because people think that it has buying power and accept it in return for property, goods and services. I have described this situation as like those cartoon characters you see chasing each other and when they run over the edge of a cliff they keep running forward on fresh air until one of them looks down, realises what's happened, and they all crash into the ravine. The whole foundation of the Sabbatian financial system is to stop people looking down except for periodic moments when they want to crash the system (as in 2008 and 2020 ongoing) and reap the rewards from all the property, businesses and wealth their borrowers had signed over as 'collateral' in return for a 'loan' of fresh air. Most people think that money is somehow created by governments when it comes into existence from the start as a debt through banks 'lending' illusory money called credit. Yes, the very currency of exchange is a *debt* from day one issued as an interest-bearing loan. Why don't governments create money interest-free and lend it to their people interest-free? Governments are controlled by Sabbatians and the financial system is controlled by Sabbatians for whom interest-free money would be a nightmare come true. Sabbatians underpin their financial domination through their global network of central banks, including the privately-owned US Federal Reserve and Britain's Bank of England, and this is orchestrated by a privately-owned central bank coordination body called the Bank for International Settlements in Basle, Switzerland, created by the usual suspects including the Rockefellers and Rothschilds. Central bank chiefs don't answer to governments or the people. They answer to the Bank for International Settlements or, in other words, the Global Cult which is dominated today by Sabbatians.

Built-in disaster

There are so many constituent scams within the overall banking scam. When you take out a loan of thin-air credit only the amount of that loan is theoretically brought into circulation to add to the amount in circulation; but you are paying back the principle plus interest. The additional interest is not created and this means that with every 'loan' there is a shortfall in the money in circulation between what is borrowed and what has to be paid back. There is never even close to enough money in circulation to repay all outstanding public and private debt including interest. Coldly weaved in the very fabric of the system is the certainty that some will lose their homes, businesses and possessions to the banking 'lender'. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts it becomes painfully obvious that there is not enough money to service all debt and interest. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts and it becomes painfully obvious – as in 2008 and currently – that there is not enough money to service all debt and interest. Sabbatian banksters have been leading the human population through a calculated series of booms (more debt incurred) and busts (when the debt can't be repaid and the banks get the debtor's tangible wealth in exchange for non-existent 'credit'). With each 'bust' Sabbatian bankers have absorbed more of the world's tangible wealth and we end up with the One-percent. Governments are in bankruptcy levels of debt to the same system and are therefore owned by a system they do not control. The Federal Reserve, 'America's central bank', is privately-owned and American presidents only nominally appoint its chairman or woman to maintain the illusion that it's an arm of government. It's not. The 'Fed' is a cartel of private banks which handed billions to its associates and friends after the crash of 2008 and has been Sabbatian-controlled since it was manipulated into being in 1913 through the covert trickery of Rothschild banking agents Jacob Schiff and Paul

Warburg, and the Sabbatian Rockefeller family. Somehow from a Jewish population of two-percent and globally 0.2 percent (Sabbatian interlopers remember are far smaller) ultra-Zionists headed the Federal Reserve for 31 years between 1987 and 2018 in the form of Alan Greenspan, Bernard Bernanke and Janet Yellen (now Biden's Treasury Secretary) with Yellen's deputy chairman a Israeli-American duel citizen and ultra-Zionist Stanley Fischer, a former governor of the Bank of Israel. Ultra-Zionist Fed chiefs spanned the presidencies of Ronald Reagan ('Republican'), Father George Bush ('Republican'), Bill Clinton ('Democrat'), Boy George Bush ('Republican') and Barack Obama ('Democrat'). We should really add the pre-Greenspan chairman, Paul Adolph Volcker, 'appointed' by Jimmy Carter ('Democrat') who ran the Fed between 1979 and 1987 during the Carter and Reagan administrations before Greenspan took over. Volcker was a long-time associate and business partner of the Rothschilds. No matter what the 'party' officially in power the United States economy was directed by the same force. Here are members of the Obama, Trump and Biden administrations and see if you can make out a common theme.

Barack Obama ('Democrat')

Ultra-Zionists Robert Rubin, Larry Summers, and Timothy Geithner ran the US Treasury in the Clinton administration and two of them reappeared with Obama. Ultra-Zionist Fed chairman Alan Greenspan had manipulated the crash of 2008 through deregulation and jumped ship just before the disaster to make way for ultra-Zionist Bernard Bernanke to hand out trillions to Sabbatian 'too big to fail' banks and businesses, including the ubiquitous ultra-Zionist Goldman Sachs which has an ongoing staff revolving door operation between itself and major financial positions in government worldwide. Obama inherited the fallout of the crash when he took office in January, 2009, and fortunately he had the support of his ultra-Zionist White House Chief of Staff Rahm Emmanuel, son of a terrorist who helped to bomb Israel into being in 1948, and his ultra-Zionist senior adviser David Axelrod, chief strategist in Obama's two

successful presidential campaigns. Emmanuel, later mayor of Chicago and former senior fundraiser and strategist for Bill Clinton, is an example of the Sabbatian policy after Israel was established of migrating insider families to America so their children would be born American citizens. 'Obama' chose this financial team throughout his administration to respond to the Sabbatian-instigated crisis:

Timothy Geithner (ultra-Zionist) Treasury Secretary; Jacob J. Lew, Treasury Secretary; Larry Summers (ultra-Zionist), director of the White House National Economic Council; Paul Adolph Volcker (Rothschild business partner), chairman of the Economic Recovery Advisory Board; Peter Orszag (ultra-Zionist), director of the Office of Management and Budget overseeing all government spending; Penny Pritzker (ultra-Zionist), Commerce Secretary; Jared Bernstein (ultra-Zionist), chief economist and economic policy adviser to Vice President Joe Biden; Mary Schapiro (ultra-Zionist), chair of the Securities and Exchange Commission (SEC); Gary Gensler (ultra-Zionist), chairman of the Commodity Futures Trading Commission (CFTC); Sheila Bair (ultra-Zionist), chair of the Federal Deposit Insurance Corporation (FDIC); Karen Mills (ultra-Zionist), head of the Small Business Administration (SBA); Kenneth Feinberg (ultra-Zionist), Special Master for Executive [bail-out] Compensation. Feinberg would be appointed to oversee compensation (with strings) to 9/11 victims and families in a campaign to stop them having their day in court to question the official story. At the same time ultra-Zionist Bernard Bernanke was chairman of the Federal Reserve and these are only some of the ultra-Zionists with allegiance to Sabbatian-controlled Israel in the Obama government. Obama's biggest corporate donor was ultra-Zionist Goldman Sachs which had employed many in his administration.

Donald Trump ('Republican')

Trump claimed to be an outsider (he wasn't) who had come to 'drain the swamp'. He embarked on this goal by immediately appointing ultra-Zionist Steve Mnuchin, a Goldman Sachs employee for 17

years, as his Treasury Secretary. Others included Gary Cohn (ultra-Zionist), chief operating officer of Goldman Sachs, his first Director of the National Economic Council and chief economic adviser, who was later replaced by Larry Kudlow (ultra-Zionist). Trump's senior adviser throughout his four years in the White House was his sinister son-in-law Jared Kushner, a life-long friend of Israel Prime Minister Benjamin Netanyahu. Kushner is the son of a convicted crook who was pardoned by Trump in his last days in office. Other ultra-Zionists in the Trump administration included: Stephen Miller, Senior Policy Adviser; Avrahm Berkowitz, Deputy Adviser to Trump and his Senior Adviser Jared Kushner; Ivanka Trump, Adviser to the President, who converted to Judaism when she married Jared Kushner; David Friedman, Trump lawyer and Ambassador to Israel; Jason Greenblatt, Trump Organization executive vice president and chief legal officer, who was made Special Representative for International Negotiations and the Israeli-Palestinian Conflict; Rod Rosenstein, Deputy Attorney General; Elliot Abrams, Special Representative for Venezuela, then Iran; John Eisenberg, National Security Council Legal Adviser and Deputy Council to the President for National Security Affairs; Anne Neuberger, Deputy National Manager, National Security Agency; Ezra Cohen-Watnick, Acting Under Secretary of Defense for Intelligence; Elan Carr, Special Envoy to monitor and combat anti-Semitism; Len Khodorkovsky, Deputy Special Envoy to monitor and combat anti-Semitism; Reed Cordish, Assistant to the President, Intragovernmental and Technology Initiatives. Trump Vice President Mike Pence and Secretary of State Mike Pompeo, both Christian Zionists, were also vehement supporters of Israel and its goals and ambitions.

Donald 'free-speech believer' Trump pardoned a number of financial and violent criminals while ignoring calls to pardon Julian Assange and Edward Snowden whose crimes are revealing highly relevant information about government manipulation and corruption and the widespread illegal surveillance of the American people by US 'security' agencies. It's so good to know that Trump is on the side of freedom and justice and not mega-criminals with

allegiance to Sabbatian-controlled Israel. These included a pardon for Israeli spy Jonathan Pollard who was jailed for life in 1987 under the Espionage Act. Aviem Sella, the Mossad agent who recruited Pollard, was also pardoned by Trump while Assange sat in jail and Snowden remained in exile in Russia. Sella had 'fled' (was helped to escape) to Israel in 1987 and was never extradited despite being charged under the Espionage Act. A Trump White House statement said that Sella's clemency had been 'supported by Benjamin Netanyahu, Ron Dermer, Israel's US Ambassador, David Friedman, US Ambassador to Israel and Miriam Adelson, wife of leading Trump donor Sheldon Adelson who died shortly before. Other friends of Jared Kushner were pardoned along with Sholom Weiss who was believed to be serving the longest-ever white-collar prison sentence of more than 800 years in 2000. The sentence was commuted of Ponzi-schemer Eliyahu Weinstein who defrauded Jews and others out of $200 million. I did mention that Assange and Snowden were ignored, right? Trump gave Sabbatians almost everything they asked for in military and political support, moving the US Embassy from Tel Aviv to Jerusalem with its critical symbolic and literal implications for Palestinian statehood, and the 'deal of the Century' designed by Jared Kushner and David Friedman which gave the Sabbatian Israeli government the green light to substantially expand its already widespread program of building illegal Jewish-only settlements in the occupied land of the West Bank. This made a two-state 'solution' impossible by seizing all the land of a potential Palestinian homeland and that had been the plan since 1948 and then 1967 when the Arab-controlled Gaza Strip, West Bank, Sinai Peninsula and Syrian Golan Heights were occupied by Israel. All the talks about talks and road maps and delays have been buying time until the West Bank was physically occupied by Israeli real estate. Trump would have to be a monumentally ill-informed idiot not to see that this was the plan he was helping to complete. The Trump administration was in so many ways the Kushner administration which means the Netanyahu administration which means the Sabbatian administration. I understand why many opposing Cult fascism in all its forms gravitated to Trump, but he

was a crucial part of the Sabbatian plan and I will deal with this in the next chapter.

Joe Biden ('Democrat')

A barely cognitive Joe Biden took over the presidency in January, 2021, along with his fellow empty shell, Vice-President Kamala Harris, as the latest Sabbatian gofers to enter the White House. Names on the door may have changed and the 'party' – the force behind them remained the same as Zionists were appointed to a stream of pivotal areas relating to Sabbatian plans and policy. They included: Janet Yellen, Treasury Secretary, former head of the Federal Reserve, and still another ultra-Zionist running the US Treasury after Mnuchin (Trump), Lew and Geithner (Obama), and Summers and Rubin (Clinton); Anthony Blinken, Secretary of State; Wendy Sherman, Deputy Secretary of State (so that's 'Biden's' Sabbatian foreign policy sorted); Jeff Zients, White House coronavirus coordinator; Rochelle Walensky, head of the Centers for Disease Control; Rachel Levine, transgender deputy health secretary (that's 'Covid' hoax policy under control); Merrick Garland, Attorney General; Alejandro Mayorkas, Secretary of Homeland Security; Cass Sunstein, Homeland Security with responsibility for new immigration laws; Avril Haines, Director of National Intelligence; Anne Neuberger, National Security Agency cybersecurity director (note, cybersecurity); David Cohen, CIA Deputy Director; Ronald Klain, Biden's Chief of Staff (see Rahm Emanuel); Eric Lander, a 'leading geneticist', Office of Science and Technology Policy director (see Smart Grid, synthetic biology agenda); Jessica Rosenworcel, acting head of the Federal Communications Commission (FCC) which controls Smart Grid technology policy and electromagnetic communication systems including 5G. How can it be that so many pivotal positions are held by two-percent of the American population and 0.2 percent of the world population administration after administration no matter who is the president and what is the party? It's a coincidence? Of course it's not and this is why Sabbatians have built their colossal global web of interlocking 'anti-

hate' hate groups to condemn anyone who asks these glaring questions as an 'anti-Semite'. The way that Jewish people horrifically abused in Sabbatian-backed Nazi Germany are exploited to this end is stomach-turning and disgusting beyond words.

Political fusion

Sabbatian manipulation has reversed the roles of Republicans and Democrats and the same has happened in Britain with the Conservative and Labour Parties. Republicans and Conservatives were always labelled the 'right' and Democrats and Labour the 'left', but look at the policy positions now and the Democrat-Labour 'left' has moved further to the 'right' than Republicans and Conservatives under the banner of 'Woke', the Cult-created far-right tyranny. Where once the Democrat-Labour 'left' defended free speech and human rights they now seek to delete them and as I said earlier despite the 'Covid' fascism of the Jackboot Johnson Conservative government in the UK the Labour Party of leader Keir Starmer demanded even more extreme measures. The Labour Party has been very publicly absorbed by Sabbatians after a political and media onslaught against the previous leader, the weak and inept Jeremy Corbyn, over made-up allegations of 'anti-Semitism' both by him and his party. The plan was clear with this 'anti-Semite' propaganda and what was required in response was a swift and decisive 'fuck off' from Corbyn and a statement to expose the Anti-Semitism Industry (Sabbatian) attempt to silence Labour criticism of the Israeli government (Sabbatians) and purge the party of all dissent against the extremes of ultra-Zionism (Sabbatians). Instead Corbyn and his party fell to their knees and appeased the abusers which, by definition, is impossible. Appeasing one demand leads only to a new demand to be appeased until takeover is complete. Like I say – 'fuck off' would have been a much more effective policy and I have used it myself with great effect over the years when Sabbatians are on my case which is most of the time. I consider that fact a great compliment, by the way. The outcome of the Labour Party capitulation is that we now have a Sabbatian-controlled

Conservative Party 'opposed' by a Sabbatian-controlled Labour Party in a one-party Sabbatian state that hurtles towards the extremes of tyranny (the Sabbatian cult agenda). In America the situation is the same. Labour's Keir Starmer spends his days on his knees with his tongue out pointing to Tel Aviv, or I guess now Jerusalem, while Boris Johnson has an 'anti-Semitism czar' in the form of former Labour MP John Mann who keeps Starmer company on his prayer mat.

Sabbatian influence can be seen in Jewish members of the Labour Party who have been ejected for criticism of Israel including those from families that suffered in Nazi Germany. Sabbatians despise real Jewish people and target them even more harshly because it is so much more difficult to dub them 'anti-Semitic' although in their desperation they do try.

CHAPTER THREE

The Pushbacker sting

Until you realize how easy it is for your mind to be manipulated, you remain the puppet of someone else's game
Evita Ochel

I will use the presidencies of Trump and Biden to show how the manipulation of the one-party state plays out behind the illusion of political choice across the world. No two presidencies could – on the face of it – be more different and apparently at odds in terms of direction and policy.

A Renegade Mind sees beyond the obvious and focuses on outcomes and consequences and not image, words and waffle. The Cult embarked on a campaign to divide America between those who blindly support its agenda (the mentality known as 'Woke') and those who are pushing back on where the Cult and its Sabbatians want to go. This presents infinite possibilities for dividing and ruling the population by setting them at war with each other and allows a perceptual ring fence of demonisation to encircle the Pushbackers in a modern version of the Little Big Horn in 1876 when American cavalry led by Lieutenant Colonel George Custer were drawn into a trap, surrounded and killed by Native American tribes defending their land of thousands of years from being seized by the government. In this modern version the roles are reversed and it's those defending themselves from the Sabbatian government who are surrounded and the government that's seeking to destroy them. This trap was set years ago and to explain how we must return to 2016

and the emergence of Donald Trump as a candidate to be President of the United States. He set out to overcome the best part of 20 other candidates in the Republican Party before and during the primaries and was not considered by many in those early stages to have a prayer of living in the White House. The Republican Party was said to have great reservations about Trump and yet somehow he won the nomination. When you know how American politics works – politics in general – there is no way that Trump could have become the party's candidate unless the Sabbatian-controlled 'Neocons' that run the Republican Party wanted that to happen. We saw the proof in emails and documents made public by WikiLeaks that the Democratic Party hierarchy, or Democons, systematically undermined the campaign of Bernie Sanders to make sure that Sabbatian gofer Hillary Clinton won the nomination to be their presidential candidate. If the Democons could do that then the Neocons in the Republican Party could have derailed Trump in the same way. But they didn't and at that stage I began to conclude that Trump could well be the one chosen to be president. If that was the case the 'why' was pretty clear to see – the goal of dividing America between Cult agenda-supporting Wokers and Pushbackers who gravitated to Trump because he was telling them what they wanted to hear. His constituency of support had been increasingly ignored and voiceless for decades and profoundly through the eight years of Sabbatian puppet Barack Obama. Now here was someone speaking their language of pulling back from the incessant globalisation of political and economic power, the exporting of American jobs to China and elsewhere by 'American' (Sabbatian) corporations, the deletion of free speech, and the mass immigration policies that had further devastated job opportunities for the urban working class of all races and the once American heartlands of the Midwest.

Beware the forked tongue

Those people collectively sighed with relief that at last a political leader was apparently on their side, but another trait of the Renegade Mind is that you look even harder at people telling you

what you want to hear than those who are telling you otherwise. Obviously as I said earlier people wish what they want to hear to be true and genuine and they are much more likely to believe that than someone saying what they don't want to here and don't want to be true. Sales people are taught to be skilled in eliciting by calculated questioning what their customers want to hear and repeating that back to them as their own opinion to get their targets to like and trust them. Assets of the Cult are also sales people in the sense of selling perception. To read Cult manipulation you have to play the long and expanded game and not fall for the Vaudeville show of party politics. Both American parties are vehicles for the Cult and they exploit them in different ways depending on what the agenda requires at that moment. Trump and the Republicans were used to be the focus of dividing America and isolating Pushbackers to open the way for a Biden presidency to become the most extreme in American history by advancing the full-blown Woke (Cult) agenda with the aim of destroying and silencing Pushbackers now labelled Nazi Trump supporters and white supremacists.

Sabbatians wanted Trump in office for the reasons described by ultra-Zionist Saul Alinsky (1909-1972) who was promoting the Woke philosophy through 'community organising' long before anyone had heard of it. In those days it still went by its traditional name of Marxism. The reason for the manipulated Trump phenomenon was laid out in Alinsky's 1971 book, *Rules for Radicals*, which was his blueprint for overthrowing democratic and other regimes and replacing them with Sabbatian Marxism. Not surprisingly his to-do list was evident in the Sabbatian French and Russian 'Revolutions' and that in China which will become very relevant in the next chapter about the 'Covid' hoax. Among Alinsky's followers have been the deeply corrupt Barack Obama, House Speaker Nancy Pelosi and Hillary Clinton who described him as a 'hero'. All three are Sabbatian stooges with Pelosi personifying the arrogant corrupt idiocy that so widely fronts up for the Cult inner core. Predictably as a Sabbatian advocate of the 'light-bringer' Alinsky features Lucifer on the dedication page of his book as the original radical who gained

his own kingdom ('Earth' as we shall see). One of Alinsky's golden radical rules was to pick an individual and focus all attention, hatred and blame on them and not to target faceless bureaucracies and corporations. *Rules for Radicals* is really a Sabbatian handbook with its contents repeatedly employed all over the world for centuries and why wouldn't Sabbatians bring to power their designer-villain to be used as the individual on which all attention, hatred and blame was bestowed? This is what they did and the only question for me is how much Trump knew that and how much he was manipulated. A bit of both, I suspect. This was Alinsky's Trump technique from a man who died in 1972. The technique has spanned history:

Pick the target, freeze it, personalize it, polarize it. Don't try to attack abstract corporations or bureaucracies. Identify a responsible individual. Ignore attempts to shift or spread the blame.

From the moment Trump came to illusory power everything was about him. It wasn't about Republican policy or opinion, but all about Trump. Everything he did was presented in negative, derogatory and abusive terms by the Sabbatian-dominated media led by Cult operations such as CNN, MSNBC, *The New York Times* and the Jeff Bezos-owned *Washington Post* – 'Pick the target, freeze it, personalize it, polarize it.' Trump was turned into a demon to be vilified by those who hated him and a demi-god loved by those who worshipped him. This, in turn, had his supporters, too, presented as equally demonic in preparation for the punchline later down the line when Biden was about to take office. It was here's a Trump, there's a Trump, everywhere a Trump, Trump. Virtually every news story or happening was filtered through the lens of 'The Donald'. You loved him or hated him and which one you chose was said to define you as Satan's spawn or a paragon of virtue. Even supporting some Trump policies or statements and not others was enough for an assault on your character. No shades of grey were or are allowed. Everything is black and white (literally and figuratively). A Californian I knew had her head utterly scrambled by her hatred for Trump while telling people they should love each other. She was so totally consumed by

Trump Derangement Syndrome as it became to be known that this glaring contradiction would never have occurred to her. By definition anyone who criticised Trump or praised his opponents was a hero and this lady described Joe Biden as 'a kind, honest gentleman' when he's a provable liar, mega-crook and vicious piece of work to boot. Sabbatians had indeed divided America using Trump as the fall-guy and all along the clock was ticking on the consequences for his supporters.

In hock to his masters

Trump gave Sabbatians via Israel almost everything they wanted in his four years. Ask and you shall receive was the dynamic between himself and Benjamin Netanyahu orchestrated by Trump's ultra-Zionist son-in-law Jared Kushner, his ultra-Zionist Ambassador to Israel, David Friedman, and ultra-Zionist 'Israel adviser', Jason Greenblatt. The last two were central to the running and protecting from collapse of his business empire, the Trump Organisation, and colossal business failures made him forever beholding to Sabbatian networks that bailed him out. By the start of the 1990s Trump owed $4 billion to banks that he couldn't pay and almost $1billion of that was down to him personally and not his companies. This mega-disaster was the result of building two new casinos in Atlantic City and buying the enormous Taj Mahal operation which led to crippling debt payments. He had borrowed fantastic sums from 72 banks with major Sabbatian connections and although the scale of debt should have had him living in a tent alongside the highway they never foreclosed. A plan was devised to lift Trump from the mire by BT Securities Corporation and Rothschild Inc. and the case was handled by Wilber Ross who had worked for the Rothschilds for 27 years. Ross would be named US Commerce Secretary after Trump's election. Another crucial figure in saving Trump was ultra-Zionist 'investor' Carl Icahn who bought the Taj Mahal casino. Icahn was made special economic adviser on financial regulation in the Trump administration. He didn't stay long but still managed to find time to make a tidy sum of a reported $31.3 million when he sold his

holdings affected by the price of steel three days before Trump imposed a 235 percent tariff on steel imports. What amazing bits of luck these people have. Trump and Sabbatian operatives have long had a close association and his mentor and legal adviser from the early 1970s until 1986 was the dark and genetically corrupt ultra-Zionist Roy Cohn who was chief counsel to Senator Joseph McCarthy's 'communist' witch-hunt in the 1950s. *Esquire* magazine published an article about Cohn with the headline 'Don't mess with Roy Cohn'. He was described as the most feared lawyer in New York and 'a ruthless master of dirty tricks ... [with] ... more than one Mafia Don on speed dial'. Cohn's influence, contacts, support and protection made Trump a front man for Sabbatians in New York with their connections to one of Cohn's many criminal employers, the 'Russian' Sabbatian Mafia. Israel-centric media mogul Rupert Murdoch was introduced to Trump by Cohn and they started a long friendship. Cohn died in 1986 weeks after being disbarred for unethical conduct by the Appellate Division of the New York State Supreme Court. The wheels of justice do indeed run slow given the length of Cohn's crooked career.

QAnon-sense

We are asked to believe that Donald Trump with his fundamental connections to Sabbatian networks and operatives has been leading the fight to stop the Sabbatian agenda for the fascistic control of America and the world. Sure he has. A man entrapped during his years in the White House by Sabbatian operatives and whose biggest financial donor was casino billionaire Sheldon Adelson who was Sabbatian to his DNA?? Oh, do come on. Trump has been used to divide America and isolate Pushbackers on the Cult agenda under the heading of 'Trump supporters', 'insurrectionists' and 'white supremacists'. The US Intelligence/Mossad Psyop or psychological operation known as QAnon emerged during the Trump years as a central pillar in the Sabbatian campaign to lead Pushbackers into the trap set by those that wished to destroy them. I knew from the start that QAnon was a scam because I had seen the same scenario many

times before over 30 years under different names and I had written about one in particular in the books. 'Not again' was my reaction when QAnon came to the fore. The same script is pulled out every few years and a new name added to the letterhead. The story always takes the same form: 'Insiders' or 'the good guys' in the government-intelligence-military 'Deep State' apparatus were going to instigate mass arrests of the 'bad guys' which would include the Rockefellers, Rothschilds, Barack Obama, Hillary Clinton, George Soros, etc., etc. Dates are given for when the 'good guys' are going to move in, but the dates pass without incident and new dates are given which pass without incident. The central message to Pushbackers in each case is that they don't have to do anything because there is 'a plan' and it is all going to be sorted by the 'good guys' on the inside. 'Trust the plan' was a QAnon mantra when the only plan was to misdirect Pushbackers into putting their trust in a Psyop they believed to be real. Beware, beware, those who tell you what you want to hear and always check it out. Right up to Biden's inauguration QAnon was still claiming that 'the Storm' was coming and Trump would stay on as president when Biden and his cronies were arrested and jailed. It was never going to happen and of course it didn't, but what did happen as a result provided that punchline to the Sabbatian Trump/QAnon Psyop.

On January 6th, 2021, a very big crowd of Trump supporters gathered in the National Mall in Washington DC down from the Capitol Building to protest at what they believed to be widespread corruption and vote fraud that stopped Trump being re-elected for a second term as president in November, 2020. I say as someone that does not support Trump or Biden that the evidence is clear that major vote-fixing went on to favour Biden, a man with cognitive problems so advanced he can often hardly string a sentence together without reading the words written for him on the Teleprompter. Glaring ballot discrepancies included serious questions about electronic voting machines that make vote rigging a comparative cinch and hundreds of thousands of paper votes that suddenly appeared during already advanced vote counts and virtually all of

them for Biden. Early Trump leads in crucial swing states suddenly began to close and disappear. The pandemic hoax was used as the excuse to issue almost limitless numbers of mail-in ballots with no checks to establish that the recipients were still alive or lived at that address. They were sent to streams of people who had not even asked for them. Private organisations were employed to gather these ballots and who knows what they did with them before they turned up at the counts. The American election system has been manipulated over decades to become a sick joke with more holes than a Swiss cheese for the express purpose of dictating the results. Then there was the criminal manipulation of information by Sabbatian tech giants like Facebook, Twitter and Google-owned YouTube which deleted pro-Trump, anti-Biden accounts and posts while everything in support of Biden was left alone. Sabbatians wanted Biden to win because after the dividing of America it was time for full-on Woke and every aspect of the Cult agenda to be unleashed.

Hunter gatherer

Extreme Silicon Valley bias included blocking information by the *New York Post* exposing a Biden scandal that should have ended his bid for president in the final weeks of the campaign. Hunter Biden, his monumentally corrupt son, is reported to have sent a laptop to be repaired at a local store and failed to return for it. Time passed until the laptop became the property of the store for non-payment of the bill. When the owner saw what was on the hard drive he gave a copy to the FBI who did nothing even though it confirmed widespread corruption in which the Joe Biden family were using his political position, especially when he was vice president to Obama, to make multiple millions in countries around the world and most notably Ukraine and China. Hunter Biden's one-time business partner Tony Bobulinski went public when the story broke in the *New York Post* to confirm the corruption he saw and that Joe Biden not only knew what was going on he also profited from the spoils. Millions were handed over by a Chinese company with close

connections – like all major businesses in China – to the Chinese communist party of President Xi Jinping. Joe Biden even boasted at a meeting of the Cult's World Economic Forum that as vice president he had ordered the government of Ukraine to fire a prosecutor. What he didn't mention was that the same man just happened to be investigating an energy company which was part of Hunter Biden's corrupt portfolio. The company was paying him big bucks for no other reason than the influence his father had. Overnight Biden's presidential campaign should have been over given that he had lied publicly about not knowing what his son was doing. Instead almost the entire Sabbatian-owned mainstream media and Sabbatian-owned Silicon Valley suppressed circulation of the story. This alone went a mighty way to rigging the election of 2020. Cult assets like Mark Zuckerberg at Facebook also spent hundreds of millions to be used in support of Biden and vote 'administration'.

The Cult had used Trump as the focus to divide America and was now desperate to bring in moronic, pliable, corrupt Biden to complete the double-whammy. No way were they going to let little things like the will of the people thwart their plan. Silicon Valley widely censored claims that the election was rigged because it *was* rigged. For the same reason anyone claiming it was rigged was denounced as a 'white supremacist' including the pathetically few Republican politicians willing to say so. Right across the media where the claim was mentioned it was described as a 'false claim' even though these excuses for 'journalists' would have done no research into the subject whatsoever. Trump won seven million more votes than any sitting president had ever achieved while somehow a cognitively-challenged soon to be 78-year-old who was hidden away from the public for most of the campaign managed to win more votes than any presidential candidate in history. It makes no sense. You only had to see election rallies for both candidates to witness the enthusiasm for Trump and the apathy for Biden. Tens of thousands would attend Trump events while Biden was speaking in empty car parks with often only television crews attending and framing their shots to hide the fact that no one was there. It was pathetic to see

footage come to light of Biden standing at a podium making speeches only to TV crews and party fixers while reading the words written for him on massive Teleprompter screens. So, yes, those protestors on January 6th had a point about election rigging, but some were about to walk into a trap laid for them in Washington by the Cult Deep State and its QAnon Psyop. This was the Capitol Hill riot ludicrously dubbed an 'insurrection'.

The spider and the fly

Renegade Minds know there are not two 'sides' in politics, only one side, the Cult, working through all 'sides'. It's a stage show, a puppet show, to direct the perceptions of the population into focusing on diversions like parties and candidates while missing the puppeteers with their hands holding all the strings. The Capitol Hill 'insurrection' brings us back to the Little Big Horn. Having created two distinct opposing groupings – Woke and Pushbackers – the trap was about to be sprung. Pushbackers were to be encircled and isolated by associating them all in the public mind with Trump and then labelling Trump as some sort of Confederate leader. I knew immediately that the Capitol riot was a set-up because of two things. One was how easy the rioters got into the building with virtually no credible resistance and secondly I could see – as with the 'Covid' hoax in the West at the start of 2020 – how the Cult could exploit the situation to move its agenda forward with great speed. My experience of Cult techniques and activities over more than 30 years has showed me that while they do exploit situations they haven't themselves created this never happens with events of fundamental agenda significance. Every time major events giving cultists the excuse to rapidly advance their plan you find they are manipulated into being for the specific reason of providing that excuse – Problem-Reaction-Solution. Only a tiny minority of the huge crowd of Washington protestors sought to gain entry to the Capitol by smashing windows and breaching doors. That didn't matter. The whole crowd and all Pushbackers, even if they did not support Trump, were going to be lumped together as dangerous

insurrectionists and conspiracy theorists. The latter term came into widespread use through a CIA memo in the 1960s aimed at discrediting those questioning the nonsensical official story of the Kennedy assassination and it subsequently became widely employed by the media. It's still being used by inept 'journalists' with no idea of its origin to discredit anyone questioning anything that authority claims to be true. When you are perpetrating a conspiracy you need to discredit the very word itself even though the dictionary definition of conspiracy is merely 'the activity of secretly planning with other people to do something bad or illegal' and 'a general agreement to keep silent about a subject for the purpose of keeping it secret'. On that basis there are conspiracies almost wherever you look. For obvious reasons the Cult and its lapdog media have to claim there are no conspiracies even though the word appears in state laws as with conspiracy to defraud, to murder, and to corrupt public morals.

Agent provocateurs are widely used by the Cult Deep State to manipulate genuine people into acting in ways that suit the desired outcome. By genuine in this case I mean protestors genuinely supporting Trump and claims that the election was stolen. In among them, however, were agents of the state wearing the garb of Trump supporters and QAnon to pump-prime the Capital riot which some genuine Trump supporters naively fell for. I described the situation as 'Come into my parlour said the spider to the fly'. Leaflets appeared through the Woke paramilitary arm Antifa, the anti-fascist fascists, calling on supporters to turn up in Washington looking like Trump supporters even though they hated him. Some of those arrested for breaching the Capitol Building were sourced to Antifa and its stable mate Black Lives Matter. Both organisations are funded by Cult billionaires and corporations. One man charged for the riot was according to his lawyer a former FBI agent who had held top secret security clearance for 40 years. Attorney Thomas Plofchan said of his client, 66-year-old Thomas Edward Caldwell:

He has held a Top Secret Security Clearance since 1979 and has undergone multiple Special Background Investigations in support of his clearances. After retiring from the Navy, he

worked as a section chief for the Federal Bureau of Investigation from 2009-2010 as a GS-12 [mid-level employee].

He also formed and operated a consulting firm performing work, often classified, for U.S government customers including the US. Drug Enforcement Agency, Department of Housing and Urban Development, the US Coast Guard, and the US Army Personnel Command.

A judge later released Caldwell pending trial in the absence of evidence about a conspiracy or that he tried to force his way into the building. *The New York Post* reported a 'law enforcement source' as saying that 'at least two known Antifa members were spotted' on camera among Trump supporters during the riot while one of the rioters arrested was John Earle Sullivan, a seriously extreme Black Lives Matter Trump-hater from Utah who was previously arrested and charged in July, 2020, over a BLM-Antifa riot in which drivers were threatened and one was shot. Sullivan is the founder of Utah-based Insurgence USA which is an affiliate of the Cult-created-and-funded Black Lives Matter movement. Footage appeared and was then deleted by Twitter of Trump supporters calling out Antifa infiltrators and a group was filmed changing into pro-Trump clothing before the riot. Security at the building was *pathetic* – as planned. Colonel Leroy Fletcher Prouty, a man with long experience in covert operations working with the US security apparatus, once described the tell-tale sign to identify who is involved in an assassination. He said:

No one has to direct an assassination – it happens. The active role is played secretly by permitting it to happen. This is the greatest single clue. Who has the power to call off or reduce the usual security precautions?

This principle applies to many other situations and certainly to the Capitol riot of January 6th, 2021.

The sting

With such a big and potentially angry crowd known to be gathering near the Capitol the security apparatus would have had a major police detail to defend the building with National Guard troops on

standby given the strength of feeling among people arriving from all over America encouraged by the QAnon Psyop and statements by Donald Trump. Instead Capitol Police 'security' was flimsy, weak, and easily breached. The same number of officers was deployed as on a regular day and that is a blatant red flag. They were not staffed or equipped for a possible riot that had been an obvious possibility in the circumstances. No protective and effective fencing worth the name was put in place and there were no contingency plans. The whole thing was basically a case of standing aside and waving people in. Once inside police mostly backed off apart from one Capitol police officer who ridiculously shot dead unarmed Air Force veteran protestor Ashli Babbitt without a warning as she climbed through a broken window. The 'investigation' refused to name or charge the officer after what must surely be considered a murder in the circumstances. They just lifted a carpet and swept. The story was endlessly repeated about five people dying in the 'armed insurrection' when there was no report of rioters using weapons. Apart from Babbitt the other four died from a heart attack, strokes and apparently a drug overdose. Capitol police officer Brian Sicknick was reported to have died after being bludgeoned with a fire extinguisher when he was alive after the riot was over and died later of what the Washington Medical Examiner's Office said was a stroke. Sicknick had no external injuries. The lies were delivered like rapid fire. There was a narrative to build with incessant repetition of the lie until the lie became the accepted 'everybody knows that' truth. The 'Big Lie' technique of Nazi Propaganda Minister Joseph Goebbels is constantly used by the Cult which was behind the Nazis and is today behind the 'Covid' and 'climate change' hoaxes. Goebbels said:

If you tell a lie big enough and keep repeating it, people will eventually come to believe it. The lie can be maintained only for such time as the State can shield the people from the political, economic and/or military consequences of the lie. It thus becomes vitally important for the State to use all of its powers to repress dissent, for the truth is the mortal enemy of the lie, and thus by extension, the truth is the greatest enemy of the State.

Most protestors had a free run of the Capitol Building. This allowed pictures to be taken of rioters in iconic parts of the building including the Senate chamber which could be used as propaganda images against all Pushbackers. One Congresswoman described the scene as 'the worst kind of non-security anybody could ever imagine'. Well, the first part was true, but someone obviously did imagine it and made sure it happened. Some photographs most widely circulated featured people wearing QAnon symbols and now the Psyop would be used to dub all QAnon followers with the ubiquitous fit-all label of 'white supremacist' and 'insurrectionists'. When a Muslim extremist called Noah Green drove his car at two police officers at the Capitol Building killing one in April, 2021, there was no such political and media hysteria. They were just disappointed he wasn't white.

The witch-hunt

Government prosecutor Michael Sherwin, an aggressive, dark-eyed, professional Rottweiler led the 'investigation' and to call it over the top would be to understate reality a thousand fold. Hundreds were tracked down and arrested for the crime of having the wrong political views and people were jailed who had done nothing more than walk in the building, committed no violence or damage to property, took a few pictures and left. They were labelled a 'threat to the Republic' while Biden sat in the White House signing executive orders written for him that were dismantling 'the Republic'. Even when judges ruled that a mother and son should not be in jail the government kept them there. Some of those arrested have been badly beaten by prison guards in Washington and lawyers for one man said he suffered a fractured skull and was made blind in one eye. Meanwhile a woman is shot dead for no reason by a Capitol Police officer and we are not allowed to know who he is never mind what has happened to him although that will be *nothing*. The Cult's QAnon/Trump sting to identify and isolate Pushbackers and then target them on the road to crushing and deleting them was a resounding success. You would have thought the Russians had

invaded the building at gunpoint and lined up senators for a firing squad to see the political and media reaction. Congresswoman Alexandria Ocasio-Cortez is a child in a woman's body, a terrible-twos, me, me, me, Woker narcissist of such proportions that words have no meaning. She said she thought she was going to die when 'insurrectionists' banged on her office door. It turned out she wasn't even in the Capitol Building when the riot was happening and the 'banging' was a Capitol Police officer. She referred to herself as a 'survivor' which is an insult to all those true survivors of violent and sexual abuse while she lives her pampered and privileged life talking drivel for a living. Her Woke colleague and fellow mega-narcissist Rashida Tlaib broke down describing the devastating effect on her, too, of *not being* in the building when the rioters were there. Ocasio-Cortez and Tlaib are members of a fully-Woke group of Congresswomen known as 'The Squad' along with Ilhan Omar and Ayanna Pressley. The Squad from what I can see can be identified by its vehement anti-white racism, anti-white men agenda, and, as always in these cases, the absence of brain cells on active duty.

The usual suspects were on the riot case immediately in the form of Democrat ultra-Zionist senators and operatives Chuck Schumer and Adam Schiff demanding that Trump be impeached for 'his part in the insurrection'. The same pair of prats had led the failed impeachment of Trump over the invented 'Russia collusion' nonsense which claimed Russia had helped Trump win the 2016 election. I didn't realise that Tel Aviv had been relocated just outside Moscow. I must find an up-to-date map. The Russia hoax was a Sabbatian operation to keep Trump occupied and impotent and to stop any rapport with Russia which the Cult wants to retain as a perceptual enemy to be pulled out at will. Puppet Biden began attacking Russia when he came to office as the Cult seeks more upheaval, division and war across the world. A two-year stage show 'Russia collusion inquiry' headed by the not-very-bright former 9/11 FBI chief Robert Mueller, with support from 19 lawyers, 40 FBI agents plus intelligence analysts, forensic accountants and other

staff, devoured tens of millions of dollars and found no evidence of Russia collusion which a ten-year-old could have told them on day one. Now the same moronic Schumer and Schiff wanted a second impeachment of Trump over the Capitol 'insurrection' (riot) which the arrested development of Schumer called another 'Pearl Harbor' while others compared it with 9/11 in which 3,000 died and, in the case of CNN, with the Rwandan genocide in the 1990s in which an estimated 500,000 to 600,000 were murdered, between 250, 000 and 500,000 women were raped, and populations of whole towns were hacked to death with machetes. To make those comparisons purely for Cult political reasons is beyond insulting to those that suffered and lost their lives and confirms yet again the callous inhumanity that we are dealing with. Schumer is a monumental idiot and so is Schiff, but they serve the Cult agenda and do whatever they're told so they get looked after. Talking of idiots – another inane man who spanned the Russia and Capitol impeachment attempts was Senator Eric Swalwell who had the nerve to accuse Trump of collusion with the Russians while sleeping with a Chinese spy called Christine Fang or 'Fang Fang' which is straight out of a Bond film no doubt starring Klaus Schwab as the bloke living on a secret island and controlling laser weapons positioned in space and pointing at world capitals. Fang Fang plays the part of Bond's infiltrator girlfriend which I'm sure she would enjoy rather more than sharing a bed with the brainless Swalwell, lying back and thinking of China. The FBI eventually warned Swalwell about Fang Fang which gave her time to escape back to the Chinese dictatorship. How very thoughtful of them. The second Trump impeachment also failed and hardly surprising when an impeachment is supposed to remove a sitting president and by the time it happened Trump was no longer president. These people are running your country America, well, officially anyway. Terrifying isn't it?

Outcomes tell the story - always

The outcome of all this – and it's the *outcome* on which Renegade Minds focus, not the words – was that a vicious, hysterical and

obviously pre-planned assault was launched on Pushbackers to censor, silence and discredit them and even targeted their right to earn a living. They have since been condemned as 'domestic terrorists' that need to be treated like Al-Qaeda and Islamic State. 'Domestic terrorists' is a label the Cult has been trying to make stick since the period of the Oklahoma bombing in 1995 which was blamed on 'far-right domestic terrorists'. If you read *The Trigger* you will see that the bombing was clearly a Problem-Reaction-Solution carried out by the Deep State during a Bill Clinton administration so corrupt that no dictionary definition of the term would even nearly suffice. Nearly 30, 000 troops were deployed from all over America to the empty streets of Washington for Biden's inauguration. Ten thousand of them stayed on with the pretext of protecting the capital from insurrectionists when it was more psychological programming to normalise the use of the military in domestic law enforcement in support of the Cult plan for a police-military state. Biden's fascist administration began a purge of 'wrong-thinkers' in the military which means anyone that is not on board with Woke. The Capitol Building was surrounded by a fence with razor wire and the Land of the Free was further symbolically and literally dismantled. The circle was completed with the installation of Biden and the exploitation of the QAnon Psyop.

America had never been so divided since the civil war of the 19th century, Pushbackers were isolated and dubbed terrorists and now, as was always going to happen, the Cult immediately set about deleting what little was left of freedom and transforming American society through a swish of the hand of the most controlled 'president' in American history leading (officially at least) the most extreme regime since the country was declared an independent state on July 4th, 1776. Biden issued undebated, dictatorial executive orders almost by the hour in his opening days in office across the whole spectrum of the Cult wish-list including diluting controls on the border with Mexico allowing thousands of migrants to illegally enter the United States to transform the demographics of America and import an election-changing number of perceived Democrat

voters. Then there were Biden deportation amnesties for the already illegally resident (estimated to be as high as 20 or even 30 million). A bill before Congress awarded American citizenship to anyone who could prove they had worked in agriculture for just 180 days in the previous two years as 'Big Ag' secured its slave labour long-term. There were the plans to add new states to the union such as Puerto Rico and making Washington DC a state. They are all parts of a plan to ensure that the Cult-owned Woke Democrats would be permanently in power.

Border – what border?

I have exposed in detail in other books how mass immigration into the United States and Europe is the work of Cult networks fuelled by the tens of billions spent to this and other ends by George Soros and his global Open Society (open borders) Foundations. The impact can be seen in America alone where the population has increased by *100 million* in little more than 30 years mostly through immigration. I wrote in *The Answer* that the plan was to have so many people crossing the southern border that the numbers become unstoppable and we are now there under Cult-owned Biden. El Salvador in Central America puts the scale of what is happening into context. A third of the population now lives in the United States, much of it illegally, and many more are on the way. The methodology is to crush Central and South American countries economically and spread violence through machete-wielding psychopathic gangs like MS-13 based in El Salvador and now operating in many American cities. Biden-imposed lax security at the southern border means that it is all but open. He said before his 'election' that he wanted to see a surge towards the border if he became president and that was the green light for people to do just that after election day to create the human disaster that followed for both America and the migrants. When that surge came the imbecilic Alexandria Ocasio-Cortez said it wasn't a 'surge' because they are 'children, not insurgents' and the term 'surge' (used by Biden) was a claim of 'white supremacists'.

This disingenuous lady may one day enter the realm of the most basic intelligence, but it won't be any time soon.

Sabbatians and the Cult are in the process of destroying America by importing violent people and gangs in among the genuine to terrorise American cities and by overwhelming services that cannot cope with the sheer volume of new arrivals. Something similar is happening in Europe as Western society in general is targeted for demographic and cultural transformation and upheaval. The plan demands violence and crime to create an environment of intimidation, fear and division and Soros has been funding the election of district attorneys across America who then stop prosecuting many crimes, reduce sentences for violent crimes and free as many violent criminals as they can. Sabbatians are creating the chaos from which order – their order – can respond in a classic Problem-Reaction-Solution. A Freemasonic moto says 'Ordo Ab Chao' (Order out of Chaos) and this is why the Cult is constantly creating chaos to impose a new 'order'. Here you have the reason the Cult is constantly creating chaos. The 'Covid' hoax can be seen with those entering the United States by plane being forced to take a 'Covid' test while migrants flooding through southern border processing facilities do not. Nothing is put in the way of mass migration and if that means ignoring the government's own 'Covid' rules then so be it. They know it's all bullshit anyway. Any pushback on this is denounced as 'racist' by Wokers and Sabbatian fronts like the ultra-Zionist Anti-Defamation League headed by the appalling Jonathan Greenblatt which at the same time argues that Israel should not give citizenship and voting rights to more Palestinian Arabs or the 'Jewish population' (in truth the Sabbatian network) will lose control of the country.

Society-changing numbers

Biden's masters have declared that countries like El Salvador are so dangerous that their people must be allowed into the United States for humanitarian reasons when there are fewer murders in large parts of many Central American countries than in US cities like

Baltimore. That is not to say Central America cannot be a dangerous place and Cult-controlled American governments have been making it so since way back, along with the dismantling of economies, in a long-term plan to drive people north into the United States. Parts of Central America are very dangerous, but in other areas the story is being greatly exaggerated to justify relaxing immigration criteria. Migrants are being offered free healthcare and education in the United States as another incentive to head for the border and there is no requirement to be financially independent before you can enter to prevent the resources of America being drained. You can't blame migrants for seeking what they believe will be a better life, but they are being played by the Cult for dark and nefarious ends. The numbers since Biden took office are huge. In February, 2021, more than 100,000 people were known to have tried to enter the US illegally through the southern border (it was 34,000 in the same month in 2020) and in March it was 170,000 – a 418 percent increase on March, 2020. These numbers are only known people, not the ones who get in unseen. The true figure for migrants illegally crossing the border in a single month was estimated by one congressman at 250,000 and that number will only rise under Biden's current policy. Gangs of murdering drug-running thugs that control the Mexican side of the border demand money – thousands of dollars – to let migrants cross the Rio Grande into America. At the same time gun battles are breaking out on the border several times a week between rival Mexican drug gangs (which now operate globally) who are equipped with sophisticated military-grade weapons, grenades and armoured vehicles. While the Capitol Building was being 'protected' from a non-existent 'threat' by thousands of troops, and others were still deployed at the time in the Cult Neocon war in Afghanistan, the southern border of America was left to its fate. This is not incompetence, it is cold calculation.

By March, 2021, there were 17,000 unaccompanied children held at border facilities and many of them are ensnared by people traffickers for paedophile rings and raped on their journey north to America. This is not conjecture – this is fact. Many of those designated

children are in reality teenage boys or older. Meanwhile Wokers posture their self-purity for encouraging poor and tragic people to come to America and face this nightmare both on the journey and at the border with the disgusting figure of House Speaker Nancy Pelosi giving disingenuous speeches about caring for migrants. The woman's evil. Wokers condemned Trump for having children in cages at the border (so did Obama, *Shhhh*), but now they are sleeping on the floor without access to a shower with one border facility 729 percent over capacity. The Biden insanity even proposed flying migrants from the southern border to the northern border with Canada for 'processing'. The whole shambles is being overseen by ultra-Zionist Secretary of Homeland Security, the moronic liar Alejandro Mayorkas, who banned news cameras at border facilities to stop Americans seeing what was happening. Mayorkas said there was not a ban on news crews; it was just that they were not allowed to film. Alongside him at Homeland Security is another ultra-Zionist Cass Sunstein appointed by Biden to oversee new immigration laws. Sunstein despises conspiracy researchers to the point where he suggests they should be banned or *taxed* for having such views. The man is not bonkers or anything. He's perfectly well-adjusted, but adjusted to what is the question. Criticise what is happening and you are a 'white supremacist' when earlier non-white immigrants also oppose the numbers which effect their lives and opportunities. Black people in poor areas are particularly damaged by uncontrolled immigration and the increased competition for work opportunities with those who will work for less. They are also losing voting power as Hispanics become more dominant in former black areas. It's a downward spiral for them while the billionaires behind the policy drone on about how much they care about black people and 'racism'. None of this is about compassion for migrants or black people – that's just wind and air. Migrants are instead being mercilessly exploited to transform America while the countries they leave are losing their future and the same is true in Europe. Mass immigration may now be the work of Woke Democrats, but it can be traced back to the 1986 Immigration Reform and Control Act (it

wasn't) signed into law by Republican hero President Ronald Reagan which gave amnesty to millions living in the United States illegally and other incentives for people to head for the southern border. Here we have the one-party state at work again.

Save me syndrome

Almost every aspect of what I have been exposing as the Cult agenda was on display in even the first days of 'Biden' with silencing of Pushbackers at the forefront of everything. A Renegade Mind will view the Trump years and QAnon in a very different light to their supporters and advocates as the dots are connected. The QAnon/Trump Psyop has given the Cult all it was looking for. We may not know how much, or little, that Trump realised he was being used, but that's a side issue. This pincer movement produced the desired outcome of dividing America and having Pushbackers isolated. To turn this around we have to look at new routes to empowerment which do not include handing our power to other people and groups through what I will call the 'Save Me Syndrome' – 'I want someone else to do it so that I don't have to'. We have seen this at work throughout human history and the QAnon/Trump Psyop is only the latest incarnation alongside all the others. Religion is an obvious expression of this when people look to a 'god' or priest to save them or tell them how to be saved and then there are 'save me' politicians like Trump. Politics is a diversion and not a 'saviour'. It is a means to block positive change, not make it possible.

Save Me Syndrome always comes with the same repeating theme of handing your power to whom or what you believe will save you while your real 'saviour' stares back from the mirror every morning. Renegade Minds are constantly vigilant in this regard and always asking the question 'What can I do?' rather than 'What can someone else do for me?' Gandhi was right when he said: 'You must be the change you want to see in the world.' We are indeed the people we have been waiting for. We are presented with a constant raft of reasons to concede that power to others and forget where the real power is. Humanity has the numbers and the Cult does not. It has to

use diversion and division to target the unstoppable power that comes from unity. Religions, governments, politicians, corporations, media, QAnon, are all different manifestations of this power-diversion and dilution. Refusing to give your power to governments and instead handing it to Trump and QAnon is not to take a new direction, but merely to recycle the old one with new names on the posters. I will explore this phenomenon as we proceed and how to break the cycles and recycles that got us here through the mists of repeating perception and so repeating history.

For now we shall turn to the most potent example in the entire human story of the consequences that follow when you give your power away. I am talking, of course, of the 'Covid' hoax.

CHAPTER FOUR

'Covid': Calculated catastrophe

Facts are threatening to those invested in fraud
DaShanne Stokes

We can easily unravel the real reason for the 'Covid pandemic' hoax by employing the Renegade Mind methodology that I have outlined this far. We'll start by comparing the long-planned Cult outcome with the 'Covid pandemic' outcome. Know the outcome and you'll see the journey.

I have highlighted the plan for the Hunger Games Society which has been in my books for so many years with the very few controlling the very many through ongoing dependency. To create this dependency it is essential to destroy independent livelihoods, businesses and employment to make the population reliant on the state (the Cult) for even the basics of life through a guaranteed pittance income. While independence of income remained these Cult ambitions would be thwarted. With this knowledge it was easy to see where the 'pandemic' hoax was going once talk of 'lockdowns' began and the closing of all but perceived 'essential' businesses to 'save' us from an alleged 'deadly virus'. Cult corporations like Amazon and Walmart were naturally considered 'essential' while mom and pop shops and stores had their doors closed by fascist decree. As a result with every new lockdown and new regulation more small and medium, even large businesses not owned by the Cult, went to the wall while Cult giants and their frontmen and women grew financially fatter by the second. Mom and pop were

denied an income and the right to earn a living and the wealth of people like Jeff Bezos (Amazon), Mark Zuckerberg (Facebook) and Sergei Brin and Larry Page (Google/Alphabet) have reached record levels. The Cult was increasing its own power through further dramatic concentrations of wealth while the competition was being destroyed and brought into a state of dependency. Lockdowns have been instigated to secure that very end and were never anything to do with health. My brother Paul spent 45 years building up a bus repair business, but lockdowns meant buses were running at a fraction of normal levels for months on end. Similar stories can told in their hundreds of millions worldwide. Efforts of a lifetime coldly destroyed by Cult multi-billionaires and their lackeys in government and law enforcement who continued to earn their living from the taxation of the people while denying the right of the same people to earn theirs. How different it would have been if those making and enforcing these decisions had to face the same financial hardships of those they affected, but they never do.

Gates of Hell

Behind it all in the full knowledge of what he is doing and why is the psychopathic figure of Cult operative Bill Gates. His puppet Tedros at the World Health Organization declared 'Covid' a pandemic in March, 2020. The WHO had changed the definition of a 'pandemic' in 2009 just a month before declaring the 'swine flu pandemic' which would not have been so under the previous definition. The same applies to 'Covid'. The definition had included… 'an infection by an infectious agent, occurring simultaneously in different countries, with a significant mortality rate relative to the proportion of the population infected'. The new definition removed the need for 'significant mortality'. The 'pandemic' has been fraudulent even down to the definition, but Gates demanded economy-destroying lockdowns, school closures, social distancing, mandatory masks, a 'vaccination' for every man, woman and child on the planet and severe consequences and restrictions for those that refused. Who gave him this power? The

Cult did which he serves like a little boy in short trousers doing what his daddy tells him. He and his psychopathic missus even smiled when they said that much worse was to come (what they knew was planned to come). Gates responded in the matter-of-fact way of all psychopaths to a question about the effect on the world economy of what he was doing:

> Well, it won't go to zero but it will shrink. Global GDP is probably going to take the biggest hit ever [Gates was smiling as he said this] … in my lifetime this will be the greatest economic hit. But you don't have a choice. People act as if you have a choice. People don't feel like going to the stadium when they might get infected … People are deeply affected by seeing these stats, by knowing they could be part of the transmission chain, old people, their parents and grandparents, could be affected by this, and so you don't get to say ignore what is going on here.
>
> There will be the ability to open up, particularly in rich countries, if things are done well over the next few months, but for the world at large normalcy only returns when we have largely vaccinated the entire population.

The man has no compassion or empathy. How could he when he's a psychopath like all Cult players? My own view is that even beyond that he is very seriously mentally ill. Look in his eyes and you can see this along with his crazy flailing arms. You don't do what he has done to the world population since the start of 2020 unless you are mentally ill and at the most extreme end of psychopathic. You especially don't do it when to you know, as we shall see, that cases and deaths from 'Covid' are fakery and a product of monumental figure massaging. 'These stats' that Gates referred to are based on a 'test' that's not testing for the 'virus' as he has known all along. He made his fortune with big Cult support as an infamously ruthless software salesman and now buys global control of 'health' (death) policy without the population he affects having any say. It's a breathtaking outrage. Gates talked about people being deeply affected by fear of 'Covid' when that was because of *him* and his global network lying to them minute-by-minute supported by a lying media that he seriously influences and funds to the tune of hundreds of millions. He's handed big sums to media operations including the BBC, NBC, Al Jazeera, Univision, *PBS NewsHour*,

ProPublica, National Journal, The Guardian, The Financial Times, The Atlantic, Texas Tribune, USA Today publisher Gannett, *Washington Monthly, Le Monde,* Center for Investigative Reporting, Pulitzer Center on Crisis Reporting, National Press Foundation, International Center for Journalists, Solutions Journalism Network, the Poynter Institute for Media Studies, and many more. Gates is everywhere in the 'Covid' hoax and the man must go to prison – or a mental facility – for the rest of his life and his money distributed to those he has taken such enormous psychopathic pleasure in crushing.

The Muscle

The Hunger Games global structure demands a police-military state – a fusion of the two into one force – which viciously imposes the will of the Cult on the population and protects the Cult from public rebellion. In that regard, too, the 'Covid' hoax just keeps on giving. Often unlawful, ridiculous and contradictory 'Covid' rules and regulations have been policed across the world by moronic automatons and psychopaths made faceless by face-nappy masks and acting like the Nazi SS and fascist blackshirts and brownshirts of Hitler and Mussolini. The smallest departure from the rules decreed by the psychos in government and their clueless gofers were jumped upon by the face-nappy fascists. Brutality against public protestors soon became commonplace even on girls, women and old people as the brave men with the batons – the Face-Nappies as I call them – broke up peaceful protests and handed out fines like confetti to people who couldn't earn a living let alone pay hundreds of pounds for what was once an accepted human right. Robot Face-Nappies of Nottingham police in the English East Midlands fined one group £11,000 for attending a child's birthday party. For decades I charted the transformation of law enforcement as genuine, decent officers were replaced with psychopaths and the brain dead who would happily and brutally do whatever their masters told them. Now they were let loose on the public and I would emphasise the point that none of this just happened. The step-by-step change in the dynamic between police and public was orchestrated from the shadows by

those who knew where this was all going and the same with the perceptual reframing of those in all levels of authority and official administration through 'training courses' by organisations such as Common Purpose which was created in the late 1980s and given a massive boost in Blair era Britain until it became a global phenomenon. Supposed public 'servants' began to view the population as the enemy and the same was true of the police. This was the start of the explosion of behaviour manipulation organisations and networks preparing for the all-war on the human psyche unleashed with the dawn of 2020. I will go into more detail about this later in the book because it is a core part of what is happening.

Police desecrated beauty spots to deter people gathering and arrested women for walking in the countryside alone 'too far' from their homes. We had arrogant, clueless sergeants in the Isle of Wight police where I live posting on Facebook what they insisted the population must do or else. A schoolmaster sergeant called Radford looked young enough for me to ask if his mother knew he was out, but he was posting what he *expected* people to do while a Sergeant Wilkinson boasted about fining lads for meeting in a McDonald's car park where they went to get a lockdown takeaway. Wilkinson added that he had even cancelled their order. What a pair of prats these people are and yet they have increasingly become the norm among Jackboot Johnson's Yellowshirts once known as the British police. This was the theme all over the world with police savagery common during lockdown protests in the United States, the Netherlands, and the fascist state of Victoria in Australia under its tyrannical and again moronic premier Daniel Andrews. Amazing how tyrannical and moronic tend to work as a team and the same combination could be seen across America as arrogant, narcissistic Woke governors and mayors such as Gavin Newsom (California), Andrew Cuomo (New York), Gretchen Whitmer (Michigan), Lori Lightfoot (Chicago) and Eric Garcetti (Los Angeles) did their Nazi and Stalin impressions with the full support of the compliant brutality of their enforcers in uniform as they arrested small business owners defying

fascist shutdown orders and took them to jail in ankle shackles and handcuffs. This happened to bistro owner Marlena Pavlos-Hackney in Gretchen Whitmer's fascist state of Michigan when police arrived to enforce an order by a state-owned judge for 'putting the community at risk' at a time when other states like Texas were dropping restrictions and migrants were pouring across the southern border without any 'Covid' questions at all. I'm sure there are many officers appalled by what they are ordered to do, but not nearly enough of them. If they were truly appalled they would not do it. As the months passed every opportunity was taken to have the military involved to make their presence on the streets ever more familiar and 'normal' for the longer-term goal of police-military fusion.

Another crucial element to the Hunger Games enforcement network has been encouraging the public to report neighbours and others for 'breaking the lockdown rules'. The group faced with £11,000 in fines at the child's birthday party would have been dobbed-in by a neighbour with a brain the size of a pea. The technique was most famously employed by the Stasi secret police in communist East Germany who had public informants placed throughout the population. A police chief in the UK says his force doesn't need to carry out 'Covid' patrols when they are flooded with so many calls from the public reporting other people for visiting the beach. Dorset police chief James Vaughan said people were so enthusiastic about snitching on their fellow humans they were now operating as an auxiliary arm of the police: 'We are still getting around 400 reports a week from the public, so we will respond to reports …We won't need to be doing hotspot patrols because people are very quick to pick the phone up and tell us.' Vaughan didn't say that this is a pillar of all tyrannies of whatever complexion and the means to hugely extend the reach of enforcement while spreading distrust among the people and making them wary of doing anything that might get them reported. Those narcissistic Isle of Wight sergeants Radford and Wilkinson never fail to add a link to their Facebook posts where the public can inform on their fellow slaves.

Neither would be self-aware enough to realise they were imitating the Stasi which they might well never have heard of. Government psychologists that I will expose later laid out a policy to turn communities against each other in the same way.

A coincidence? Yep, and I can knit fog

I knew from the start of the alleged pandemic that this was a Cult operation. It presented limitless potential to rapidly advance the Cult agenda and exploit manipulated fear to demand that every man, woman and child on the planet was 'vaccinated' in a process never used on humans before which infuses self-replicating *synthetic* material into human cells. Remember the plan to transform the human body from a biological to a synthetic biological state. I'll deal with the 'vaccine' (that's not actually a vaccine) when I focus on the genetic agenda. Enough to say here that mass global 'vaccination' justified by this 'new virus' set alarms ringing after 30 years of tracking these people and their methods. The 'Covid' hoax officially beginning in China was also a big red flag for reasons I will be explaining. The agenda potential was so enormous that I could dismiss any idea that the 'virus' appeared naturally. Major happenings with major agenda implications never occur without Cult involvement in making them happen. My questions were twofold in early 2020 as the media began its campaign to induce global fear and hysteria: Was this alleged infectious agent released on purpose by the Cult or did it even exist at all? I then did what I always do in these situations. I sat, observed and waited to see where the evidence and information would take me. By March and early April synchronicity was strongly – and ever more so since then – pointing me in the direction of *there is no 'virus'*. I went public on that with derision even from swathes of the alternative media that voiced a scenario that the Chinese government released the 'virus' in league with Deep State elements in the United States from a top-level bio-lab in Wuhan where the 'virus' is said to have first appeared. I looked at that possibility, but I didn't buy it for several reasons. Deaths from the 'virus' did not in any way match what they

would have been with a 'deadly bioweapon' and it is much more effective if you sell the *illusion* of an infectious agent rather than having a real one unless you can control through injection who has it and who doesn't. Otherwise you lose control of events. A made-up 'virus' gives you a blank sheet of paper on which you can make it do whatever you like and have any symptoms or mutant 'variants' you choose to add while a real infectious agent would limit you to what it actually does. A phantom disease allows you to have endless ludicrous 'studies' on the 'Covid' dollar to widen the perceived impact by inventing ever more 'at risk' groups including one study which said those who walk slowly may be almost four times more likely to die from the 'virus'. People are in psychiatric wards for less.

A real 'deadly bioweapon' can take out people in the hierarchy that are not part of the Cult, but essential to its operation. Obviously they don't want that. Releasing a real disease means you immediately lose control of it. Releasing an illusory one means you don't. Again it's vital that people are extra careful when dealing with what they want to hear. A bioweapon unleashed from a Chinese laboratory in collusion with the American Deep State may fit a conspiracy narrative, but is it true? Would it not be far more effective to use the excuse of a 'virus' to justify the real bioweapon – the 'vaccine'? That way your disease agent does not have to be transmitted and arrives directly through a syringe. I saw a French virologist Luc Montagnier quoted in the alternative media as saying he had discovered that the alleged 'new' severe acute respiratory syndrome coronavirus , or SARS-CoV-2, was made artificially and included elements of the human immunodeficiency 'virus' (HIV) and a parasite that causes malaria. SARS-CoV-2 is alleged to trigger an alleged illness called Covid-19. I remembered Montagnier's name from my research years before into claims that an HIV 'retrovirus' causes AIDs – claims that were demolished by Berkeley virologist Peter Duesberg who showed that no one had ever proved that HIV causes acquired immunodeficiency syndrome or AIDS. Claims that become accepted as fact, publicly and medically, with no proof whatsoever are an ever-recurring story that profoundly applies to

'Covid'. Nevertheless, despite the lack of proof, Montagnier's team at the Pasteur Institute in Paris had a long dispute with American researcher Robert Gallo over which of them discovered and isolated the HIV 'virus' and with *no evidence* found it to cause AIDS. You will see later that there is also no evidence that any 'virus' causes any disease or that there is even such a thing as a 'virus' in the way it is said to exist. The claim to have 'isolated' the HIV 'virus' will be presented in its real context as we come to the shocking story – and it is a story – of SARS-CoV-2 and so will Montagnier's assertion that he identified the full SARS-CoV-2 genome.

Hoax in the making

We can pick up the 'Covid' story in 2010 and the publication by the Rockefeller Foundation of a document called 'Scenarios for the Future of Technology and International Development'. The inner circle of the Rockefeller family has been serving the Cult since John D. Rockefeller (1839-1937) made his fortune with Standard Oil. It is less well known that the same Rockefeller – the Bill Gates of his day – was responsible for establishing what is now referred to as 'Big Pharma', the global network of pharmaceutical companies that make outrageous profits dispensing scalpel and drug 'medicine' and are obsessed with pumping vaccines in ever-increasing number into as many human arms and backsides as possible. John D. Rockefeller was the driving force behind the creation of the 'education' system in the United States and elsewhere specifically designed to program the perceptions of generations thereafter. The Rockefeller family donated exceptionally valuable land in New York for the United Nations building and were central in establishing the World Health Organization in 1948 as an agency of the UN which was created from the start as a Trojan horse and stalking horse for world government. Now enter Bill Gates. His family and the Rockefellers have long been extremely close and I have seen genealogy which claims that if you go back far enough the two families fuse into the same bloodline. Gates has said that the Bill and Melinda Gates Foundation was inspired by the Rockefeller Foundation and why not

when both are serving the same Cult? Major tax-exempt foundations are overwhelmingly criminal enterprises in which Cult assets fund the Cult agenda in the guise of 'philanthropy' while avoiding tax in the process. Cult operatives can become mega-rich in their role of front men and women for the psychopaths at the inner core and they, too, have to be psychopaths to knowingly serve such evil. Part of the deal is that a big percentage of the wealth gleaned from representing the Cult has to be spent advancing the ambitions of the Cult and hence you have the Rockefeller Foundation, Bill and Melinda Gates Foundation (and *so* many more) and people like George Soros with his global Open Society Foundations spending their billions in pursuit of global Cult control. Gates is a global public face of the Cult with his interventions in world affairs including Big Tech influence; a central role in the 'Covid' and 'vaccine' scam; promotion of the climate change shakedown; manipulation of education; geoengineering of the skies; and his food-control agenda as the biggest owner of farmland in America, his GMO promotion and through other means. As one writer said: 'Gates monopolizes or wields disproportionate influence over the tech industry, global health and vaccines, agriculture and food policy (including biopiracy and fake food), weather modification and other climate technologies, surveillance, education and media.' The almost limitless wealth secured through Microsoft and other not-allowed-to-fail ventures (including vaccines) has been ploughed into a long, long list of Cult projects designed to enslave the entire human race. Gates and the Rockefellers have been working as one unit with the Rockefeller-established World Health Organization leading global 'Covid' policy controlled by Gates through his mouth-piece Tedros. Gates became the WHO's biggest funder when Trump announced that the American government would cease its donations, but Biden immediately said he would restore the money when he took office in January, 2021. The Gates Foundation (the Cult) owns through limitless funding the world health system and the major players across the globe in the 'Covid' hoax.

Okay, with that background we return to that Rockefeller Foundation document of 2010 headed 'Scenarios for the Future of Technology and International Development' and its 'imaginary' epidemic of a virulent and deadly influenza strain which infected 20 percent of the global population and killed eight million in seven months. The Rockefeller scenario was that the epidemic destroyed economies, closed shops, offices and other businesses and led to governments imposing fierce rules and restrictions that included mandatory wearing of face masks and body-temperature checks to enter communal spaces like railway stations and supermarkets. The document predicted that even after the height of the Rockefeller-envisaged epidemic the authoritarian rule would continue to deal with further pandemics, transnational terrorism, environmental crises and rising poverty. Now you may think that the Rockefellers are our modern-day seers or alternatively, and rather more likely, that they well knew what was planned a few years further on. Fascism had to be imposed, you see, to 'protect citizens from risk and exposure'. The Rockefeller scenario document said:

During the pandemic, national leaders around the world flexed their authority and imposed airtight rules and restrictions, from the mandatory wearing of face masks to body-temperature checks at the entries to communal spaces like train stations and supermarkets. Even after the pandemic faded, this more authoritarian control and oversight of citizens and their activities stuck and even intensified. In order to protect themselves from the spread of increasingly global problems – from pandemics and transnational terrorism to environmental crises and rising poverty – leaders around the world took a firmer grip on power.

At first, the notion of a more controlled world gained wide acceptance and approval. Citizens willingly gave up some of their sovereignty – and their privacy – to more paternalistic states in exchange for greater safety and stability. Citizens were more tolerant, and even eager, for top-down direction and oversight, and national leaders had more latitude to impose order in the ways they saw fit.

In developed countries, this heightened oversight took many forms: biometric IDs for all citizens, for example, and tighter regulation of key industries whose stability was deemed vital to national interests. In many developed countries, enforced cooperation with a suite of new regulations and agreements slowly but steadily restored both order and, importantly, economic growth.

There we have the prophetic Rockefellers in 2010 and three years later came their paper for the Global Health Summit in Beijing, China, when government representatives, the private sector, international organisations and groups met to discuss the next 100 years of 'global health'. The Rockefeller Foundation-funded paper was called 'Dreaming the Future of Health for the Next 100 Years and more prophecy ensued as it described a dystopian future: 'The abundance of data, digitally tracking and linking people may mean the 'death of privacy' and may replace physical interaction with transient, virtual connection, generating isolation and raising questions of how values are shaped in virtual networks.' Next in the 'Covid' hoax preparation sequence came a 'table top' simulation in 2018 for another 'imaginary' pandemic of a disease called Clade X which was said to kill 900 million people. The exercise was organised by the Gates-funded Johns Hopkins University's Center for Health Security in the United States and this is the very same university that has been compiling the disgustingly and systematically erroneous global figures for 'Covid' cases and deaths. Similar Johns Hopkins health crisis scenarios have included the Dark Winter exercise in 2001 and Atlantic Storm in 2005.

Nostradamus 201

For sheer predictive genius look no further prophecy-watchers than the Bill Gates-funded Event 201 held only six weeks before the 'coronavirus pandemic' is supposed to have broken out in China and Event 201 was based on a scenario of a global 'coronavirus pandemic'. Melinda Gates, the great man's missus, told the BBC that he had 'prepared for years' for a coronavirus pandemic which told us what we already knew. Nostradamugates had predicted in a TED talk in 2015 that a pandemic was coming that would kill a lot of people and demolish the world economy. My god, the man is a machine – possibly even literally. Now here he was only weeks before the real thing funding just such a simulated scenario and involving his friends and associates at Johns Hopkins, the World Economic Forum Cult-front of Klaus Schwab, the United Nations,

Johnson & Johnson, major banks, and officials from China and the Centers for Disease Control in the United States. What synchronicity – Johns Hopkins would go on to compile the fraudulent 'Covid' figures, the World Economic Forum and Schwab would push the 'Great Reset' in response to 'Covid', the Centers for Disease Control would be at the forefront of 'Covid' policy in the United States, Johnson & Johnson would produce a 'Covid vaccine', and everything would officially start just weeks later in China. Spooky, eh? They were even accurate in creating a simulation of a 'virus' pandemic because the 'real thing' would also be a simulation. Event 201 was not an exercise preparing for something that might happen; it was a rehearsal for what those in control knew was *going* to happen and very shortly. Hours of this simulation were posted on the Internet and the various themes and responses mirrored what would soon be imposed to transform human society. News stories were inserted and what they said would be commonplace a few weeks later with still more prophecy perfection. Much discussion focused on the need to deal with misinformation and the 'anti-vax movement' which is exactly what happened when the 'virus' arrived – was said to have arrived – in the West.

Cult-owned social media banned criticism and exposure of the official 'virus' narrative and when I said there *was* no 'virus' in early April, 2020, I was banned by one platform after another including YouTube, Facebook and later Twitter. The mainstream broadcast media in Britain was in effect banned from interviewing me by the Tony-Blair-created government broadcasting censor Ofcom headed by career government bureaucrat Melanie Dawes who was appointed just as the 'virus' hoax was about to play out in January, 2020. At the same time the Ickonic media platform was using Vimeo, another ultra-Zionist-owned operation, while our own player was being created and they deleted in an instant hundreds of videos, documentaries, series and shows to confirm their unbelievable vindictiveness. We had copies, of course, and they had to be restored one by one when our player was ready. These people have no class. Sabbatian Facebook promised free advertisements for the Gates-

controlled World Health Organization narrative while deleting 'false claims and conspiracy theories' to stop 'misinformation' about the alleged coronavirus. All these responses could be seen just a short while earlier in the scenarios of Event 201. Extreme censorship was absolutely crucial for the Cult because the official story was so ridiculous and unsupportable by the evidence that it could never survive open debate and the free-flow of information and opinion. If you can't win a debate then don't have one is the Cult's approach throughout history. Facebook's little boy front man – front boy – Mark Zuckerberg equated 'credible and accurate information' with official sources and exposing their lies with 'misinformation'.

Silencing those that can see

The censorship dynamic of Event 201 is now the norm with an army of narrative-supporting 'fact-checker' organisations whose entire reason for being is to tell the public that official narratives are true and those exposing them are lying. One of the most appalling of these 'fact-checkers' is called NewsGuard founded by ultra-Zionist Americans Gordon Crovitz and Steven Brill. Crovitz is a former publisher of *The Wall Street Journal*, former Executive Vice President of Dow Jones, a member of the Council on Foreign Relations (CFR), and on the board of the American Association of Rhodes Scholars. The CFR and Rhodes Scholarships, named after Rothschild agent Cecil Rhodes who plundered the gold and diamonds of South Africa for his masters and the Cult, have featured widely in my books. NewsGuard don't seem to like me for some reason – I really can't think why – and they have done all they can to have me censored and discredited which is, to quote an old British politician, like being savaged by a dead sheep. They are, however, like all in the censorship network, very well connected and funded by organisations themselves funded by, or connected to, Bill Gates. As you would expect with anything associated with Gates NewsGuard has an offshoot called HealthGuard which 'fights online health care hoaxes'. How very kind. Somehow the NewsGuard European Managing Director Anna-Sophie Harling, a remarkably young-

looking woman with no broadcasting experience and little hands-on work in journalism, has somehow secured a position on the 'Content Board' of UK government broadcast censor Ofcom. An executive of an organisation seeking to discredit dissidents of the official narratives is making decisions for the government broadcast 'regulator' about content?? Another appalling 'fact-checker' is Full Fact funded by George Soros and global censors Google and Facebook.

It's amazing how many activists in the 'fact-checking', 'anti-hate', arena turn up in government-related positions – people like UK Labour Party activist Imran Ahmed who heads the Center for Countering Digital Hate founded by people like Morgan McSweeney, now chief of staff to the Labour Party's hapless and useless 'leader' Keir Starmer. Digital Hate – which is what it really is – uses the American spelling of Center to betray its connection to a transatlantic network of similar organisations which in 2020 shapeshifted from attacking people for 'hate' to attacking them for questioning the 'Covid' hoax and the dangers of the 'Covid vaccine'. It's just a coincidence, you understand. This is one of Imran Ahmed's hysterical statements: 'I would go beyond calling anti-vaxxers conspiracy theorists to say they are an extremist group that pose a national security risk.' No one could ever accuse this prat of understatement and he's including in that those parents who are now against vaccines after their children were damaged for life or killed by them. He's such a nice man. Ahmed does the rounds of the Woke media getting soft-ball questions from spineless 'journalists' who never ask what right he has to campaign to destroy the freedom of speech of others while he demands it for himself. There also seems to be an overrepresentation in Ofcom of people connected to the narrative-worshipping BBC. This incredible global network of narrative-support was super-vital when the 'Covid' hoax was played in the light of the mega-whopper lies that have to be defended from the spotlight cast by the most basic intelligence.

Setting the scene

The Cult plays the long game and proceeds step-by-step ensuring that everything is in place before major cards are played and they don't come any bigger than the 'Covid' hoax. The psychopaths can't handle events where the outcome isn't certain and as little as possible – preferably nothing – is left to chance. Politicians, government and medical officials who would follow direction were brought to illusory power in advance by the Cult web whether on the national stage or others like state governors and mayors of America. For decades the dynamic between officialdom, law enforcement and the public was changed from one of service to one of control and dictatorship. Behaviour manipulation networks established within government were waiting to impose the coming 'Covid' rules and regulations specifically designed to subdue and rewire the psyche of the people in the guise of protecting health. These included in the UK the Behavioural Insights Team part-owned by the British government Cabinet Office; the Scientific Pandemic Insights Group on Behaviours (SPI-B); and a whole web of intelligence and military groups seeking to direct the conversation on social media and control the narrative. Among them are the cyberwarfare (on the people) 77th Brigade of the British military which is also coordinated through the Cabinet Office as civilian and military leadership continues to combine in what they call the Fusion Doctrine. The 77th Brigade is a British equivalent of the infamous Israeli (Sabbatian) military cyberwarfare and Internet manipulation operation Unit 8200 which I expose at length in *The Trigger*. Also carefully in place were the medical and science advisers to government – many on the payroll past or present of Bill Gates – and a whole alternative structure of unelected government stood by to take control when elected parliaments were effectively closed down once the 'Covid' card was slammed on the table. The structure I have described here and so much more was installed in every major country through the Cult networks. The top-down control hierarchy looks like this: The Cult – Cult-owned Gates – the World Health Organization and Tedros – Gates-funded or controlled chief medical officers and science 'advisers' (dictators) in each country –

political 'leaders'– law enforcement – The People. Through this simple global communication and enforcement structure the policy of the Cult could be imposed on virtually the entire human population so long as they acquiesced to the fascism. With everything in place it was time for the button to be pressed in late 2019/early 2020.

These were the prime goals the Cult had to secure for its will to prevail:

1) Locking down economies, closing all but designated 'essential' businesses (Cult-owned corporations were 'essential'), and putting the population under house arrest was an imperative to destroy independent income and employment and ensure dependency on the Cult-controlled state in the Hunger Games Society. Lockdowns had to be established as the global blueprint from the start to respond to the 'virus' and followed by pretty much the entire world.

2) The global population had to be terrified into believing in a deadly 'virus' that didn't actually exist so they would unquestioningly obey authority in the belief that authority must know how best to protect them and their families. Software salesman Gates would suddenly morph into the world's health expert and be promoted as such by the Cult-owned media.

3) A method of testing that wasn't testing for the 'virus', but was only claimed to be, had to be in place to provide the illusion of 'cases' and subsequent 'deaths' that had a very different cause to the 'Covid-19' that would be scribbled on the death certificate.

4) Because there was no 'virus' and the great majority testing positive with a test not testing for the 'virus' would have no symptoms of anything the lie had to be sold that people without symptoms (without the 'virus') could still pass it on to others. This was crucial to justify for the first time quarantining – house arresting – healthy people. Without this the economy-destroying lockdown of *everybody* could not have been credibly sold.

5) The 'saviour' had to be seen as a vaccine which beyond evil drug companies were working like angels of mercy to develop as quickly as possible, with all corners cut, to save the day. The public must absolutely not know that the 'vaccine' had nothing to do with a 'virus' or that the contents were ready and waiting with a very different motive long before the 'Covid' card was even lifted from the pack.

I said in March, 2020, that the 'vaccine' would have been created way ahead of the 'Covid' hoax which justified its use and the following December an article in the New York *Intelligencer* magazine said the Moderna 'vaccine' had been 'designed' by

January, 2020. This was 'before China had even acknowledged that the disease could be transmitted from human to human, more than a week before the first confirmed coronavirus case in the United States'. The article said that by the time the first American death was announced a month later 'the vaccine had already been manufactured and shipped to the National Institutes of Health for the beginning of its Phase I clinical trial'. The 'vaccine' was actually 'designed' long before that although even with this timescale you would expect the article to ask how on earth it could have been done that quickly. Instead it asked why the 'vaccine' had not been rolled out then and not months later. Journalism in the mainstream is truly dead. I am going to detail in the next chapter why the 'virus' has never existed and how a hoax on that scale was possible, but first the foundation on which the Big Lie of 'Covid' was built.

The test that doesn't test

Fraudulent 'testing' is the bottom line of the whole 'Covid' hoax and was the means by which a 'virus' that did not exist *appeared* to exist. They could only achieve this magic trick by using a test not testing for the 'virus'. To use a test that *was* testing for the 'virus' would mean that every test would come back negative given there was no 'virus'. They chose to exploit something called the RT-PCR test invented by American biochemist Kary Mullis in the 1980s who said publicly that his PCR test … *cannot detect infectious disease*. Yes, the 'test' used worldwide to detect infectious 'Covid' to produce all the illusory 'cases' and 'deaths' compiled by Johns Hopkins and others *cannot detect infectious disease*. This fact came from the mouth of the man who invented PCR and was awarded the Nobel Prize in Chemistry in 1993 for doing so. Sadly, and incredibly conveniently for the Cult, Mullis died in August, 2019, at the age of 74 just before his test would be fraudulently used to unleash fascism on the world. He was said to have died from pneumonia which was an irony in itself. A few months later he would have had 'Covid-19' on his death certificate. I say the timing of his death was convenient because had he lived Mullis, a brilliant, honest and decent man, would have been

vociferously speaking out against the use of his test to detect 'Covid' when it was never designed, or able, to do that. I know that to be true given that Mullis made the same point when his test was used to 'detect' – not detect – HIV. He had been seriously critical of the Gallo/Montagnier claim to have isolated the HIV 'virus' and shown it to cause AIDS for which Mullis said there was no evidence. AIDS is actually not a disease but a series of diseases from which people die all the time. When they die from those *same diseases* after a positive 'test' for HIV then AIDS goes on their death certificate. I think I've heard that before somewhere. Countries instigated a policy with 'Covid' that anyone who tested positive with a test not testing for the 'virus' and died of any other cause within 28 days and even longer 'Covid-19' had to go on the death certificate. Cases have come from the test that can't test for infectious disease and the deaths are those who have died of *anything* after testing positive with a test not testing for the 'virus'. I'll have much more later about the death certificate scandal.

Mullis was deeply dismissive of the now US 'Covid' star Anthony Fauci who he said was a liar who didn't know anything about anything – 'and I would say that to his face – nothing.' He said of Fauci: 'The man thinks he can take a blood sample, put it in an electron microscope and if it's got a virus in there you'll know it – he doesn't understand electron microscopy and he doesn't understand medicine and shouldn't be in a position like he's in.' That position, terrifyingly, has made him the decider of 'Covid' fascism policy on behalf of the Cult in his role as director since 1984 of the National Institute of Allergy and Infectious Diseases (NIAID) while his record of being wrong is laughable; but being wrong, so long as it's the *right kind* of wrong, is why the Cult loves him. He'll say anything the Cult tells him to say. Fauci was made Chief Medical Adviser to the President immediately Biden took office. Biden was installed in the White House by Cult manipulation and one of his first decisions was to elevate Fauci to a position of even more control. This is a coincidence? Yes, and I identify as a flamenco dancer called Lola. How does such an incompetent criminal like Fauci remain in that

pivotal position in American health since *the 1980s*? When you serve the Cult it looks after you until you are surplus to requirements. Kary Mullis said prophetically of Fauci and his like: 'Those guys have an agenda and it's not an agenda we would like them to have … they make their own rules, they change them when they want to, and Tony Fauci does not mind going on television in front of the people who pay his salary and lie directly into the camera.' Fauci has done that almost daily since the 'Covid' hoax began. Lying is in Fauci's DNA. To make the situation crystal clear about the PCR test this is a direct quote from its inventor Kary Mullis:

> It [the PCR test] doesn't tell you that you're sick and doesn't tell you that the thing you ended up with was really going to hurt you ...'

Ask yourself why governments and medical systems the world over have been using this very test to decide who is 'infected' with the SARS-CoV-2 'virus' and the alleged disease it allegedly causes, 'Covid-19'. The answer to that question will tell you what has been going on. By the way, here's a little show-stopper – the 'new' SARS-CoV-2 'virus' was 'identified' as such right from the start using … *the PCR test not testing for the 'virus'*. If you are new to this and find that shocking then stick around. I have hardly started yet. Even worse, other 'tests', like the 'Lateral Flow Device' (LFD), are considered so useless that they have to be *confirmed* by the PCR test! Leaked emails written by Ben Dyson, adviser to UK 'Health' Secretary Matt Hancock, said they were 'dangerously unreliable'. Dyson, executive director of strategy at the Department of Health, wrote: 'As of today, someone who gets a positive LFD result in (say) London has at best a 25 per cent chance of it being a true positive, but if it is a self-reported test potentially as low as 10 per cent (on an optimistic assumption about specificity) or as low as 2 per cent (on a more pessimistic assumption).' These are the 'tests' that schoolchildren and the public are being urged to have twice a week or more and have to isolate if they get a positive. Each fake positive goes in the statistics as a 'case' no matter how ludicrously inaccurate and the

'cases' drive lockdown, masks and the pressure to 'vaccinate'. The government said in response to the email leak that the 'tests' were accurate which confirmed yet again what shocking bloody liars they are. The real false positive rate is *100 percent* as we'll see. In another 'you couldn't make it up' the UK government agreed to pay £2.8 billion to California's Innova Medical Group to supply the irrelevant lateral flow tests. The company's primary test-making centre is in China. Innova Medical Group, established in March, 2020, is owned by Pasaca Capital Inc, chaired by Chinese-American millionaire Charles Huang who was born in Wuhan.

How it works – and how it doesn't

The RT-PCR test, known by its full title of Polymerase chain reaction, is used across the world to make millions, even billions, of copies of a DNA/RNA genetic information sample. The process is called 'amplification' and means that a tiny sample of genetic material is amplified to bring out the detailed content. I stress that it is not testing for an infectious disease. It is simply amplifying a sample of genetic material. In the words of Kary Mullis: 'PCR is … just a process that's used to make a whole lot of something out of something.' To emphasise the point companies that make the PCR tests circulated around the world to 'test' for 'Covid' warn on the box that it can't be used to detect 'Covid' or infectious disease and is for research purposes only. It's okay, rest for a minute and you'll be fine. This is the test that produces the 'cases' and 'deaths' that have been used to destroy human society. All those global and national medical and scientific 'experts' demanding this destruction to 'save us' *KNOW* that the test is not testing for the 'virus' and the cases and deaths they claim to be real are an almost unimaginable fraud. Every one of them and so many others including politicians and psychopaths like Gates and Tedros must be brought before Nuremburg-type trials and jailed for the rest of their lives. The more the genetic sample is amplified by PCR the more elements of that material become sensitive to the test and by that I don't mean sensitive for a 'virus' but for elements of the genetic material which

is *naturally* in the body or relates to remnants of old conditions of various kinds lying dormant and causing no disease. Once the amplification of the PCR reaches a certain level *everyone* will test positive. So much of the material has been made sensitive to the test that everyone will have some part of it in their body. Even lying criminals like Fauci have said that once PCR amplifications pass 35 cycles everything will be a false positive that cannot be trusted for the reasons I have described. I say, like many proper doctors and scientists, that 100 percent of the 'positives' are false, but let's just go with Fauci for a moment.

He says that any amplification over 35 cycles will produce false positives and yet the US Centers for Disease Control (CDC) and Food and Drug Administration (FDA) have recommended up to *40 cycles* and the National Health Service (NHS) in Britain admitted in an internal document for staff that it was using *45 cycles* of amplification. A long list of other countries has been doing the same and at least one 'testing' laboratory has been using *50 cycles*. Have you ever heard a doctor, medical 'expert' or the media ask what level of amplification has been used to claim a 'positive'. The 'test' comes back 'positive' and so you have the 'virus', end of story. Now we can see how the government in Tanzania could send off samples from a goat and a pawpaw fruit under human names and both came back positive for 'Covid-19'. Tanzania president John Magufuli mocked the 'Covid' hysteria, the PCR test and masks and refused to import the DNA-manipulating 'vaccine'. The Cult hated him and an article sponsored by the Bill Gates Foundation appeared in the London *Guardian* in February, 2021, headed 'It's time for Africa to rein in Tanzania's anti-vaxxer president'. Well, 'reined in' he shortly was. Magufuli appeared in good health, but then, in March, 2021, he was dead at 61 from 'heart failure'. He was replaced by Samia Hassan Suhulu who is connected to Klaus Schwab's World Economic Forum and she immediately reversed Magufuli's 'Covid' policy. A sample of cola tested positive for 'Covid' with the PCR test in Germany while American actress and singer-songwriter Erykah Badu tested positive in one nostril and negative in the other. Footballer Ronaldo called

the PCR test 'bullshit' after testing positive three times and being forced to quarantine and miss matches when there was nothing wrong with him. The mantra from Tedros at the World Health Organization and national governments (same thing) has been test, test, test. They know that the more tests they can generate the more fake 'cases' they have which go on to become 'deaths' in ways I am coming to. The UK government has its Operation Moonshot planned to test multiple millions every day in workplaces and schools with free tests for everyone to use twice a week at home in line with the Cult plan from the start to make testing part of life. A government advertisement for an 'Interim Head of Asymptomatic Testing Communication' said the job included responsibility for delivering a 'communications strategy' (propaganda) 'to support the expansion of asymptomatic testing that *'normalises testing as part of everyday life*'. More tests means more fake 'cases', 'deaths' and fascism. I have heard of, and from, many people who booked a test, couldn't turn up, and yet got a positive result through the post for a test they'd never even had. The whole thing is crazy, but for the Cult there's method in the madness. Controlling and manipulating the level of amplification of the test means the authorities can control whenever they want the number of apparent 'cases' and 'deaths'. If they want to justify more fascist lockdown and destruction of livelihoods they keep the amplification high. If they want to give the illusion that lockdowns and the 'vaccine' are working then they lower the amplification and 'cases' and 'deaths' will appear to fall. In January, 2021, the Cult-owned World Health Organization suddenly warned laboratories about over-amplification of the test and to lower the threshold. Suddenly headlines began appearing such as: 'Why ARE "Covid" cases plummeting?' This was just when the vaccine rollout was underway and I had predicted months before they would make cases appear to fall through amplification tampering when the 'vaccine' came. These people are so predictable.

Cow vaccines?

The question must be asked of what is on the test swabs being poked far up the nose of the population to the base of the brain? A nasal swab punctured one woman's brain and caused it to leak fluid. Most of these procedures are being done by people with little training or medical knowledge. Dr Lorraine Day, former orthopaedic trauma surgeon and Chief of Orthopaedic Surgery at San Francisco General Hospital, says the tests are really a *'vaccine'*. Cows have long been vaccinated this way. She points out that masks have to cover the nose and the mouth where it is claimed the 'virus' exists in saliva. Why then don't they take saliva from the mouth as they do with a DNA test instead of pushing a long swab up the nose towards the brain? The ethmoid bone separates the nasal cavity from the brain and within that bone is the cribriform plate. Dr Day says that when the swab is pushed up against this plate and twisted the procedure is 'depositing things back there'. She claims that among these 'things' are nanoparticles that can enter the brain. Researchers have noted that a team at the Gates-funded Johns Hopkins have designed tiny, star-shaped micro-devices that can latch onto intestinal mucosa and release drugs into the body. Mucosa is the thin skin that covers the inside surface of parts of the body such as *the nose* and mouth and produces mucus to protect them. The Johns Hopkins micro-devices are called 'theragrippers' and were 'inspired' by a parasitic worm that digs its sharp teeth into a host's intestines. Nasal swabs are also coated in the sterilisation agent ethylene oxide. The US National Cancer Institute posts this explanation on its website:

> At room temperature, ethylene oxide is a flammable colorless gas with a sweet odor. It is used primarily to produce other chemicals, including antifreeze. In smaller amounts, ethylene oxide is used as a pesticide and a sterilizing agent. The ability of ethylene oxide to damage DNA makes it an effective sterilizing agent but also accounts for its cancer-causing activity.

The Institute mentions lymphoma and leukaemia as cancers most frequently reported to be associated with occupational exposure to ethylene oxide along with stomach and breast cancers. How does anyone think this is going to work out with the constant testing

regime being inflicted on adults and children at home and at school that will accumulate in the body anything that's on the swab?

Doctors know best

It is vital for people to realise that 'hero' doctors 'know' only what the Big Pharma-dominated medical authorities tell them to 'know' and if they refuse to 'know' what they are told to 'know' they are out the door. They are mostly not physicians or healers, but repeaters of the official narrative – or else. I have seen alleged professional doctors on British television make shocking statements that we are supposed to take seriously. One called 'Dr' Amir Khan, who is actually telling patients how to respond to illness, said that men could take the birth pill to 'help slow down the effects of Covid-19'. In March, 2021, another ridiculous 'Covid study' by an American doctor proposed injecting men with the female sex hormone progesterone as a 'Covid' treatment. British doctor Nighat Arif told the BBC that face coverings were now going to be part of ongoing normal. Yes, the vaccine protects you, she said (evidence?) … but the way to deal with viruses in the community was always going to come down to hand washing, face covering and keeping a physical distance. That's not what we were told before the 'vaccine' was circulating. Arif said she couldn't imagine ever again going on the underground or in a lift without a mask. I was just thanking my good luck that she was not my doctor when she said – in March, 2021 – that if 'we are *behaving* and we are doing all the right things' she thought we could 'have our nearest and dearest around us at home … around *Christmas* and N*ew Year!* Her patronising delivery was the usual school teacher talking to six-year-olds as she repeated every government talking point and probably believed them all. If we have learned anything from the 'Covid' experience surely it must be that humanity's perception of doctors needs a fundamental rethink. NHS 'doctor' Sara Kayat told her television audience that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Not even Big Pharma claimed that. We have to stop taking 'experts' at their word without question when so many of them are

clueless and only repeating the party line on which their careers depend. That is not to say there are not brilliants doctors – there are and I have spoken to many of them since all this began – but you won't see them in the mainstream media or quoted by the psychopaths and yes-people in government.

Remember the name – Christian Drosten

German virologist Christian Drosten, Director of Charité Institute of Virology in Berlin, became a national star after the pandemic hoax began. He was feted on television and advised the German government on 'Covid' policy. Most importantly to the wider world Drosten led a group that produced the 'Covid' testing protocol for the PCR test. What a remarkable feat given the PCR cannot test for infectious disease and even more so when you think that Drosten said that his method of testing for SARS-CoV-2 was developed 'without having virus material available'. *He developed a test for a 'virus' that he didn't have and had never seen*. Let that sink in as you survey the global devastation that came from what he did. The whole catastrophe of Drosten's 'test' was based on the alleged genetic sequence published by Chinese scientists on the Internet. We will see in the next chapter that this alleged 'genetic sequence' has never been produced by China or anyone and cannot be when there *is no* SARS-CoV-2. Drosten, however, doesn't seem to let little details like that get in the way. He was the lead author with Victor Corman from the same Charité Hospital of the paper 'Detection of 2019 novel coronavirus (2019-nCoV) by real-time PCR' published in a magazine called *Eurosurveillance*. This became known as the Corman-Drosten paper. In November, 2020, with human society devastated by the effects of the Corman-Drosten test baloney, the protocol was publicly challenged by 22 international scientists and independent researchers from Europe, the United States, and Japan. Among them were senior molecular geneticists, biochemists, immunologists, and microbiologists. They produced a document headed 'External peer review of the RTPCR test to detect SARS-Cov-2 Reveals 10 Major Flaws At The Molecular and Methodological Level: Consequences

For False-Positive Results'. The flaws in the Corman-Drosten test included the following:

- The test is non-specific because of erroneous design
- Results are enormously variable
- The test is unable to discriminate between the whole 'virus' and viral fragments
- It doesn't have positive or negative controls
- The test lacks a standard operating procedure
- It is unsupported by proper peer view

The scientists said the PCR 'Covid' testing protocol was not founded on science and they demanded the Corman-Drosten paper be retracted by *Eurosurveillance*. They said all present and previous Covid deaths, cases, and 'infection rates' should be subject to a massive retroactive inquiry. Lockdowns and travel restrictions should be reviewed and relaxed and those diagnosed through PCR to have 'Covid-19' should not be forced to isolate. Dr Kevin Corbett, a health researcher and nurse educator with a long academic career producing a stream of peer-reviewed publications at many UK universities, made the same point about the PCR test debacle. He said of the scientists' conclusions: 'Every scientific rationale for the development of that test has been totally destroyed by this paper. It's like Hiroshima/Nagasaki to the Covid test.' He said that China hadn't given them an isolated 'virus' when Drosten developed the test. Instead they had developed the test from *a sequence in a gene bank*.' Put another way … *they made it up*! The scientists were supported in this contention by a Portuguese appeals court which ruled in November, 2020, that PCR tests are unreliable and it is unlawful to quarantine people based solely on a PCR test. The point about China not providing an isolated virus must be true when the 'virus' has never been isolated to this day and the consequences of that will become clear. Drosten and company produced this useless 'protocol' right on cue in January, 2020, just as the 'virus' was said to

be moving westward and it somehow managed to successfully pass a peer-review in 24 hours. In other words there was no peer-review for a test that would be used to decide who had 'Covid' and who didn't across the world. The Cult-created, Gates-controlled World Health Organization immediately recommended all its nearly 200 member countries to use the Drosten PCR protocol to detect 'cases' and 'deaths'. The sting was underway and it continues to this day.

So who is this Christian Drosten that produced the means through which death, destruction and economic catastrophe would be justified? His education background, including his doctoral thesis, would appear to be somewhat shrouded in mystery and his track record is dire as with another essential player in the 'Covid' hoax, the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College in London of whom more shortly. Drosten predicted in 2003 that the alleged original SARS 'virus' (SARS-1') was an epidemic that could have serious effects on economies and an effective vaccine would take at least two years to produce. Drosten's answer to every alleged 'outbreak' is a vaccine which you won't be shocked to know. What followed were just 774 official deaths worldwide and none in Germany where there were only nine cases. That is even if you believe there ever was a SARS 'virus' when the evidence is zilch and I will expand on this in the next chapter. Drosten claims to be co-discoverer of 'SARS-1' and developed a test for it in 2003. He was screaming warnings about 'swine flu' in 2009 and how it was a widespread infection far more severe than any dangers from a vaccine could be and people should get vaccinated. It would be helpful for Drosten's vocal chords if he simply recorded the words 'the virus is deadly and you need to get vaccinated' and copies could be handed out whenever the latest made-up threat comes along. Drosten's swine flu epidemic never happened, but Big Pharma didn't mind with governments spending hundreds of millions on vaccines that hardly anyone bothered to use and many who did wished they hadn't. A study in 2010 revealed that the risk of dying from swine flu, or H1N1, was no higher than that of the annual seasonal flu which is what at least most of 'it' really was as in

the case of 'Covid-19'. A media investigation into Drosten asked how with such a record of inaccuracy he could be *the* government adviser on these issues. The answer to that question is the same with Drosten, Ferguson and Fauci – they keep on giving the authorities the 'conclusions' and 'advice' they want to hear. Drosten certainly produced the goods for them in January, 2020, with his PCR protocol garbage and provided the foundation of what German internal medicine specialist Dr Claus Köhnlein, co-author of *Virus Mania*, called the 'test pandemic'. The 22 scientists in the *Eurosurveillance* challenge called out conflicts of interest within the Drosten 'protocol' group and with good reason. Olfert Landt, a regular co-author of Drosten 'studies', owns the biotech company TIB Molbiol Syntheselabor GmbH in Berlin which manufactures and sells the tests that Drosten and his mates come up with. They have done this with SARS, Enterotoxigenic E. coli (ETEC), MERS, Zika 'virus', yellow fever, and now 'Covid'. Landt told the *Berliner Zeitung* newspaper:

> The testing, design and development came from the Charité [Drosten and Corman]. We simply implemented it immediately in the form of a kit. And if we don't have the virus, which originally only existed in Wuhan, we can make a synthetic gene to simulate the genome of the virus. That's what we did very quickly.

This is more confirmation that the Drosten test was designed without access to the 'virus' and only a synthetic simulation which is what SARS-CoV-2 really is – a computer-generated synthetic fiction. It's quite an enterprise they have going here. A Drosten team decides what the test for something should be and Landt's biotech company flogs it to governments and medical systems across the world. His company must have made an absolute fortune since the 'Covid' hoax began. Dr Reiner Fuellmich, a prominent German consumer protection trial lawyer in Germany and California, is on Drosten's case and that of Tedros at the World Health Organization for crimes against humanity with a class-action lawsuit being prepared in the United States and other legal action in Germany.

Why China?

Scamming the world with a 'virus' that doesn't exist would seem impossible on the face of it, but not if you have control of the relatively few people that make policy decisions and the great majority of the global media. Remember it's not about changing 'real' reality it's about controlling *perception* of reality. You don't have to make something happen you only have make people *believe* that it's happening. Renegade Minds understand this and are therefore much harder to swindle. 'Covid-19' is not a 'real' 'virus'. It's a mind virus, like a computer virus, which has infected the minds, not the bodies, of billions. It all started, publically at least, in China and that alone is of central significance. The Cult was behind the revolution led by its asset Mao Zedong, or Chairman Mao, which established the People's Republic of China on October 1st, 1949. It should have been called The Cult's Republic of China, but the name had to reflect the recurring illusion that vicious dictatorships are run by and for the people (see all the 'Democratic Republics' controlled by tyrants). In the same way we have the 'Biden' Democratic Republic of America officially ruled by a puppet tyrant (at least temporarily) on behalf of Cult tyrants. The creation of Mao's merciless communist/fascist dictatorship was part of a frenzy of activity by the Cult at the conclusion of World War Two which, like the First World War, it had instigated through its assets in Germany, Britain, France, the United States and elsewhere. Israel was formed in 1948; the Soviet Union expanded its 'Iron Curtain' control, influence and military power with the Warsaw Pact communist alliance in 1955; the United Nations was formed in 1945 as a Cult precursor to world government; and a long list of world bodies would be established including the World Health Organization (1948), World Trade Organization (1948 under another name until 1995), International Monetary Fund (1945) and World Bank (1944). Human society was redrawn and hugely centralised in the global Problem-Reaction-Solution that was World War Two. All these changes were significant. Israel would become the headquarters of the Sabbatians

and the revolution in China would prepare the ground and control system for the events of 2019/2020.

Renegade Minds know there are no borders except for public consumption. The Cult is a seamless, borderless global entity and to understand the game we need to put aside labels like borders, nations, countries, communism, fascism and democracy. These delude the population into believing that countries are ruled within their borders by a government of whatever shade when these are mere agencies of a global power. America's illusion of democracy and China's communism/fascism are subsidiaries – vehicles – for the same agenda. We may hear about conflict and competition between America and China and on the lower levels that will be true; but at the Cult level they are branches of the same company in the way of the McDonald's example I gave earlier. I have tracked in the books over the years support by US governments of both parties for Chinese Communist Party infiltration of American society through allowing the sale of land, even military facilities, and the acquisition of American business and university influence. All this is underpinned by the infamous stealing of intellectual property and technological know-how. Cult-owned Silicon Valley corporations waive their fraudulent 'morality' to do business with human-rights-free China; Cult-controlled Disney has become China's PR department; and China in effect owns 'American' sports such as basketball which depends for much of its income on Chinese audiences. As a result any sports player, coach or official speaking out against China's horrific human rights record is immediately condemned or fired by the China-worshipping National Basketball Association. One of the first acts of China-controlled Biden was to issue an executive order telling federal agencies to stop making references to the 'virus' by the 'geographic location of its origin'. Long-time Congressman Jerry Nadler warned that criticising China, America's biggest rival, leads to hate crimes against Asian people in the United States. So shut up you bigot. China is fast closing in on Israel as a country that must not be criticised which is apt, really, given that Sabbatians control them both. The two countries have

developed close economic, military, technological and strategic ties which include involvement in China's 'Silk Road' transport and economic initiative to connect China with Europe. Israel was the first country in the Middle East to recognise the establishment of Mao's tyranny in 1950 months after it was established.

Project Wuhan – the 'Covid' Psyop

I emphasise again that the Cult plays the long game and what is happening to the world today is the result of centuries of calculated manipulation following a script to take control step-by-step of every aspect of human society. I will discuss later the common force behind all this that has spanned those centuries and thousands of years if the truth be told. Instigating the Mao revolution in China in 1949 with a 2020 'pandemic' in mind is not only how they work – the 71 years between them is really quite short by the Cult's standards of manipulation preparation. The reason for the Cult's Chinese revolution was to create a fiercely-controlled environment within which an extreme structure for human control could be incubated to eventually be unleashed across the world. We have seen this happen since the 'pandemic' emerged from China with the Chinese control-structure founded on AI technology and tyrannical enforcement sweep across the West. Until the moment when the Cult went for broke in the West and put its fascism on public display Western governments had to pay some lip-service to freedom and democracy to not alert too many people to the tyranny-in-the-making. Freedoms were more subtly eroded and power centralised with covert government structures put in place waiting for the arrival of 2020 when that smokescreen of 'freedom' could be dispensed with. The West was not able to move towards tyranny before 2020 anything like as fast as China which was created as a tyranny and had no limits on how fast it could construct the Cult's blueprint for global control. When the time came to impose that structure on the world it was the same Cult-owned Chinese communist/fascist government that provided the excuse – the 'Covid pandemic'. It was absolutely crucial to the Cult plan for the Chinese response to the 'pandemic' –

draconian lockdowns of the entire population – to become the blueprint that Western countries would follow to destroy the livelihoods and freedom of their people. This is why the Cult-owned, Gates-owned, WHO Director-General Tedros said early on:

The Chinese government is to be congratulated for the extraordinary measures it has taken to contain the outbreak. China is actually setting a new standard for outbreak response and it is not an exaggeration.

Forbes magazine said of China: '… those measures protected untold millions from getting the disease'. The Rockefeller Foundation 'epidemic scenario' document in 2010 said 'prophetically':

However, a few countries did fare better – China in particular. The Chinese government's quick imposition and enforcement of mandatory quarantine for all citizens, as well as its instant and near-hermetic sealing off of all borders, saved millions of lives, stopping the spread of the virus far earlier than in other countries and enabling a swifter post-pandemic recovery.

Once again – *spooky*.

The first official story was the 'bat theory' or rather the bat diversion. The source of the 'virus outbreak' we were told was a ''wet market' in Wuhan where bats and other animals are bought and eaten in horrifically unhygienic conditions. Then another story emerged through the alternative media that the 'virus' had been released on purpose or by accident from a BSL-4 (biosafety level 4) laboratory in Wuhan not far from the wet market. The lab was reported to create and work with lethal concoctions and bioweapons. Biosafety level 4 is the highest in the World Health Organization system of safety and containment. Renegade Minds are aware of what I call designer manipulation. The ideal for the Cult is for people to buy its prime narrative which in the opening salvoes of the 'pandemic' was the wet market story. It knows, however, that there is now a considerable worldwide alternative media of researchers sceptical of anything governments say and they are often given a version of events in a form they can perceive as credible while misdirecting them from the real truth. In this case let them

think that the conspiracy involved is a 'bioweapon virus' released from the Wuhan lab to keep them from the real conspiracy – *there is no 'virus'*. The WHO's current position on the source of the outbreak at the time of writing appears to be: 'We haven't got a clue, mate.' This is a good position to maintain mystery and bewilderment. The inner circle will know where the 'virus' came from – *nowhere*. The bottom line was to ensure the public believed there *was* a 'virus' and it didn't much matter if they thought it was natural or had been released from a lab. The belief that there was a 'deadly virus' was all that was needed to trigger global panic and fear. The population was terrified into handing their power to authority and doing what they were told. They had to or they were 'all gonna die'.

In March, 2020, information began to come my way from real doctors and scientists and my own additional research which had my intuition screaming: 'Yes, that's it! *There is no virus*.' The 'bioweapon' was not the 'virus'; it was the *'vaccine'* already being talked about that would be the bioweapon. My conclusion was further enhanced by happenings in Wuhan. The 'virus' was said to be sweeping the city and news footage circulated of people collapsing in the street (which they've never done in the West with the same 'virus'). The Chinese government was building 'new hospitals' in a matter of ten days to 'cope with demand' such was the virulent nature of the 'virus'. Yet in what seemed like no time the 'new hospitals' closed – even if they even opened – and China declared itself 'virus-free'. It was back to business as usual. This was more propaganda to promote the Chinese draconian lockdowns in the West as the way to 'beat the virus'. Trouble was that we subsequently had lockdown after lockdown, but never business as usual. As the people of the West and most of the rest of the world were caught in an ever-worsening spiral of lockdown, social distancing, masks, isolated old people, families forced apart, and livelihood destruction, it was party-time in Wuhan. Pictures emerged of thousands of people enjoying pool parties and concerts. It made no sense until you realised there never was a 'virus' and the

whole thing was a Cult set-up to transform human society out of one its major global strongholds – China.

How is it possible to deceive virtually the entire world population into believing there is a deadly virus when there is not even a 'virus' let alone a deadly one? It's nothing like as difficult as you would think and that's clearly true because it happened.

Postscript: See end of book Postscript for more on the 'Wuhan lab virus release' story which the authorities and media were pushing heavily in the summer of 2021 to divert attention from the truth that the 'Covid virus' is pure invention.

CHAPTER FIVE

There *is no* 'virus'

You can fool some of the people all of the time, and all of the people some of the time, but you cannot fool all of the people all of the time
Abraham Lincoln

The greatest form of mind control is repetition. The more you repeat the same mantra of alleged 'facts' the more will accept them to be true. It becomes an 'everyone knows that, mate'. If you can also censor any other version or alternative to your alleged 'facts' you are pretty much home and cooking.

By the start of 2020 the Cult owned the global mainstream media almost in its entirety to spew out its 'Covid' propaganda and ignore or discredit any other information and view. Cult-owned social media platforms in Cult-owned Silicon Valley were poised and ready to unleash a campaign of ferocious censorship to obliterate all but the official narrative. To complete the circle many demands for censorship by Silicon Valley were led by the mainstream media as 'journalists' became full-out enforcers for the Cult both as propagandists and censors. Part of this has been the influx of young people straight out of university who have become 'journalists' in significant positions. They have no experience and a headful of programmed perceptions from their years at school and university at a time when today's young are the most perceptually-targeted generations in known human history given the insidious impact of technology. They enter the media perceptually prepared and ready to repeat the narratives of the system that programmed them to

repeat its narratives. The BBC has a truly pathetic 'specialist disinformation reporter' called Marianna Spring who fits this bill perfectly. She is clueless about the world, how it works and what is really going on. Her role is to discredit anyone doing the job that a proper journalist would do and system-serving hacks like Spring wouldn't dare to do or even see the need to do. They are too busy licking the arse of authority which can never be wrong and, in the case of the BBC propaganda programme, *Panorama*, contacting payments systems such as PayPal to have a donations page taken down for a film company making documentaries questioning vaccines. Even the BBC soap opera *EastEnders* included a disgracefully biased scene in which an inarticulate white working class woman was made to look foolish for questioning the 'vaccine' while a well-spoken black man and Asian woman promoted the government narrative. It ticked every BBC box and the fact that the black and minority community was resisting the 'vaccine' had nothing to do with the way the scene was written. The BBC has become a disgusting tyrannical propaganda and censorship operation that should be defunded and disbanded and a free media take its place with a brief to stop censorship instead of demanding it. A BBC 'interview' with Gates goes something like: 'Mr Gates, sir, if I can call you sir, would you like to tell our audience why you are such a great man, a wonderful humanitarian philanthropist, and why you should absolutely be allowed as a software salesman to decide health policy for approaching eight billion people? Thank you, sir, please sir.' Propaganda programming has been incessant and merciless and when all you hear is the same story from the media, repeated by those around you who have only heard the same story, is it any wonder that people on a grand scale believe absolute mendacious garbage to be true? You are about to see, too, why this level of information control is necessary when the official 'Covid' narrative is so nonsensical and unsupportable by the evidence.

Structure of Deceit

The pyramid structure through which the 'Covid' hoax has been manifested is very simple and has to be to work. As few people as possible have to be involved with full knowledge of what they are doing – and why – or the real story would get out. At the top of the pyramid are the inner core of the Cult which controls Bill Gates who, in turn, controls the World Health Organization through his pivotal funding and his puppet Director-General mouthpiece, Tedros. Before he was appointed Tedros was chair of the Gates-founded Global Fund to 'fight against AIDS, tuberculosis and malaria', a board member of the Gates-funded 'vaccine alliance' GAVI, and on the board of another Gates-funded organisation. Gates owns him and picked him for a specific reason – Tedros is a crook and worse. 'Dr' Tedros (he's not a medical doctor, the first WHO chief not to be) was a member of the tyrannical Marxist government of Ethiopia for decades with all its human rights abuses. He has faced allegations of corruption and misappropriation of funds and was exposed three times for covering up cholera epidemics while Ethiopia's health minister. Tedros appointed the mass-murdering genocidal Zimbabwe dictator Robert Mugabe as a WHO goodwill ambassador for public health which, as with Tedros, is like appointing a psychopath to run a peace and love campaign. The move was so ridiculous that he had to drop Mugabe in the face of widespread condemnation. American economist David Steinman, a Nobel peace prize nominee, lodged a complaint with the International Criminal Court in The Hague over alleged genocide by Tedros when he was Ethiopia's foreign minister. Steinman says Tedros was a 'crucial decision maker' who directed the actions of Ethiopia's security forces from 2013 to 2015 and one of three officials in charge when those security services embarked on the 'killing' and 'torturing' of Ethiopians. You can see where Tedros is coming from and it's sobering to think that he has been the vehicle for Gates and the Cult to direct the global response to 'Covid'. Think about that. A psychopathic Cult dictates to psychopath Gates who dictates to psychopath Tedros who dictates how countries of the world must respond to a 'Covid virus' never scientifically shown to exist. At the same time psychopathic Cult-owned Silicon Valley information

giants like Google, YouTube, Facebook and Twitter announced very early on that they would give the Cult/Gates/Tedros/WHO version of the narrative free advertising and censor those who challenged their intelligence-insulting, mendacious story.

The next layer in the global 'medical' structure below the Cult, Gates and Tedros are the chief medical officers and science 'advisers' in each of the WHO member countries which means virtually all of them. Medical officers and arbiters of science (they're not) then take the WHO policy and recommended responses and impose them on their country's population while the political 'leaders' say they are deciding policy (they're clearly not) by 'following the science' on the advice of the 'experts' – the same medical officers and science 'advisers' (dictators). In this way with the rarest of exceptions the entire world followed the same policy of lockdown, people distancing, masks and 'vaccines' dictated by the psychopathic Cult, psychopathic Gates and psychopathic Tedros who we are supposed to believe give a damn about the health of the world population they are seeking to enslave. That, amazingly, is all there is to it in terms of crucial decision-making. Medical staff in each country then follow like sheep the dictates of the shepherds at the top of the national medical hierarchies – chief medical officers and science 'advisers' who themselves follow like sheep the shepherds of the World Health Organization and the Cult. Shepherds at the national level often have major funding and other connections to Gates and his Bill and Melinda Gates Foundation which carefully hands out money like confetti at a wedding to control the entire global medical system from the WHO down.

Follow the money

Christopher Whitty, Chief Medical Adviser to the UK Government at the centre of 'virus' policy, a senior adviser to the government's Scientific Advisory Group for Emergencies (SAGE), and Executive Board member of the World Health Organization, was gifted a grant of $40 million by the Bill and Melinda Gates Foundation for malaria research in Africa. The BBC described the unelected Whitty as 'the

official who will probably have the greatest impact on our everyday lives of any individual policymaker in modern times' and so it turned out. What Gates and Tedros have said Whitty has done like his equivalents around the world. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of Big Pharma giant GlaxoSmithKline with its fundamental financial and business connections to Bill Gates. In September, 2020, it was revealed that Vallance owned a deferred bonus of shares in GlaxoSmithKline worth £600,000 while the company was 'developing' a 'Covid vaccine'. Move along now – nothing to see here – what could possibly be wrong with that? Imperial College in London, a major player in 'Covid' policy in Britain and elsewhere with its 'Covid-19' Response Team, is funded by Gates and has big connections to China while the now infamous Professor Neil Ferguson, the useless 'computer modeller' at Imperial College is also funded by Gates. Ferguson delivered the dramatically inaccurate excuse for the first lockdowns (much more in the next chapter). The Institute for Health Metrics and Evaluation (IHME) in the United States, another source of outrageously false 'Covid' computer models to justify lockdowns, is bankrolled by Gates who is a vehement promotor of lockdowns. America's version of Whitty and Vallance, the again now infamous Anthony Fauci, has connections to 'Covid vaccine' maker Moderna as does Bill Gates through funding from the Bill and Melinda Gates Foundation. Fauci is director of the National Institute of Allergy and Infectious Diseases (NIAID), a major recipient of Gates money, and they are very close. Deborah Birx who was appointed White House Coronavirus Response Coordinator in February, 2020, is yet another with ties to Gates. Everywhere you look at the different elements around the world behind the coordination and decision making of the 'Covid' hoax there is Bill Gates and his money. They include the World Health Organization; Centers for Disease Control (CDC) in the United States; National Institutes of Health (NIH) of Anthony Fauci; Imperial College and Neil Ferguson; the London School of Hygiene where Chris Whitty worked; Regulatory agencies like the UK Medicines & Healthcare products Regulatory Agency (MHRA)

which gave emergency approval for 'Covid vaccines'; Wellcome Trust; GAVI, the Vaccine Alliance; the Coalition for Epidemic Preparedness Innovations (CEPI); Johns Hopkins University which has compiled the false 'Covid' figures; and the World Economic Forum. A Nationalfile.com article said:

> Gates has a lot of pull in the medical world, he has a multi-million dollar relationship with Dr. Fauci, and Fauci originally took the Gates line supporting vaccines and casting doubt on [the drug hydroxychloroquine]. Coronavirus response team member Dr. Deborah Birx, appointed by former president Obama to serve as United States Global AIDS Coordinator, also sits on the board of a group that has received billions from Gates' foundation, and Birx reportedly used a disputed Bill Gates-funded model for the White House's Coronavirus effort. Gates is a big proponent for a population lockdown scenario for the Coronavirus outbreak.

Another funder of Moderna is the Defense Advanced Research Projects Agency (DARPA), the technology-development arm of the Pentagon and one of the most sinister organisations on earth. DARPA had a major role with the CIA covert technology-funding operation In-Q-Tel in the development of Google and social media which is now at the centre of global censorship. Fauci and Gates are extremely close and openly admit to talking regularly about 'Covid' policy, but then why wouldn't Gates have a seat at every national 'Covid' table after his Foundation committed $1.75 billion to the 'fight against Covid-19'. When passed through our Orwellian Translation Unit this means that he has bought and paid for the Cult-driven 'Covid' response worldwide. Research the major 'Covid' response personnel in your own country and you will find the same Gates funding and other connections again and again. Medical and science chiefs following World Health Organization 'policy' sit atop a medical hierarchy in their country of administrators, doctors and nursing staff. These 'subordinates' are told they must work and behave in accordance with the policy delivered from the 'top' of the national 'health' pyramid which is largely the policy delivered by the WHO which is the policy delivered by Gates and the Cult. The whole 'Covid' narrative has been imposed on medical staff by a climate of fear although great numbers don't even need that to comply. They do so through breathtaking levels of ignorance and

include doctors who go through life simply repeating what Big Pharma and their hierarchical masters tell them to say and believe. No wonder Big Pharma 'medicine' is one of the biggest killers on Planet Earth.

The same top-down system of intimidation operates with regard to the Cult Big Pharma cartel which also dictates policy through national and global medical systems in this way. The Cult and Big Pharma agendas are the same because the former controls and owns the latter. 'Health' administrators, doctors, and nursing staff are told to support and parrot the dictated policy or they will face consequences which can include being fired. How sad it's been to see medical staff meekly repeating and imposing Cult policy without question and most of those who can see through the deceit are only willing to speak anonymously off the record. They know what will happen if their identity is known. This has left the courageous few to expose the lies about the 'virus', face masks, overwhelmed hospitals that aren't, and the dangers of the 'vaccine' that isn't a vaccine. When these medical professionals and scientists, some renowned in their field, have taken to the Internet to expose the truth their articles, comments and videos have been deleted by Cult-owned Facebook, Twitter and YouTube. What a real head-shaker to see YouTube videos with leading world scientists and highly qualified medical specialists with an added link underneath to the notorious Cult propaganda website *Wikipedia* to find the 'facts' about the same subject.

HIV – the 'Covid' trial-run

I'll give you an example of the consequences for health and truth that come from censorship and unquestioning belief in official narratives. The story was told by PCR inventor Kary Mullis in his book *Dancing Naked in the Mind Field*. He said that in 1984 he accepted as just another scientific fact that Luc Montagnier of France's Pasteur Institute and Robert Gallo of America's National Institutes of Health had independently discovered that a 'retrovirus' dubbed HIV (human immunodeficiency virus) caused AIDS. They

were, after all, Mullis writes, specialists in retroviruses. This is how the medical and science pyramids work. Something is announced or *assumed* and then becomes an everybody-knows-that purely through repetition of the assumption as if it is fact. Complete crap becomes accepted truth with no supporting evidence and only repetition of the crap. This is how a 'virus' that doesn't exist became the 'virus' that changed the world. The HIV-AIDS fairy story became a multi-billion pound industry and the media poured out propaganda terrifying the world about the deadly HIV 'virus' that caused the lethal AIDS. By then Mullis was working at a lab in Santa Monica, California, to detect retroviruses with his PCR test in blood donations received by the Red Cross. In doing so he asked a virologist where he could find a reference for HIV being the cause of AIDS. 'You don't need a reference,' the virologist said … *'Everybody knows it.'* Mullis said he wanted to quote a reference in the report he was doing and he said he felt a little funny about not knowing the source of such an important discovery when everyone else seemed to. The virologist suggested he cite a report by the Centers for Disease Control and Prevention (CDC) on morbidity and mortality. Mullis read the report, but it only said that an organism had been identified and did not say how. The report did not identify the original scientific work. Physicians, however, *assumed* (key recurring theme) that if the CDC was convinced that HIV caused AIDS then proof must exist. Mullis continues:

I did computer searches. Neither Montagnier, Gallo, nor anyone else had published papers describing experiments which led to the conclusion that HIV probably caused AIDS. I read the papers in Science for which they had become well known as AIDS doctors, but all they had said there was that they had found evidence of a past infection by something which was probably HIV in some AIDS patients.

They found antibodies. Antibodies to viruses had always been considered evidence of past disease, not present disease. Antibodies signaled that the virus had been defeated. The patient had saved himself. There was no indication in these papers that this virus caused a disease. They didn't show that everybody with the antibodies had the disease. In fact they found some healthy people with antibodies.

Mullis asked why their work had been published if Montagnier and Gallo hadn't really found this evidence, and why had they been fighting so hard to get credit for the discovery? He says he was hesitant to write 'HIV is the probable cause of AIDS' until he found published evidence to support that. 'Tens of thousands of scientists and researchers were spending billions of dollars a year doing research based on this idea,' Mullis writes. 'The reason had to be there somewhere; otherwise these people would not have allowed their research to settle into one narrow channel of investigation.' He said he lectured about PCR at numerous meetings where people were always talking about HIV and he asked them how they knew that HIV was the cause of AIDS:

> Everyone said something. Everyone had the answer at home, in the office, in some drawer. They all knew, and they would send me the papers as soon as they got back. But I never got any papers. Nobody ever sent me the news about how AIDS was caused by HIV.

Eventually Mullis was able to ask Montagnier himself about the reference proof when he lectured in San Diego at the grand opening of the University of California AIDS Research Center. Mullis says this was the last time he would ask his question without showing anger. Montagnier said he should reference the CDC report. 'I read it', Mullis said, and it didn't answer the question. 'If Montagnier didn't know the answer who the hell did?' Then one night Mullis was driving when an interview came on National Public Radio with Peter Duesberg, a prominent virologist at Berkeley and a California Scientist of the Year. Mullis says he finally understood why he could not find references that connected HIV to AIDS – *there weren't any!* No one had ever proved that HIV causes AIDS even though it had spawned a multi-billion pound global industry and the media was repeating this as fact every day in their articles and broadcasts terrifying the shit out of people about AIDS and giving the impression that a positive test for HIV (see 'Covid') was a death sentence. Duesberg was a threat to the AIDS gravy train and the agenda that underpinned it. He was therefore abused and castigated after he told the Proceedings of the National Academy of Sciences

there was no good evidence implicating the new 'virus'. Editors rejected his manuscripts and his research funds were deleted. Mullis points out that the CDC has defined AIDS as one of more than 30 diseases *if accompanied* by a positive result on a test that detects antibodies to HIV; but those same diseases are not defined as AIDS cases when antibodies are not detected:

> If an HIV-positive woman develops uterine cancer, for example, she is considered to have AIDS. If she is not HIV positive, she simply has uterine cancer. An HIV-positive man with tuberculosis has AIDS; if he tests negative he simply has tuberculosis. If he lives in Kenya or Colombia, where the test for HIV antibodies is too expensive, he is simply presumed to have the antibodies and therefore AIDS, and therefore he can be treated in the World Health Organization's clinic. It's the only medical help available in some places. And it's free, because the countries that support WHO are worried about AIDS.

Mullis accuses the CDC of continually adding new diseases (see ever more 'Covid symptoms') to the grand AIDS definition and of virtually doctoring the books to make it appear as if the disease continued to spread. He cites how in 1993 the CDC enormously broadened its AIDS definition and county health authorities were delighted because they received $2,500 per year from the Federal government for every reported AIDS case. Ladies and gentlemen, I have just described, via Kary Mullis, the 'Covid pandemic' of 2020 and beyond. Every element is the same and it's been pulled off in the same way by the same networks.

The 'Covid virus' exists? Okay – prove it. Er … still waiting

What Kary Mullis described with regard to 'HIV' has been repeated with 'Covid'. A claim is made that a new, or 'novel', infection has been found and the entire medical system of the world repeats that as fact exactly as they did with HIV and AIDS. No one in the mainstream asks rather relevant questions such as 'How do you know?' and 'Where is your proof?' The SARS-Cov-2 'virus' and the 'Covid-19 disease' became an overnight 'everybody-knows-that'. The origin could be debated and mulled over, but what you could not suggest was that 'SARS-Cov-2' didn't exist. That would be

ridiculous. 'Everybody knows' the 'virus' exists. Well, I didn't for one along with American proper doctors like Andrew Kaufman and Tom Cowan and long-time American proper journalist Jon Rappaport. We dared to pursue the obvious and simple question: 'Where's the evidence?' The overwhelming majority in medicine, journalism and the general public did not think to ask that. After all, *everyone knew* there was a new 'virus'. Everyone was saying so and I heard it on the BBC. Some would eventually argue that the 'deadly virus' was nothing like as deadly as claimed, but few would venture into the realms of its very existence. Had they done so they would have found that the evidence for that claim had gone AWOL as with HIV causes AIDS. In fact, not even that. For something to go AWOL it has to exist in the first place and scientific proof for a 'SARS-Cov-2' can be filed under nothing, nowhere and zilch.

Dr Andrew Kaufman is a board-certified forensic psychiatrist in New York State, a Doctor of Medicine and former Assistant Professor and Medical Director of Psychiatry at SUNY Upstate Medical University, and Medical Instructor of Hematology and Oncology at the Medical School of South Carolina. He also studied biology at the Massachusetts Institute of Technology (MIT) and trained in Psychiatry at Duke University. Kaufman is retired from allopathic medicine, but remains a consultant and educator on natural healing, I saw a video of his very early on in the 'Covid' hoax in which he questioned claims about the 'virus' in the absence of any supporting evidence and with plenty pointing the other way. I did everything I could to circulate his work which I felt was asking the pivotal questions that needed an answer. I can recommend an excellent pull-together interview he did with the website The Last Vagabond entitled *Dr Andrew Kaufman: Virus Isolation, Terrain Theory and Covid-19* and his website is andrewkaufmanmd.com. Kaufman is not only a forensic psychiatrist; he is forensic in all that he does. He always reads original scientific papers, experiments and studies instead of second-third-fourth-hand reports about the 'virus' in the media which are repeating the repeated repetition of the narrative. When he did so with the original Chinese 'virus' papers Kaufman

realised that there was no evidence of a 'SARS-Cov-2'. They had never – from the start – shown it to exist and every repeat of this claim worldwide was based on the accepted existence of proof that was nowhere to be found – see Kary Mullis and HIV. Here we go again.

Let's postulate

Kaufman discovered that the Chinese authorities immediately concluded that the cause of an illness that broke out among about 200 initial patients in Wuhan was a 'new virus' when there were no grounds to make that conclusion. The alleged 'virus' was not isolated from other genetic material in their samples and then shown through a system known as Koch's postulates to be the causative agent of the illness. The world was told that the SARS-Cov-2 'virus' caused a disease they called 'Covid-19' which had 'flu-like' symptoms and could lead to respiratory problems and pneumonia. If it wasn't so tragic it would almost be funny. *'Flu-like' symptoms'? Pneumonia? Respiratory disease?* What in *CHINA* and particularly in *Wuhan*, one of the most polluted cities in the world with a resulting epidemic of respiratory disease?? Three hundred thousand people get pneumonia in China every year and there are nearly a billion cases worldwide of 'flu-like symptoms'. These have a whole range of causes – including pollution in Wuhan – but no other possibility was credibly considered in late 2019 when the world was told there was a new and deadly 'virus'. The global prevalence of pneumonia and 'flu-like systems' gave the Cult networks unlimited potential to re-diagnose these other causes as the mythical 'Covid-19' and that is what they did from the very start. Kaufman revealed how Chinese medical and science authorities (all subordinates to the Cult-owned communist government) took genetic material from the lungs of only a few of the first patients. The material contained their own cells, bacteria, fungi and other microorganisms living in their bodies. The only way you could prove the existence of the 'virus' and its responsibility for the alleged 'Covid-19' was to isolate the virus from all the other material – a process also known as 'purification' – and

then follow the postulates sequence developed in the late 19th century by German physician and bacteriologist Robert Koch which became the 'gold standard' for connecting an alleged causation agent to a disease:

1. The microorganism (bacteria, fungus, virus, etc.) must be present in every case of the disease and all patients must have the same symptoms. It must also *not be present in healthy individuals*.

2. The microorganism must be isolated from the host with the disease. If the microorganism is a bacteria or fungus it must be grown in a pure culture. If it is a virus, it must be purified (i.e. containing no other material except the virus particles) from a clinical sample.

3. The specific disease, with all of its characteristics, must be reproduced when the infectious agent (the purified virus or a pure culture of bacteria or fungi) is inoculated into a healthy, susceptible host.

4. The microorganism must be recoverable from the experimentally infected host as in step 2.

Not one of these criteria has been met in the case of 'SARS-Cov-2' and 'Covid-19'. Not ONE. *EVER*. Robert Koch refers to bacteria and not viruses. What are called 'viral particles' are so minute (hence masks are useless by any definition) that they could only be seen after the invention of the electron microscope in the 1930s and can still only be observed through that means. American bacteriologist and virologist Thomas Milton Rivers, the so-called 'Father of Modern Virology' who was very significantly director of the Rockefeller Institute for Medical Research in the 1930s, developed a less stringent version of Koch's postulates to identify 'virus' causation known as 'Rivers criteria'. 'Covid' did not pass that process either. Some even doubt whether any 'virus' can be isolated from other particles containing genetic material in the Koch method. Freedom of Information requests in many countries asking for scientific proof that the 'Covid virus' has been purified and isolated and shown to exist have all come back with a 'we don't have that' and when this happened with a request to the UK Department of Health they added this comment:

However, outside of the scope of the [Freedom of Information Act] and on a discretionary basis, the following information has been advised to us, which may be of interest. Most infectious diseases are caused by viruses, bacteria or fungi. Some bacteria or fungi have the capacity to grow on their own in isolation, for example in colonies on a petri dish. Viruses are different in that they are what we call 'obligate pathogens' – that is, they cannot survive or reproduce without infecting a host ...

… For some diseases, it is possible to establish causation between a microorganism and a disease by isolating the pathogen from a patient, growing it in pure culture and reintroducing it to a healthy organism. These are known as 'Koch's postulates' and were developed in 1882. However, as our understanding of disease and different disease-causing agents has advanced, these are no longer the method for determining causation [Andrew Kaufman asks why in that case are there two published articles falsely claiming to satisfy Koch's postulates].

It has long been known that viral diseases cannot be identified in this way as viruses cannot be grown in 'pure culture'. When a patient is tested for a viral illness, this is normally done by looking for the presence of antigens, or viral genetic code in a host with molecular biology techniques [Kaufman asks how you could know the origin of these chemicals without having a pure culture for comparison].

For the record 'antigens' are defined so:

Invading microorganisms have antigens on their surface that the human body can recognise as being foreign – meaning not belonging to it. When the body recognises a foreign antigen, lymphocytes (white blood cells) produce antibodies, which are complementary in shape to the antigen.

Notwithstanding that this is open to question in relation to 'SARS-Cov-2' the presence of 'antibodies' can have many causes and they are found in people that are perfectly well. Kary Mullis said: 'Antibodies … had always been considered evidence of past disease, not present disease.'

'Covid' really is a *computer* 'virus'

Where the UK Department of Health statement says 'viruses' are now 'diagnosed' through a 'viral genetic code in a host with molecular biology techniques', they mean … *the PCR test* which its inventor said cannot test for infectious disease. They have no credible method of connecting a 'virus' to a disease and we will see that there is no scientific proof that any 'virus' causes any disease or there is any such thing as a 'virus' in the way that it is described. Tenacious Canadian researcher Christine Massey and her team made

some 40 Freedom of Information requests to national public health agencies in different countries asking for proof that SARS-CoV-2 has been isolated and not one of them could supply that information. Massey said of her request in Canada: 'Freedom of Information reveals Public Health Agency of Canada has no record of 'SARS-COV-2' isolation performed by anyone, anywhere, ever.' If you accept the comment from the UK Department of Health it's because they can't isolate a 'virus'. Even so many 'science' papers claimed to have isolated the 'Covid virus' until they were questioned and had to admit they hadn't. A reply from the Robert Koch Institute in Germany was typical: 'I am not aware of a paper which purified isolated SARS-CoV-2.' So what the hell was Christian Drosten and his gang using to design the 'Covid' testing protocol that has produced all the illusory Covid' cases and 'Covid' deaths when the head of the Chinese version of the CDC admitted there was a problem right from the start in that the 'virus' had never been isolated/purified? Breathe deeply: What they are calling 'Covid' is actually created by a *computer program* i.e. *they made it up* – er, that's it. They took lung fluid, with many sources of genetic material, from one single person alleged to be infected with Covid-19 by a PCR test which they *claimed*, without clear evidence, contained a 'virus'. They used several computer programs to create a model of a theoretical virus genome sequence from more than fifty-six million small sequences of RNA, each of an unknown source, assembling them like a puzzle with no known solution. The computer filled in the gaps with sequences from bits in the gene bank to make it look like a bat SARS-like coronavirus! A wave of the magic wand and poof, an in silico (computer-generated) genome, a scientific fantasy, was created. UK health researcher Dr Kevin Corbett made the same point with this analogy:

> … It's like giving you a few bones and saying that's your fish. It could be any fish. Not even a skeleton. Here's a few fragments of bones. That's your fish … It's all from gene bank and the bits of the virus sequence that weren't there they made up.
>
> They synthetically created them to fill in the blanks. That's what genetics is; it's a code. So it's ABBBCCDDD and you're missing some what you think is EEE so you put it in. It's all

synthetic. You just manufacture the bits that are missing. This is the end result of the geneticization of virology. This is basically a computer virus.

Further confirmation came in an email exchange between British citizen journalist Frances Leader and the government's Medicines & Healthcare Products Regulatory Agency (the Gates-funded MHRA) which gave emergency permission for untested 'Covid vaccines' to be used. The agency admitted that the 'vaccine' is not based on an isolated 'virus', but comes from a *computer-generated model*. Frances Leader was naturally banned from Cult-owned fascist Twitter for making this exchange public. The process of creating computer-generated alleged 'viruses' is called 'in silico' or 'in silicon' – computer chips – and the term 'in silico' is believed to originate with biological experiments using only a computer in 1989. 'Vaccines' involved with 'Covid' are also produced 'in silico' or by computer not a natural process. If the original 'virus' is nothing more than a made-up computer model how can there be 'new variants' of something that never existed in the first place? They are not new 'variants'; they are new *computer models* only minutely different to the original program and designed to further terrify the population into having the 'vaccine' and submitting to fascism. You want a 'new variant'? Click, click, enter – there you go. Tell the medical profession that you have discovered a 'South African variant', 'UK variants' or a 'Brazilian variant' and in the usual HIV-causes-AIDS manner they will unquestioningly repeat it with no evidence whatsoever to support these claims. They will go on television and warn about the dangers of 'new variants' while doing nothing more than repeating what they have been told to be true and knowing that any deviation from that would be career suicide. Big-time insiders will know it's a hoax, but much of the medical community is clueless about the way they are being played and themselves play the public without even being aware they are doing so. What an interesting 'coincidence' that AstraZeneca and Oxford University were conducting 'Covid vaccine trials' in the three countries – the UK, South Africa and Brazil – where the first three 'variants' were claimed to have 'broken out'.

Here's your 'virus' – it's a unicorn

Dr Andrew Kaufman presented a brilliant analysis describing how the 'virus' was imagined into fake existence when he dissected an article published by *Nature* and written by 19 authors detailing *alleged* 'sequencing of a complete viral genome' of the 'new SARS-CoV-2 virus'. This computer-modelled *in silico* genome was used as a template for all subsequent genome sequencing experiments that resulted in the so-called variants which he said now number more than *6,000*. The fake genome was constructed from more than 56 million individual short strands of RNA. Those little pieces were assembled into longer pieces by finding areas of overlapping sequences. The computer programs created over two million possible combinations from which the authors simply chose the longest one. They then compared this to a 'bat virus' and the computer 'alignment' rearranged the sequence and filled in the gaps! They called this computer-generated abomination the 'complete genome'. Dr Tom Cowan, a fellow medical author and collaborator with Kaufman, said such computer-generation constitutes scientific fraud and he makes this superb analogy:

> Here is an equivalency: A group of researchers claim to have found a unicorn because they found a piece of a hoof, a hair from a tail, and a snippet of a horn. They then add that information into a computer and program it to re-create the unicorn, and they then claim this computer re-creation is the real unicorn. Of course, they had never actually seen a unicorn so could not possibly have examined its genetic makeup to compare their samples with the actual unicorn's hair, hooves and horn.
>
> The researchers claim they decided which is the real genome of SARS-CoV-2 by 'consensus', sort of like a vote. Again, different computer programs will come up with different versions of the imaginary 'unicorn', so they come together as a group and decide which is the real imaginary unicorn.

This is how the 'virus' that has transformed the world was brought into fraudulent 'existence'. Extraordinary, yes, but as the Nazis said the bigger the lie the more will believe it. Cowan, however, wasn't finished and he went on to identify what he called the real blockbuster in the paper. He quotes this section from a paper written

by virologists and published by the CDC and then explains what it means:

Therefore, we examined the capacity of SARS-CoV-2 to infect and replicate in several common primate and human cell lines, including human adenocarcinoma cells (A549), human liver cells (HUH 7.0), and human embryonic kidney cells (HEK-293T). In addition to Vero E6 and Vero CCL81 cells. ... Each cell line was inoculated at high multiplicity of infection and examined 24h post-infection.

No CPE was observed in any of the cell lines except in Vero cells, which grew to greater than 10 to the 7th power at 24 h post-infection. In contrast, HUH 7.0 and 293T showed only modest viral replication, and A549 cells were incompatible with SARS CoV-2 infection.

Cowan explains that when virologists attempt to prove infection they have three possible 'hosts' or models on which they can test. The first was humans. Exposure to humans was generally not done for ethical reasons and has never been done with SARS-CoV-2 or any coronavirus. The second possible host was animals. Cowan said that forgetting for a moment that they never actually use purified virus when exposing animals they do use solutions that they *claim* contain the virus. Exposure to animals has been done with SARS-CoV-2 in an experiment involving mice and this is what they found: *None of the wild (normal) mice got sick*. In a group of genetically-modified mice, a statistically insignificant number lost weight and had slightly bristled fur, but they experienced nothing like the illness called 'Covid-19'. Cowan said the third method – the one they mostly rely on – is to inoculate solutions they *say* contain the virus onto a variety of tissue cultures. This process had never been shown to kill tissue *unless* the sample material was starved of nutrients and poisoned as *part of the process*. Yes, incredibly, in tissue experiments designed to show the 'virus' is responsible for killing the tissue they starve the tissue of nutrients and add toxic drugs including antibiotics and they do not have control studies to see if it's the starvation and poisoning that is degrading the tissue rather than the 'virus' they allege to be in there somewhere. You want me to pinch you? Yep, I understand. Tom Cowan said this about the whole nonsensical farce as he explains what that quote from the CDC paper really means:

The shocking thing about the above quote is that using their own methods, the virologists found that solutions containing SARS-CoV-2 – even in high amounts – were NOT, I repeat NOT, infective to any of the three human tissue cultures they tested. In plain English, this means they proved, on their terms, that this 'new coronavirus' is not infectious to human beings. It is ONLY infective to monkey kidney cells, and only then when you add two potent drugs (gentamicin and amphotericin), known to be toxic to kidneys, to the mix.

My friends, read this again and again. These virologists, published by the CDC, performed a clear proof, on their terms, showing that the SARS-CoV-2 virus is harmless to human beings. That is the only possible conclusion, but, unfortunately, this result is not even mentioned in their conclusion. They simply say they can provide virus stocks cultured only on monkey Vero cells, thanks for coming.

Cowan concluded: 'If people really understood how this "science" was done, I would hope they would storm the gates and demand honesty, transparency and truth.' Dr Michael Yeadon, former Vice President and Chief Scientific Adviser at drug giant Pfizer has been a vocal critic of the 'Covid vaccine' and its potential for multiple harm. He said in an interview in April, 2021, that 'not one [vaccine] has the virus. He was asked why vaccines normally using a 'dead' version of a disease to activate the immune system were not used for 'Covid' and instead we had the synthetic methods of the 'mRNA Covid vaccine'. Yeadon said that to do the former 'you'd have to have some of [the virus] wouldn't you?' He added: 'No-one's got any – seriously.' Yeadon said that surely they couldn't have fooled the whole world for a year without having a virus, 'but oddly enough ask around – no one's got it'. He didn't know why with all the 'great labs' around the world that the virus had not been isolated – 'Maybe they've been too busy running bad PCR tests and vaccines that people don't need.' What is today called 'science' is not 'science' at all. Science is no longer what is, but whatever people can be manipulated to *believe* that it is. Real science has been hijacked by the Cult to dispense and produce the 'expert scientists' and contentions that suit the agenda of the Cult. How big-time this has happened with the 'Covid' hoax which is entirely based on fake science delivered by fake 'scientists' and fake 'doctors'. The human-caused climate change hoax is also entirely based on fake science delivered by fake 'scientists' and fake 'climate experts'. In both cases real

scientists, climate experts and doctors have their views suppressed and deleted by the Cult-owned science establishment, media and Silicon Valley. This is the 'science' that politicians claim to be 'following' and a common denominator of 'Covid' and climate are Cult psychopaths Bill Gates and his mate Klaus Schwab at the Gates-funded World Economic Forum. But, don't worry, it's all just a coincidence and absolutely nothing to worry about. *Zzzzzzzz*.

What is a 'virus' REALLY?

Dr Tom Cowan is one of many contesting the very existence of viruses let alone that they cause disease. This is understandable when there is no scientific evidence for a disease-causing 'virus'. German virologist Dr Stefan Lanka won a landmark case in 2017 in the German Supreme Court over his contention that there is no such thing as a measles virus. He had offered a big prize for anyone who could prove there is and Lanka won his case when someone sought to claim the money. There is currently a prize of more than 225,000 euros on offer from an Isolate Truth Fund for anyone who can prove the isolation of SARS-CoV-2 and its genetic substance. Lanka wrote in an article headed 'The Misconception Called Virus' that scientists think a 'virus' is causing tissue to become diseased and degraded when in fact it is the *processes they are using* which do that – not a 'virus'. Lanka has done an important job in making this point clear as Cowan did in his analysis of the CDC paper. Lanka says that all claims about viruses as disease-causing pathogens are wrong and based on 'easily recognisable, understandable and verifiable misinterpretations.' Scientists believed they were working with 'viruses' in their laboratories when they were really working with 'typical particles of specific dying tissues or cells …' Lanka said that the tissue decaying process claimed to be caused by a 'virus' still happens when no alleged 'virus' is involved. It's the *process* that does the damage and not a 'virus'. The genetic sample is deprived of nutrients, removed from its energy supply through removal from the body and then doused in toxic antibiotics to remove any bacteria. He confirms again that establishment scientists do not (pinch me)

conduct control experiments to see if this is the case and if they did they would see the claims that 'viruses' are doing the damage is nonsense. He adds that during the measles 'virus' court case he commissioned an independent laboratory to perform just such a control experiment and the result was that the tissues and cells died in the exact same way as with alleged 'infected' material. This is supported by a gathering number of scientists, doctors and researchers who reject what is called 'germ theory' or the belief in the body being infected by contagious sources emitted by other people. Researchers Dawn Lester and David Parker take the same stance in their highly-detailed and sourced book *What Really Makes You Ill – Why everything you thought you knew about disease is wrong* which was recommended to me by a number of medical professionals genuinely seeking the truth. Lester and Parker say there is no provable scientific evidence to show that a 'virus' can be transmitted between people or people and animals or animals and people:

> The definition also claims that viruses are the cause of many diseases, as if this has been definitively proven. But this is not the case; there is no original scientific evidence that definitively demonstrates that any virus is the cause of any disease. The burden of proof for any theory lies with those who proposed it; but none of the existing documents provides 'proof' that supports the claim that 'viruses' are pathogens.

Dr Tom Cowan employs one of his clever analogies to describe the process by which a 'virus' is named as the culprit for a disease when what is called a 'virus' is only material released by cells detoxing themselves from infiltration by chemical or radiation poisoning. The tidal wave of technologically-generated radiation in the 'smart' modern world plus all the toxic food and drink are causing this to happen more than ever. Deluded 'scientists' misread this as a gathering impact of what they wrongly label 'viruses'.

Paper can infect houses

Cowan said in an article for davidicke.com – with his tongue only mildly in his cheek – that he believed he had made a tremendous

discovery that may revolutionise science. He had discovered that small bits of paper are alive, 'well alive-ish', can 'infect' houses, and then reproduce themselves inside the house. The result was that this explosion of growth in the paper inside the house causes the house to explode, blowing it to smithereens. His evidence for this new theory is that in the past months he had carefully examined many of the houses in his neighbourhood and found almost no scraps of paper on the lawns and surrounds of the house. There was an occasional stray label, but nothing more. Then he would return to these same houses a week or so later and with a few, not all of them, particularly the old and decrepit ones, he found to his shock and surprise they were littered with stray bits of paper. He knew then that the paper had infected these houses, made copies of itself, and blew up the house. A young boy on a bicycle at one of the sites told him he had seen a demolition crew using dynamite to explode the house the previous week, but Cowan dismissed this as the idle thoughts of silly boys because 'I was on to something big'. He was on to how 'scientists' mistake genetic material in the detoxifying process for something they call a 'virus'. Cowan said of his house and paper story:

> If this sounds crazy to you, it's because it should. This scenario is obviously nuts. But consider this admittedly embellished, for effect, current viral theory that all scientists, medical doctors and virologists currently believe.

He takes the example of the 'novel SARS-Cov2' virus to prove the point. First they take someone with an undefined illness called 'Covid-19' and don't even attempt to find any virus in their sputum. Never mind the scientists still describe how this 'virus', which they have not located attaches to a cell receptor, injects its genetic material, in 'Covid's' case, RNA, into the cell. The RNA once inserted exploits the cell to reproduce itself and makes 'thousands, nay millions, of copies of itself … Then it emerges victorious to claim its next victim':

If you were to look in the scientific literature for proof, actual scientific proof, that uniform SARS-CoV2 viruses have been properly isolated from the sputum of a sick person, that actual spike proteins could be seen protruding from the virus (which has not been found), you would find that such evidence doesn't exist.

If you go looking in the published scientific literature for actual pictures, proof, that these spike proteins or any viral proteins are ever attached to any receptor embedded in any cell membrane, you would also find that no such evidence exists. If you were to look for a video or documented evidence of the intact virus injecting its genetic material into the body of the cell, reproducing itself and then emerging victorious by budding off the cell membrane, you would find that no such evidence exists.

The closest thing you would find is electron micrograph pictures of cellular particles, possibly attached to cell debris, both of which to be seen were stained by heavy metals, a process that completely distorts their architecture within the living organism. This is like finding bits of paper stuck to the blown-up bricks, thereby proving the paper emerged by taking pieces of the bricks on its way out.

The Enders baloney

Cowan describes the 'Covid' story as being just as make-believe as his paper story and he charts back this fantasy to a Nobel Prize winner called John Enders (1897-1985), an American biomedical scientist who has been dubbed 'The Father of Modern Vaccines'. Enders is claimed to have 'discovered' the process of the viral culture which 'proved' that a 'virus' caused measles. Cowan explains how Enders did this 'by using the EXACT same procedure that has been followed by every virologist to find and characterize every new virus since 1954'. Enders took throat swabs from children with measles and immersed them in 2ml of milk. Penicillin (100u/ml) and the antibiotic streptomycin (50,g/ml) were added and the whole mix was centrifuged – rotated at high speed to separate large cellular debris from small particles and molecules as with milk and cream, for example. Cowan says that if the aim is to find little particles of genetic material ('viruses') in the snot from children with measles it would seem that the last thing you would do is mix the snot with other material – milk –that also has genetic material. 'How are you ever going to know whether whatever you found came from the snot or the milk?' He points out that streptomycin is a 'nephrotoxic' or poisonous-to-the-kidney drug. You will see the relevance of that

shortly. Cowan says that it gets worse, much worse, when Enders describes the culture medium upon which the virus 'grows': 'The culture medium consisted of bovine amniotic fluid (90%), beef embryo extract (5%), horse serum (5%), antibiotics and phenol red as an indicator of cell metabolism.' Cowan asks incredulously: 'Did he just say that the culture medium also contained fluids and tissues that are themselves rich sources of genetic material?' The genetic cocktail, or 'medium', is inoculated onto tissue and cells from rhesus monkey *kidney* tissue. This is where the importance of streptomycin comes in and currently-used antimicrobials and other drugs that are *poisonous to kidneys* and used in ALL modern viral cultures (e.g. gentamicin, streptomycin, and amphotericin). Cowan asks: 'How are you ever going to know from this witch's brew where any genetic material comes from as we now have five different sources of rich genetic material in our mix?' Remember, he says, that all genetic material, whether from monkey kidney tissues, bovine serum, milk, etc., is made from the exact same components. The same central question returns: 'How are you possibly going to know that it was the virus that killed the kidney tissue and not the toxic antibiotic and starvation rations on which you are growing the tissue?' John Enders answered the question himself – *you can't*:

A second agent was obtained from an uninoculated culture of monkey kidney cells. The cytopathic changes [death of the cells] it induced in the unstained preparations could not be distinguished with confidence from the viruses isolated from measles.

The death of the cells ('cytopathic changes') happened in exactly the same manner, whether they inoculated the kidney tissue with the measles snot or not, Cowan says. 'This is evidence that the destruction of the tissue, the very proof of viral causation of illness, was not caused by anything in the snot because they saw the same destructive effect when the snot was not even used … the cytopathic, i.e., cell-killing, changes come from the process of the culture itself, not from any virus in any snot, period.' Enders quotes in his 1957 paper a virologist called Ruckle as reporting similar findings 'and in addition has isolated an agent from monkey kidney tissue that is so

far indistinguishable from human measles virus'. In other words, Cowan says, these particles called 'measles viruses' are simply and clearly breakdown products of the starved and poisoned tissue. For measles 'virus' see all 'viruses' including the so-called 'Covid virus'. Enders, the 'Father of Modern Vaccines', also said:

There is a potential risk in employing cultures of primate cells for the production of vaccines composed of attenuated virus, since the presence of other agents possibly latent in primate tissues cannot be definitely excluded by any known method.

Cowan further quotes from a paper published in the journal *Viruses* in May, 2020, while the 'Covid pandemic' was well underway in the media if not in reality. 'EVs' here refers to particles of genetic debris from our own tissues, such as exosomes of which more in a moment: 'The remarkable resemblance between EVs and viruses has caused quite a few problems in the studies focused on the analysis of EVs released during viral infections.' Later the paper adds that to date a reliable method that can actually guarantee a complete separation (of EVs from viruses) DOES NOT EXIST. This was published at a time when a fairy tale 'virus' was claimed in total certainty to be causing a fairy tale 'viral disease' called 'Covid-19' – a fairy tale that was already well on the way to transforming human society in the image that the Cult has worked to achieve for so long. Cowan concludes his article:

To summarize, there is no scientific evidence that pathogenic viruses exist. What we think of as 'viruses' are simply the normal breakdown products of dead and dying tissues and cells. When we are well, we make fewer of these particles; when we are starved, poisoned, suffocated by wearing masks, or afraid, we make more.

There is no engineered virus circulating and making people sick. People in laboratories all over the world are making genetically modified products to make people sick. These are called vaccines. There is no virome, no 'ecosystem' of viruses, viruses are not 8%, 50% or 100 % of our genetic material. These are all simply erroneous ideas based on the misconception called a virus.

What is 'Covid'? Load of bollocks

The background described here by Cowan and Lanka was emphasised in the first video presentation that I saw by Dr Andrew Kaufman when he asked whether the 'Covid virus' was in truth a natural defence mechanism of the body called 'exosomes'. These are released by cells when in states of toxicity – see the same themes returning over and over. They are released ever more profusely as chemical and radiation toxicity increases and think of the potential effect therefore of 5G alone as its destructive frequencies infest the human energetic information field with a gathering pace (5G went online in Wuhan in 2019 as the 'virus' emerged). I'll have more about this later. Exosomes transmit a warning to the rest of the body that 'Houston, we have a problem'. Kaufman presented images of exosomes and compared them with 'Covid' under an electron microscope and the similarity was remarkable. They both attach to the same cell receptors (*claimed* in the case of 'Covid'), contain the same genetic material in the form of RNA or ribonucleic acid, and both are found in 'viral cell cultures' with damaged or dying cells. James Hildreth MD, President and Chief Executive Officer of the Meharry Medical College at Johns Hopkins, said: 'The virus is fully an exosome in every sense of the word.' Kaufman's conclusion was that there is no 'virus': 'This entire pandemic is a completely manufactured crisis … there is no evidence of anyone dying from [this] illness.' Dr Tom Cowan and Sally Fallon Morell, authors of *The Contagion Myth*, published a statement with Dr Kaufman in February, 2021, explaining why the 'virus' does not exist and you can read it that in full in the Appendix.

'Virus' theory can be traced to the 'cell theory' in 1858 of German physician Rudolf Virchow (1821-1920) who contended that disease originates from a single cell infiltrated by a 'virus'. Dr Stefan Lanka said that findings and insights with respect to the structure, function and central importance of tissues in the creation of life, which were already known in 1858, comprehensively refute the cell theory. Virchow ignored them. We have seen the part later played by John Enders in the 1950s and Lanka notes that infection theories were only established as a global dogma through the policies and

eugenics of the Third Reich in Nazi Germany (creation of the same Sabbatian cult behind the 'Covid' hoax). Lanka said: 'Before 1933, scientists dared to contradict this theory; after 1933, these critical scientists were silenced'. Dr Tom Cowan's view is that ill-heath is caused by too much of something, too little of something, or toxification from chemicals and radiation – not contagion. We must also highlight as a major source of the 'virus' theology a man still called the 'Father of Modern Virology' – Thomas Milton Rivers (1888-1962). There is no way given the Cult's long game policy that it was a coincidence for the 'Father of Modern Virology' to be director of the Rockefeller Institute for Medical Research from 1937 to 1956 when he is credited with making the Rockefeller Institute a leader in 'viral research'. Cult Rockefellers were the force behind the creation of Big Pharma 'medicine', established the World Health Organisation in 1948, and have long and close associations with the Gates family that now runs the WHO during the pandemic hoax through mega-rich Cult gofer and psychopath Bill Gates.

Only a Renegade Mind can see through all this bullshit by asking the questions that need to be answered, not taking 'no' or prevarication for an answer, and certainly not hiding from the truth in fear of speaking it. Renegade Minds have always changed the world for the better and they will change this one no matter how bleak it may currently appear to be.

CHAPTER SIX

Sequence of deceit

If you tell the truth, you don't have to remember anything
Mark Twain

Against the background that I have laid out this far the sequence that took us from an invented 'virus' in Cult-owned China in late 2019 to the fascist transformation of human society can be seen and understood in a whole new context.

We were told that a deadly disease had broken out in Wuhan and the world media began its campaign (coordinated by behavioural psychologists as we shall see) to terrify the population into unquestioning compliance. We were shown images of Chinese people collapsing in the street which never happened in the West with what was supposed to be the same condition. In the earliest days when alleged cases and deaths were few the fear register was hysterical in many areas of the media and this would expand into the common media narrative across the world. The real story was rather different, but we were never told that. The Chinese government, one of the Cult's biggest centres of global operation, said they had discovered a new illness with flu-like and pneumonia-type symptoms in a city with such toxic air that it is overwhelmed with flu-like symptoms, pneumonia and respiratory disease. Chinese scientists said it was a new – 'novel' – coronavirus which they called Sars-Cov-2 and that it caused a disease they labelled 'Covid-19'. There was no evidence for this and the 'virus' has never to this day been isolated, purified and its genetic code established from that. It

was from the beginning a computer-generated fiction. Stories of Chinese whistleblowers saying the number of deaths was being supressed or that the 'new disease' was related to the Wuhan bio-lab misdirected mainstream and alternative media into cul-de-sacs to obscure the real truth – there was no 'virus'.

Chinese scientists took genetic material from the lung fluid of just a few people and said they had found a 'new' disease when this material had a wide range of content. There was no evidence for a 'virus' for the very reasons explained in the last two chapters. The 'virus' has never been shown to (a) exist and (b) cause any disease. People were diagnosed on symptoms that are so widespread in Wuhan and polluted China and with a PCR test that can't detect infectious disease. On this farce the whole global scam was sold to the rest of the world which would also diagnose respiratory disease as 'Covid-19' from symptoms alone or with a PCR test not testing for a 'virus'. Flu miraculously disappeared *worldwide* in 2020 and into 2021 as it was redesignated 'Covid-19'. It was really the same old flu with its 'flu-like' symptoms attributed to 'flu-like' 'Covid-19'. At the same time with very few exceptions the Chinese response of draconian lockdown and fascism was the chosen weapon to respond across the West as recommended by the Cult-owned Tedros at the Cult-owned World Health Organization run by the Cult-owned Gates. All was going according to plan. Chinese scientists – everything in China is controlled by the Cult-owned government – compared their contaminated RNA lung-fluid material with other RNA sequences and said it appeared to be just under 80 percent identical to the SARS-CoV-1 'virus' claimed to be the cause of the SARS (severe acute respiratory syndrome) 'outbreak' in 2003. They decreed that because of this the 'new virus' had to be related and they called it SARS-CoV-2. There are some serious problems with this assumption and *assumption* was all it was. Most 'factual' science turns out to be assumptions repeated into everyone-knows-that. A match of under 80-percent is meaningless. Dr Kaufman makes the point that there's a *96 percent* genetic correlation between humans and chimpanzees, but 'no one would say our genetic material is part

of the chimpanzee family'. Yet the Chinese authorities were claiming that a much lower percentage, less than 80 percent, proved the existence of a new 'coronavirus'. For goodness sake human DNA is 60 percent similar to a *banana*.

You are feeling sleepy

The entire 'Covid' hoax is a global Psyop, a psychological operation to program the human mind into believing and fearing a complete fantasy. A crucial aspect of this was what *appeared* to happen in Italy. It was all very well streaming out daily images of an alleged catastrophe in Wuhan, but to the Western mind it was still on the other side of the world in a very different culture and setting. A reaction of 'this could happen to me and my family' was still nothing like as intense enough for the mind-doctors. The Cult needed a Western example to push people over that edge and it chose Italy, one of its major global locations going back to the Roman Empire. An Italian 'Covid' crisis was manufactured in a particular area called Lombardy which just happens to be notorious for its toxic air and therefore respiratory disease. Wuhan, China, déjà vu. An hysterical media told horror stories of Italians dying from 'Covid' in their droves and how Lombardy hospitals were being overrun by a tidal wave of desperately ill people needing treatment after being struck down by the 'deadly virus'. Here was the psychological turning point the Cult had planned. Wow, if this is happening in Italy, the Western mind concluded, this indeed could happen to me and my family. Another point is that Italian authorities responded by following the Chinese blueprint so vehemently recommended by the Cult-owned World Health Organization. They imposed fascistic lockdowns on the whole country viciously policed with the help of surveillance drones sweeping through the streets seeking out anyone who escaped from mass house arrest. Livelihoods were destroyed and psychology unravelled in the way we have witnessed since in all lockdown countries. Crucial to the plan was that Italy responded in this way to set the precedent of suspending freedom and imposing fascism in a 'Western liberal democracy'. I emphasised in an

animated video explanation on davidicke.com posted in the summer of 2020 how important it was to the Cult to expand the Chinese lockdown model across the West. Without this, and the bare-faced lie that non-symptomatic people could still transmit a 'disease' they didn't have, there was no way locking down the whole population, sick and not sick, could be pulled off. At just the right time and with no evidence Cult operatives and gofers claimed that people without symptoms could pass on the 'disease'. In the name of protecting the 'vulnerable' like elderly people, who lockdowns would kill by the tens of thousands, we had for the first time healthy people told to isolate as well as the sick. The great majority of people who tested positive had no symptoms because there was nothing wrong with them. It was just a trick made possible by a test not testing for the 'virus'.

Months after my animated video the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College confirmed that I was right. He didn't say it in those terms, naturally, but he did say it. Ferguson will enter the story shortly for his outrageously crazy 'computer models' that led to Britain, the United States and many other countries following the Chinese and now Italian methods of response. Put another way, following the Cult script. Ferguson said that SAGE, the UK government's scientific advisory group which has controlled 'Covid' policy from the start, wanted to follow the Chinese lockdown model (while they all continued to work and be paid), but they wondered if they could possibly, in Ferguson's words, 'get away with it in Europe'. 'Get away with it'? Who the hell do these moronic, arrogant people think they are? This appalling man Ferguson said that once Italy went into national lockdown they realised they, too, could mimic China:

> It's a communist one-party state, we said. We couldn't get away with it in Europe, we thought … and then Italy did it. And we realised we could. Behind this garbage from Ferguson is a simple fact: Doing the same as China in every country was the plan from the start and Ferguson's 'models' would play a central role in achieving that. It's just a coincidence, of course, and absolutely nothing to worry your little head about.

Oops, sorry, our mistake

Once the Italian segment of the Psyop had done the job it was designed to do a very different story emerged. Italian authorities revealed that 99 percent of those who had 'died from Covid-19' in Italy had one, two, three, or more 'co-morbidities' or illnesses and health problems that could have ended their life. The US Centers for Disease Control and Prevention (CDC) published a figure of 94 percent for Americans dying of 'Covid' while having other serious medical conditions – on average two to three (some five or six) other potential causes of death. In terms of death from an unproven 'virus' I say it is 100 percent. The other one percent in Italy and six percent in the US would presumably have died from 'Covid's' flu-like symptoms with a range of other possible causes in conjunction with a test not testing for the 'virus'. Fox News reported that even more startling figures had emerged in one US county in which 410 of 422 deaths attributed to 'Covid-19' had other potentially deadly health conditions. The Italian National Health Institute said later that the average age of people dying with a 'Covid-19' diagnosis in Italy was about 81. Ninety percent were over 70 with ten percent over 90. In terms of other reasons to die some 80 percent had two or more chronic diseases with half having three or more including cardiovascular problems, diabetes, respiratory problems and cancer. Why is the phantom 'Covid-19' said to kill overwhelmingly old people and hardly affect the young? Old people continually die of many causes and especially respiratory disease which you can re-diagnose 'Covid-19' while young people die in tiny numbers by comparison and rarely of respiratory disease. Old people 'die of Covid' because they die of other things that can be redesignated 'Covid' and it really is that simple.

Flu has flown

The blueprint was in place. Get your illusory 'cases' from a test not testing for the 'virus' and redesignate other causes of death as 'Covid-19'. You have an instant 'pandemic' from something that is nothing more than a computer-generated fiction. With near-on a

billion people having 'flu-like' symptoms every year the potential was limitless and we can see why flu quickly and apparently miraculously disappeared *worldwide* by being diagnosed 'Covid-19'. The painfully bloody obvious was explained away by the childlike media in headlines like this in the UK '*Independent*': 'Not a single case of flu detected by Public Health England this year as Covid restrictions suppress virus'. I kid you not. The masking, social distancing and house arrest that did not make the 'Covid virus' disappear somehow did so with the 'flu virus'. Even worse the article, by a bloke called Samuel Lovett, suggested that maybe the masking, sanitising and other 'Covid' measures should continue to keep the flu away. With a ridiculousness that disturbs your breathing (it's 'Covid-19') the said Lovett wrote: 'With widespread social distancing and mask-wearing measures in place throughout the UK, the usual routes of transmission for influenza have been blocked.' He had absolutely no evidence to support that statement, but look at the consequences of him acknowledging the obvious. With flu not disappearing at all and only being relabelled 'Covid-19' he would have to contemplate that 'Covid' was a hoax on a scale that is hard to imagine. You need guts and commitment to truth to even go there and that's clearly something Samuel Lovett does not have in abundance. He would never have got it through the editors anyway.

Tens of thousands die in the United States alone every winter from flu including many with pneumonia complications. CDC figures record *45 million* Americans diagnosed with flu in 2017-2018 of which 61,000 died and some reports claim 80,000. Where was the same hysteria then that we have seen with 'Covid-19'? Some 250,000 Americans are admitted to hospital with pneumonia every year with about 50,000 cases proving fatal. About 65 million suffer respiratory disease every year and three million deaths makes this the third biggest cause of death worldwide. You only have to redesignate a portion of all these people 'Covid-19' and you have an instant global pandemic or the *appearance* of one. Why would doctors do this? They are told to do this and all but a few dare not refuse those who must be obeyed. Doctors in general are not researching their own

knowledge and instead take it direct and unquestioned from the authorities that own them and their careers. The authorities say they must now diagnose these symptoms 'Covid-19' and not flu, or whatever, and they do it. Dark suits say put 'Covid-19' on death certificates no matter what the cause of death and the doctors do it. Renegade Minds don't fall for the illusion that doctors and medical staff are all highly-intelligent, highly-principled, seekers of medical truth. *Some are*, but not the majority. They are repeaters, gofers, and yes sir, no sir, purveyors of what the system demands they purvey. The 'Covid' con is not merely confined to diseases of the lungs. Instructions to doctors to put 'Covid-19' on death certificates for anyone dying of *anything* within 28 days (or much more) of a positive test not testing for the 'virus' opened the floodgates. The term dying *with* 'Covid' and not *of* 'Covid' was coined to cover the truth. Whether it was a *with* or an *of* they were all added to the death numbers attributed to the 'deadly virus' compiled by national governments and globally by the Gates-funded Johns Hopkins operation in the United States that was so involved in those 'pandemic' simulations. Fraudulent deaths were added to the ever-growing list of fraudulent 'cases' from false positives from a false test. No wonder Professor Walter Ricciardi, scientific advisor to the Italian minister of health, said after the Lombardy hysteria had done its job that 'Covid' death rates were due to Italy having the second oldest population in the world and to *how hospitals record deaths*:

The way in which we code deaths in our country is very generous in the sense that all the people who die in hospitals with the coronavirus are deemed to be dying of the coronavirus. On re-evaluation by the National Institute of Health, only 12 per cent of death certificates have shown a direct causality from coronavirus, while 88 per cent of patients who have died have at least one pre-morbidity – many had two or three.

This is extraordinary enough when you consider the propaganda campaign to use Italy to terrify the world, but how can they even say twelve percent were genuine when the 'virus' has not been shown to exist, its 'code' is a computer program, and diagnosis comes from a test not testing for it? As in China, and soon the world, 'Covid-19' in

Italy was a redesignation of diagnosis. Lies and corruption were to become the real 'pandemic' fuelled by a pathetically-compliant medical system taking its orders from the tiny few at the top of their national hierarchy who answered to the World Health Organization which answers to Gates and the Cult. Doctors were told – ordered – to diagnose a particular set of symptoms 'Covid-19' and put that on the death certificate for any cause of death if the patient had tested positive with a test not testing for the virus or had 'Covid' symptoms like the flu. The United States even introduced big financial incentives to manipulate the figures with hospitals receiving £4,600 from the Medicare system for diagnosing someone with regular pneumonia, $13,000 if they made the diagnosis from the same symptoms 'Covid-19' pneumonia, and $39, 000 if they put a 'Covid' diagnosed patient on a ventilator that would almost certainly kill them. A few – painfully and pathetically few – medical whistleblowers revealed (before Cult-owned YouTube deleted their videos) that they had been instructed to 'let the patient crash' and put them straight on a ventilator instead of going through a series of far less intrusive and dangerous methods as they would have done before the pandemic hoax began and the financial incentives kicked in. We are talking cold-blooded murder given that ventilators are so damaging to respiratory systems they are usually the last step before heaven awaits. Renegade Minds never fall for the belief that people in white coats are all angels of mercy and cannot be full-on psychopaths. I have explained in detail in *The Answer* how what I am describing here played out across the world coordinated by the World Health Organization through the medical hierarchies in almost every country.

Medical scientist calls it

Information about the non-existence of the 'virus' began to emerge for me in late March, 2020, and mushroomed after that. I was sent an email by Sir Julian Rose, a writer, researcher, and organic farming promotor, from a medical scientist friend of his in the United States. Even at that early stage in March the scientist was able to explain

how the 'Covid' hoax was being manipulated. He said there were no reliable tests for a specific 'Covid-19 virus' and nor were there any reliable agencies or media outlets for reporting numbers of actual 'Covid-19' cases. We have seen in the long period since then that he was absolutely right. 'Every action and reaction to Covid-19 is based on totally flawed data and we simply cannot make accurate assessments,' he said. Most people diagnosed with 'Covid-19' were showing nothing more than cold and flu-like symptoms 'because most coronavirus strains *are* nothing more than cold/flu-like symptoms'. We had farcical situations like an 84-year-old German man testing positive for 'Covid-19' and his nursing home ordered to quarantine only for him to be found to have a common cold. The scientist described back then why PCR tests and what he called the 'Mickey Mouse test kits' were useless for what they were claimed to be identifying. 'The idea these kits can isolate a specific virus like Covid-19 is nonsense,' he said. Significantly, he pointed out that 'if you want to create a totally false panic about a totally false pandemic – pick a coronavirus'. This is exactly what the Cult-owned Gates, World Economic Forum and Johns Hopkins University did with their Event 201 'simulation' followed by their real-life simulation called the 'pandemic'. The scientist said that all you had to do was select the sickest of people with respiratory-type diseases in a single location – 'say Wuhan' – and administer PCR tests to them. You can then claim that anyone showing 'viral sequences' similar to a coronavirus 'which will inevitably be quite a few' is suffering from a 'new' disease:

> Since you already selected the sickest flu cases a fairly high proportion of your sample will go on to die. You can then say this 'new' virus has a CFR [case fatality rate] higher than the flu and use this to infuse more concern and do more tests which will of course produce more 'cases', which expands the testing, which produces yet more 'cases' and so on and so on. Before long you have your 'pandemic', and all you have done is use a simple test kit trick to convert the worst flu and pneumonia cases into something new that doesn't ACTUALLY EXIST [my emphasis].

He said that you then 'just run the same scam in other countries' and make sure to keep the fear message running high 'so that people

will feel panicky and less able to think critically'. The only problem to overcome was the fact *there is no* actual new deadly pathogen and only regular sick people. This meant that deaths from the 'new deadly pathogen' were going to be way too low for a real new deadly virus pandemic, but he said this could be overcome in the following ways – all of which would go on to happen:

1. You can claim this is just the beginning and more deaths are imminent [you underpin this with fantasy 'computer projections']. Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.

2. You can [say that people] 'minimizing' the dangers are irresponsible and bully them into not talking about numbers.

3. You can talk crap about made up numbers hoping to blind people with pseudoscience.

4. You can start testing well people (who, of course, will also likely have shreds of coronavirus [RNA] in them) and thus inflate your 'case figures' with 'asymptomatic carriers' (you will of course have to spin that to sound deadly even though any virologist knows the more symptom-less cases you have the less deadly is your pathogen).

The scientist said that if you take these simple steps 'you can have your own entirely manufactured pandemic up and running in weeks'. His analysis made so early in the hoax was brilliantly prophetic of what would actually unfold. Pulling all the information together in these recent chapters we have this is simple 1, 2, 3, of how you can delude virtually the entire human population into believing in a 'virus' that doesn't exist:

- A 'Covid case' is someone who tests positive with a test not testing for the 'virus'.

- A 'Covid death' is someone who dies of *any cause* within 28 days (or much longer) of testing positive with a test not testing for the 'virus.

- Asymptomatic means there is nothing wrong with you, but they claim you can pass on what you don't have to justify locking

down (quarantining) healthy people in totality.

The foundations of the hoax are that simple. A study involving ten million people in Wuhan, published in November, 2020, demolished the whole lie about those without symptoms passing on the 'virus'. They found '300 asymptomatic cases' and traced their contacts to find that not one of them was detected with the 'virus'. 'Asymptomatic' patients and their contacts were isolated for no less than two weeks and nothing changed. I know it's all crap, but if you are going to claim that those without symptoms can transmit 'the virus' then you must produce evidence for that and they never have. Even World Health Organization official Dr Maria Van Kerkhove, head of the emerging diseases and zoonosis unit, said as early as June, 2020, that she doubted the validity of asymptomatic transmission. She said that 'from the data we have, it still seems to be rare that an asymptomatic person actually transmits onward to a secondary individual' and by 'rare' she meant that she couldn't cite any case of asymptomatic transmission.

The Ferguson factor

The problem for the Cult as it headed into March, 2020, when the script had lockdown due to start, was that despite all the manipulation of the case and death figures they still did not have enough people alleged to have died from 'Covid' to justify mass house arrest. This was overcome in the way the scientist described: 'You can claim this is just the beginning and more deaths are imminent … Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.' Enter one Professor Neil Ferguson, the Gates-funded 'epidemiologist' at the Gates-funded Imperial College in London. Ferguson is Britain's Christian Drosten in that he has a dire record of predicting health outcomes, but is still called upon to advise government on the next health outcome when another 'crisis' comes along. This may seem to be a strange and ridiculous thing to do. Why would you keep turning for policy guidance to people who have a history of being

monumentally wrong? Ah, but it makes sense from the Cult point of view. These 'experts' keep on producing predictions that suit the Cult agenda for societal transformation and so it was with Neil Ferguson as he revealed his horrific (and clearly insane) computer model predictions that allowed lockdowns to be imposed in Britain, the United States and many other countries. Ferguson does not have even an A-level in biology and would appear to have no formal training in computer modelling, medicine or epidemiology, according to Derek Winton, an MSc in Computational Intelligence. He wrote an article somewhat aghast at what Ferguson did which included taking no account of respiratory disease 'seasonality' which means it is far worse in the winter months. Who would have thought that respiratory disease could be worse in the winter? Well, certainly not Ferguson.

The massively China-connected Imperial College and its bizarre professor provided the excuse for the long-incubated Chinese model of human control to travel westward at lightning speed. Imperial College confirms on its website that it collaborates with the Chinese Research Institute; publishes more than 600 research papers every year with Chinese research institutions; has 225 Chinese staff; 2,600 Chinese students – the biggest international group; 7,000 former students living in China which is the largest group outside the UK; and was selected for a tour by China's President Xi Jinping during his state visit to the UK in 2015. The college takes major donations from China and describes itself as the UK's number one university collaborator with Chinese research institutions. The China communist/fascist government did not appear phased by the woeful predictions of Ferguson and Imperial when during the lockdown that Ferguson induced the college signed a five-year collaboration deal with China tech giant Huawei that will have Huawei's indoor 5G network equipment installed at the college's West London tech campus along with an 'AI cloud platform'. The deal includes Chinese sponsorship of Imperial's Venture Catalyst entrepreneurship competition. Imperial is an example of the enormous influence the Chinese government has within British and North American

universities and research centres – and further afield. Up to 200 academics from more than a dozen UK universities are being investigated on suspicion of 'unintentionally' helping the Chinese government build weapons of mass destruction by 'transferring world-leading research in advanced military technology such as aircraft, missile designs and cyberweapons'. Similar scandals have broken in the United States, but it's all a coincidence. Imperial College serves the agenda in many other ways including the promotion of every aspect of the United Nations Agenda 21/2030 (the Great Reset) and produced computer models to show that human-caused 'climate change' is happening when in the real world it isn't. Imperial College is driving the climate agenda as it drives the 'Covid' agenda (both Cult hoaxes) while Patrick Vallance, the UK government's Chief Scientific Adviser on 'Covid', was named Chief Scientific Adviser to the UN 'climate change' conference known as COP26 hosted by the government in Glasgow, Scotland. 'Covid' and 'climate' are fundamentally connected.

Professor Woeful

From Imperial's bosom came Neil Ferguson still advising government despite his previous disasters and it was announced early on that he and other key people like UK Chief Medical Adviser Chris Whitty had caught the 'virus' as the propaganda story was being sold. Somehow they managed to survive and we had Prime Minister Boris Johnson admitted to hospital with what was said to be a severe version of the 'virus' in this same period. His whole policy and demeanour changed when he returned to Downing Street. It's a small world with these government advisors – especially in their communal connections to Gates – and Ferguson had partnered with Whitty to write a paper called 'Infectious disease: Tough choices to reduce Ebola transmission' which involved another scare-story that didn't happen. Ferguson's 'models' predicted that up to150, 000 could die from 'mad cow disease', or BSE, and its version in sheep if it was transmitted to humans. BSE was not transmitted and instead triggered by an organophosphate pesticide used to treat a pest on

cows. Fewer than 200 deaths followed from the human form. Models by Ferguson and his fellow incompetents led to the unnecessary culling of millions of pigs, cattle and sheep in the foot and mouth outbreak in 2001 which destroyed the lives and livelihoods of farmers and their families who had often spent decades building their herds and flocks. Vast numbers of these animals did not have foot and mouth and had no contact with the infection. Another 'expert' behind the cull was Professor Roy Anderson, a computer modeller at Imperial College specialising in the epidemiology of *human*, not animal, disease. Anderson has served on the Bill and Melinda Gates Grand Challenges in Global Health advisory board and chairs another Gates-funded organisation. Gates is everywhere.

In a precursor to the 'Covid' script Ferguson backed closing schools 'for prolonged periods' over the swine flu 'pandemic' in 2009 and said it would affect a third of the world population if it continued to spread at the speed he claimed to be happening. His mates at Imperial College said much the same and a news report said: 'One of the authors, the epidemiologist and disease modeller Neil Ferguson, who sits on the World Health Organisation's emergency committee for the outbreak, said the virus had "full pandemic potential".' Professor Liam Donaldson, the Chris Whitty of his day as Chief Medical Officer, said the worst case could see 30 percent of the British people infected by swine flu with 65,000 dying. Ferguson and Donaldson were indeed proved correct when at the end of the year the number of deaths attributed to swine flu was 392. The term 'expert' is rather liberally applied unfortunately, not least to complete idiots. Swine flu 'projections' were great for GlaxoSmithKline (GSK) as millions rolled in for its Pandemrix influenza vaccine which led to brain damage with children most affected. The British government (taxpayers) paid out more than £60 million in compensation after GSK was given immunity from prosecution. Yet another 'Covid' déjà vu. Swine flu was supposed to have broken out in Mexico, but Dr Wolfgang Wodarg, a German doctor, former member of parliament and critic of the 'Covid' hoax, observed 'the spread of swine flu' in Mexico City at the time. He

said: 'What we experienced in Mexico City was a very mild flu which did not kill more than usual – which killed even fewer people than usual.' Hyping the fear against all the facts is not unique to 'Covid' and has happened many times before. Ferguson is reported to have over-estimated the projected death toll of bird flu (H5N1) by some three million-fold, but bird flu vaccine makers again made a killing from the scare. This is some of the background to the Neil Ferguson who produced the perfectly-timed computer models in early 2020 predicting that half a million people would die in Britain without draconian lockdown and 2.2 million in the United States. Politicians panicked, people panicked, and lockdowns of alleged short duration were instigated to 'flatten the curve' of cases gleaned from a test not testing for the 'virus'. I said at the time that the public could forget the 'short duration' bit. This was an agenda to destroy the livelihoods of the population and force them into mass control through dependency and there was going to be nothing 'short' about it. American researcher Daniel Horowitz described the consequences of the 'models' spewed out by Gates-funded Ferguson and Imperial College:

> What led our government and the governments of many other countries into panic was a single Imperial College of UK study, funded by global warming activists, that predicted 2.2 million deaths if we didn't lock down the country. In addition, the reported 8-9% death rate in Italy scared us into thinking there was some other mutation of this virus that they got, which might have come here.
>
> Together with the fact that we were finally testing and had the ability to actually report new cases, we thought we were headed for a death spiral. But again … we can't flatten a curve if we don't know when the curve started.

How about it *never* started?

Giving them what they want

An investigation by German news outlet *Welt Am Sonntag (World on Sunday)* revealed how in March, 2020, the German government gathered together 'leading scientists from several research institutes and universities' and 'together, they were to produce a [modelling]

paper that would serve as legitimization for further tough political measures'. The Cult agenda was justified by computer modelling not based on evidence or reality; it was specifically constructed to justify the Cult demand for lockdowns all over the world to destroy the independent livelihoods of the global population. All these modellers and everyone responsible for the 'Covid' hoax have a date with a trial like those in Nuremberg after World War Two when Nazis faced the consequences of their war crimes. These corrupt-beyond-belief 'modellers' wrote the paper according to government instructions and it said that that if lockdown measures were lifted then up to one million Germans would die from 'Covid-19' adding that some would die 'agonizingly at home, gasping for breath' unable to be treated by hospitals that couldn't cope. All lies. No matter – it gave the Cult all that it wanted. What did long-time government 'modeller' Neil Ferguson say? If the UK and the United States didn't lockdown half a million would die in Britain and 2.2 million Americans. Anyone see a theme here? 'Modellers' are such a crucial part of the lockdown strategy that we should look into their background and follow the money. Researcher Rosemary Frei produced an excellent article headlined 'The Modelling-paper Mafiosi'. She highlights a guy called John Edmunds, a British epidemiologist, and professor in the Faculty of Epidemiology and Population Health at the London School of Hygiene & Tropical Medicine. He studied at Imperial College. Edmunds is a member of government 'Covid' advisory bodies which have been dictating policy, the New and Emerging Respiratory Virus Threats Advisory Group (NERVTAG) and the Scientific Advisory Group for Emergencies (SAGE).

Ferguson, another member of NERVTAG and SAGE, led the way with the original 'virus' and Edmunds has followed in the 'variant' stage and especially the so-called UK or Kent variant known as the 'Variant of Concern' (VOC) B.1.1.7. He said in a co-written report for the Centre for Mathematical modelling of Infectious Diseases at the London School of Hygiene and Tropical Medicine, with input from the Centre's 'Covid-19' Working Group, that there was 'a realistic

possibility that VOC B.1.1.7 is associated with an increased risk of death compared to non-VOC viruses'. Fear, fear, fear, get the vaccine, fear, fear, fear, get the vaccine. Rosemary Frei reveals that almost all the paper's authors and members of the modelling centre's 'Covid-19' Working Group receive funding from the Bill and Melinda Gates Foundation and/or the associated Gates-funded Wellcome Trust. The paper was published by e-journal *Medr χiv* which only publishes papers not peer-reviewed and the journal was established by an organisation headed by Facebook's Mark Zuckerberg and his missus. What a small world it is. Frei discovered that Edmunds is on the Scientific Advisory Board of the Coalition for Epidemic Preparedness Innovations (CEPI) which was established by the Bill and Melinda Gates Foundation, Klaus Schwab's Davos World Economic Forum and Big Pharma giant Wellcome. CEPI was 'launched in Davos [in 2017] to develop vaccines to stop future epidemics', according to its website. 'Our mission is to accelerate the development of vaccines against emerging infectious diseases and enable equitable access to these vaccines for people during outbreaks.' What kind people they are. Rosemary Frei reveals that Public Health England (PHE) director Susan Hopkins is an author of her organisation's non-peer-reviewed reports on 'new variants'. Hopkins is a professor of infectious diseases at London's Imperial College which is gifted tens of millions of dollars a year by the Bill and Melinda Gates Foundation. Gates-funded modelling disaster Neil Ferguson also co-authors Public Health England reports and he spoke in December, 2020, about the potential danger of the B.1.1.7. 'UK variant' promoted by Gates-funded modeller John Edmunds. When I come to the 'Covid vaccines' the 'new variants' will be shown for what they are – bollocks.

Connections, connections

All these people and modellers are lockdown-obsessed or, put another way, they demand what the Cult demands. Edmunds said in January, 2021, that to ease lockdowns too soon would be a disaster and they had to 'vaccinate much, much, much more widely than the

elderly'. Rosemary Frei highlights that Edmunds is married to Jeanne Pimenta who is described in a LinkedIn profile as director of epidemiology at GlaxoSmithKline (GSK) and she held shares in the company. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of GSK and has a deferred bonus of shares in the company worth £600,000. GSK has serious business connections with Bill Gates and is collaborating with mRNA-'vaccine' company CureVac to make 'vaccines' for the new variants that Edmunds is talking about. GSK is planning a 'Covid vaccine' with drug giant Sanofi. Puppet Prime Minister Boris Johnson announced in the spring of 2021 that up to 60 million vaccine doses were to be made at the GSK facility at Barnard Castle in the English North East. Barnard Castle, with a population of just 6,000, was famously visited in breach of lockdown rules in April, 2020, by Johnson aide Dominic Cummings who said that he drove there 'to test his eyesight' before driving back to London. Cummings would be better advised to test his integrity – not that it would take long. The GSK facility had nothing to do with his visit then although I'm sure Patrick Vallance would have been happy to arrange an introduction and some tea and biscuits. Ruthless psychopath Gates has made yet another fortune from vaccines in collaboration with Big Pharma companies and gushes at the phenomenal profits to be made from vaccines – more than a 20-to-1 return as he told one interviewer. Gates also tweeted in December, 2019, with the foreknowledge of what was coming: 'What's next for our foundation? I'm particularly excited about what the next year could mean for one of the best buys in global health: vaccines.'

Modeller John Edmunds is a big promotor of vaccines as all these people appear to be. He's the dean of the London School of Hygiene & Tropical Medicine's Faculty of Epidemiology and Population Health which is primarily funded by the Bill and Melinda Gates Foundation and the Gates-established and funded GAVI vaccine alliance which is the Gates vehicle to vaccinate the world. The organisation Doctors Without Borders has described GAVI as being 'aimed more at supporting drug-industry desires to promote new

products than at finding the most efficient and sustainable means for fighting the diseases of poverty'. But then that's why the psychopath Gates created it. John Edmunds said in a video that the London School of Hygiene & Tropical Medicine is involved in every aspect of vaccine development including large-scale clinical trials. He contends that mathematical modelling can show that vaccines protect individuals and society. That's on the basis of shit in and shit out, I take it. Edmunds serves on the UK Vaccine Network as does Ferguson and the government's foremost 'Covid' adviser, the grim-faced, dark-eyed Chris Whitty. The Vaccine Network says it works 'to support the government to identify and shortlist targeted investment opportunities for the most promising vaccines and vaccine technologies that will help combat infectious diseases with epidemic potential, and to address structural issues related to the UK's broader vaccine infrastructure'. Ferguson is acting Director of the Imperial College Vaccine Impact Modelling Consortium which has funding from the Bill and Melina Gates Foundation and the Gates-created GAVI 'vaccine alliance'. Anyone wonder why these characters see vaccines as the answer to every problem? Ferguson is wildly enthusiastic in his support for GAVI's campaign to vaccine children en masse in poor countries. You would expect someone like Gates who has constantly talked about the need to reduce the population to want to fund vaccines to keep more people alive. I'm sure that's why he does it. The John Edmunds London School of Hygiene & Tropical Medicine (LSHTM) has a Vaccines Manufacturing Innovation Centre which develops, tests and commercialises vaccines. Rosemary Frei writes:

> The vaccines centre also performs affiliated activities like combating 'vaccine hesitancy'. The latter includes the Vaccine Confidence Project. The project's stated purpose is, among other things, 'to provide analysis and guidance for early response and engagement with the public to ensure sustained confidence in vaccines and immunisation'. The Vaccine Confidence Project's director is LSHTM professor Heidi Larson. For more than a decade she's been researching how to combat vaccine hesitancy.

How the bloody hell can blokes like John Edmunds and Neil Ferguson with those connections and financial ties model 'virus' case

and death projections for the government and especially in a way that gives their paymasters like Gates exactly what they want? It's insane, but this is what you find throughout the world.

'Covid' is not dangerous, oops, wait, yes it is

Only days before Ferguson's nightmare scenario made Jackboot Johnson take Britain into a China-style lockdown to save us from a deadly 'virus' the UK government website gov.uk was reporting something very different to Ferguson on a page of official government guidance for 'high consequence infectious diseases (HCID)'. It said this about 'Covid-19':

As of 19 March 2020, COVID-19 *is no longer considered to be a high consequence infectious diseases (HCID) in the UK* [my emphasis]. The 4 nations public health HCID group made an interim recommendation in January 2020 to classify COVID-19 as an HCID. This was based on consideration of the UK HCID criteria about the virus and the disease with information available during the early stages of the outbreak.

Now that more is known about COVID-19, the public health bodies in the UK have reviewed the most up to date information about COVID-19 against the UK HCID criteria. They have determined that several features have now changed; in particular, more information is available about mortality rates (low overall), and there is now greater clinical awareness and a specific and sensitive laboratory test, the availability of which continues to increase. The Advisory Committee on Dangerous Pathogens (ACDP) is also of the opinion that COVID-19 should no longer be classified as an HCID.

Soon after the government had been exposed for downgrading the risk they upgraded it again and everyone was back to singing from the same Cult hymn book. Ferguson and his fellow Gates clones indicated that lockdowns and restrictions would have to continue until a Gates-funded vaccine was developed. Gates said the same because Ferguson and his like were repeating the Gates script which is the Cult script. 'Flatten the curve' became an ongoing nightmare of continuing lockdowns with periods in between of severe restrictions in pursuit of destroying independent incomes and had nothing to do with protecting health about which the Cult gives not a shit. Why wouldn't Ferguson be pushing a vaccine 'solution' when he's owned by vaccine-obsessive Gates who makes a fortune from them and

when Ferguson heads the Vaccine Impact Modelling Consortium at Imperial College funded by the Gates Foundation and GAVI, the 'vaccine alliance', created by Gates as his personal vaccine promotion operation? To compound the human catastrophe that Ferguson's 'models' did so much to create he was later exposed for breaking his own lockdown rules by having sexual liaisons with his married girlfriend Antonia Staats at his home while she was living at another location with her husband and children. Staats was a 'climate' activist and senior campaigner at the Soros-funded Avaaz which I wouldn't trust to tell me that grass is green. Ferguson had to resign as a government advisor over this hypocrisy in May, 2020, but after a period of quiet he was back being quoted by the ridiculous media on the need for more lockdowns and a vaccine rollout. Other government-advising 'scientists' from Imperial College' held the fort in his absence and said lockdown could be indefinite until a vaccine was found. The Cult script was being sung by the payrolled choir. I said there was no intention of going back to 'normal' when the 'vaccine' came because the 'vaccine' is part of a very different agenda that I will discuss in Human 2.0. Why would the Cult want to let the world go back to normal when destroying that normal forever was the whole point of what was happening? House arrest, closing businesses and schools through lockdown, (un)social distancing and masks all followed the Ferguson fantasy models. Again as I predicted (these people are so predictable) when the 'vaccine' arrived we were told that house arrest, lockdown, (un)social distancing and masks would still have to continue. I will deal with the masks in the next chapter because they are of fundamental importance.

Where's the 'pandemic'?

Any mildly in-depth assessment of the figures revealed what was really going on. Cult-funded and controlled organisations still have genuine people working within them such is the number involved. So it is with Genevieve Briand, assistant program director of the Applied Economics master's degree program at Johns Hopkins

University. She analysed the impact that 'Covid-19' had on deaths from *all* causes in the United States using official data from the CDC for the period from early February to early September, 2020. She found that allegedly 'Covid' *related*-deaths exceeded those from heart disease which she found strange with heart disease always the biggest cause of fatalities. Her research became even more significant when she noted the sudden decline in 2020 of *all* non-'Covid' deaths: 'This trend is completely contrary to the pattern observed in all previous years … the total decrease in deaths by other causes almost exactly equals the increase in deaths by Covid-19.' This was such a game, set and match in terms of what was happening that Johns Hopkins University deleted the article on the grounds that it 'was being used to support false and dangerous inaccuracies about the impact of the pandemic'. No – because it exposed the scam from official CDC figures and this was confirmed when those figures were published in January, 2021. Here we can see the effect of people dying from heart attacks, cancer, road accidents and gunshot wounds – *anything* – having 'Covid-19' on the death certificate along with those diagnosed from 'symptoms' who had even not tested positive with a test not testing for the 'virus'. I am not kidding with the gunshot wounds, by the way. Brenda Bock, coroner in Grand County, Colorado, revealed that two gunshot victims tested positive for the 'virus' within the previous 30 days and were therefore classified as 'Covid deaths'. Bock said: 'These two people had tested positive for Covid, but that's not what killed them. A gunshot wound is what killed them.' She said she had not even finished her investigation when the state listed the gunshot victims as deaths due to the 'virus'. The death and case figures for 'Covid-19' are an absolute joke and yet they are repeated like parrots by the media, politicians and alleged medical 'experts'. The official Cult narrative is the only show in town.

Genevieve Briand found that deaths from all causes were not exceptional in 2020 compared with previous years and a Spanish magazine published figures that said the same about Spain which was a 'Covid' propaganda hotspot at one point. *Discovery Salud*, a

health and medicine magazine, quoted government figures which showed how 17,000 *fewer* people died in Spain in 2020 than in 2019 and more than 26,000 fewer than in 2018. The age-standardised mortality rate for England and Wales when age distribution is taken into account was significantly lower in 2020 than the 1970s, 80s and 90s, and was only the ninth highest since 2000. Where is the 'pandemic'?

Post mortems and autopsies virtually disappeared for 'Covid' deaths amid claims that 'virus-infected' bodily fluids posed a risk to those carrying out the autopsy. This was rejected by renowned German pathologist and forensic doctor Klaus Püschel who said that he and his staff had by then done 150 autopsies on 'Covid' patients with no problems at all. He said they were needed to know why some 'Covid' patients suffered blood clots and not severe respiratory infections. The 'virus' is, after all, called SARS or 'severe acute respiratory syndrome'. I highlighted in the spring of 2020 this phenomenon and quoted New York intensive care doctor Cameron Kyle-Sidell who posted a soon deleted YouTube video to say that they had been told to prepare to treat an infectious disease called 'Covid-19', but that was not what they were dealing with. Instead he likened the lung condition of the most severely ill patients to what you would expect with cabin depressurisation in a plane at 30,000 feet or someone dropped on the top of Everest without oxygen or acclimatisation. I have never said this is not happening to a small minority of alleged 'Covid' patients – I am saying this is not caused by a phantom 'contagious virus'. Indeed Kyle-Sidell said that 'Covid-19' was not the disease they were told was coming their way. 'We are operating under a medical paradigm that is untrue,' he said, and he believed they were treating the wrong disease: 'These people are being slowly starved of oxygen.' Patients would take off their oxygen masks in a state of fear and stress and while they were blue in the face on the brink of death. They did not look like patients dying of pneumonia. You can see why they don't want autopsies when their virus doesn't exist and there is another condition in some people that they don't wish to be uncovered. I should add here that

the 5G system of millimetre waves was being rapidly introduced around the world in 2020 and even more so now as they fire 5G at the Earth from satellites. At 60 gigahertz within the 5G range that frequency interacts with the oxygen molecule and stops people breathing in sufficient oxygen to be absorbed into the bloodstream. They are installing 5G in schools and hospitals. The world is not mad or anything. 5G can cause major changes to the lungs and blood as I detail in *The Answer* and these consequences are labelled 'Covid-19', the alleged symptoms of which can be caused by 5G and other electromagnetic frequencies as cells respond to radiation poisoning.

The 'Covid death' scam

Dr Scott Jensen, a Minnesota state senator and medical doctor, exposed 'Covid' Medicare payment incentives to hospitals and death certificate manipulation. He said he was sent a seven-page document by the US Department of Health 'coaching' him on how to fill out death certificates which had never happened before. The document said that he didn't need to have a laboratory test for 'Covid-19' to put that on the death certificate and that shocked him when death certificates are supposed to be about facts. Jensen described how doctors had been 'encouraged, if not pressured' to make a diagnosis of 'Covid-19' if they thought it was probable or *'presumed*'. No positive test was necessary – not that this would have mattered anyway. He said doctors were told to diagnose 'Covid' by symptoms when these were the same as colds, allergies, other respiratory problems, and certainly with influenza which 'disappeared' in the 'Covid' era. A common sniffle was enough to get the dreaded verdict. Ontario authorities decreed that a single care home resident with *one* symptom from a long list must lead to the isolation of the entire home. Other courageous doctors like Jensen made the same point about death figure manipulation and how deaths by other causes were falling while 'Covid-19 deaths' were rising at the same rate due to re-diagnosis. Their videos rarely survive long on YouTube with its Cult-supporting algorithms courtesy of CEO Susan Wojcicki and her bosses at Google. Figure-tampering was so glaring

and ubiquitous that even officials were letting it slip or outright saying it. UK chief scientific adviser Patrick Vallance said on one occasion that 'Covid' on the death certificate doesn't mean 'Covid' was the cause of death (so why the hell is it there?) and we had the rare sight of a BBC reporter telling the truth when she said: 'Someone could be successfully treated for Covid, in say April, discharged, and then in June, get run over by a bus and die … That person would still be counted as a Covid death in England.' Yet the BBC and the rest of the world media went on repeating the case and death figures as if they were real. Illinois Public Health Director Dr Ngozi Ezike revealed the deceit while her bosses must have been clenching their buttocks:

> If you were in a hospice and given a few weeks to live and you were then found to have Covid that would be counted as a Covid death. [There might be] a clear alternate cause, but it is still listed as a Covid death. So everyone listed as a Covid death doesn't mean that was the cause of the death, but that they had Covid at the time of death.

Yes, a 'Covid virus' never shown to exist and tested for with a test not testing for the 'virus'. In the first period of the pandemic hoax through the spring of 2020 the process began of designating almost everything a 'Covid' death and this has continued ever since. I sat in a restaurant one night listening to a loud conversation on the next table where a family was discussing in bewilderment how a relative who had no symptoms of 'Covid', and had died of a long-term problem, could have been diagnosed a death by the 'virus'. I could understand their bewilderment. If they read this book they will know why this medical fraud has been perpetrated the world over.

Some media truth shock

The media ignored the evidence of death certificate fraud until eventually one columnist did speak out when she saw it first-hand. Bel Mooney is a long-time national newspaper journalist in Britain currently working for the *Daily Mail*. Her article on February 19th, 2021, carried this headline: 'My dad Ted passed three Covid tests

and died of a chronic illness yet he's officially one of Britain's 120,000 victims of the virus and is far from alone ... so how many more are there?' She told how her 99-year-old father was in a care home with a long-standing chronic obstructive pulmonary disease and vascular dementia. Maybe, but he was still aware enough to tell her from the start that there was no 'virus' and he refused the 'vaccine' for that reason. His death was not unexpected given his chronic health problems and Mooney said she was shocked to find that 'Covid-19' was declared the cause of death on his death certificate. She said this was a 'bizarre and unacceptable untruth' for a man with long-time health problems who had tested negative twice at the home for the 'virus'. I was also shocked by this story although not by what she said. I had been highlighting the death certificate manipulation for ten months. It was the confirmation that a professional full-time journalist only realised this was going on when it affected her directly and neither did she know that whether her dad tested positive or negative was irrelevant with the test not testing for the 'virus'. Where had she been? She said she did not believe in 'conspiracy theories' without knowing I'm sure that this and 'conspiracy theorists' were terms put into widespread circulation by the CIA in the 1960s to discredit those who did not accept the ridiculous official story of the Kennedy assassination. A blanket statement of 'I don't believe in conspiracy theories' is always bizarre. The dictionary definition of the term alone means the world is drowning in conspiracies. What she said was even more daft when her dad had just been affected by the 'Covid' conspiracy. Why else does she think that 'Covid-19' was going on the death certificates of people who died of something else?

To be fair once she saw from personal experience what was happening she didn't mince words. Mooney was called by the care home on the morning of February 9th to be told her father had died in his sleep. When she asked for the official cause of death what came back was 'Covid-19'. Mooney challenged this and was told there had been deaths from Covid on the dementia floor (confirmed by a test not testing for the 'virus') so they considered it 'reasonable

to assume'. 'But doctor,' Mooney rightly protested, 'an assumption isn't a diagnosis.' She said she didn't blame the perfectly decent and sympathetic doctor – 'he was just doing his job'. Sorry, but that's *bullshit*. He wasn't doing his job at all. He was putting a false cause of death on the death certificate and that is a criminal offence for which he should be brought to account and the same with the millions of doctors worldwide who have done the same. They were not doing their job they were following orders and that must not wash at new Nuremberg trials any more than it did at the first ones. Mooney's doctor was 'assuming' (presuming) as he was told to, but 'just following orders' makes no difference to his actions. A doctor's job is to serve the patient and the truth, not follow orders, but that's what they have done all over the world and played a central part in making the 'Covid' hoax possible with all its catastrophic consequences for humanity. Shame on them and they must answer for their actions. Mooney said her disquiet worsened when she registered her father's death by telephone and was told by the registrar there had been very many other cases like hers where 'the deceased' had not tested positive for 'Covid' yet it was recorded as the cause of death. The test may not matter, but those involved at their level *think* it matters and it shows a callous disregard for accurate diagnosis. The pressure to do this is coming from the top of the national 'health' pyramids which in turn obey the World Health Organization which obeys Gates and the Cult. Mooney said the registrar agreed that this must distort the national figures adding that 'the strangest thing is that every winter we record countless deaths from flu, and this winter there have been none. Not one!' She asked if the registrar thought deaths from flu were being misdiagnosed and lumped together with 'Covid' deaths. The answer was a 'puzzled yes'. Mooney said that the funeral director said the same about 'Covid' deaths which had nothing to do with 'Covid'. They had lost count of the number of families upset by this and other funeral companies in different countries have had the same experience. Mooney wrote:

The nightly shroud-waving and shocking close-ups of pain imposed on us by the TV news bewildered and terrified the population into eager compliance with lockdowns. We were invited to 'save the NHS' and to grieve for strangers – the real-life loved ones behind those shocking death counts. Why would the public imagine what I now fear, namely that the way Covid-19 death statistics are compiled might make the numbers seem greater than they are?

Oh, just a little bit – like 100 percent.

Do the maths

Mooney asked why a country would wish to skew its mortality figures by wrongly certifying deaths? What had been going on? Well, if you don't believe in conspiracies you will never find the answer which is that *it's a conspiracy*. She did, however, describe what she had discovered as a 'national scandal'. In reality it's a global scandal and happening everywhere. Pillars of this conspiracy were all put into place before the button was pressed with the Drosten PCR protocol and high amplifications to produce the cases and death certificate changes to secure illusory 'Covid' deaths. Mooney notes that normally two doctors were needed to certify a death, with one having to know the patient, and how the rules were changed in the spring of 2020 to allow one doctor to do this. In the same period 'Covid deaths' were decreed to be all cases where Covid-19 was put on the death certificate even without a positive test or any symptoms. Mooney asked: 'How many of the 30,851 (as of January 15) care home resident deaths with Covid-19 on the certificate (32.4 per cent of all deaths so far) were based on an assumption, like that of my father? And what has that done to our national psyche?'All of them is the answer to the first question and it has devastated and dismantled the national psyche, actually the global psyche, on a colossal scale. In the UK case and death data is compiled by organisations like Public Health England (PHE) and the Office for National Statistics (ONS). Mooney highlights the insane policy of counting a death from any cause as 'Covid-19' if this happens within 28 days of a positive test (with a test not testing for the 'virus') and she points out that ONS statistics reflect deaths 'involving Covid' 'or due to Covid' which meant in practice any

death where 'Covid-19' was mentioned on the death certificate. She described the consequences of this fraud:

Most people will accept the narrative they are fed, so panicky governments here and in Europe witnessed the harsh measures enacted in totalitarian China and jumped into lockdown. Headlines about Covid deaths tolled like the knell that would bring doomsday to us all. Fear stalked our empty streets. Politicians parroted the frankly ridiculous aim of 'zero Covid' and shut down the economy, while most British people agreed that lockdown was essential and (astonishingly to me, as a patriotic Brit) even wanted more restrictions.

For what? Lies on death certificates? Never mind the grim toll of lives ruined, suicides, schools closed, rising inequality, depression, cancelled hospital treatments, cancer patients in a torture of waiting, poverty, economic devastation, loneliness, families kept apart, and so on. How many lives have been lost as a direct result of lockdown?

She said that we could join in a national chorus of shock and horror at reaching the 120,000 death toll which was surely certain to have been totally skewed all along, but what about the human cost of lockdown justified by these 'death figures'? *The British Medical Journal* had reported a 1,493 percent increase in cases of children taken to Great Ormond Street Hospital with abusive head injuries alone and then there was the effect on families:

Perhaps the most shocking thing about all this is that families have been kept apart – and obeyed the most irrational, changing rules at the whim of government – because they believed in the statistics. They succumbed to fear, which his generation rejected in that war fought for freedom. Dad (God rest his soul) would be angry. And so am I.

Another theme to watch is that in the winter months when there are more deaths from all causes they focus on 'Covid' deaths and in the summer when the British Lung Foundation says respiratory disease plummets by 80 percent they rage on about 'cases'. Either way fascism on population is always the answer.

Nazi eugenics in the 21st century

Elderly people in care homes have been isolated from their families month after lonely month with no contact with relatives and grandchildren who were banned from seeing them. We were told

that lockdown fascism was to 'protect the vulnerable' like elderly people. At the same time Do Not Resuscitate (DNR) orders were placed on their medical files so that if they needed resuscitation it wasn't done and 'Covid-19' went on their death certificates. Old people were not being 'protected' they were being culled – murdered in truth. DNR orders were being decreed for disabled and young people with learning difficulties or psychological problems. The UK Care Quality Commission, a non-departmental body of the Department of Health and Social Care, found that 34 percent of those working in health and social care were pressured into placing 'do not attempt cardiopulmonary resuscitation' orders on 'Covid' patients who suffered from disabilities and learning difficulties without involving the patient or their families in the decision. UK judges ruled that an elderly woman with dementia should have the DNA-manipulating 'Covid vaccine' against her son's wishes and that a man with severe learning difficulties should have the jab despite his family's objections. Never mind that many had already died. The judiciary always supports doctors and government in fascist dictatorships. They wouldn't dare do otherwise. A horrific video was posted showing fascist officers from Los Angeles police forcibly giving the 'Covid' shot to women with special needs who were screaming that they didn't want it. The same fascists are seen giving the jab to a sleeping elderly woman in a care home. This is straight out of the Nazi playbook. Hitler's Nazis committed mass murder of the mentally ill and physically disabled throughout Germany and occupied territories in the programme that became known as Aktion T4, or just T4. Sabbatian-controlled Hitler and his grotesque crazies set out to kill those they considered useless and unnecessary. The Reich Committee for the Scientific Registering of Hereditary and Congenital Illnesses registered the births of babies identified by physicians to have 'defects'. By 1941 alone more than 5,000 children were murdered by the state and it is estimated that in total the number of innocent people killed in Aktion T4 was between 275,000 and 300,000. Parents were told their children had been sent away for 'special treatment' never to return. It is rather pathetic to see claims about plans for new extermination camps being dismissed today

when the same force behind current events did precisely that 80 years ago. Margaret Sanger was a Cult operative who used 'birth control' to sanitise her programme of eugenics. Organisations she founded became what is now Planned Parenthood. Sanger proposed that 'the whole dysgenic population would have its choice of segregation or sterilization'. These included epileptics, 'feeble-minded', and prostitutes. Sanger opposed charity because it perpetuated 'human waste'. She reveals the Cult mentality and if anyone thinks that extermination camps are a 'conspiracy theory' their naivety is touching if breathtakingly stupid.

If you don't believe that doctors can act with callous disregard for their patients it is worth considering that doctors and medical staff agreed to put government-decreed DNR orders on medical files and do nothing when resuscitation is called for. I don't know what you call such people in your house. In mine they are Nazis from the Josef Mengele School of Medicine. Phenomenal numbers of old people have died worldwide from the effects of lockdown, depression, lack of treatment, the 'vaccine' (more later) and losing the will to live. A common response at the start of the manufactured pandemic was to remove old people from hospital beds and transfer them to nursing homes. The decision would result in a mass cull of elderly people in those homes through lack of treatment – *not* 'Covid'. Care home whistleblowers have told how once the 'Covid' era began doctors would not come to their homes to treat patients and they were begging for drugs like antibiotics that often never came. The most infamous example was ordered by New York governor Andrew Cuomo, brother of a moronic CNN host, who amazingly was given an Emmy Award for his handling of the 'Covid crisis' by the ridiculous Wokers that hand them out. Just how ridiculous could be seen in February, 2021, when a Department of Justice and FBI investigation began into how thousands of old people in New York died in nursing homes after being discharged from hospital to make way for 'Covid' patients on Cuomo's say-so – and how he and his staff covered up these facts. This couldn't have happened to a nicer psychopath. Even then there was a 'Covid' spin. Reports said that

thousands of old people who tested positive for 'Covid' in hospital were transferred to nursing homes to both die of 'Covid' and transmit it to others. No – they were in hospital because they were ill and the fact that they tested positive with a test not testing for the 'virus' is irrelevant. They were ill often with respiratory diseases ubiquitous in old people near the end of their lives. Their transfer out of hospital meant that their treatment stopped and many would go on to die.

They're old. Who gives a damn?

I have exposed in the books for decades the Cult plan to cull the world's old people and even to introduce at some point what they call a 'demise pill' which at a certain age everyone would take and be out of here by law. In March, 2021, Spain legalised euthanasia and assisted suicide following the Netherlands, Belgium, Luxembourg and Canada on the Tiptoe to the demise pill. Treatment of old people by many 'care' homes has been a disgrace in the 'Covid' era. There are many, many, caring staff – I know some. There have, however, been legions of stories about callous treatment of old people and their families. Police were called when families came to take their loved ones home in the light of isolation that was killing them. They became prisoners of the state. Care home residents in insane, fascist Ontario, Canada, were not allowed to leave their *room* once the 'Covid' hoax began. UK staff have even wheeled elderly people away from windows where family members were talking with them. Oriana Criscuolo from Stockport in the English North West dropped off some things for her 80-year-old father who has Parkinson's disease and dementia and she wanted to wave to him through a ground-floor window. She was told that was 'illegal'. When she went anyway they closed the curtains in the middle of the day. Oriana said:

> It's just unbelievable. I cannot understand how care home staff – people who are being paid to care – have become so uncaring. Their behaviour is inhumane and cruel. It's beyond belief.

She was right and this was not a one-off. What a way to end your life in such loveless circumstances. UK registered nurse Nicky Millen, a proper old school nurse for 40 years, said that when she started her career care was based on dignity, choice, compassion and empathy. Now she said 'the things that are important to me have gone out of the window.' She was appalled that people were dying without their loved ones and saying goodbye on iPads. Nicky described how a distressed 89-year-old lady stroked her face and asked her 'how many paracetamol would it take to finish me off'. Life was no longer worth living while not seeing her family. Nicky said she was humiliated in front of the ward staff and patients for letting the lady stroke her face and giving her a cuddle. Such is the dehumanisation that the 'Covid' hoax has brought to the surface. Nicky worked in care homes where patients told her they were being held prisoner. 'I want to live until I die', one said to her. 'I had a lady in tears because she hadn't seen her great-grandson.' Nicky was compassionate old school meeting psychopathic New Normal. She also said she had worked on a 'Covid' ward with no 'Covid' patients. Jewish writer Shai Held wrote an article in March, 2020, which was headlined 'The Staggering, Heartless Cruelty Toward the Elderly'. What he described was happening from the earliest days of lockdown. He said 'the elderly' were considered a group and not unique individuals (the way of the Woke). Shai Held said:

Notice how the all-too-familiar rhetoric of dehumanization works: 'The elderly' are bunched together as a faceless mass, all of them considered culprits and thus effectively deserving of the suffering the pandemic will inflict upon them. Lost entirely is the fact that the elderly are individual human beings, each with a distinctive face and voice, each with hopes and dreams, memories and regrets, friendships and marriages, loves lost and loves sustained.

'The elderly' have become another dehumanised group for which anything goes and for many that has resulted in cold disregard for their rights and their life. The distinctive face that Held talks about is designed to be deleted by masks until everyone is part of a faceless mass.

‘War-zone’ hospitals myth

Again and again medical professionals have told me what was really going on and how hospitals ‘overrun like war zones’ according to the media were virtually empty. The mantra from medical whistleblowers was please don’t use my name or my career is over. Citizen journalists around the world sneaked into hospitals to film evidence exposing the ‘war-zone’ lie. They really *were* largely empty with closed wards and operating theatres. I met a hospital worker in my town on the Isle of Wight during the first lockdown in 2020 who said the only island hospital had never been so quiet. Lockdown was justified by the psychopaths to stop hospitals being overrun. At the same time that the island hospital was near-empty the military arrived here to provide *extra beds*. It was all propaganda to ramp up the fear to ensure compliance with fascism as were never-used temporary hospitals with thousands of beds known as Nightingales and never-used make-shift mortuaries opened by the criminal UK government. A man who helped to install those extra island beds attributed to the army said they were never used and the hospital was empty. Doctors and nurses ‘stood around talking or on their phones, wandering down to us to see what we were doing’. There were no masks or social distancing. He accused the useless local island paper, the *County Press*, of ‘pumping the fear as if our hospital was overrun and we only have one so it should have been’. He described ambulances parked up with crews outside in deck chairs. When his brother called an ambulance he was told there was a two-hour backlog which he called ‘bullshit’. An old lady on the island fell ‘and was in a bad way’, but a caller who rang for an ambulance was told the situation wasn’t urgent enough. Ambulance stations were working under capacity while people would hear ambulances with sirens blaring driving through the streets. When those living near the stations realised what was going on they would follow them as they left, circulated around an urban area with the sirens going, and then came back without stopping. All this was to increase levels of fear and the same goes for the ‘ventilator shortage crisis’ that cost tens of millions for hastily produced ventilators never to be used.

Ambulance crews that agreed to be exploited in this way for fear propaganda might find themselves a mirror. I wish them well with that. Empty hospitals were the obvious consequence of treatment and diagnoses of non-'Covid' conditions cancelled and those involved handed a death sentence. People have been dying at home from undiagnosed and untreated cancer, heart disease and other life-threatening conditions to allow empty hospitals to deal with a 'pandemic' that wasn't happening.

Death of the innocent

'War-zones' have been laying off nursing staff, even doctors where they can. There was no work for them. Lockdown was justified by saving lives and protecting the vulnerable they were actually killing with DNR orders and preventing empty hospitals being 'overrun'. In Britain the mantra of stay at home to 'save the NHS' was everywhere and across the world the same story was being sold when it was all lies. Two California doctors, Dan Erickson and Artin Massihi at Accelerated Urgent Care in Bakersfield, held a news conference in April, 2020, to say that intensive care units in California were 'empty, essentially', with hospitals shutting floors, not treating patients and laying off doctors. The California health system was working at minimum capacity 'getting rid of doctors because we just don't have the volume'. They said that people with conditions such as heart disease and cancer were not coming to hospital out of fear of 'Covid-19'. Their video was deleted by Susan Wojcicki's Cult-owned YouTube after reaching five million views. Florida governor Ron Desantis, who rejected the severe lockdowns of other states and is being targeted for doing so, said that in March, 2020, every US governor was given models claiming they would run out of hospital beds in days. That was never going to happen and the 'modellers' knew it. Deceit can be found at every level of the system. Urgent children's operations were cancelled including fracture repairs and biopsies to spot cancer. Eric Nicholls, a consultant paediatrician, said 'this is obviously concerning and we need to return to normal operating and to increase capacity as soon as possible'. Psychopaths

in power were rather less concerned *because* they are psychopaths. Deletion of urgent care and diagnosis has been happening all over the world and how many kids and others have died as a result of the actions of these cold and heartless lunatics dictating 'health' policy? The number must be stratospheric. Richard Sullivan, professor of cancer and global health at King's College London, said people feared 'Covid' more than cancer such was the campaign of fear. 'Years of lost life will be quite dramatic', Sullivan said, with 'a huge amount of avoidable mortality'. Sarah Woolnough, executive director for policy at Cancer Research UK, said there had been a 75 percent drop in urgent referrals to hospitals by family doctors of people with suspected cancer. Sullivan said that 'a lot of services have had to scale back – we've seen a dramatic decrease in the amount of elective cancer surgery'. Lockdown deaths worldwide has been absolutely fantastic with the *New York Post* reporting how data confirmed that 'lockdowns end more lives than they save':

> There was a sharp decline in visits to emergency rooms and an increase in fatal heart attacks because patients didn't receive prompt treatment. Many fewer people were screened for cancer. Social isolation contributed to excess deaths from dementia and Alzheimer's.
>
> Researchers predicted that the social and economic upheaval would lead to tens of thousands of "deaths of despair" from drug overdoses, alcoholism and suicide. As unemployment surged and mental-health and substance-abuse treatment programs were interrupted, the reported levels of anxiety, depression and suicidal thoughts increased dramatically, as did alcohol sales and fatal drug overdoses.

This has been happening while nurses and other staff had so much time on their hands in the 'war-zones' that Tic-Tok dancing videos began appearing across the Internet with medical staff dancing around in empty wards and corridors as people died at home from causes that would normally have been treated in hospital.

Mentions in dispatches

One brave and truth-committed whistleblower was Louise Hampton, a call handler with the UK NHS who made a viral Internet video saying she had done 'fuck all' during the 'pandemic'

which was 'a load of bollocks'. She said that 'Covid-19' was rebranded flu and of course she lost her job. This is what happens in the medical and endless other professions now when you tell the truth. Louise filmed inside 'war-zone' accident and emergency departments to show they were empty and I mean *empty* as in no one there. The mainstream media could have done the same and blown the gaff on the whole conspiracy. They haven't to their eternal shame. Not that most 'journalists' seem capable of manifesting shame as with the psychopaths they slavishly repeat without question. The relative few who were admitted with serious health problems were left to die alone with no loved ones allowed to see them because of 'Covid' rules and they included kids dying without the comfort of mum and dad at their bedside while the evil behind this couldn't give a damn. It was all good fun to them. A Scottish NHS staff nurse publicly quit in the spring of 2021 saying: 'I can no longer be part of the lies and the corruption by the government.' She said hospitals 'aren't full, the beds aren't full, beds have been shut, wards have been shut'. Hospitals were never busy throughout 'Covid'. The staff nurse said that Nicola Sturgeon, tragically the leader of the Scottish government, was on television saying save the hospitals and the NHS – 'but the beds are empty' and 'we've not seen flu, we always see flu every year'. She wrote to government and spoke with her union Unison (the unions are Cult-compromised and *useless*, but nothing changed. Many of her colleagues were scared of losing their jobs if they spoke out as they wanted to. She said nursing staff were being affected by wearing masks all day and 'my head is splitting every shift from wearing a mask'. The NHS is part of the fascist tyranny and must be dismantled so we can start again with human beings in charge. (Ironically, hospitals were reported to be busier again when official 'Covid' cases *fell* in spring/summer of 2021 and many other conditions required treatment at the same time as *the fake vaccine rollout*.)

I will cover the 'Covid vaccine' scam in detail later, but it is another indicator of the sickening disregard for human life that I am highlighting here. The DNA-manipulating concoctions do not fulfil

the definition of a 'vaccine', have never been used on humans before and were given only emergency approval because trials were not completed and they continued using the unknowing public. The result was what a NHS senior nurse with responsibility for 'vaccine' procedure said was 'genocide'. She said the 'vaccines' were not 'vaccines'. They had not been shown to be safe and claims about their effectiveness by drug companies were 'poetic licence'. She described what was happening as a 'horrid act of human annihilation'. The nurse said that management had instigated a policy of not providing a Patient Information Leaflet (PIL) before people were 'vaccinated' even though health care professionals are supposed to do this according to protocol. Patients should also be told that they are taking part in an ongoing clinical trial. Her challenges to what is happening had seen her excluded from meetings and ridiculed in others. She said she was told to 'watch my step … or I would find myself surplus to requirements'. The nurse, who spoke anonymously in fear of her career, said she asked her NHS manager why he/she was content with taking part in genocide against those having the 'vaccines'. The reply was that everyone had to play their part and to 'put up, shut up, and get it done'. Government was 'leaning heavily' on NHS management which was clearly leaning heavily on staff. This is how the global 'medical' hierarchy operates and it starts with the Cult and its World Health Organization.

She told the story of a doctor who had the Pfizer jab and when questioned had no idea what was in it. The doctor had never read the literature. We have to stop treating doctors as intellectual giants when so many are moral and medical pygmies. The doctor did not even know that the 'vaccines' were not fully approved or that their trials were ongoing. They were, however, asking their patients if they minded taking part in follow-ups for research purposes – yes, the *ongoing clinical trial*. The nurse said the doctor's ignorance was not rare and she had spoken to a hospital consultant who had the jab without any idea of the background or that the 'trials' had not been completed. Nurses and pharmacists had shown the same ignorance.

'My NHS colleagues have forsaken their duty of care, broken their code of conduct – Hippocratic Oath – and have been brainwashed just the same as the majority of the UK public through propaganda …' She said she had not been able to recruit a single NHS colleague, doctor, nurse or pharmacist to stand with her and speak out. Her union had refused to help. She said that if the genocide came to light she would not hesitate to give evidence at a Nuremberg-type trial against those in power who could have affected the outcomes but didn't.

And all for what?

To put the nonsense into perspective let's say the 'virus' does exist and let's go completely crazy and accept that the official manipulated figures for cases and deaths are accurate. *Even then* a study by Stanford University epidemiologist Dr John Ioannidis published on the World Health Organization website produced an average infection to fatality rate of … *0.23 percent!* Ioannidis said: 'If one could sample equally from all locations globally, the median infection fatality rate might even be substantially lower than the 0.23% observed in my analysis.' For healthy people under 70 it was … *0.05 percent*! This compares with the 3.4 percent claimed by the Cult-owned World Health Organization when the hoax was first played and maximum fear needed to be generated. An updated Stanford study in April, 2021, put the 'infection' to 'fatality' rate at just 0.15 percent. Another team of scientists led by Megan O'Driscoll and Henrik Salje studied data from 45 countries and published their findings on the Nature website. For children and young people the figure is so small it virtually does not register although authorities will be hyping dangers to the young when they introduce DNA-manipulating 'vaccines' for children. The O'Driscoll study produced an average infection-fatality figure of 0.003 for children from birth to four; 0.001 for 5 to 14; 0.003 for 15 to 19; and it was still only 0.456 up to 64. To claim that children must be 'vaccinated' to protect them from 'Covid' is an obvious lie and so there must be another reason and there is. What's more the average age of a 'Covid' death is akin

to the average age that people die in general. The average age of death in England is about 80 for men and 83 for women. The average age of death from alleged 'Covid' is between 82 and 83. California doctors, Dan Erickson and Artin Massihi, said at their April media conference that projection models of millions of deaths had been 'woefully inaccurate'. They produced detailed figures showing that Californians had a 0.03 chance of dying from 'Covid' based on the number of people who tested positive (with a test not testing for the 'virus'). Erickson said there was a 0.1 percent chance of dying from 'Covid' in the *state* of New York, not just the city, and a 0.05 percent chance in Spain, a centre of 'Covid-19' hysteria at one stage. The Stanford studies supported the doctors' data with fatality rate estimates of 0.23 and 0.15 percent. How close are these figures to my estimate of *zero*? Death-rate figures claimed by the World Health Organization at the start of the hoax were some 15 times higher. The California doctors said there was no justification for lockdowns and the economic devastation they caused. Everything they had ever learned about quarantine was that you quarantine the *sick* and not the healthy. They had never seen this before and it made no medical sense.

Why in the in the light of all this would governments and medical systems the world over say that billions must go under house arrest; lose their livelihood; in many cases lose their mind, their health and their life; force people to wear masks dangerous to health and psychology; make human interaction and even family interaction a criminal offence; ban travel; close restaurants, bars, watching live sport, concerts, theatre, and any activity involving human togetherness and discourse; and closing schools to isolate children from their friends and cause many to commit suicide in acts of hopelessness and despair? The California doctors said lockdown consequences included increased child abuse, partner abuse, alcoholism, depression, and other impacts they were seeing every day. Who would do that to the entire human race if not mentally-ill psychopaths of almost unimaginable extremes like Bill Gates? We must face the reality of what we are dealing with and come out of

denial. Fascism and tyranny are made possible only by the target population submitting and acquiescing to fascism and tyranny. The whole of human history shows that to be true. Most people naively and unquestioning believed what they were told about a 'deadly virus' and meekly and weakly submitted to house arrest. Those who didn't believe it – at least in total – still submitted in fear of the consequences of not doing so. For the rest who wouldn't submit draconian fines have been imposed, brutal policing by psychopaths *for* psychopaths, and condemnation from the meek and weak who condemn the Pushbackers on behalf of the very force that has them, too, in its gunsights. 'Pathetic' does not even begin to suffice. Britain's brainless 'Health' Secretary Matt Hancock warned anyone lying to border officials about returning from a list of 'hotspot' countries could face a jail sentence of up to ten years which is more than for racially-aggravated assault, incest and attempting to have sex with a child under 13. Hancock is a lunatic, but he has the state apparatus behind him in a Cult-led chain reaction and the same with UK 'Vaccine Minister' Nadhim Zahawi, a prominent member of the mega-Cult secret society, Le Cercle, which featured in my earlier books. The Cult enforces its will on governments and medical systems; government and medical systems enforce their will on business and police; business enforces its will on staff who enforce it on customers; police enforce the will of the Cult on the population and play their essential part in creating a world of fascist control that their own children and grandchildren will have to live in their entire lives. It is a hierarchical pyramid of imposition and acquiescence and, yes indeedy, of clinical insanity.

Does anyone bright enough to read this book have to ask what the answer is? I think not, but I will reveal it anyway in the fewest of syllables: Tell the psychos and their moronic lackeys to fuck off and let's get on with our lives. We are many – They are few.

CHAPTER SEVEN

War on your mind

One believes things because one has been conditioned to believe them
Aldous Huxley, *Brave New World*

I have described the 'Covid' hoax as a 'Psyop' and that is true in every sense and on every level in accordance with the definition of that term which is psychological warfare. Break down the 'Covid pandemic' to the foundation themes and it is psychological warfare on the human individual and collective mind.

The same can be said for the entire human belief system involving every subject you can imagine. Huxley was right in his contention that people believe what they are conditioned to believe and this comes from the repetition throughout their lives of the same falsehoods. They spew from government, corporations, media and endless streams of 'experts' telling you what the Cult wants you to believe and often believing it themselves (although *far* from always). 'Experts' are rewarded with 'prestigious' jobs and titles and as agents of perceptual programming with regular access to the media. The Cult has to control the narrative – control *information* – or they lose control of the vital, crucial, without-which-they-cannot-prevail public perception of reality. The foundation of that control today is the Internet made possible by the Defense Advanced Research Projects Agency (DARPA), the incredibly sinister technological arm of the Pentagon. The Internet is the result of military technology.

DARPA openly brags about establishing the Internet which has been a long-term project to lasso the minds of the global population. I have said for decades the plan is to control information to such an extreme that eventually no one would see or hear anything that the Cult does not approve. We are closing in on that end with ferocious censorship since the 'Covid' hoax began and in my case it started back in the 1990s in terms of books and speaking venues. I had to create my own publishing company in 1995 precisely because no one else would publish my books even then. I think they're all still running.

Cult Internet

To secure total control of information they needed the Internet in which pre-programmed algorithms can seek out 'unclean' content for deletion and even stop it being posted in the first place. The Cult had to dismantle print and non-Internet broadcast media to ensure the transfer of information to the appropriate-named 'Web' – a critical expression of the *Cult* web. We've seen the ever-quickening demise of traditional media and control of what is left by a tiny number of corporations operating worldwide. Independent journalism in the mainstream is already dead and never was that more obvious than since the turn of 2020. The Cult wants all information communicated via the Internet to globally censor and allow the plug to be pulled any time. Lockdowns and forced isolation has meant that communication between people has been through electronic means and no longer through face-to-face discourse and discussion. Cult psychopaths have targeted the bars, restaurants, sport, venues and meeting places in general for this reason. None of this is by chance and it's to stop people gathering in any kind of privacy or number while being able to track and monitor all Internet communications and block them as necessary. Even private messages between individuals have been censored by these fascists that control Cult fronts like Facebook, Twitter, Google and YouTube which are all officially run by Sabbatian place-people and from the background by higher-level Sabbatian place people.

Facebook, Google, Amazon and their like were seed-funded and supported into existence with money-no-object infusions of funds either directly or indirectly from DARPA and CIA technology arm In-Q-Tel. The Cult plays the long game and prepares very carefully for big plays like 'Covid'. Amazon is another front in the psychological war and pretty much controls the global market in book sales and increasingly publishing. Amazon's limitless funds have deleted fantastic numbers of independent publishers to seize global domination on the way to deciding which books can be sold and circulated and which cannot. Moves in that direction are already happening. Amazon's leading light Jeff Bezos is the grandson of Lawrence Preston Gise who worked with DARPA predecessor ARPA. Amazon has big connections to the CIA and the Pentagon. The plan I have long described went like this:

1. Employ military technology to establish the Internet.

2. Sell the Internet as a place where people can freely communicate without censorship and allow that to happen until the Net becomes the central and irreversible pillar of human society. If the Internet had been highly censored from the start many would have rejected it.

3. Fund and manipulate major corporations into being to control the circulation of information on your Internet using cover stories about geeks in garages to explain how they came about. Give them unlimited funds to expand rapidly with no need to make a profit for years while non-Cult companies who need to balance the books cannot compete. You know that in these circumstances your Googles, YouTubes, Facebooks and Amazons are going to secure near monopolies by either crushing or buying up the opposition.

4. Allow freedom of expression on both the Internet and communication platforms to draw people in until the Internet is the central and irreversible pillar of human society and your communication corporations have reached a stage of near monopoly domination.

5. Then unleash your always-planned frenzy of censorship on the basis of 'where else are you going to go?' and continue to expand that until nothing remains that the Cult does not want its human targets to see.

The process was timed to hit the 'Covid' hoax to ensure the best chance possible of controlling the narrative which they knew they had to do at all costs. They were, after all, about to unleash a 'deadly virus' that didn't really exist. If you do that in an environment of free-flowing information and opinion you would be dead in the

water before you could say Gates is a psychopath. The network was in place through which the Cult-created-and-owned World Health Organization could dictate the 'Covid' narrative and response policy slavishly supported by Cult-owned Internet communication giants and mainstream media while those telling a different story were censored. Google, YouTube, Facebook and Twitter openly announced that they would do this. What else would we expect from Cult-owned operations like Facebook which former executives have confirmed set out to make the platform more addictive than cigarettes and coldly manipulates emotions of its users to sow division between people and groups and scramble the minds of the young? If Zuckerberg lives out the rest of his life without going to jail for crimes against humanity, and most emphatically against the young, it will be a travesty of justice. Still, no matter, cause and effect will catch up with him eventually and the same with Sergey Brin and Larry Page at Google with its CEO Sundar Pichai who fix the Google search results to promote Cult narratives and hide the opposition. Put the same key words into Google and other search engines like DuckDuckGo and you will see how different results can be. Wikipedia is another intensely biased 'encyclopaedia' which skews its content to the Cult agenda. YouTube links to Wikipedia's version of 'Covid' and 'climate change' on video pages in which experts in their field offer a different opinion (even that is increasingly rare with Wojcicki censorship). Into this 'Covid' silence-them network must be added government media censors, sorry 'regulators', such as Ofcom in the UK which imposed tyrannical restrictions on British broadcasters that had the effect of banning me from ever appearing. Just to debate with me about my evidence and views on 'Covid' would mean breaking the fascistic impositions of Ofcom and its CEO career government bureaucrat Melanie Dawes. Gutless British broadcasters tremble at the very thought of fascist Ofcom.

Psychos behind 'Covid'

The reason for the 'Covid' catastrophe in all its facets and forms can be seen by whom and what is driving the policies worldwide in such a coordinated way. Decisions are not being made to protect health, but to target psychology. The dominant group guiding and 'advising' government policy are not medical professionals. They are psychologists and behavioural scientists. Every major country has its own version of this phenomenon and I'll use the British example to show how it works. In many ways the British version has been affecting the wider world in the form of the huge behaviour manipulation network in the UK which operates in other countries. The network involves private companies, government, intelligence and military. The Cabinet Office is at the centre of the government 'Covid' Psyop and part-owns, with 'innovation charity' Nesta, the Behavioural Insights Team (BIT) which claims to be independent of government but patently isn't. The BIT was established in 2010 and its job is to manipulate the psyche of the population to acquiesce to government demands and so much more. It is also known as the 'Nudge Unit', a name inspired by the 2009 book by two ultra-Zionists, Cass Sunstein and Richard Thaler, called *Nudge: Improving Decisions About Health, Wealth, and Happiness*. The book, as with the Behavioural Insights Team, seeks to 'nudge' behaviour (manipulate it) to make the public follow patterns of action and perception that suit those in authority (the Cult). Sunstein is so skilled at this that he advises the World Health Organization and the UK Behavioural Insights Team and was Administrator of the White House Office of Information and Regulatory Affairs in the Obama administration. Biden appointed him to the Department of Homeland Security – another ultra-Zionist in the fold to oversee new immigration laws which is another policy the Cult wants to control. Sunstein is desperate to silence anyone exposing conspiracies and co-authored a 2008 report on the subject in which suggestions were offered to ban 'conspiracy theorizing' or impose 'some kind of tax, financial or otherwise, on those who disseminate such theories'. I guess a psychiatrist's chair is out of the question?

Sunstein's mate Richard Thaler, an 'academic affiliate' of the UK Behavioural Insights Team, is a proponent of 'behavioural economics' which is defined as the study of 'the effects of psychological, cognitive, emotional, cultural and social factors on the decisions of individuals and institutions'. Study the effects so they can be manipulated to be what you want them to be. Other leading names in the development of behavioural economics are ultra-Zionists Daniel Kahneman and Robert J. Shiller and they, with Thaler, won the Nobel Memorial Prize in Economic Sciences for their work in this field. The Behavioural Insights Team is operating at the heart of the UK government and has expanded globally through partnerships with several universities including Harvard, Oxford, Cambridge, University College London (UCL) and Pennsylvania. They claim to have 'trained' (reframed) 20,000 civil servants and run more than 750 projects involving 400 randomised controlled trials in dozens of countries' as another version of mind reframers Common Purpose. BIT works from its office in New York with cities and their agencies, as well as other partners, across the United States and Canada – this is a company part-owned by the British government Cabinet Office. An executive order by President Cult-servant Obama established a US Social and Behavioral Sciences Team in 2015. They all have the same reason for being and that's to brainwash the population directly and by brainwashing those in positions of authority.

'Covid' mind game

Another prime aspect of the UK mind-control network is the 'independent' [joke] Scientific Pandemic Insights Group on Behaviours (SPI-B) which 'provides behavioural science advice aimed at anticipating and helping people adhere to interventions that are recommended by medical or epidemiological experts'. That means manipulating public perception and behaviour to do whatever government tells them to do. It's disgusting and if they really want the public to be 'safe' this lot should all be under lock and key. According to the government website SPI-B consists of

'behavioural scientists, health and social psychologists, anthropologists and historians' and advises the Whitty-Vallance-led Scientific Advisory Group for Emergencies (SAGE) which in turn advises the government on 'the science' (it doesn't) and 'Covid' policy. When politicians say they are being guided by 'the science' this is the rabble in each country they are talking about and that 'science' is dominated by behaviour manipulators to enforce government fascism through public compliance. The Behaviour Insight Team is headed by psychologist David Solomon Halpern, a visiting professor at King's College London, and connects with a national and global web of other civilian and military organisations as the Cult moves towards its goal of fusing them into one fascistic whole in every country through its 'Fusion Doctrine'. The behaviour manipulation network involves, but is not confined to, the Foreign Office; National Security Council; government communications headquarters (GCHQ); MI5; MI6; the Cabinet Office-based Media Monitoring Unit; and the Rapid Response Unit which 'monitors digital trends to spot emerging issues; including misinformation and disinformation; and identifies the best way to respond'.

There is also the 77th Brigade of the UK military which operates like the notorious Israeli military's Unit 8200 in manipulating information and discussion on the Internet by posing as members of the public to promote the narrative and discredit those who challenge it. Here we have the military seeking to manipulate *domestic* public opinion while the Nazis in government are fine with that. Conservative Member of Parliament Tobias Ellwood, an advocate of lockdown and control through 'vaccine passports', is a Lieutenant Colonel reservist in the 77th Brigade which connects with the military operation jHub, the 'innovation centre' for the Ministry of Defence and Strategic Command. jHub has also been involved with the civilian National Health Service (NHS) in 'symptom tracing' the population. The NHS is a key part of this mind control network and produced a document in December, 2020, explaining to staff how to use psychological manipulation with different groups and ages to get them to have the DNA-manipulating 'Covid vaccine'

that's designed to cumulatively rewrite human genetics. The document, called 'Optimising Vaccination Roll Out – Do's and Dont's for all messaging, documents and "communications" in the widest sense', was published by NHS England and the NHS Improvement *Behaviour Change Unit* in partnership with Public Health England and Warwick Business School. I hear the mantra about 'save the NHS' and 'protect the NHS' when we need to scrap the NHS and start again. The current version is far too corrupt, far too anti-human and totally compromised by Cult operatives and their assets. UK government broadcast media censor Ofcom will connect into this web – as will the BBC with its tremendous Ofcom influence – to control what the public see and hear and dictate mass perception. Nuremberg trials must include personnel from all these organisations.

The fear factor

The 'Covid' hoax has led to the creation of the UK Cabinet Office-connected Joint Biosecurity Centre (JBC) which is officially described as providing 'expert advice on pandemics' using its independent [all Cult operations are 'independent'] analytical function to provide real-time analysis about infection outbreaks to identify and respond to outbreaks of Covid-19'. Another role is to advise the government on a response to spikes in infections – 'for example by closing schools or workplaces in local areas where infection levels have risen'. Put another way, promoting the Cult agenda. The Joint Biosecurity Centre is modelled on the Joint Terrorism Analysis Centre which analyses intelligence to set 'terrorism threat levels' and here again you see the fusion of civilian and military operations and intelligence that has led to military intelligence producing documents about 'vaccine hesitancy' and how it can be combated. Domestic civilian matters and opinions should not be the business of the military. The Joint Biosecurity Centre is headed by Tom Hurd, director general of the Office for Security and Counter-Terrorism from the establishment-to-its-fingertips Hurd family. His father is former Foreign Secretary Douglas Hurd. How coincidental that Tom

Hurd went to the elite Eton College and Oxford University with Boris Johnson. Imperial College with its ridiculous computer modeller Neil Ferguson will connect with this gigantic web that will itself interconnect with similar set-ups in other major and not so major countries. Compared with this Cult network the politicians, be they Boris Johnson, Donald Trump or Joe Biden, are bit-part players 'following the science'. The network of psychologists was on the 'Covid' case from the start with the aim of generating maximum fear of the 'virus' to ensure compliance by the population. A government behavioural science group known as SPI-B produced a paper in March, 2020, for discussion by the main government science advisory group known as SAGE. It was headed 'Options for increasing adherence to social distancing measures' and it said the following in a section headed 'Persuasion':

- A substantial number of people still do not feel sufficiently personally threatened; it could be that they are reassured by the low death rate in their demographic group, although levels of concern may be rising. Having a good understanding of the risk has been found to be positively associated with adoption of COVID-19 social distancing measures in Hong Kong.

- The perceived level of personal threat needs to be increased among those who are complacent, using hard-hitting evaluation of options for increasing social distancing emotional messaging. To be effective this must also empower people by making clear the actions they can take to reduce the threat.

- Responsibility to others: There seems to be insufficient understanding of, or feelings of responsibility about, people's role in transmitting the infection to others … Messaging about actions need to be framed positively in terms of protecting oneself and the community, and increase confidence that they will be effective.

- Some people will be more persuaded by appeals to play by the rules, some by duty to the community, and some to personal risk.

> All these different approaches are needed. The messaging also needs to take account of the realities of different people's lives. Messaging needs to take account of the different motivational levers and circumstances of different people.

All this could be achieved the SPI-B psychologists said by *using the media to increase the sense of personal threat* which translates as terrify the shit out of the population, including children, so they all do what we want. That's not happened has it? Those excuses for 'journalists' who wouldn't know journalism if it bit them on the arse (the great majority) have played their crucial part in serving this Cult-government Psyop to enslave their own kids and grandkids. How they live with themselves I have no idea. The psychological war has been underpinned by constant government 'Covid' propaganda in almost every television and radio ad break, plus the Internet and print media, which has pounded out the fear with taxpayers footing the bill for their own programming. The result has been people terrified of a 'virus' that doesn't exist or one with a tiny fatality rate even if you believe it does. People walk down the street and around the shops wearing face-nappies damaging their health and psychology while others report those who refuse to be that naïve to the police who turn up in their own face-nappies. I had a cameraman come to my flat and he was so frightened of 'Covid' he came in wearing a mask and refused to shake my hand in case he caught something. He had – naïveitis – and the thought that he worked in the mainstream media was both depressing and made his behaviour perfectly explainable. The fear which has gripped the minds of so many and frozen them into compliance has been carefully cultivated by these psychologists who are really psychopaths. If lives get destroyed and a lot of young people commit suicide it shows our plan is working. SPI-B then turned to compulsion on the public to comply. 'With adequate preparation, rapid change can be achieved', it said. Some countries had introduced mandatory self-isolation on a wide scale without evidence of major public unrest and a large majority of the UK's population appeared to be supportive of more coercive measures with 64 percent of adults saying they would

support putting London under a lockdown (watch the 'polls' which are designed to make people believe that public opinion is in favour or against whatever the subject in hand).

For 'aggressive protective measures' to be effective, the SPI-B paper said, special attention should be devoted to those population groups that are more at risk. Translated from the Orwellian this means making the rest of population feel guilty for not protecting the 'vulnerable' such as old people which the Cult and its agencies were about to kill on an industrial scale with lockdown, lack of treatment and the Gates 'vaccine'. Psychopath psychologists sold their guilt-trip so comprehensively that Los Angeles County Supervisor Hilda Solis reported that children were apologising (from a distance) to their parents and grandparents for bringing 'Covid' into their homes and getting them sick. '… These apologies are just some of the last words that loved ones will ever hear as they die alone,' she said. Gut-wrenchingly Solis then used this childhood tragedy to tell children to stay at home and 'keep your loved ones alive'. Imagine heaping such potentially life-long guilt on a kid when it has absolutely nothing to do with them. These people are deeply disturbed and the psychologists behind this even more so.

Uncivil war – divide and rule

Professional mind-controllers at SPI-B wanted the media to increase a sense of responsibility to others (do as you're told) and promote 'positive messaging' for those actions while in contrast to invoke 'social disapproval' by the unquestioning, obedient, community of anyone with a mind of their own. Again the compliant Goebbels-like media obliged. This is an old, old, trick employed by tyrannies the world over throughout human history. You get the target population to keep the target population in line – *your* line. SPI-B said this could 'play an important role in preventing anti-social behaviour or discouraging failure to enact pro-social behaviour'. For 'anti-social' in the Orwellian parlance of SPI-B see any behaviour that government doesn't approve. SPI-B recommendations said that 'social disapproval' should be accompanied by clear messaging and

promotion of strong collective identity – hence the government and celebrity mantra of 'we're all in this together'. Sure we are. The mind doctors have such contempt for their targets that they think some clueless comedian, actor or singer telling them to do what the government wants will be enough to win them over. We have had UK comedian Lenny Henry, actor Michael Caine and singer Elton John wheeled out to serve the propagandists by urging people to have the DNA-manipulating 'Covid' non-'vaccine'. The role of Henry and fellow black celebrities in seeking to coax a 'vaccine' reluctant black community into doing the government's will was especially stomach-turning. An emotion-manipulating script and carefully edited video featuring these black 'celebs' was such an insult to the intelligence of black people and where's the self-respect of those involved selling their souls to a fascist government agenda? Henry said he heard black people's 'legitimate worries and concerns', but people must 'trust the facts' when they were doing exactly that by not having the 'vaccine'. They had to include the obligatory reference to Black Lives Matter with the line … 'Don't let coronavirus cost even more black lives – because we matter'. My god, it was pathetic. 'I know the vaccine is safe and what it does.' How? 'I'm a comedian and it says so in my script.'

SPI-B said social disapproval needed to be carefully managed to avoid victimisation, scapegoating and misdirected criticism, but they knew that their 'recommendations' would lead to exactly that and the media were specifically used to stir-up the divide-and-conquer hostility. Those who conform like good little baa, baas, are praised while those who have seen through the tidal wave of lies are 'Covidiots'. The awake have been abused by the fast asleep for not conforming to fascism and impositions that the awake know are designed to endanger their health, dehumanise them, and tear asunder the very fabric of human society. We have had the curtain-twitchers and morons reporting neighbours and others to the face-nappied police for breaking 'Covid rules' with fascist police delighting in posting links and phone numbers where this could be done. The Cult cannot impose its will without a compliant police

and military or a compliant population willing to play their part in enslaving themselves and their kids. The words of a pastor in Nazi Germany are so appropriate today:

First they came for the socialists and I did not speak out because I was not a socialist.

Then they came for the trade unionists and I did not speak out because I was not a trade unionist.

Then they came for the Jews and I did not speak out because I was not a Jew.

Then they came for me and there was no one left to speak for me.

Those who don't learn from history are destined to repeat it and so many are.

'Covid' rules: Rewiring the mind

With the background laid out to this gigantic national and global web of psychological manipulation we can put 'Covid' rules into a clear and sinister perspective. Forget the claims about protecting health. 'Covid' rules are about dismantling the human mind, breaking the human spirit, destroying self-respect, and then putting Humpty Dumpty together again as a servile, submissive slave. Social isolation through lockdown and distancing have devastating effects on the human psyche as the psychological psychopaths well know and that's the real reason for them. Humans need contact with each other, discourse, closeness and touch, or they eventually, and literarily, go crazy. Masks, which I will address at some length, fundamentally add to the effects of isolation and the Cult agenda to dehumanise and de-individualise the population. To do this while knowing – in fact *seeking* – this outcome is the very epitome of evil and psychologists involved in this *are* the epitome of evil. They must like all the rest of the Cult demons and their assets stand trial for crimes against humanity on a scale that defies the imagination. Psychopaths in uniform use isolation to break enemy troops and agents and make them subservient and submissive to tell what they know. The technique is rightly considered a form of torture and

torture is most certainly what has been imposed on the human population.

Clinically-insane American psychologist Harry Harlow became famous for his isolation experiments in the 1950s in which he separated baby monkeys from their mothers and imprisoned them for months on end in a metal container or 'pit of despair'. They soon began to show mental distress and depression as any idiot could have predicted. Harlow put other monkeys in steel chambers for three, six or twelve months while denying them any contact with animals or humans. He said that the effects of total social isolation for six months were 'so devastating and debilitating that we had assumed initially that twelve months of isolation would not produce any additional decrement'; but twelve months of isolation 'almost obliterated the animals socially'. This is what the Cult and its psychopaths are doing to you and your children. Even monkeys in partial isolation in which they were not allowed to form relationships with other monkeys became 'aggressive and hostile, not only to others, but also towards their own bodies'. We have seen this in the young as a consequence of lockdown. UK government psychopaths launched a public relations campaign telling people not to hug each other even after they received the 'Covid-19 vaccine' which we were told with more lies would allow a return to 'normal life'. A government source told *The Telegraph*: 'It will be along the lines that it is great that you have been vaccinated, but if you are going to visit your family and hug your grandchildren there is a chance you are going to infect people you love.' The source was apparently speaking from a secure psychiatric facility. Janet Lord, director of Birmingham University's Institute of Inflammation and Ageing, said that parents and grandparents should avoid hugging their children. Well, how can I put it, Ms Lord? Fuck off. Yep, that'll do.

Destroying the kids – where are the parents?

Observe what has happened to people enslaved and isolated by lockdown as suicide and self-harm has soared worldwide,

particularly among the young denied the freedom to associate with their friends. A study of 49,000 people in English-speaking countries concluded that almost half of young adults are at clinical risk of mental health disorders. A national survey in America of 1,000 currently enrolled high school and college students found that 5 percent reported attempting suicide during the pandemic. Data from the US CDC's National Syndromic Surveillance Program from January 1st to October 17th, 2020, revealed a *31 percent* increase in mental health issues among adolescents aged 12 to 17 compared with 2019. The CDC reported that America in general suffered the biggest drop in life expectancy since World War Two as it fell by a year in the first half of 2020 as a result of 'deaths of despair' – overdoses and suicides. Deaths of despair have leapt by more than 20 percent during lockdown and include the highest number of fatal overdoses ever recorded in a single year – 81,000. Internet addiction is another consequence of being isolated at home which lowers interest in physical activities as kids fall into inertia and what's the point? Children and young people are losing hope and giving up on life, sometimes literally. A 14-year-old boy killed himself in Maryland because he had 'given up' when his school district didn't reopen; an 11-year-old boy shot himself during a zoom class; a teenager in Maine succumbed to the isolation of the 'pandemic' when he ended his life after experiencing a disrupted senior year at school. Children as young as nine have taken their life and all these stories can be repeated around the world. Careers are being destroyed before they start and that includes those in sport in which promising youngsters have not been able to take part. The plan of the psycho-psychologists is working all right. Researchers at Cambridge University found that lockdowns cause significant harm to children's mental health. Their study was published in the *Archives of Disease in Childhood*, and followed 168 children aged between 7 and 11. The researchers concluded:

> During the UK lockdown, children's depression symptoms have increased substantially, relative to before lockdown. The scale of this effect has direct relevance for the continuation of different elements of lockdown policy, such as complete or partial school closures …

… Specifically, we observed a statistically significant increase in ratings of depression, with a medium-to-large effect size. Our findings emphasise the need to incorporate the potential impact of lockdown on child mental health in planning the ongoing response to the global pandemic and the recovery from it.

Not a chance when the Cult's psycho-psychologists were getting exactly what they wanted. The UK's Royal College of Paediatrics and Child Health has urged parents to look for signs of eating disorders in children and young people after a three to four fold increase. Specialists say the 'pandemic' is a major reason behind the rise. You don't say. The College said isolation from friends during school closures, exam cancellations, loss of extra-curricular activities like sport, and an increased use of social media were all contributory factors along with fears about the virus (psycho-psychologists again), family finances, and students being forced to quarantine. Doctors said young people were becoming severely ill by the time they were seen with 'Covid' regulations reducing face-to-face consultations. Nor is it only the young that have been devastated by the psychopaths. Like all bullies and cowards the Cult is targeting the young, elderly, weak and infirm. A typical story was told by a British lady called Lynn Parker who was not allowed to visit her husband in 2020 for the last ten and half months of his life 'when he needed me most' between March 20th and when he died on December 19th. This vacates the criminal and enters the territory of evil. The emotional impact on the immune system alone is immense as are the number of people of all ages worldwide who have died as a result of Cult-demanded, Gates-demanded, lockdowns.

Isolation is torture

The experience of imposing solitary confinement on millions of prisoners around the world has shown how a large percentage become 'actively psychotic and/or acutely suicidal'. Social isolation has been found to trigger 'a specific psychiatric syndrome, characterized by hallucinations; panic attacks; overt paranoia; diminished impulse control; hypersensitivity to external stimuli; and difficulties with thinking, concentration and memory'. Juan Mendez,

a United Nations rapporteur (investigator), said that isolation is a form of torture. Research has shown that even after isolation prisoners find it far more difficult to make social connections and I remember chatting to a shop assistant after one lockdown who told me that when her young son met another child again he had no idea how to act or what to do. Hannah Flanagan, Director of Emergency Services at Journey Mental Health Center in Dane County, Wisconsin, said: 'The specificity about Covid social distancing and isolation that we've come across as contributing factors to the suicides are really new to us this year.' But they are not new to those that devised them. They are getting the effect they want as the population is psychologically dismantled to be rebuilt in a totally different way. Children and the young are particularly targeted. They will be the adults when the full-on fascist AI-controlled technocracy is planned to be imposed and they are being prepared to meekly submit. At the same time older people who still have a memory of what life was like before – and how fascist the new normal really is – are being deleted. You are going to see efforts to turn the young against the old to support this geriatric genocide. Hannah Flanagan said the big increase in suicide in her county proved that social isolation is not only harmful, but deadly. Studies have shown that isolation from others is one of the main risk factors in suicide and even more so with women. Warnings that lockdown could create a 'perfect storm' for suicide were ignored. After all this was one of the *reasons* for lockdown. Suicide, however, is only the most extreme of isolation consequences. There are many others. Dr Dhruv Khullar, assistant professor of healthcare policy at Weill Cornell Medical College, said in a *New York Times* article in 2016 long before the fake 'pandemic':

> A wave of new research suggests social separation is bad for us. Individuals with less social connection have disrupted sleep patterns, altered immune systems, more inflammation and higher levels of stress hormones. One recent study found that isolation increases the risk of heart disease by 29 percent and stroke by 32 percent. Another analysis that pooled data from 70 studies and 3.4 million people found that socially isolated individuals had a 30 percent higher risk of dying in the next seven years, and that this effect was largest in middle age.

Loneliness can accelerate cognitive decline in older adults, and isolated individuals are twice as likely to die prematurely as those with more robust social interactions. These effects start early: Socially isolated children have significantly poorer health 20 years later, even after controlling for other factors. All told, loneliness is as important a risk factor for early death as obesity and smoking.

There you have proof from that one article alone four years before 2020 that those who have enforced lockdown, social distancing and isolation knew what the effect would be and that is even more so with professional psychologists that have been driving the policy across the globe. We can go back even further to the years 2000 and 2003 and the start of a major study on the effects of isolation on health by Dr Janine Gronewold and Professor Dirk M. Hermann at the University Hospital in Essen, Germany, who analysed data on 4,316 people with an average age of 59 who were recruited for the long-term research project. They found that socially isolated people are more than 40 percent more likely to have a heart attack, stroke, or other major cardiovascular event and nearly 50 percent more likely to die from any cause. Given the financial Armageddon unleashed by lockdown we should note that the study found a relationship between increased cardiovascular risk and lack of financial support. After excluding other factors social isolation was still connected to a 44 percent increased risk of cardiovascular problems and a 47 percent increased risk of death by any cause. Lack of financial support was associated with a 30 percent increase in the risk of cardiovascular health events. Dr Gronewold said it had been known for some time that feeling lonely or lacking contact with close friends and family can have an impact on physical health and the study had shown that having strong social relationships is of high importance for heart health. Gronewold said they didn't understand yet why people who are socially isolated have such poor health outcomes, but this was obviously a worrying finding, particularly during these times of prolonged social distancing. Well, it can be explained on many levels. You only have to identify the point in the body where people feel loneliness and missing people they are parted from – it's in the centre of the chest where they feel the ache of loneliness and the ache of missing people. 'My heart aches for

you' … 'My heart aches for some company.' I will explain this more in the chapter Escaping Wetiko, but when you realise that the body is the mind – they are expressions of each other – the reason why state of the mind dictates state of the body becomes clear.

American psychologist Ranjit Powar was highlighting the effects of lockdown isolation as early as April, 2020. She said humans have evolved to be social creatures and are wired to live in interactive groups. Being isolated from family, friends and colleagues could be unbalancing and traumatic for most people and could result in short or even long-term psychological and physical health problems. An increase in levels of anxiety, aggression, depression, forgetfulness and hallucinations were possible psychological effects of isolation. 'Mental conditions may be precipitated for those with underlying pre-existing susceptibilities and show up in many others without any pre-condition.' Powar said personal relationships helped us cope with stress and if we lost this outlet for letting off steam the result can be a big emotional void which, for an average person, was difficult to deal with. 'Just a few days of isolation can cause increased levels of anxiety and depression' – so what the hell has been the effect on the global population of *18 months* of this at the time of writing? Powar said: 'Add to it the looming threat of a dreadful disease being repeatedly hammered in through the media and you have a recipe for many shades of mental and physical distress.' For those with a house and a garden it is easy to forget that billions have had to endure lockdown isolation in tiny overcrowded flats and apartments with nowhere to go outside. The psychological and physical consequences of this are unimaginable and with lunatic and abusive partners and parents the consequences have led to tremendous increases in domestic and child abuse and alcoholism as people seek to shut out the horror. Ranjit Powar said:

Staying in a confined space with family is not all a rosy picture for everyone. It can be extremely oppressive and claustrophobic for large low-income families huddled together in small single-room houses. Children here are not lucky enough to have many board/electronic games or books to keep them occupied.

Add to it the deep insecurity of running out of funds for food and basic necessities. On the other hand, there are people with dysfunctional family dynamics, such as domineering, abusive or alcoholic partners, siblings or parents which makes staying home a period of trial. Incidence of suicide and physical abuse against women has shown a worldwide increase. Heightened anxiety and depression also affect a person's immune system, making them more susceptible to illness.

To think that Powar's article was published on April 11th, 2020.

Six-feet fantasy

Social (unsocial) distancing demanded that people stay six feet or two metres apart. UK government advisor Robert Dingwall from the New and Emerging Respiratory Virus Threats Advisory Group said in a radio interview that the two-metre rule was 'conjured up out of nowhere' and was not based on science. No, it was not based on *medical* science, but it didn't come out of nowhere. The distance related to *psychological* science. Six feet/two metres was adopted in many countries and we were told by people like the criminal Anthony Fauci and his ilk that it was founded on science. Many schools could not reopen because they did not have the space for six-feet distancing. Then in March, 2021, after a year of six-feet 'science', a study published in the *Journal of Infectious Diseases* involving more than 500,000 students and almost 100,000 staff over 16 weeks revealed no significant difference in 'Covid' cases between six feet and three feet and Fauci changed his tune. Now three feet was okay. There is no difference between six feet and three *inches* when there is no 'virus' and they got away with six feet for psychological reasons for as long as they could. I hear journalists and others talk about 'unintended consequences' of lockdown. They are not *unintended* at all; they have been coldly-calculated for a specific outcome of human control and that's why super-psychopaths like Gates have called for them so vehemently. Super-psychopath psychologists have demanded them and psychopathic or clueless, spineless, politicians have gone along with them by 'following the science'. But it's not science at all. 'Science' is not what is; it's only what people can be manipulated to believe it is. The whole 'Covid' catastrophe is

founded on mind control. Three word or three statement mantras issued by the UK government are a well-known mind control technique and so we've had 'Stay home/protect the NHS/save lives', 'Stay alert/control the virus/save lives' and 'hands/face/space'. One of the most vocal proponents of extreme 'Covid' rules in the UK has been Professor Susan Michie, a member of the British Communist Party, who is not a medical professional. Michie is the director of the Centre for Behaviour Change at University College London. She is a *behavioural psychologist* and another filthy rich 'Marxist' who praised China's draconian lockdown. She was known by fellow students at Oxford University as 'Stalin's nanny' for her extreme Marxism. Michie is an influential member of the UK government's Scientific Advisory Group for Emergencies (SAGE) and behavioural manipulation groups which have dominated 'Covid' policy. She is a consultant adviser to the World Health Organization on 'Covid-19' and behaviour. Why the hell are lockdowns anything to do with her when they are claimed to be about health? Why does a behavioural psychologist from a group charged with changing the behaviour of the public want lockdown, human isolation and mandatory masks? Does that question really need an answer? Michie *absolutely* has to explain herself before a Nuremberg court when humanity takes back its world again and even more so when you see the consequences of masks that she demands are compulsory. This is a Michie classic:

> The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Those words alone should carry a prison sentence when you ponder on the callous disregard for children involved and what a statement it makes about the mind and motivations of Susan Michie. What a lovely lady and what she said there encapsulates the mentality of the psychopaths behind the 'Covid' horror. Let us compare what Michie said with a countrywide study in Germany published at researchsquare.com involving 25,000 school children and 17,854 health complaints submitted by parents. Researchers

found that masks are harming children physically, psychologically, and behaviourally with 24 health issues associated with mask wearing. They include: shortness of breath (29.7%); dizziness (26.4%); increased headaches (53%); difficulty concentrating (50%); drowsiness or fatigue (37%); and malaise (42%). Nearly a third of children experienced more sleep issues than before and a quarter developed new fears. Researchers found health issues and other impairments in 68 percent of masked children covering their faces for an average of 4.5 hours a day. Hundreds of those taking part experienced accelerated respiration, tightness in the chest, weakness, and short-term impairment of consciousness. A reminder of what Michie said again:

The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Psychopaths in government and psychology now have children and young people – plus all the adults – wearing masks for hours on end while clueless teachers impose the will of the psychopaths on the young they should be protecting. What the hell are parents doing?

Cult lab rats

We have some schools already imposing on students microchipped buzzers that activate when they get 'too close' to their pals in the way they do with lab rats. How apt. To the Cult and its brain-dead servants our children *are* lab rats being conditioned to be unquestioning, dehumanised slaves for the rest of their lives. Children and young people are being weaned and frightened away from the most natural human instincts including closeness and touch. I have tracked in the books over the years how schools were banning pupils from greeting each other with a hug and the whole Cult-induced Me Too movement has terrified men and boys from a relaxed and natural interaction with female friends and work colleagues to the point where many men try never to be in a room

alone with a woman that's not their partner. Airhead celebrities have as always played their virtue-signalling part in making this happen with their gross exaggeration. For every monster like Harvey Weinstein there are at least tens of thousands of men that don't treat women like that; but everyone must be branded the same and policy changed for them as well as the monster. I am going to be using the word 'dehumanise' many times in this chapter because that is what the Cult is seeking to do and it goes very deep as we shall see. Don't let them kid you that social distancing is planned to end one day. That's not the idea. We are seeing more governments and companies funding and producing wearable gadgets to keep people apart and they would not be doing that if this was meant to be short-term. A tech start-up company backed by GCHQ, the British Intelligence and military surveillance headquarters, has created a social distancing wrist sensor that alerts people when they get too close to others. The CIA has also supported tech companies developing similar devices. The wearable sensor was developed by Tended, one of a number of start-up companies supported by GCHQ (see the CIA and DARPA). The device can be worn on the wrist or as a tag on the waistband and will vibrate whenever someone wearing the device breaches social distancing and gets anywhere near natural human contact. The company had a lucky break in that it was developing a distancing sensor when the 'Covid' hoax arrived which immediately provided a potentially enormous market. How fortunate. The government in big-time Cult-controlled Ontario in Canada is investing $2.5 million in wearable contact tracing technology that 'will alert users if they may have been exposed to the Covid-19 in the workplace and will beep or vibrate if they are within six feet of another person'. Facedrive Inc., the technology company behind this, was founded in 2016 with funding from the Ontario Together Fund and obviously they, too, had a prophet on the board of directors. The human surveillance and control technology is called TraceSCAN and would be worn by the human cyborgs in places such as airports, workplaces, construction sites, care homes and … *schools*.

I emphasise schools with children and young people the prime targets. You know what is planned for society as a whole if you keep your eyes on the schools. They have always been places where the state program the next generation of slaves to be its compliant worker-ants – or Woker-ants these days; but in the mist of the 'Covid' madness they have been transformed into mind laboratories on a scale never seen before. Teachers and head teachers are just as programmed as the kids – often more so. Children are kept apart from human interaction by walk lanes, classroom distancing, staggered meal times, masks, and the rolling-out of buzzer systems. Schools are now physically laid out as a laboratory maze for lab-rats. Lunatics at a school in Anchorage, Alaska, who should be prosecuted for child abuse, took away desks and forced children to kneel (know your place) on a mat for five hours a day while wearing a mask and using their chairs as a desk. How this was supposed to impact on a 'virus' only these clinically insane people can tell you and even then it would be clap-trap. The school banned recess (interaction), art classes (creativity), and physical exercise (getting body and mind moving out of inertia). Everyone behind this outrage should be in jail or better still a mental institution. The behavioural manipulators are all for this dystopian approach to schools. Professor Susan Michie, the mind-doctor and British Communist Party member, said it was wrong to say that schools were safe. They had to be made so by 'distancing', masks and ventilation (sitting all day in the cold). I must ask this lady round for dinner on a night I know I am going to be out and not back for weeks. She probably wouldn't be able to make it, anyway, with all the visits to her own psychologist she must have block-booked.

Masking identity

I know how shocking it must be for you that a behaviour manipulator like Michie wants everyone to wear masks which have long been a feature of mind-control programs like the infamous MKUltra in the United States, but, there we are. We live and learn. I spent many years from 1996 to right across the millennium

researching mind control in detail on both sides of the Atlantic and elsewhere. I met a large number of mind-control survivors and many had been held captive in body and mind by MKUltra. MK stands for mind-control, but employs the German spelling in deference to the Nazis spirited out of Germany at the end of World War Two by Operation Paperclip in which the US authorities, with help from the Vatican, transported Nazi mind-controllers and engineers to America to continue their work. Many of them were behind the creation of NASA and they included Nazi scientist and SS officer Wernher von Braun who swapped designing V-2 rockets to bombard London with designing the Saturn V rockets that powered the NASA moon programme's Apollo craft. I think I may have mentioned that the Cult has no borders. Among Paperclip escapees was Josef Mengele, the Angel of Death in the Nazi concentration camps where he conducted mind and genetic experiments on children often using twins to provide a control twin to measure the impact of his 'work' on the other. If you want to observe the Cult mentality in all its extremes of evil then look into the life of Mengele. I have met many people who suffered mercilessly under Mengele in the United States where he operated under the name Dr Greene and became a stalwart of MKUltra programming and torture. Among his locations was the underground facility in the Mojave Desert in California called the China Lake Naval Weapons Station which is almost entirely below the surface. My books *The Biggest Secret*, *Children of the Matrix* and *The Perception Deception* have the detailed background to MKUltra.

The best-known MKUltra survivor is American Cathy O'Brien. I first met her and her late partner Mark Phillips at a conference in Colorado in 1996. Mark helped her escape and deprogram from decades of captivity in an offshoot of MKUltra known as Project Monarch in which 'sex slaves' were provided for the rich and famous including Father George Bush, Dick Cheney and the Clintons. Read Cathy and Mark's book *Trance-Formation of America* and if you are new to this you will be shocked to the core. I read it in 1996 shortly before, with the usual synchronicity of my life, I found

myself given a book table at the conference right next to hers. MKUltra never ended despite being very publicly exposed (only a small part of it) in the 1970s and continues in other guises. I am still in touch with Cathy. She contacted me during 2020 after masks became compulsory in many countries to tell me how they were used as part of MKUltra programming. I had been observing 'Covid regulations' and the relationship between authority and public for months. I saw techniques that I knew were employed on individuals in MKUltra being used on the global population. I had read many books and manuals on mind control including one called *Silent Weapons for Quiet Wars* which came to light in the 1980s and was a guide on how to perceptually program on a mass scale. 'Silent Weapons' refers to mind-control. I remembered a line from the manual as governments, medical authorities and law enforcement agencies have so obviously talked to – or rather at – the adult population since the 'Covid' hoax began as if they are children. The document said:

> If a person is spoken to by a T.V. advertiser as if he were a twelve-year-old, then, due to suggestibility, he will, with a certain probability, respond or react to that suggestion with the uncritical response of a twelve-year-old and will reach in to his economic reservoir and deliver its energy to buy that product on impulse when he passes it in the store.

That's why authority has spoken to adults like children since all this began.

Why did Michael Jackson wear masks?

Every aspect of the 'Covid' narrative has mind-control as its central theme. Cathy O'Brien wrote an article for davidicke.com about the connection between masks and mind control. Her daughter Kelly who I first met in the 1990s was born while Cathy was still held captive in MKUltra. Kelly was forced to wear a mask as part of her programming from the age of *two* to dehumanise her, target her sense of individuality and reduce the amount of oxygen her brain and body received. *Bingo*. This is the real reason for compulsory

masks, why they have been enforced en masse, and why they seek to increase the number they demand you wear. First one, then two, with one disgraceful alleged 'doctor' recommending four which is nothing less than a death sentence. Where and how often they must be worn is being expanded for the purpose of mass mind control and damaging respiratory health which they can call 'Covid-19'. Canada's government headed by the man-child Justin Trudeau, says it's fine for children of two and older to wear masks. An insane 'study' in Italy involving just 47 children concluded there was no problem for babies as young as *four months* wearing them. Even after people were 'vaccinated' they were still told to wear masks by the criminal that is Anthony Fauci. Cathy wrote that mandating masks is allowing the authorities literally to control the air we breathe which is what was done in MKUltra. You might recall how the singer Michael Jackson wore masks and there is a reason for that. He was subjected to MKUltra mind control through Project Monarch and his psyche was scrambled by these simpletons. Cathy wrote:

In MKUltra Project Monarch mind control, Michael Jackson had to wear a mask to silence his voice so he could not reach out for help. Remember how he developed that whisper voice when he wasn't singing? Masks control the mind from the outside in, like the redefining of words is doing. By controlling what we can and cannot say for fear of being labeled racist or beaten, for example, it ultimately controls thought that drives our words and ultimately actions (or lack thereof).

Likewise, a mask muffles our speech so that we are not heard, which controls voice … words … mind. This is Mind Control. Masks are an obvious mind control device, and I am disturbed so many people are complying on a global scale. Masks depersonalize while making a person feel as though they have no voice. It is a barrier to others. People who would never choose to comply but are forced to wear a mask in order to keep their job, and ultimately their family fed, are compromised. They often feel shame and are subdued. People have stopped talking with each other while media controls the narrative.

The 'no voice' theme has often become literal with train passengers told not to speak to each other in case they pass on the 'virus', singing banned for the same reason and bonkers California officials telling people riding roller coasters that they cannot shout and scream. Cathy said she heard every day from healed MKUltra survivors who cannot wear a mask without flashing back on ways

their breathing was controlled – 'from ball gags and penises to water boarding'. She said that through the years when she saw images of people in China wearing masks 'due to pollution' that it was really to control their oxygen levels. 'I knew it was as much of a population control mechanism of depersonalisation as are burkas', she said. Masks are another Chinese communist/fascist method of control that has been swept across the West as the West becomes China at lightning speed since we entered 2020.

Mask-19

There are other reasons for mandatory masks and these include destroying respiratory health to call it 'Covid-19' and stunting brain development of children and the young. Dr Margarite Griesz-Brisson MD, PhD, is a Consultant Neurologist and Neurophysiologist and the Founder and Medical Director of the London Neurology and Pain Clinic. Her CV goes down the street and round the corner. She is clearly someone who cares about people and won't parrot the propaganda. Griesz-Brisson has a PhD in pharmacology, with special interest in neurotoxicology, environmental medicine, neuroregeneration and neuroplasticity (the way the brain can change in the light of information received). She went public in October, 2020, with a passionate warning about the effects of mask-wearing laws:

> The reinhalation of our exhaled air will without a doubt create oxygen deficiency and a flooding of carbon dioxide. We know that the human brain is very sensitive to oxygen deprivation. There are nerve cells for example in the hippocampus that can't be longer than 3 minutes without oxygen – they cannot survive. The acute warning symptoms are headaches, drowsiness, dizziness, issues in concentration, slowing down of reaction time – reactions of the cognitive system.

Oh, I know, let's tell bus, truck and taxi drivers to wear them and people working machinery. How about pilots, doctors and police? Griesz-Brisson makes the important point that while the symptoms she mentions may fade as the body readjusts this does not alter the fact that people continue to operate in oxygen deficit with long list of

potential consequences. She said it was well known that neurodegenerative diseases take years or decades to develop. 'If today you forget your phone number, the breakdown in your brain would have already started 20 or 30 years ago.' She said degenerative processes in your brain are getting amplified as your oxygen deprivation continues through wearing a mask. Nerve cells in the brain are unable to divide themselves normally in these circumstances and lost nerve cells will no longer be regenerated. 'What is gone is gone.' Now consider that people like shop workers and *schoolchildren* are wearing masks for hours every day. What in the name of sanity is going to be happening to them? 'I do not wear a mask, I need my brain to think', Griesz-Brisson said, 'I want to have a clear head when I deal with my patients and not be in a carbon dioxide-induced anaesthesia'. If you are told to wear a mask anywhere ask the organisation, police, store, whatever, for their risk assessment on the dangers and negative effects on mind and body of enforcing mask-wearing. They won't have one because it has never been done not even by government. All of them must be subject to class-action lawsuits as the consequences come to light. They don't do mask risk assessments for an obvious reason. They know what the conclusions would be and independent scientific studies that *have* been done tell a horror story of consequences.

'Masks are criminal'

Dr Griesz-Brisson said that for children and adolescents, masks are an absolute no-no. They had an extremely active and adaptive immune system and their brain was incredibly active with so much to learn. 'The child's brain, or the youth's brain, is thirsting for oxygen.' The more metabolically active an organ was, the more oxygen it required; and in children and adolescents every organ was metabolically active. Griesz-Brisson said that to deprive a child's or adolescent's brain of oxygen, or to restrict it in any way, was not only dangerous to their health, it was absolutely criminal. 'Oxygen deficiency inhibits the development of the brain, and the damage that has taken place as a result CANNOT be reversed.' Mind

manipulators of MKUltra put masks on two-year-olds they wanted to neurologically rewire and you can see why. Griesz-Brisson said a child needs the brain to learn and the brain needs oxygen to function. 'We don't need a clinical study for that. This is simple, indisputable physiology.' Consciously and purposely induced oxygen deficiency was an absolutely deliberate health hazard, and an absolute medical contraindication which means that 'this drug, this therapy, this method or measure should not be used, and is not allowed to be used'. To coerce an entire population to use an absolute medical contraindication by force, she said, there had to be definite and serious reasons and the reasons must be presented to competent interdisciplinary and independent bodies to be verified and authorised. She had this warning of the consequences that were coming if mask wearing continued:

When, in ten years, dementia is going to increase exponentially, and the younger generations couldn't reach their god-given potential, it won't help to say 'we didn't need the masks'. I know how damaging oxygen deprivation is for the brain, cardiologists know how damaging it is for the heart, pulmonologists know how damaging it is for the lungs. Oxygen deprivation damages every single organ. Where are our health departments, our health insurance, our medical associations? It would have been their duty to be vehemently against the lockdown and to stop it and stop it from the very beginning.

Why do the medical boards issue punishments to doctors who give people exemptions? Does the person or the doctor seriously have to prove that oxygen deprivation harms people? What kind of medicine are our doctors and medical associations representing? Who is responsible for this crime? The ones who want to enforce it? The ones who let it happen and play along, or the ones who don't prevent it?

All of the organisations and people she mentions there either answer directly to the Cult or do whatever hierarchical levels above them tell them to do. The outcome of both is the same. 'It's not about masks, it's not about viruses, it's certainly not about your health', Griesz-Brisson said. 'It is about much, much more. I am not participating. I am not afraid.' They were taking our air to breathe and there was no unfounded medical exemption from face masks. Oxygen deprivation was dangerous for every single brain. It had to be the free decision of every human being whether they want to

wear a mask that was absolutely ineffective to protect themselves from a virus. She ended by rightly identifying where the responsibility lies for all this:

> The imperative of the hour is personal responsibility. We are responsible for what we think, not the media. We are responsible for what we do, not our superiors. We are responsible for our health, not the World Health Organization. And we are responsible for what happens in our country, not the government.

Halle-bloody-lujah.

But surgeons wear masks, right?

Independent studies of mask-wearing have produced a long list of reports detailing mental, emotional and physical dangers. What a definition of insanity to see police officers imposing mask-wearing on the public which will cumulatively damage their health while the police themselves wear masks that will cumulatively damage *their* health. It's utter madness and both public and police do this because 'the government says so' – yes a government of brain-donor idiots like UK Health Secretary Matt Hancock reading the 'follow the science' scripts of psychopathic, lunatic psychologists. The response you get from Stockholm syndrome sufferers defending the very authorities that are destroying them and their families is that 'surgeons wear masks'. This is considered the game, set and match that they must work and don't cause oxygen deficit. Well, actually, scientific studies have shown that they *do* and oxygen levels are monitored in operating theatres to compensate. Surgeons wear masks to stop spittle and such like dropping into open wounds – not to stop 'viral particles' which are so miniscule they can only be seen through an electron microscope. Holes in the masks are significantly bigger than 'viral particles' and if you sneeze or cough they will breach the mask. I watched an incredibly disingenuous 'experiment' that claimed to prove that masks work in catching 'virus' material from the mouth and nose. They did this with a slow motion camera and the mask did block big stuff which stayed inside the mask and

against the face to be breathed in or cause infections on the face as we have seen with many children. 'Viral particles', however, would never have been picked up by the camera as they came through the mask when they are far too small to be seen. The 'experiment' was therefore disingenuous *and* useless.

Studies have concluded that wearing masks in operating theatres (and thus elsewhere) make no difference to preventing infection while the opposite is true with toxic shite building up in the mask and this had led to an explosion in tooth decay and gum disease dubbed by dentists 'mask mouth'. You might have seen the Internet video of a furious American doctor urging people to take off their masks after a four-year-old patient had been rushed to hospital the night before and nearly died with a lung infection that doctors sourced to mask wearing. A study in the journal *Cancer Discovery* found that inhalation of harmful microbes can contribute to advanced stage lung cancer in adults and long-term use of masks can help breed dangerous pathogens. Microbiologists have said frequent mask wearing creates a moist environment in which microbes can grow and proliferate before entering the lungs. The Canadian Agency for Drugs and Technologies in Health, or CADTH, a Canadian national organisation that provides research and analysis to healthcare decision-makers, said this as long ago as 2013 in a report entitled 'Use of Surgical Masks in the Operating Room: A Review of the Clinical Effectiveness and Guidelines'. It said:

- No evidence was found to support the use of surgical face masks to reduce the frequency of surgical site infections
- No evidence was found on the effectiveness of wearing surgical face masks to protect staff from infectious material in the operating room.
- Guidelines recommend the use of surgical face masks by staff in the operating room to protect both operating room staff and patients (despite the lack of evidence).

We were told that the world could go back to 'normal' with the arrival of the 'vaccines'. When they came, fraudulent as they are, the story changed as I knew that it would. We are in the midst of transforming 'normal', not going back to it. Mary Ramsay, head of immunisation at Public Health England, echoed the words of US criminal Anthony Fauci who said masks and other regulations must stay no matter if people are vaccinated. The Fauci idiot continued to wear two masks – different colours so both could be clearly seen – after he *claimed* to have been vaccinated. Senator Rand Paul told Fauci in one exchange that his double-masks were 'theatre' and he was right. It's all theatre. Mary Ramsay back-tracked on the vaccine-return-to-normal theme when she said the public may need to wear masks and social-distance for years despite the jabs. 'People have got used to those lower-level restrictions now, and [they] can live with them', she said telling us what the idea has been all along. 'The vaccine does not give you a pass, even if you have had it, you must continue to follow all the guidelines' said a Public Health England statement which reneged on what we had been told before and made having the 'vaccine' irrelevant to 'normality' even by the official story. Spain's fascist government trumped everyone by passing a law mandating the wearing of masks on the beach and even when swimming in the sea. The move would have devastated what's left of the Spanish tourist industry, posed potential breathing dangers to swimmers and had Northern European sunbathers walking around with their forehead brown and the rest of their face white as a sheet. The ruling was so crazy that it had to be retracted after pressure from public and tourist industry, but it confirmed where the Cult wants to go with masks and how clinically insane authority has become. The determination to make masks permanent and hide the serious dangers to body and mind can be seen in the censorship of scientist Professor Denis Rancourt by Bill Gates-funded academic publishing website ResearchGate over his papers exposing the dangers and uselessness of masks. Rancourt said:

ResearchGate today has permanently locked my account, which I have had since 2015. Their reasons graphically show the nature of their attack against democracy, and their corruption of

science … By their obscene non-logic, a scientific review of science articles reporting on harms caused by face masks has a 'potential to cause harm'. No criticism of the psychological device (face masks) is tolerated, if the said criticism shows potential to influence public policy.

This is what happens in a fascist world.

Where are the 'greens' (again)?

Other dangers of wearing masks especially regularly relate to the inhalation of minute plastic fibres into the lungs and the deluge of discarded masks in the environment and oceans. Estimates predicted that more than 1.5 billion disposable masks will end up in the world's oceans every year polluting the water with tons of plastic and endangering marine wildlife. Studies project that humans are using 129 billion face masks each month worldwide – about three million a minute. Most are disposable and made from plastic, non-biodegradable microfibers that break down into smaller plastic particles that become widespread in ecosystems. They are littering cities, clogging sewage channels and turning up in bodies of water. I have written in other books about the immense amounts of microplastics from endless sources now being absorbed into the body. Rolf Halden, director of the Arizona State University (ASU) Biodesign Center for Environmental Health Engineering, was the senior researcher in a 2020 study that analysed 47 human tissue samples and found microplastics in all of them. 'We have detected these chemicals of plastics in every single organ that we have investigated', he said. I wrote in *The Answer* about the world being deluged with microplastics. A study by the Worldwide Fund for Nature (WWF) found that people are consuming on average every week some 2,000 tiny pieces of plastic mostly through water and also through marine life and the air. Every year humans are ingesting enough microplastics to fill a heaped dinner plate and in a life-time of 79 years it is enough to fill two large waste bins. Marco Lambertini, WWF International director general said: 'Not only are plastics polluting our oceans and waterways and killing marine life – it's in all of us and we can't escape consuming plastics,' American

geologists found tiny plastic fibres, beads and shards in rainwater samples collected from the remote slopes of the Rocky Mountain National Park near Denver, Colorado. Their report was headed: 'It is raining plastic.' Rachel Adams, senior lecturer in Biomedical Science at Cardiff Metropolitan University, said that among health consequences are internal inflammation and immune responses to a 'foreign body'. She further pointed out that microplastics become carriers of toxins including mercury, pesticides and dioxins (a known cause of cancer and reproductive and developmental problems). These toxins accumulate in the fatty tissues once they enter the body through microplastics. Now this is being compounded massively by people putting plastic on their face and throwing it away.

Workers exposed to polypropylene plastic fibres known as 'flock' have developed 'flock worker's lung' from inhaling small pieces of the flock fibres which can damage lung tissue, reduce breathing capacity and exacerbate other respiratory problems. *Now* … commonly used surgical masks have three layers of melt-blown textiles made of … polypropylene. We have billions of people putting these microplastics against their mouth, nose and face for hours at a time day after day in the form of masks. How does anyone think that will work out? I mean – what could possibly go wrong? We posted a number of scientific studies on this at davidicke.com, but when I went back to them as I was writing this book the links to the science research website where they were hosted were dead. Anything that challenges the official narrative in any way is either censored or vilified. The official narrative is so unsupportable by the evidence that only deleting the truth can protect it. A study by Chinese scientists still survived – with the usual twist which it why it was still active, I guess. Yes, they found that virtually all the masks they tested increased the daily intake of microplastic fibres, but people should still wear them because the danger from the 'virus' was worse said the crazy 'team' from the Institute of Hydrobiology in Wuhan. Scientists first discovered microplastics in lung tissue of some patients who died of lung cancer

in the 1990s. Subsequent studies have confirmed the potential health damage with the plastic degrading slowly and remaining in the lungs to accumulate in volume. Wuhan researchers used a machine simulating human breathing to establish that masks shed up to nearly 4,000 microplastic fibres in a month with reused masks producing more. Scientists said some masks are laced with toxic chemicals and a variety of compounds seriously restricted for both health and environmental reasons. They include cobalt (used in blue dye) and formaldehyde known to cause watery eyes, burning sensations in the eyes, nose, and throat, plus coughing, wheezing and nausea. No – that must be 'Covid-19'.

Mask 'worms'

There is another and potentially even more sinister content of masks. Mostly new masks of different makes filmed under a microscope around the world have been found to contain strange black fibres or 'worms' that appear to move or 'crawl' by themselves and react to heat and water. The nearest I have seen to them are the self-replicating fibres that are pulled out through the skin of those suffering from Morgellons disease which has been connected to the phenomena of 'chemtrails' which I will bring into the story later on. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. Black 'worm' fibres in masks have that kind of feel to them and there is a nanotechnology technique called 'worm micelles' which carry and release drugs or anything else you want to deliver to the body. For sure the suppression of humanity by mind altering drugs is the Cult agenda big time and the more excuses they can find to gain access to the body the more opportunities there are to make that happen whether through 'vaccines' or masks pushed against the mouth and nose for hours on end.

So let us summarise the pros and cons of masks:

Against masks: Breathing in your own carbon dioxide; depriving the body and brain of sufficient oxygen; build-up of toxins in the mask that can be breathed into the lungs and cause rashes on the face and 'mask-mouth'; breathing microplastic fibres and toxic chemicals into the lungs; dehumanisation and deleting individualisation by literally making people faceless; destroying human emotional interaction through facial expression and deleting parental connection with their babies which look for guidance to their facial expression.

For masks: They don't protect you from a 'virus' that doesn't exist and even if it did 'viral' particles are so minute they are smaller than the holes in the mask.

Governments, police, supermarkets, businesses, transport companies, and all the rest who seek to impose masks have done no risk assessment on their consequences for health and psychology and are now open to group lawsuits when the impact becomes clear with a cumulative epidemic of respiratory and other disease. Authorities will try to exploit these effects and hide the real cause by dubbing them 'Covid-19'. Can you imagine setting out to force the population to wear health-destroying masks without doing any assessment of the risks? It is criminal and it is evil, but then how many people targeted in this way, who see their children told to wear them all day at school, have asked for a risk assessment? Billions can't be imposed upon by the few unless the billions allow it. Oh, yes, with just a tinge of irony, 85 percent of all masks made worldwide come from *China*.

Wash your hands in toxic shite

'Covid' rules include the use of toxic sanitisers and again the health consequences of constantly applying toxins to be absorbed through the skin is obvious to any level of Renegade Mind. America's Food and Drug Administration (FDA) said that sanitisers are drugs and issued a warning about 75 dangerous brands which contain

methanol used in antifreeze and can cause death, kidney damage and blindness. The FDA circulated the following warning even for those brands that it claims to be safe:

Store hand sanitizer out of the reach of pets and children, and children should use it only with adult supervision. Do not drink hand sanitizer. This is particularly important for young children, especially toddlers, who may be attracted by the pleasant smell or brightly colored bottles of hand sanitizer.

Drinking even a small amount of hand sanitizer can cause alcohol poisoning in children. (However, there is no need to be concerned if your children eat with or lick their hands after using hand sanitizer.) During this coronavirus pandemic, poison control centers have had an increase in calls about accidental ingestion of hand sanitizer, so it is important that adults monitor young children's use.

Do not allow pets to swallow hand sanitizer. If you think your pet has eaten something potentially dangerous, call your veterinarian or a pet poison control center right away. Hand sanitizer is flammable and should be stored away from heat and flames. When using hand sanitizer, rub your hands until they feel completely dry before performing activities that may involve heat, sparks, static electricity, or open flames.

There you go, perfectly safe, then, and that's without even a mention of the toxins absorbed through the skin. Come on kids – sanitise your hands everywhere you go. It will save you from the 'virus'. Put all these elements together of the 'Covid' normal and see how much health and psychology is being cumulatively damaged, even devastated, to 'protect your health'. Makes sense, right? They are only imposing these things because they care, right? *Right?*

Submitting to insanity

Psychological reframing of the population goes very deep and is done in many less obvious ways. I hear people say how contradictory and crazy 'Covid' rules are and how they are ever changing. This is explained away by dismissing those involved as idiots. It is a big mistake. The Cult is delighted if its cold calculation is perceived as incompetence and idiocy when it is anything but. Oh, yes, there are idiots within the system – lots of them – but they are *administering* the Cult agenda, mostly unknowingly. They are not deciding and dictating it. The bulwark against tyranny is self-

respect, always has been, always will be. It is self-respect that has broken every tyranny in history. By its very nature self-respect will not bow to oppression and its perpetrators. There is so little self-respect that it's always the few that overturn dictators. Many may eventually follow, but the few with the iron spines (self-respect) kick it off and generate the momentum. The Cult targets self-respect in the knowledge that once this has gone only submission remains. Crazy, contradictory, ever-changing 'Covid' rules are systematically applied by psychologists to delete self-respect. They *want* you to see that the rules make no sense. It is one thing to decide to do something when *you* have made the choice based on evidence and logic. You still retain your self-respect. It is quite another when you can see what you are being told to do is insane, ridiculous and makes no sense, and *yet you still do it*. Your self-respect is extinguished and this has been happening as ever more obviously stupid and nonsensical things have been demanded and the great majority have complied even when they can see they are stupid and nonsensical.

People walk around in face-nappies knowing they are damaging their health and make no difference to a 'virus'. They do it in fear of not doing it. I know it's daft, but I'll do it anyway. When that happens something dies inside of you and submissive reframing has begun. Next there's a need to hide from yourself that you have conceded your self-respect and you convince yourself that you have not really submitted to fear and intimidation. You begin to believe that you are complying with craziness because it's the right thing to do. When first you concede your self-respect of 2+2 = 4 to 2+2 = 5 you *know* you are compromising your self-respect. Gradually to avoid facing that fact you begin to *believe* that 2+2=5. You have been reframed and I have been watching this process happening in the human psyche on an industrial scale. The Cult is working to break your spirit and one of its major tools in that war is humiliation. I read how former American soldier Bradley Manning (later Chelsea Manning after a sex-change) was treated after being jailed for supplying WikiLeaks with documents exposing the enormity of

government and elite mendacity. Manning was isolated in solitary confinement for eight months, put under 24-hour surveillance, forced to hand over clothing before going to bed, and stand naked for every roll call. This is systematic humiliation. The introduction of anal swab 'Covid' tests in China has been done for the same reason to delete self-respect and induce compliant submission. Anal swabs are mandatory for incoming passengers in parts of China and American diplomats have said they were forced to undergo the indignity which would have been calculated humiliation by the Cult-owned Chinese government that has America in its sights.

Government-people: An abusive relationship

Spirit-breaking psychological techniques include giving people hope and apparent respite from tyranny only to take it away again. This happened in the UK during Christmas, 2020, when the psycho-psychologists and their political lackeys announced an easing of restrictions over the holiday only to reimpose them almost immediately on the basis of yet another lie. There is a big psychological difference between getting used to oppression and being given hope of relief only to have that dashed. Psychologists know this and we have seen the technique used repeatedly. Then there is traumatising people before you introduce more extreme regulations that require compliance. A perfect case was the announcement by the dark and sinister Whitty and Vallance in the UK that 'new data' predicted that 4,000 could die every day over the winter of 2020/2021 if we did not lockdown again. I think they call it lying and after traumatising people with that claim out came Jackboot Johnson the next day with new curbs on human freedom. Psychologists know that a frightened and traumatised mind becomes suggestable to submission and behaviour reframing. Underpinning all this has been to make people fearful and suspicious of each other and see themselves as a potential danger to others. In league with deleted self-respect you have the perfect psychological recipe for self-loathing. The relationship between authority and public is now demonstrably the same as that of

subservience to an abusive partner. These are signs of an abusive relationship explained by psychologist Leslie Becker-Phelps:

Psychological and emotional abuse: Undermining a partner's self-worth with verbal attacks, name-calling, and belittling. Humiliating the partner in public, unjustly accusing them of having an affair, or interrogating them about their every behavior. Keeping partner confused or off balance by saying they were just kidding or blaming the partner for 'making' them act this way … Feigning in public that they care while turning against them in private. This leads to victims frequently feeling confused, incompetent, unworthy, hopeless, and chronically self-doubting. [Apply these techniques to how governments have treated the population since New Year, 2020, and the parallels are obvious.]

Physical abuse: The abuser might physically harm their partner in a range of ways, such as grabbing, hitting, punching, or shoving them. They might throw objects at them or harm them with a weapon. [Observe the physical harm imposed by masks, lockdown, and so on.]

Threats and intimidation: One way abusers keep their partners in line is by instilling fear. They might be verbally threatening, or give threatening looks or gestures. Abusers often make it known that they are tracking their partner's every move. They might destroy their partner's possessions, threaten to harm them, or threaten to harm their family members. Not surprisingly, victims of this abuse often feel anxiety, fear, and panic. [No words necessary.]

Isolation: Abusers often limit their partner's activities, forbidding them to talk or interact with friends or family. They might limit access to a car or even turn off their phone. All of this might be done by physically holding them against their will, but is often accomplished through psychological abuse and intimidation. The more isolated a person feels, the fewer resources they have to help gain perspective on their situation and to escape from it. [No words necessary.]

Economic abuse: Abusers often make their partners beholden to them for money by controlling access to funds of any kind. They might prevent their partner from getting a job or withhold access to money they earn from a job. This creates financial dependency that makes leaving the relationship very difficult. [See destruction of livelihoods and the proposed meagre 'guaranteed income' so long as you do whatever you are told.]

Using children: An abuser might disparage their partner's parenting skills, tell their children lies about their partner, threaten to take custody of their children, or threaten to harm their children. These tactics instil fear and often elicit compliance. [See reframed social service mafia and how children are being mercilessly abused by the state over 'Covid' while their parents look on too frightened to do anything.]

A further recurring trait in an abusive relationship is the abused blaming themselves for their abuse and making excuses for the abuser. We have the public blaming each other for lockdown abuse by government and many making excuses for the government while attacking those who challenge the government. How often we have heard authorities say that rules are being imposed or reimposed only because people have refused to 'behave' and follow the rules. We don't want to do it – it's *you*.

Renegade Minds are an antidote to all of these things. They will never concede their self-respect no matter what the circumstances. Even when apparent humiliation is heaped upon them they laugh in its face and reflect back the humiliation on the abuser where it belongs. Renegade Minds will never wear masks they know are only imposed to humiliate, suppress and damage both physically and psychologically. Consequences will take care of themselves and they will never break their spirit or cause them to concede to tyranny. UK newspaper columnist Peter Hitchens was one of the few in the mainstream media to speak out against lockdowns and forced vaccinations. He then announced he had taken the jab. He wanted to see family members abroad and he believed vaccine passports were inevitable even though they had not yet been introduced. Hitchens

has a questioning and critical mind, but not a Renegade one. If he had no amount of pressure would have made him concede. Hitchens excused his action by saying that the battle has been lost. Renegade Minds never accept defeat when freedom is at stake and even if they are the last one standing the self-respect of not submitting to tyranny is more important than any outcome or any consequence.

That's why Renegade Minds are the only minds that ever changed anything worth changing.

CHAPTER EIGHT

'Reframing' insanity

Insanity is relative. It depends on who has who locked in what cage
Ray Bradbury

'Reframing' a mind means simply to change its perception and behaviour. This can be done subconsciously to such an extent that subjects have no idea they have been 'reframed' while to any observer changes in behaviour and attitudes are obvious.

Human society is being reframed on a ginormous scale since the start of 2020 and here we have the reason why psychologists rather than doctors have been calling the shots. Ask most people who have succumbed to 'Covid' reframing if they have changed and most will say 'no'; but they *have* and fundamentally. The Cult's long-game has been preparing for these times since way back and crucial to that has been to prepare both population and officialdom mentally and emotionally. To use the mind-control parlance they had to reframe the population with a mentality that would submit to fascism and reframe those in government and law enforcement to impose fascism or at least go along with it. The result has been the fact-deleted mindlessness of 'Wokeness' and officialdom that has either enthusiastically or unquestioningly imposed global tyranny demanded by reframed politicians on behalf of psychopathic and deeply evil cultists. 'Cognitive reframing' identifies and challenges the way someone sees the world in the form of situations, experiences and emotions and then restructures those perceptions to view the same set of circumstances in a different way. This can have

benefits if the attitudes are personally destructive while on the other side it has the potential for individual and collective mind control which the subject has no idea has even happened.

Cognitive therapy was developed in the 1960s by Aaron T. Beck who was born in Rhode Island in 1921 as the son of Jewish immigrants from the Ukraine. He became interested in the techniques as a treatment for depression. Beck's daughter Judith S. Beck is prominent in the same field and they founded the Beck Institute for Cognitive Behavior Therapy in Philadelphia in 1994. Cognitive reframing, however, began to be used worldwide by those with a very dark agenda. The Cult reframes politicians to change their attitudes and actions until they are completely at odds with what they once appeared to stand for. The same has been happening to government administrators at all levels, law enforcement, military and the human population. Cultists love mind control for two main reasons: It allows them to control what people think, do and say to secure agenda advancement and, by definition, it calms their legendary insecurity and fear of the unexpected. I have studied mind control since the time I travelled America in 1996. I may have been talking to next to no one in terms of an audience in those years, but my goodness did I gather a phenomenal amount of information and knowledge about so many things including the techniques of mind control. I have described this in detail in other books going back to *The Biggest Secret* in 1998. I met a very large number of people recovering from MKUltra and its offshoots and successors and I began to see how these same techniques were being used on the population in general. This was never more obvious than since the 'Covid' hoax began.

Reframing the enforcers

I have observed over the last two decades and more the very clear transformation in the dynamic between the police, officialdom and the public. I tracked this in the books as the relationship mutated from one of serving the public to seeing them as almost the enemy and certainly a lower caste. There has always been a class divide

based on income and always been some psychopathic, corrupt, and big-I-am police officers. This was different. Wholesale change was unfolding in the collective dynamic; it was less about money and far more about position and perceived power. An us-and-them was emerging. Noses were lifted skyward by government administration and law enforcement and their attitude to the public they were *supposed* to be serving changed to one of increasing contempt, superiority and control. The transformation was so clear and widespread that it had to be planned. Collective attitudes and dynamics do not change naturally and organically that quickly on that scale. I then came across an organisation in Britain called Common Purpose created in the late 1980s by Julia Middleton who would work in the office of Deputy Prime Minister John Prescott during the long and disastrous premiership of war criminal Tony Blair. When Blair speaks the Cult is speaking and the man should have been in jail a long time ago. Common Purpose proclaims itself to be one of the biggest 'leadership development' organisations in the world while functioning as a *charity* with all the financial benefits which come from that. It hosts 'leadership development' courses and programmes all over the world and claims to have 'brought together' what it calls 'leaders' from more than 100 countries on six continents. The modus operandi of Common Purpose can be compared with the work of the UK government's reframing network that includes the Behavioural Insights Team 'nudge unit' and 'Covid' reframing specialists at SPI-B. WikiLeaks described Common Purpose long ago as 'a hidden virus in our government and schools' which is unknown to the general public: 'It recruits and trains "leaders" to be loyal to the directives of Common Purpose and the EU, instead of to their own departments, which they then undermine or subvert, the NHS [National Health Service] being an example.' This is a vital point to understand the 'Covid' hoax. The NHS, and its equivalent around the world, has been utterly reframed in terms of administrators and much of the medical personnel with the transformation underpinned by recruitment policies. The outcome has been the criminal and psychopathic behaviour of the

NHS over 'Covid' and we have seen the same in every other major country. WikiLeaks said Common Purpose trainees are 'learning to rule without regard to democracy' and to usher in a police state (current events explained). Common Purpose operated like a 'glue' and had members in the NHS, BBC, police, legal profession, church, many of Britain's 7,000 quangos, local councils, the Civil Service, government ministries and Parliament, and controlled many RDA's (Regional Development Agencies). Here we have one answer for how and why British institutions and their like in other countries have changed so negatively in relation to the public. This further explains how and why the beyond-disgraceful reframed BBC has become a propaganda arm of 'Covid' fascism. They are all part of a network pursuing the same goal.

By 2019 Common Purpose was quoting a figure of 85,000 'leaders' that had attended its programmes. These 'students' of all ages are known as Common Purpose 'graduates' and they consist of government, state and local government officials and administrators, police chiefs and officers, and a whole range of others operating within the national, local and global establishment. Cressida Dick, Commissioner of the London Metropolitan Police, is the Common Purpose graduate who was the 'Gold Commander' that oversaw what can only be described as the murder of Brazilian electrician Jean Charles de Menezes in 2005. He was held down by psychopathic police and shot seven times in the head by a psychopathic lunatic after being mistaken for a terrorist when he was just a bloke going about his day. Dick authorised officers to pursue and keep surveillance on de Menezes and ordered that he be stopped from entering the underground train system. Police psychopaths took her at her word clearly. She was 'disciplined' for this outrage by being *promoted* – eventually to the top of the 'Met' police where she has been a disaster. Many Chief Constables controlling the police in different parts of the UK are and have been Common Purpose graduates. I have heard the 'graduate' network described as a sort of Mafia or secret society operating within the fabric of government at all levels pursuing a collective policy

ingrained at Common Purpose training events. Founder Julia Middleton herself has said:

> Locally and internationally, Common Purpose graduates will be 'lighting small fires' to create change in their organisations and communities … The Common Purpose effect is best illustrated by the many stories of small changes brought about by leaders, who themselves have changed.

A Common Purpose mission statement declared:

> Common Purpose aims to improve the way society works by expanding the vision, decision-making ability and influence of all kinds of leaders. The organisation runs a variety of educational programmes for leaders of all ages, backgrounds and sectors, in order to provide them with the inspirational, information and opportunities they need to change the world.

Yes, but into what? Since 2020 the answer has become clear.

NLP and the Delphi technique

Common Purpose would seem to be a perfect name or would common programming be better? One of the foundation methods of reaching 'consensus' (group think) is by setting the agenda theme and then encouraging, cajoling or pressuring everyone to agree a 'consensus' in line with the core theme promoted by Common Purpose. The methodology involves the 'Delphi technique', or an adaption of it, in which opinions are expressed that are summarised by a 'facilitator or change agent' at each stage. Participants are 'encouraged' to modify their views in the light of what others have said. Stage by stage the former individual opinions are merged into group consensus which just happens to be what Common Purpose wants them to believe. A key part of this is to marginalise anyone refusing to concede to group think and turn the group against them to apply pressure to conform. We are seeing this very technique used on the general population to make 'Covid' group-thinkers hostile to those who have seen through the bullshit. People can be reframed by using perception manipulation methods such as Neuro-Linguistic Programming (NLP) in which you change perception with the use of

carefully constructed language. An NLP website described the technique this way:

… A method of influencing brain behaviour (the 'neuro' part of the phrase) through the use of language (the 'linguistic' part) and other types of communication to enable a person to 'recode' the way the brain responds to stimuli (that's the 'programming') and manifest new and better behaviours. Neuro-Linguistic Programming often incorporates hypnosis and self-hypnosis to help achieve the change (or 'programming') that is wanted.

British alternative media operation UKColumn has done very detailed research into Common Purpose over a long period. I quoted co-founder and former naval officer Brian Gerrish in my book *Remember Who You Are*, published in 2011, as saying the following years before current times:

It is interesting that many of the mothers who have had children taken by the State speak of the Social Services people being icily cool, emotionless and, as two ladies said in slightly different words, '… like little robots'. We know that NLP is cumulative, so people can be given small imperceptible doses of NLP in a course here, another in a few months, next year etc. In this way, major changes are accrued in their personality, but the day by day change is almost unnoticeable.

In these and other ways 'graduates' have had their perceptions uniformly reframed and they return to their roles in the institutions of government, law enforcement, legal profession, military, 'education', the UK National Health Service and the whole swathe of the establishment structure to pursue a common agenda preparing for the 'post-industrial', 'post-democratic' society. I say 'preparing' but we are now there. 'Post-industrial' is code for the Great Reset and 'post-democratic' is 'Covid' fascism. UKColumn has spoken to partners of those who have attended Common Purpose 'training'. They have described how personalities and attitudes of 'graduates' changed very noticeably for the worse by the time they had completed the course. They had been 'reframed' and told they are the 'leaders' – the special ones – who know better than the population. There has also been the very demonstrable recruitment of psychopaths and narcissists into government administration at all

levels and law enforcement. If you want psychopathy hire psychopaths and you get a simple cause and effect. If you want administrators, police officers and 'leaders' to perceive the public as lesser beings who don't matter then employ narcissists. These personalities are identified using 'psychometrics' that identifies knowledge, abilities, attitudes and personality traits, mostly through carefully-designed questionnaires and tests. As this policy has passed through the decades we have had power-crazy, power-trippers appointed into law enforcement, security and government administration in preparation for current times and the dynamic between public and law enforcement/officialdom has been transformed. UKColumn's Brian Gerrish said of the narcissistic personality:

> Their love of themselves and power automatically means that they will crush others who get in their way. I received a major piece of the puzzle when a friend pointed out that when they made public officials re-apply for their own jobs several years ago they were also required to do psychometric tests. This was undoubtedly the start of the screening process to get 'their' sort of people in post.

How obvious that has been since 2020 although it was clear what was happening long before if people paid attention to the changing public-establishment dynamic.

Change agents

At the centre of events in 'Covid' Britain is the National Health Service (NHS) which has behaved disgracefully in slavishly following the Cult agenda. The NHS management structure is awash with Common Purpose graduates or 'change agents' working to a common cause. Helen Bevan, a Chief of Service Transformation at the NHS Institute for Innovation and Improvement, co-authored a document called 'Towards a million change agents, a review of the social movements literature: implications for large scale change in the NHS'. The document compared a project management approach to that of change and social movements where 'people change

themselves and each other – peer to peer'. Two definitions given for a 'social movement' were:

A group of people who consciously attempt to build a radically new social order; involves people of a broad range of social backgrounds; and deploys politically confrontational and socially disruptive tactics – Cyrus Zirakzadeh 1997

Collective challenges, based on common purposes and social solidarities, in sustained interaction with elites, opponents, and authorities – Sidney Tarrow 1994

Helen Bevan wrote another NHS document in which she defined 'framing' as 'the process by which leaders construct, articulate and put across their message in a powerful and compelling way in order to win people to their cause and call them to action'. I think I could come up with another definition that would be rather more accurate. The National Health Service and institutions of Britain and the wider world have been taken over by reframed 'change agents' and that includes everything from the United Nations to national governments, local councils and social services which have been kidnapping children from loving parents on an extraordinary and gathering scale on the road to the end of parenthood altogether. Children from loving homes are stolen and kidnapped by the state and put into the 'care' (inversion) of the local authority through council homes, foster parents and forced adoption. At the same time children are allowed to be abused without response while many are under council 'care'. UKColumn highlighted the Common Purpose connection between South Yorkshire Police and Rotherham council officers in the case of the scandal in that area of the sexual exploitation of children to which the authorities turned not one blind eye, but both:

We were alarmed to discover that the Chief Executive, the Strategic Director of Children and Young People's Services, the Manager for the Local Strategic Partnership, the Community Cohesion Manager, the Cabinet Member for Cohesion, the Chief Constable and his predecessor had all attended Leadership training courses provided by the pseudo-charity Common Purpose.

Once 'change agents' have secured positions of hire and fire within any organisation things start to move very quickly. Personnel are then hired and fired on the basis of whether they will work towards the agenda the change agent represents. If they do they are rapidly promoted even though they may be incompetent. Those more qualified and skilled who are pre-Common Purpose 'old school' see their careers stall and even disappear. This has been happening for decades in every institution of state, police, 'health' and social services and all of them have been transformed as a result in their attitudes to their jobs and the public. Medical professions, including nursing, which were once vocations for the caring now employ many cold, callous and couldn't give a shit personality types. The UKColumn investigation concluded:

By blurring the boundaries between people, professions, public and private sectors, responsibility and accountability, Common Purpose encourages 'graduates' to believe that as new selected leaders, they can work together, outside of the established political and social structures, to achieve a paradigm shift or CHANGE – so called 'Leading Beyond Authority'. In doing so, the allegiance of the individual becomes 'reframed' on CP colleagues and their NETWORK.

Reframing the Face-Nappies

Nowhere has this process been more obvious than in the police where recruitment of psychopaths and development of unquestioning mind-controlled group-thinkers have transformed law enforcement into a politically-correct 'Woke' joke and a travesty of what should be public service. Today they wear their face-nappies like good little gofers and enforce 'Covid' rules which are fascism under another name. Alongside the specifically-recruited psychopaths we have software minds incapable of free thought. Brian Gerrish again:

An example is the policeman who would not get on a bike for a press photo because he had not done the cycling proficiency course. Normal people say this is political correctness gone mad. Nothing could be further from the truth. The policeman has been reframed, and in his reality it is perfect common sense not to get on the bike 'because he hasn't done the cycling course'.

Another example of this is where the police would not rescue a boy from a pond until they had taken advice from above on the 'risk assessment'. A normal person would have arrived, perhaps thought of the risk for a moment, and dived in. To the police now 'reframed', they followed 'normal' procedure.

There are shocking cases of reframed ambulance crews doing the same. Sheer unthinking stupidity of London Face-Nappies headed by Common Purpose graduate Cressida Dick can be seen in their behaviour at a vigil in March, 2021, for a murdered woman, Sarah Everard. A police officer had been charged with the crime. Anyone with a brain would have left the vigil alone in the circumstances. Instead they 'manhandled' women to stop them breaking 'Covid rules' to betray classic reframing. Minds in the thrall of perception control have no capacity for seeing a situation on its merits and acting accordingly. 'Rules is rules' is their only mind-set. My father used to say that rules and regulations are for the guidance of the intelligent and the blind obedience of the idiot. Most of the intelligent, decent, coppers have gone leaving only the other kind and a few old school for whom the job must be a daily nightmare. The combination of psychopaths and rule-book software minds has been clearly on public display in the 'Covid' era with automaton robots in uniform imposing fascistic 'Covid' regulations on the population without any personal initiative or judging situations on their merits. There are thousands of examples around the world, but I'll make my point with the infamous Derbyshire police in the English East Midlands – the ones who think pouring dye into beauty spots and using drones to track people walking in the countryside away from anyone is called 'policing'. To them there are rules decreed by the government which they have to enforce and in their bewildered state a group gathering in a closed space and someone walking alone in the countryside are the same thing. It is beyond idiocy and enters the realm of clinical insanity.

Police officers in Derbyshire said they were 'horrified' – *horrified* – to find 15 to 20 'irresponsible' kids playing a football match at a closed leisure centre 'in breach of coronavirus restrictions'. When they saw the police the kids ran away leaving their belongings behind and the reframed men and women of Derbyshire police were seeking to establish their identities with a view to fining their parents. The most natural thing for youngsters to do – kicking a ball about – is turned into a criminal activity and enforced by the moronic software programs of Derbyshire police. You find the same mentality in every country. These barely conscious 'horrified' officers said they had to take action because 'we need to ensure these rules are being followed' and 'it is of the utmost importance that you ensure your children are following the rules and regulations for Covid-19'. Had any of them done ten seconds of research to see if this parroting of their masters' script could be supported by any evidence? Nope. Reframed people don't think – others think for them and that's the whole idea of reframing. I have seen police officers one after the other repeating without question word for word what officialdom tells them just as I have seen great swathes of the public doing the same. Ask either for 'their' opinion and out spews what they have been told to think by the official narrative. Police and public may seem to be in different groups, but their mentality is the same. Most people do whatever they are told in fear not doing so or because they believe what officialdom tells them; almost the entirety of the police do what they are told for the same reason. Ultimately it's the tiny inner core of the global Cult that's telling both what to do.

So Derbyshire police were 'horrified'. Oh, really? Why did they think those kids were playing football? It was to relieve the psychological consequences of lockdown and being denied human contact with their friends and interaction, touch and discourse vital to human psychological health. Being denied this month after month has dismantled the psyche of many children and young people as depression and suicide have exploded. Were Derbyshire police *horrified by that*? Are you kidding? Reframed people don't have those

mental and emotional processes that can see how the impact on the psychological health of youngsters is far more dangerous than any 'virus' even if you take the mendacious official figures to be true. The reframed are told (programmed) how to act and so they do. The Derbyshire Chief Constable in the first period of lockdown when the black dye and drones nonsense was going on was Peter Goodman. He was the man who severed the connection between his force and the Derbyshire Constabulary *Male Voice* Choir when he decided that it was not inclusive enough to allow women to join. The fact it was a male voice choir making a particular sound produced by male voices seemed to elude a guy who terrifyingly ran policing in Derbyshire. He retired weeks after his force was condemned as disgraceful by former Supreme Court Justice Jonathan Sumption for their behaviour over extreme lockdown impositions. Goodman was replaced by his deputy Rachel Swann who was in charge when her officers were 'horrified'. The police statement over the boys committing the hanging-offence of playing football included the line about the youngsters being 'irresponsible in the times we are all living through' missing the point that the real relevance of the 'times we are all living through' is the imposition of fascism enforced by psychopaths and reframed minds of police officers playing such a vital part in establishing the fascist tyranny that their own children and grandchildren will have to live in their entire lives. As a definition of insanity that is hard to beat although it might be run close by imposing masks on people that can have a serious effect on their health while wearing a face nappy all day themselves. Once again public and police do it for the same reason – the authorities tell them to and who are they to have the self-respect to say no?

Wokers in uniform

How reframed do you have to be to arrest a *six-year-old* and take him to court for *picking a flower* while waiting for a bus? Brain dead police and officialdom did just that in North Carolina where criminal proceedings happen regularly for children under nine. Attorney Julie Boyer gave the six-year-old crayons and a colouring book

during the 'flower' hearing while the 'adults' decided his fate. County Chief District Court Judge Jay Corpening asked: 'Should a child that believes in Santa Claus, the Easter Bunny and the tooth fairy be making life-altering decisions?' Well, of course not, but common sense has no meaning when you have a common purpose and a reframed mind. Treating children in this way, and police operating in American schools, is all part of the psychological preparation for children to accept a police state as normal all their adult lives. The same goes for all the cameras and biometric tracking technology in schools. Police training is focused on reframing them as snowflake Wokers and this is happening in the military. Pentagon top brass said that 'training sessions on extremism' were needed for troops who asked why they were so focused on the Capitol Building riot when Black Lives Matter riots were ignored. What's the difference between them some apparently and rightly asked. Actually, there is a difference. Five people died in the Capitol riot, only one through violence, and that was a police officer shooting an unarmed protestor. BLM riots killed at least 25 people and cost billions. Asking the question prompted the psychopaths and reframed minds that run the Pentagon to say that more 'education' (programming) was needed. Troop training is all based on psychological programming to make them fodder for the Cult – 'Military men are just dumb, stupid animals to be used as pawns in foreign policy' as Cult-to-his-DNA former Secretary of State Henry Kissinger famously said. Governments see the police in similar terms and it's time for those among them who can see this to defend the people and stop being enforcers of the Cult agenda upon the people.

The US military, like the country itself, is being targeted for destruction through a long list of Woke impositions. Cult-owned gaga 'President' Biden signed an executive order when he took office to allow taxpayer money to pay for transgender surgery for active military personnel and veterans. Are you a man soldier? No, I'm a LGBTQIA+ with a hint of Skoliosexual and Spectrasexual. Oh, good man. Bad choice of words you bigot. The Pentagon announced in March, 2021, the appointment of the first 'diversity and inclusion

officer' for US Special Forces. Richard Torres-Estrada arrived with the publication of a 'D&I Strategic Plan which will guide the enterprise-wide effort to institutionalize and sustain D&I'. If you think a Special Forces 'Strategic Plan' should have something to do with defending America you haven't been paying attention. Defending Woke is now the military's new role. Torres-Estrada has posted images comparing Donald Trump with Adolf Hitler and we can expect no bias from him as a representative of the supposedly non-political Pentagon. Cable news host Tucker Carlson said: 'The Pentagon is now the Yale faculty lounge but with cruise missiles.' Meanwhile Secretary of Defense Lloyd Austin, a board member of weapons-maker Raytheon with stock and compensation interests in October, 2020, worth $1.4 million, said he was purging the military of the 'enemy within' – anyone who isn't Woke and supports Donald Trump. Austin refers to his targets as 'racist extremists' while in true Woke fashion being himself a racist extremist. Pentagon documents pledge to 'eradicate, eliminate and conquer all forms of racism, sexism and homophobia'. The definitions of these are decided by 'diversity and inclusion committees' peopled by those who see racism, sexism and homophobia in every situation and opinion. Woke (the Cult) is dismantling the US military and purging testosterone as China expands its military and gives its troops 'masculinity training'. How do we think that is going to end when this is all Cult coordinated? The US military, like the British military, is controlled by Woke and spineless top brass who just go along with it out of personal career interests.

'Woke' means fast asleep

Mind control and perception manipulation techniques used on individuals to create group-think have been unleashed on the global population in general. As a result many have no capacity to see the obvious fascist agenda being installed all around them or what 'Covid' is really all about. Their brains are firewalled like a computer system not to process certain concepts, thoughts and realisations that are bad for the Cult. The young are most targeted as the adults they

will be when the whole fascist global state is planned to be fully implemented. They need to be prepared for total compliance to eliminate all pushback from entire generations. The Cult has been pouring billions into taking complete control of 'education' from schools to universities via its operatives and corporations and not least Bill Gates as always. The plan has been to transform 'education' institutions into programming centres for the mentality of 'Woke'. James McConnell, professor of psychology at the University of Michigan, wrote in *Psychology Today* in 1970:

> The day has come when we can combine sensory deprivation with drugs, hypnosis, and astute manipulation of reward and punishment, to gain almost absolute control over an individual's behaviour. It should then be possible to achieve a very rapid and highly effective type of brainwashing that would allow us to make dramatic changes in a person's behaviour and personality ...
>
> … We should reshape society so that we all would be trained from birth to want to do what society wants us to do. We have the techniques to do it... no-one owns his own personality you acquired, and there's no reason to believe you should have the right to refuse to acquire a new personality if your old one is anti-social.

This was the potential for mass brainwashing in 1970 and the mentality there displayed captures the arrogant psychopathy that drives it forward. I emphasise that not all young people have succumbed to Woke programming and those that haven't are incredibly impressive people given that today's young are the most perceptually-targeted generations in history with all the technology now involved. Vast swathes of the young generations, however, have fallen into the spell – and that's what it is – of Woke. The Woke mentality and perceptual program is founded on *inversion* and you will appreciate later why that is so significant. Everything with Woke is inverted and the opposite of what it is claimed to be. Woke was a term used in African-American culture from the 1900s and referred to an awareness of social and racial justice. This is not the meaning of the modern version or 'New Woke' as I call it in *The Answer*. Oh, no, Woke today means something very different no matter how much Wokers may seek to hide that and insist Old Woke and New

Woke are the same. See if you find any 'awareness of social justice' here in the modern variety:

- Woke demands 'inclusivity' while excluding anyone with a different opinion and calls for mass censorship to silence other views.

- Woke claims to stand against oppression when imposing oppression is the foundation of all that it does. It is the driver of political correctness which is nothing more than a Cult invention to manipulate the population to silence itself.

- Woke believes itself to be 'liberal' while pursuing a global society that can only be described as fascist (see 'anti-fascist' fascist Antifa).

- Woke calls for 'social justice' while spreading injustice wherever it goes against the common 'enemy' which can be easily identified as a differing view.

- Woke is supposed to be a metaphor for 'awake' when it is solid-gold asleep and deep in a Cult-induced coma that meets the criteria for 'off with the fairies'.

I state these points as obvious facts if people only care to look. I don't do this with a sense of condemnation. We need to appreciate that the onslaught of perceptual programming on the young has been incessant and merciless. I can understand why so many have been reframed, or, given their youth, framed from the start to see the world as the Cult demands. The Cult has had access to their minds day after day in its 'education' system for their entire formative years. Perception is formed from information received and the Cult-created system is a life-long download of information delivered to elicit a particular perception, thus behaviour. The more this has expanded into still new extremes in recent decades and ever-increasing censorship has deleted other opinions and information why wouldn't that lead to a perceptual reframing on a mass scale? I

have described already cradle-to-grave programming and in more recent times the targeting of young minds from birth to adulthood has entered the stratosphere. This has taken the form of skewing what is 'taught' to fit the Cult agenda and the omnipresent techniques of group-think to isolate non-believers and pressure them into line. There has always been a tendency to follow the herd, but we really are in a new world now in relation to that. We have parents who can see the 'Covid' hoax told by their children not to stop them wearing masks at school, being 'Covid' tested or having the 'vaccine' in fear of the peer-pressure consequences of being different. What is 'peer-pressure' if not pressure to conform to group-think? Renegade Minds never group-think and always retain a set of perceptions that are unique to them. Group-think is always underpinned by consequences for not group-thinking. Abuse now aimed at those refusing DNA-manipulating 'Covid vaccines' are a potent example of this. The biggest pressure to conform comes from the very group which is itself being manipulated. 'I am programmed to be part of a hive mind and so you must be.'

Woke control structures in 'education' now apply to every mainstream organisation. Those at the top of the 'education' hierarchy (the Cult) decide the policy. This is imposed on governments through the Cult network; governments impose it on schools, colleges and universities; their leadership impose the policy on teachers and academics and they impose it on children and students. At any level where there is resistance, perhaps from a teacher or university lecturer, they are targeted by the authorities and often fired. Students themselves regularly demand the dismissal of academics (increasingly few) at odds with the narrative that the students have been programmed to believe in. It is quite a thought that students who are being targeted by the Cult become so consumed by programmed group-think that they launch protests and demand the removal of those who are trying to push back against those targeting the students. Such is the scale of perceptual inversion. We see this with 'Covid' programming as the Cult imposes the rules via psycho-psychologists and governments on

shops, transport companies and businesses which impose them on their staff who impose them on their customers who pressure Pushbackers to conform to the will of the Cult which is in the process of destroying them and their families. Scan all aspects of society and you will see the same sequence every time.

Fact free Woke and hijacking the 'left'

There is no more potent example of this than 'Woke', a mentality only made possible by the deletion of factual evidence by an 'education' system seeking to produce an ever more uniform society. Why would you bother with facts when you don't know any? Deletion of credible history both in volume and type is highly relevant. Orwell said: 'Who controls the past controls the future: who controls the present controls the past.' They who control the perception of the past control the perception of the future and they who control the present control the perception of the past through the writing and deleting of history. Why would you oppose the imposition of Marxism in the name of Wokeism when you don't know that Marxism cost at least 100 million lives in the 20th century alone? Watch videos and read reports in which Woker generations are asked basic historical questions – it's mind-blowing. A survey of 2,000 people found that six percent of millennials (born approximately early1980s to early 2000s) believed the Second World War (1939-1945) broke out with the assassination of President Kennedy (in 1963) and one in ten thought Margaret Thatcher was British Prime Minister at the time. She was in office between 1979 and 1990. We are in a post-fact society. Provable facts are no defence against the fascism of political correctness or Silicon Valley censorship. Facts don't matter anymore as we have witnessed with the 'Covid' hoax. Sacrificing uniqueness to the Woke group-think religion is all you are required to do and that means thinking for yourself is the biggest Woke no, no. All religions are an expression of group-think and censorship and Woke is just another religion with an orthodoxy defended by group-think and censorship. Burned at

the stake becomes burned on Twitter which leads back eventually to burned at the stake as Woke humanity regresses to ages past.

The biggest Woke inversion of all is its creators and funders. I grew up in a traditional left of centre political household on a council estate in Leicester in the 1950s and 60s – you know, the left that challenged the power of wealth-hoarding elites and threats to freedom of speech and opinion. In those days students went on marches defending freedom of speech while today's Wokers march for its deletion. What on earth could have happened? Those very elites (collectively the Cult) that we opposed in my youth and early life have funded into existence the antithesis of that former left and hijacked the 'brand' while inverting everything it ever stood for. We have a mentality that calls itself 'liberal' and 'progressive' while acting like fascists. Cult billionaires and their corporations have funded themselves into control of 'education' to ensure that Woke programming is unceasing throughout the formative years of children and young people and that non-Wokers are isolated (that word again) whether they be students, teachers or college professors. The Cult has funded into existence the now colossal global network of Woke organisations that have spawned and promoted all the 'causes' on the Cult wish-list for global transformation and turned Wokers into demanders of them. Does anyone really think it's a coincidence that the Cult agenda for humanity is a carbon (sorry) copy of the societal transformations desired by Woke?? These are only some of them:

Political correctness: The means by which the Cult deletes all public debates that it knows it cannot win if we had the free-flow of information and evidence.

Human-caused 'climate change': The means by which the Cult seeks to transform society into a globally-controlled dictatorship imposing its will over the fine detail of everyone's lives 'to save the planet' which doesn't actually need saving.

Transgender obsession: Preparing collective perception to accept the 'new human' which would not have genders because it would be created technologically and not through procreation. I'll have much more on this in Human 2.0.

Race obsession: The means by which the Cult seeks to divide and rule the population by triggering racial division through the perception that society is more racist than ever when the opposite is the case. Is it perfect in that regard? No. But to compare today with the racism of apartheid and segregation brought to an end by the civil rights movement in the 1960s is to insult the memory of that movement and inspirations like Martin Luther King. Why is the 'anti-racism' industry (which it is) so dominated by privileged white people?

White supremacy: This is a label used by privileged white people to demonise poor and deprived white people pushing back on tyranny to marginalise and destroy them. White people are being especially targeted as the dominant race by number within Western society which the Cult seeks to transform in its image. If you want to change a society you must weaken and undermine its biggest group and once you have done that by using the other groups you next turn on them to do the same … 'Then they came for the Jews and I was not a Jew so I did nothing.'

Mass migration: The mass movement of people from the Middle East, Africa and Asia into Europe, from the south into the United States and from Asia into Australia are another way the Cult seeks to dilute the racial, cultural and political influence of white people on Western society. White people ask why their governments appear to be working against them while being politically and culturally biased towards incoming cultures. Well, here's your answer. In the same way sexually 'straight' people, men and women, ask why the

authorities are biased against them in favour of other sexualities. The answer is the same – that's the way the Cult wants it to be for very sinister motives.

These are all central parts of the Cult agenda and central parts of the Woke agenda and Woke was created and continues to be funded to an immense degree by Cult billionaires and corporations. If anyone begins to say 'coincidence' the syllables should stick in their throat.

Billionaire 'social justice warriors'

Joe Biden is a 100 percent-owned asset of the Cult and the Wokers' man in the White House whenever he can remember his name and for however long he lasts with his rapidly diminishing cognitive function. Even walking up the steps of an aircraft without falling on his arse would appear to be a challenge. He's not an empty-shell puppet or anything. From the minute Biden took office (or the Cult did) he began his executive orders promoting the Woke wish-list. You will see the Woke agenda imposed ever more severely because it's really the *Cult* agenda. Woke organisations and activist networks spawned by the Cult are funded to the extreme so long as they promote what the Cult wants to happen. Woke is funded to promote 'social justice' by billionaires who become billionaires by destroying social justice. The social justice mantra is only a cover for dismantling social justice and funded by billionaires that couldn't give a damn about social justice. Everything makes sense when you see that. One of Woke's premier funders is Cult billionaire financier George Soros who said: 'I am basically there to make money, I cannot and do not look at the social consequences of what I do.' This is the same Soros who has given more than $32 billion to his Open Society Foundations global Woke network and funded Black Lives Matter, mass immigration into Europe and the United States, transgender activism, climate change activism, political correctness and groups targeting 'white supremacy' in the form of privileged white thugs that dominate Antifa. What a scam it all is and when

you are dealing with the unquestioning fact-free zone of Woke scamming them is child's play. All you need to pull it off in all these organisations are a few in-the-know agents of the Cult and an army of naïve, reframed, uninformed, narcissistic, know-nothings convinced of their own self-righteousness, self-purity and virtue.

Soros and fellow billionaires and billionaire corporations have poured hundreds of millions into Black Lives Matter and connected groups and promoted them to a global audience. None of this is motivated by caring about black people. These are the billionaires that have controlled and exploited a system that leaves millions of black people in abject poverty and deprivation which they do absolutely nothing to address. The same Cult networks funding BLM were behind the *slave trade!* Black Lives Matter hijacked a phrase that few would challenge and they have turned this laudable concept into a political weapon to divide society. You know that BLM is a fraud when it claims that *All* Lives Matter, the most inclusive statement of all, is 'racist'. BLM and its Cult masters don't want to end racism. To them it's a means to an end to control all of humanity never mind the colour, creed, culture or background. What has destroying the nuclear family got to do with ending racism? Nothing – but that is one of the goals of BLM and also happens to be a goal of the Cult as I have been exposing in my books for decades. Stealing children from loving parents and giving schools ever more power to override parents is part of that same agenda. BLM is a Marxist organisation and why would that not be the case when the Cult created Marxism *and* BLM? Patrisse Cullors, a BLM co-founder, said in a 2015 video that she and her fellow organisers, including co-founder Alicia Garza, are 'trained Marxists'. The lady known after marriage as Patrisse Khan-Cullors bought a $1.4 million home in 2021 in one of the whitest areas of California with a black population of just 1.6 per cent and has so far bought *four* high-end homes for a total of $3.2 million. How very Marxist. There must be a bit of spare in the BLM coffers, however, when Cult corporations and billionaires have handed over the best part of $100 million. Many black people can see that Black Lives Matter is not

working for them, but against them, and this is still more confirmation. Black journalist Jason Whitlock, who had his account suspended by Twitter for simply linking to the story about the 'Marxist's' home buying spree, said that BLM leaders are 'making millions of dollars off the backs of these dead black men who they wouldn't spit on if they were on fire and alive'.

Black Lies Matter

Cult assets and agencies came together to promote BLM in the wake of the death of career criminal George Floyd who had been jailed a number of times including for forcing his way into the home of a black woman with others in a raid in which a gun was pointed at her stomach. Floyd was filmed being held in a Minneapolis street in 2020 with the knee of a police officer on his neck and he subsequently died. It was an appalling thing for the officer to do, but the same technique has been used by police on peaceful protestors of lockdown without any outcry from the Woke brigade. As unquestioning supporters of the Cult agenda Wokers have supported lockdown and all the 'Covid' claptrap while attacking anyone standing up to the tyranny imposed in its name. Court documents would later include details of an autopsy on Floyd by County Medical Examiner Dr Andrew Baker who concluded that Floyd had taken a fatal level of the drug fentanyl. None of this mattered to fact-free, question-free, Woke. Floyd's death was followed by worldwide protests against police brutality amid calls to defund the police. Throwing babies out with the bathwater is a Woke speciality. In the wake of the murder of British woman Sarah Everard a Green Party member of the House of Lords, Baroness Jones of Moulescoomb (Nincompoopia would have been better), called for a 6pm curfew for all men. This would be in breach of the Geneva Conventions on war crimes which ban collective punishment, but that would never have crossed the black and white Woke mind of Baroness Nincompoopia who would have been far too convinced of her own self-righteousness to compute such details. Many American cities did defund the police in the face of Floyd riots

and after $15 million was deleted from the police budget in Washington DC under useless Woke mayor Muriel Bowser car-jacking alone rose by 300 percent and within six months the US capital recorded its highest murder rate in 15 years. The same happened in Chicago and other cities in line with the Cult/Soros plan to bring fear to streets and neighbourhoods by reducing the police, releasing violent criminals and not prosecuting crime. This is the mob-rule agenda that I have warned in the books was coming for so long. Shootings in the area of Minneapolis where Floyd was arrested increased by 2,500 percent compared with the year before. Defunding the police over George Floyd has led to a big increase in dead people with many of them black. Police protection for politicians making these decisions stayed the same or increased as you would expect from professional hypocrites. The Cult doesn't actually want to abolish the police. It wants to abolish local control over the police and hand it to federal government as the psychopaths advance the Hunger Games Society. Many George Floyd protests turned into violent riots with black stores and businesses destroyed by fire and looting across America fuelled by Black Lives Matter. Woke doesn't do irony. If you want civil rights you must loot the liquor store and the supermarket and make off with a smart TV. It's the only way.

It's not a race war – it's a class war

Black people are patronised by privileged blacks and whites alike and told they are victims of white supremacy. I find it extraordinary to watch privileged blacks supporting the very system and bloodline networks behind the slave trade and parroting the same Cult-serving manipulative crap of their privileged white, often billionaire, associates. It is indeed not a race war but a class war and colour is just a diversion. Black Senator Cory Booker and black Congresswoman Maxine Waters, more residents of Nincompoopia, personify this. Once you tell people they are victims of someone else you devalue both their own responsibility for their plight and the power they have to impact on their reality and experience. Instead

we have: 'You are only in your situation because of whitey – turn on them and everything will change.' It won't change. Nothing changes in our lives unless *we* change it. Crucial to that is never seeing yourself as a victim and always as the creator of your reality. Life is a simple sequence of choice and consequence. Make different choices and you create different consequences. *You* have to make those choices – not Black Lives Matter, the Woke Mafia and anyone else that seeks to dictate your life. Who are they these Wokers, an emotional and psychological road traffic accident, to tell you what to do? Personal empowerment is the last thing the Cult and its Black Lives Matter want black people or anyone else to have. They claim to be defending the underdog while *creating* and perpetuating the underdog. The Cult's worst nightmare is human unity and if they are going to keep blacks, whites and every other race under economic servitude and control then the focus must be diverted from what they have in common to what they can be manipulated to believe divides them. Blacks have to be told that their poverty and plight is the fault of the white bloke living on the street in the same poverty and with the same plight they are experiencing. The difference is that your plight black people is due to him, a white supremacist with 'white privilege' living on the street. Don't unite as one human family against your mutual oppressors and suppressors – fight the oppressor with the white face who is as financially deprived as you are. The Cult knows that as its 'Covid' agenda moves into still new levels of extremism people are going to respond and it has been spreading the seeds of disunity everywhere to stop a united response to the evil that targets *all of us*.

Racist attacks on 'whiteness' are getting ever more outrageous and especially through the American Democratic Party which has an appalling history for anti-black racism. Barack Obama, Joe Biden, Hillary Clinton and Nancy Pelosi all eulogised about Senator Robert Byrd at his funeral in 2010 after a nearly 60-year career in Congress. Byrd was a brutal Ku Klux Klan racist and a violent abuser of Cathy O'Brien in MKUltra. He said he would never fight in the military 'with a negro by my side' and 'rather I should die a thousand times,

and see Old Glory trampled in the dirt never to rise again, than to see this beloved land of ours become degraded by race mongrels, a throwback to the blackest specimen from the wilds'. Biden called Byrd a 'very close friend and mentor'. These 'Woke' hypocrites are not anti-racist they are anti-poor and anti-people not of their perceived class. Here is an illustration of the scale of anti-white racism to which we have now descended. Seriously Woke and moronic *New York Times* contributor Damon Young described whiteness as a 'virus' that 'like other viruses will not die until there are no bodies left for it to infect'. He went on: '… the only way to stop it is to locate it, isolate it, extract it, and kill it.' Young can say that as a black man with no consequences when a white man saying the same in reverse would be facing a jail sentence. *That's* racism. We had super-Woke numbskull senators Tammy Duckworth and Mazie Hirono saying they would object to future Biden Cabinet appointments if he did not nominate more Asian Americans and Pacific Islanders. Never mind the ability of the candidate what do they look like? Duckworth said: 'I will vote for racial minorities and I will vote for LGBTQ, but anyone else I'm not voting for.' Appointing people on the grounds of race is illegal, but that was not a problem for this ludicrous pair. They were on-message and that's a free pass in any situation.

Critical race racism

White children are told at school they are intrinsically racist as they are taught the divisive 'critical race theory'. This claims that the law and legal institutions are inherently racist and that race is a socially constructed concept used by white people to further their economic and political interests at the expense of people of colour. White is a 'virus' as we've seen. Racial inequality results from 'social, economic, and legal differences that white people create between races to maintain white interests which leads to poverty and criminality in minority communities'. I must tell that to the white guy sleeping on the street. The principal of East Side Community School in New York sent white parents a manifesto that called on

them to become 'white traitors' and advocate for full 'white abolition'. These people are teaching your kids when they urgently need a psychiatrist. The 'school' included a chart with 'eight white identities' that ranged from 'white supremacist' to 'white abolition' and defined the behaviour white people must follow to end 'the regime of whiteness'. Woke blacks and their privileged white associates are acting exactly like the slave owners of old and Ku Klux Klan racists like Robert Byrd. They are too full of their own self-purity to see that, but it's true. Racism is not a body type; it's a state of mind that can manifest through any colour, creed or culture.

Another racial fraud is *'equity'*. Not equality of treatment and opportunity – equity. It's a term spun as equality when it means something very different. Equality in its true sense is a raising up while 'equity' is a race to the bottom. Everyone in the same level of poverty is 'equity'. Keep everyone down – that's equity. The Cult doesn't want anyone in the human family to be empowered and BLM leaders, like all these 'anti-racist' organisations, continue their privileged, pampered existence by perpetuating the perception of gathering racism. When is the last time you heard an 'anti-racist' or 'anti-Semitism' organisation say that acts of racism and discrimination have *fallen?* It's not in the interests of their fund-raising and power to influence and the same goes for the professional soccer anti-racism operation, Kick It Out. Two things confirmed that the Black Lives Matter riots in the summer of 2020 were Cult creations. One was that while anti-lockdown protests were condemned in this same period for 'transmitting 'Covid' the authorities supported mass gatherings of Black Lives Matter supporters. I even saw self-deluding people claiming to be doctors say the two types of protest were not the same. No – the non-existent 'Covid' was in favour of lockdowns and attacked those that protested against them while 'Covid' supported Black Lives Matter and kept well away from its protests. The whole thing was a joke and as lockdown protestors were arrested, often brutally, by reframed Face-Nappies we had the grotesque sight of police officers taking the knee to Black Lives Matter, a Cult-funded Marxist

organisation that supports violent riots and wants to destroy the nuclear family and white people.

He's not white? Shucks!

Woke obsession with race was on display again when ten people were shot dead in Boulder, Colorado, in March, 2021. Cult-owned Woke TV channels like CNN said the shooter appeared to be a white man and Wokers were on Twitter condemning 'violent white men' with the usual mantras. Then the shooter's name was released as Ahmad Al Aliwi Alissa, an anti-Trump Arab-American, and the sigh of disappointment could be heard five miles away. Never mind that ten people were dead and what that meant for their families. Race baiting was all that mattered to these sick Cult-serving people like Barack Obama who exploited the deaths to further divide America on racial grounds which is his job for the Cult. This is the man that 'racist' white Americans made the first black president of the United States and then gave him a second term. Not-very-bright Obama has become filthy rich on the back of that and today appears to have a big influence on the Biden administration. Even so he's still a downtrodden black man and a victim of white supremacy. This disingenuous fraud reveals the contempt he has for black people when he puts on a Deep South Alabama accent whenever he talks to them, no, *at* them.

Another BLM red flag was how the now fully-Woke (fully-Cult) and fully-virtue-signalled professional soccer authorities had their teams taking the knee before every match in support of Marxist Black Lives Matter. Soccer authorities and clubs displayed 'Black Lives Matter' on the players' shirts and flashed the name on electronic billboards around the pitch. Any fans that condemned what is a Freemasonic taking-the-knee ritual were widely condemned as you would expect from the Woke virtue-signallers of professional sport and the now fully-Woke media. We have reverse racism in which you are banned from criticising any race or culture except for white people for whom anything goes – say what you like, no problem. What has this got to do with racial harmony and

equality? We've had black supremacists from Black Lives Matter telling white people to fall to their knees in the street and apologise for their white supremacy. Black supremacists acting like white supremacist slave owners of the past couldn't breach their self-obsessed, race-obsessed sense of self-purity. Joe Biden appointed a race-obsessed black supremacist Kristen Clarke to head the Justice Department Civil Rights Division. Clarke claimed that blacks are endowed with 'greater mental, physical and spiritual abilities' than whites. If anyone reversed that statement they would be vilified. Clarke is on-message so no problem. She's never seen a black-white situation in which the black figure is anything but a virtuous victim and she heads the Civil Rights Division which should treat everyone the same or it isn't civil rights. Another perception of the Renegade Mind: If something or someone is part of the Cult agenda they will be supported by Woke governments and media no matter what. If they're not, they will be condemned and censored. It really is that simple and so racist Clarke prospers despite (make that because of) her racism.

The end of culture

Biden's administration is full of such racial, cultural and economic bias as the Cult requires the human family to be divided into warring factions. We are now seeing racially-segregated graduations and everything, but everything, is defined through the lens of perceived 'racism. We have 'racist' mathematics, 'racist' food and even 'racist' *plants*. World famous Kew Gardens in London said it was changing labels on plants and flowers to tell its pre-'Covid' more than two million visitors a year how racist they are. Kew director Richard Deverell said this was part of an effort to 'move quickly to decolonise collections' after they were approached by one Ajay Chhabra 'an actor with an insight into how sugar cane was linked to slavery'. They are *plants* you idiots. 'Decolonisation' in the Woke manual really means colonisation of society with its mentality and by extension colonisation by the Cult. We are witnessing a new Chinese-style 'Cultural Revolution' so essential to the success of all

Marxist takeovers. Our cultural past and traditions have to be swept away to allow a new culture to be built-back-better. Woke targeting of long-standing Western cultural pillars including historical monuments and cancelling of historical figures is what happened in the Mao revolution in China which 'purged remnants of capitalist and traditional elements from Chinese society' and installed Maoism as the dominant ideology'. For China see the Western world today and for 'dominant ideology' see Woke. Better still see Marxism or Maoism. The 'Covid' hoax has specifically sought to destroy the arts and all elements of Western culture from people meeting in a pub or restaurant to closing theatres, music venues, sports stadiums, places of worship and even banning *singing*. Destruction of Western society is also why criticism of any religion is banned except for Christianity which again is the dominant religion as white is the numerically-dominant race. Christianity may be fading rapidly, but its history and traditions are weaved through the fabric of Western society. Delete the pillars and other structures will follow until the whole thing collapses. I am not a Christian defending that religion when I say that. I have no religion. It's just a fact. To this end Christianity has itself been turned Woke to usher its own downfall and its ranks are awash with 'change agents' – knowing and unknowing – at every level including Pope Francis (*definitely* knowing) and the clueless Archbishop of Canterbury Justin Welby (possibly not, but who can be sure?). Woke seeks to coordinate attacks on Western culture, traditions, and ways of life through 'intersectionality' defined as 'the complex, cumulative way in which the effects of multiple forms of discrimination (such as racism, sexism, and classism) combine, overlap, or intersect especially in the experiences of marginalised individuals or groups'. Wade through the Orwellian Woke-speak and this means coordinating disparate groups in a common cause to overthrow freedom and liberal values.

The entire structure of public institutions has been infested with Woke – government at all levels, political parties, police, military, schools, universities, advertising, media and trade unions. This abomination has been achieved through the Cult web by appointing

Wokers to positions of power and battering non-Wokers into line through intimidation, isolation and threats to their job. Many have been fired in the wake of the empathy-deleted, vicious hostility of 'social justice' Wokers and the desire of gutless, spineless employers to virtue-signal their Wokeness. Corporations are filled with Wokers today, most notably those in Silicon Valley. Ironically at the top they are not Woke at all. They are only exploiting the mentality their Cult masters have created and funded to censor and enslave while the Wokers cheer them on until it's their turn. Thus the Woke 'liberal left' is an inversion of the traditional liberal left. Campaigning for justice on the grounds of power and wealth distribution has been replaced by campaigning for identity politics. The genuine traditional left would never have taken money from today's billionaire abusers of fairness and justice and nor would the billionaires have wanted to fund that genuine left. It would not have been in their interests to do so. The division of opinion in those days was between the haves and have nots. This all changed with Cult manipulated and funded identity politics. The division of opinion today is between Wokers and non-Wokers and not income brackets. Cult corporations and their billionaires may have taken wealth disparity to cataclysmic levels of injustice, but as long as they speak the language of Woke, hand out the dosh to the Woke network and censor the enemy they are 'one of us'. Billionaires who don't give a damn about injustice are laughing at them till their bellies hurt. Wokers are not even close to self-aware enough to see that. The transformed 'left' dynamic means that Wokers who drone on about 'social justice' are funded by billionaires that have destroyed social justice the world over. It's *why* they are billionaires.

The climate con

Nothing encapsulates what I have said more comprehensively than the hoax of human-caused global warming. I have detailed in my books over the years how Cult operatives and organisations were the pump-primers from the start of the climate con. A purpose-built vehicle for this is the Club of Rome established by the Cult in 1968

with the Rockefellers and Rothschilds centrally involved all along. Their gofer frontman Maurice Strong, a Canadian oil millionaire, hosted the Earth Summit in Rio de Janeiro, Brazil, in 1992 where the global 'green movement' really expanded in earnest under the guiding hand of the Cult. The Earth Summit established Agenda 21 through the Cult-created-and-owned United Nations to use the illusion of human-caused climate change to justify the transformation of global society to save the world from climate disaster. It is a No-Problem-Reaction-Solution sold through governments, media, schools and universities as whole generations have been terrified into believing that the world was going to end in their lifetimes unless what old people had inflicted upon them was stopped by a complete restructuring of how everything is done. Chill, kids, it's all a hoax. Such restructuring is precisely what the Cult agenda demands (purely by coincidence of course). Today this has been given the codename of the Great Reset which is only an updated term for Agenda 21 and its associated Agenda 2030. The latter, too, is administered through the UN and was voted into being by the General Assembly in 2015. Both 21 and 2030 seek centralised control of all resources and food right down to the raindrops falling on your own land. These are some of the demands of Agenda 21 established in 1992. See if you recognise this society emerging today:

- End national sovereignty
- State planning and management of all land resources, ecosystems, deserts, forests, mountains, oceans and fresh water; agriculture; rural development; biotechnology; and ensuring *'equity'*
- The state to 'define the role' of business and financial resources
- Abolition of private property
- 'Restructuring' the family unit (see BLM)
- Children raised by the state
- People told what their job will be
- Major restrictions on movement
- Creation of 'human settlement zones'

- Mass resettlement as people are forced to vacate land where they live
- Dumbing down education
- Mass global depopulation in pursuit of all the above

The United Nations was created as a Trojan horse for world government. With the climate con of critical importance to promoting that outcome you would expect the UN to be involved. Oh, it's involved all right. The UN is promoting Agenda 21 and Agenda 2030 justified by 'climate change' while also driving the climate hoax through its Intergovernmental Panel on Climate Change (IPCC), one of the world's most corrupt organisations. The IPCC has been lying ferociously and constantly since the day it opened its doors with the global media hanging unquestioningly on its every mendacious word. The Green movement is entirely Woke and has long lost its original environmental focus since it was co-opted by the Cult. An obsession with 'global warming' has deleted its values and scrambled its head. I experienced a small example of what I mean on a beautiful country walk that I have enjoyed several times a week for many years. The path merged into the fields and forests and you felt at one with the natural world. Then a 'Green' organisation, the Hampshire and Isle of Wight Wildlife Trust, took over part of the land and proceeded to cut down a large number of trees, including mature ones, to install a horrible big, bright steel 'this-is-ours-stay-out' fence that destroyed the whole atmosphere of this beautiful place. No one with a feel for nature would do that. Day after day I walked to the sound of chainsaws and a magnificent mature weeping willow tree that I so admired was cut down at the base of the trunk. When I challenged a Woke young girl in a green shirt (of course) about this vandalism she replied: 'It's a weeping willow – it will grow back.' This is what people are paying for when they donate to the Hampshire and Isle of Wight Wildlife Trust and many other 'green' organisations today. It is not the environmental movement that I knew and instead has become a support-system – as with Extinction Rebellion – for a very dark agenda.

Private jets for climate justice

The Cult-owned, Gates-funded, World Economic Forum and its founder Klaus Schwab were behind the emergence of Greta Thunberg to harness the young behind the climate agenda and she was invited to speak to the world at … the UN. Schwab published a book, *Covid-19: The Great Reset* in 2020 in which he used the 'Covid' hoax and the climate hoax to lay out a new society straight out of Agenda 21 and Agenda 2030. Bill Gates followed in early 2021 when he took time out from destroying the world to produce a book in his name about the way to save it. Gates flies across the world in private jets and admitted that 'I probably have one of the highest greenhouse gas footprints of anyone on the planet … my personal flying alone is gigantic.' He has also bid for the planet's biggest private jet operator. Other climate change saviours who fly in private jets include John Kerry, the US Special Presidential Envoy for Climate, and actor Leonardo DiCaprio, a 'UN Messenger of Peace with special focus on climate change'. These people are so full of bullshit they could corner the market in manure. We mustn't be sceptical, though, because the Gates book, *How to Avoid a Climate Disaster: The Solutions We Have and the Breakthroughs We Need*, is a genuine attempt to protect the world and not an obvious pile of excrement attributed to a mega-psychopath aimed at selling his masters' plans for humanity. The Gates book and the other shite-pile by Klaus Schwab could have been written by the same person and may well have been. Both use 'climate change' and 'Covid' as the excuses for their new society and by coincidence the Cult's World Economic Forum and Bill and Melinda Gates Foundation promote the climate hoax and hosted Event 201 which pre-empted with a 'simulation' the very 'coronavirus' hoax that would be simulated for real on humanity within weeks. The British 'royal' family is promoting the 'Reset' as you would expect through Prince 'climate change caused the war in Syria' Charles and his hapless son Prince William who said that we must 'reset our relationship with nature and our trajectory as a species' to avoid a climate disaster. Amazing how many promotors of the 'Covid' and 'climate change' control

systems are connected to Gates and the World Economic Forum. A 'study' in early 2021 claimed that carbon dioxide emissions must fall by the equivalent of a global lockdown roughly every two years for the next decade to save the planet. The 'study' appeared in the same period that the Schwab mob claimed in a video that lockdowns destroying the lives of billions are good because they make the earth 'quieter' with less 'ambient noise'. They took down the video amid a public backlash for such arrogant, empathy-deleted stupidity You see, however, where they are going with this. Corinne Le Quéré, a professor at the Tyndall Centre for Climate Change Research, University of East Anglia, was lead author of the climate lockdown study, and she writes for … the World Economic Forum. Gates calls in 'his' book for changing 'every aspect of the economy' (long-time Cult agenda) and for humans to eat synthetic 'meat' (predicted in my books) while cows and other farm animals are eliminated. Australian TV host and commentator Alan Jones described what carbon emission targets would mean for farm animals in Australia alone if emissions were reduced as demanded by 35 percent by 2030 and zero by 2050:

Well, let's take agriculture, the total emissions from agriculture are about 75 million tonnes of carbon dioxide, equivalent. Now reduce that by 35 percent and you have to come down to 50 million tonnes, I've done the maths. So if you take for example 1.5 million cows, you're going to have to reduce the herd by 525,000 [by] 2030, nine years, that's 58,000 cows a year. The beef herd's 30 million, reduce that by 35 percent, that's 10.5 million, which means 1.2 million cattle have to go every year between now and 2030. This is insanity!

There are 75 million sheep. Reduce that by 35 percent, that's 26 million sheep, that's almost 3 million a year. So under the Paris Agreement over 30 million beasts. dairy cows, cattle, pigs and sheep would go. More than 8,000 every minute of every hour for the next decade, do these people know what they're talking about?

Clearly they don't at the level of campaigners, politicians and administrators. The Cult *does* know; that's the outcome it wants. We are faced with not just a war on humanity. Animals and the natural world are being targeted and I have been saying since the 'Covid' hoax began that the plan eventually was to claim that the 'deadly virus' is able to jump from animals, including farm animals and

domestic pets, to humans. Just before this book went into production came this story: 'Russia registers world's first Covid-19 vaccine for cats & dogs as makers of Sputnik V warn pets & farm animals could spread virus'. The report said 'top scientists warned that the deadly pathogen could soon begin spreading through homes and farms' and 'the next stage is the infection of farm and domestic animals'. Know the outcome and you'll see the journey. Think what that would mean for animals and keep your eye on a term called zoonosis or zoonotic diseases which transmit between animals and humans. The Cult wants to break the connection between animals and people as it does between people and people. Farm animals fit with the Cult agenda to transform food from natural to synthetic.

The gas of life is killing us

There can be few greater examples of Cult inversion than the condemnation of carbon dioxide as a dangerous pollutant when it is the gas of life. Without it the natural world would be dead and so we would all be dead. We breathe in oxygen and breathe out carbon dioxide while plants produce oxygen and absorb carbon dioxide. It is a perfect symbiotic relationship that the Cult wants to dismantle for reasons I will come to in the final two chapters. Gates, Schwab, other Cult operatives and mindless repeaters, want the world to be 'carbon neutral' by at least 2050 and the earlier the better. 'Zero carbon' is the cry echoed by lunatics calling for 'Zero Covid' when we already have it. These carbon emission targets will deindustrialise the world in accordance with Cult plans – the post-industrial, post-democratic society – and with so-called renewables like solar and wind not coming even close to meeting human energy needs blackouts and cold are inevitable. Texans got the picture in the winter of 2021 when a snow storm stopped wind turbines and solar panels from working and the lights went down along with water which relies on electricity for its supply system. Gates wants everything to be powered by electricity to ensure that his masters have the kill switch to stop all human activity, movement, cooking, water and warmth any time they like. The climate lie is so

stupendously inverted that it claims we must urgently reduce carbon dioxide when we *don't have enough*.

Co2 in the atmosphere is a little above 400 parts per million when the optimum for plant growth is 2,000 ppm and when it falls anywhere near 150 ppm the natural world starts to die and so do we. It fell to as low as 280 ppm in an 1880 measurement in Hawaii and rose to 413 ppm in 2019 with industrialisation which is why the planet has become *greener* in the industrial period. How insane then that psychopathic madman Gates is not satisfied only with blocking the rise of Co2. He's funding technology to suck it out of the atmosphere. The reason why will become clear. The industrial era is not destroying the world through Co2 and has instead turned around a potentially disastrous ongoing fall in Co2. Greenpeace co-founder and scientist Patrick Moore walked away from Greenpeace in 1986 and has exposed the green movement for fear-mongering and lies. He said that 500 million years ago there was *17 times* more Co2 in the atmosphere than we have today and levels have been falling for hundreds of millions of years. In the last 150 million years Co2 levels in Earth's atmosphere had reduced by *90 percent*. Moore said that by the time humanity began to unlock carbon dioxide from fossil fuels we were at '38 seconds to midnight' and in that sense: 'Humans are [the Earth's] salvation.' Moore made the point that only half the Co2 emitted by fossil fuels stays in the atmosphere and we should remember that all pollution pouring from chimneys that we are told is carbon dioxide is in fact nothing of the kind. It's pollution. Carbon dioxide is an invisible gas.

William Happer, Professor of Physics at Princeton University and long-time government adviser on climate, has emphasised the Co2 deficiency for maximum growth and food production. Greenhouse growers don't add carbon dioxide for a bit of fun. He said that most of the warming in the last 100 years, after the earth emerged from the super-cold period of the 'Little Ice Age' into a natural warming cycle, was over by 1940. Happer said that a peak year for warming in 1988 can be explained by a 'monster El Nino' which is a natural and cyclical warming of the Pacific that has nothing to do with 'climate

change'. He said the effect of Co2 could be compared to painting a wall with red paint in that once two or three coats have been applied it didn't matter how much more you slapped on because the wall will not get much redder. Almost all the effect of the rise in Co2 has already happened, he said, and the volume in the atmosphere would now have to *double* to increase temperature by a single degree. Climate hoaxers know this and they have invented the most ridiculously complicated series of 'feedback' loops to try to overcome this rather devastating fact. You hear puppet Greta going on cluelessly about feedback loops and this is why.

The Sun affects temperature? No you *climate denier*

Some other nonsense to contemplate: Climate graphs show that rises in temperature do not follow rises in Co2 – *it's the other way round* with a lag between the two of some 800 years. If we go back 800 years from present time we hit the Medieval Warm Period when temperatures were higher than now without any industrialisation and this was followed by the Little Ice Age when temperatures plummeted. The world was still emerging from these centuries of serious cold when many climate records began which makes the ever-repeated line of the 'hottest year since records began' meaningless when you are not comparing like with like. The coldest period of the Little Ice Age corresponded with the lowest period of sunspot activity when the Sun was at its least active. Proper scientists will not be at all surprised by this when it confirms the obvious fact that earth temperature is affected by the scale of Sun activity and the energetic power that it subsequently emits; but when is the last time you heard a climate hoaxer talking about the Sun as a source of earth temperature?? Everything has to be focussed on Co2 which makes up just 0.117 percent of so-called greenhouse gases and only a fraction of even that is generated by human activity. The rest is natural. More than *90 percent* of those greenhouse gases are water vapour and clouds (Fig 9). Ban moisture I say. Have you noticed that the climate hoaxers no longer use the polar bear as their promotion image? That's because far from becoming extinct polar

bear communities are stable or thriving. Joe Bastardi, American meteorologist, weather forecaster and outspoken critic of the climate lie, documents in his book *The Climate Chronicles* how weather patterns and events claimed to be evidence of climate change have been happening since long before industrialisation: 'What happened before naturally is happening again, as is to be expected given the cyclical nature of the climate due to the design of the planet.' If you read the detailed background to the climate hoax in my other books you will shake your head and wonder how anyone could believe the crap which has spawned a multi-trillion dollar industry based on absolute garbage (see HIV causes AIDs and Sars-Cov-2 causes 'Covid-19'). Climate and 'Covid' have much in common given they have the same source. They both have the contradictory *everything* factor in which everything is explained by reference to them. It's hot – 'it's climate change'. It's cold – 'it's climate change'. I got a sniffle – 'it's Covid'. I haven't got a sniffle – 'it's Covid'. Not having a sniffle has to be a symptom of 'Covid'. Everything is and not having a sniffle is especially dangerous if you are a slow walker. For sheer audacity I offer you a Cambridge University 'study' that actually linked 'Covid' to 'climate change'. It had to happen eventually. They concluded that climate change played a role in 'Covid-19' spreading from animals to humans because … wait for it … I kid you not … *the two groups were forced closer together as populations grow*. Er, that's it. The whole foundation on which this depended was that 'Bats are the likely zoonotic origin of SARS-CoV-1 and SARS-CoV-2'. Well, they are not. They are nothing to do with it. Apart from bats not being the origin and therefore 'climate change' effects on bats being irrelevant I am in awe of their academic insight. Where would we be without them? Not where we are that's for sure.

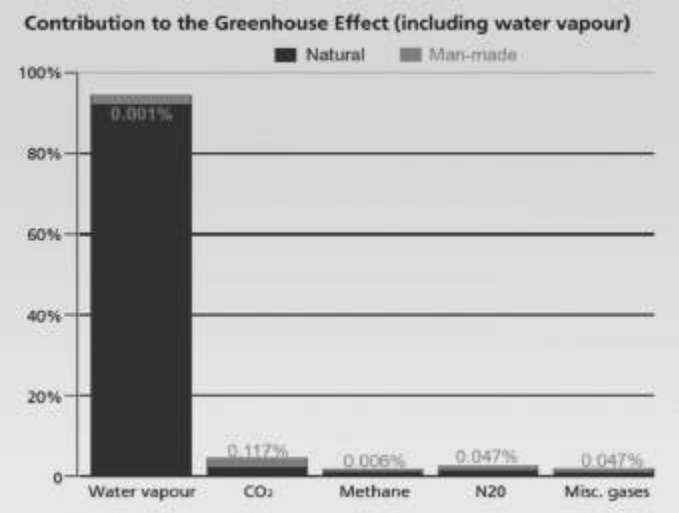

Figure 9: The idea that the gas of life is disastrously changing the climate is an insult to brain cell activity.

One other point about the weather is that climate modification is now well advanced and not every major weather event is natural – or earthquake come to that. I cover this subject at some length in other books. China is openly planning a rapid expansion of its weather modification programme which includes changing the climate in an area more than one and a half times the size of India. China used weather manipulation to ensure clear skies during the 2008 Olympics in Beijing. I have quoted from US military documents detailing how to employ weather manipulation as a weapon of war and they did that in the 1960s and 70s during the conflict in Vietnam with Operation Popeye manipulating monsoon rains for military purposes. Why would there be international treaties on weather modification if it wasn't possible? Of course it is. Weather is energetic information and it can be changed.

How was the climate hoax pulled off? See 'Covid'

If you can get billions to believe in a 'virus' that doesn't exist you can get them to believe in human-caused climate change that doesn't exist. Both are being used by the Cult to transform global society in the way it has long planned. Both hoaxes have been achieved in pretty much the same way. First you declare a lie is a fact. There's a

'virus' you call SARS-Cov-2 or humans are warming the planet with their behaviour. Next this becomes, via Cult networks, the foundation of government, academic and science policy and belief. Those who parrot the mantra are given big grants to produce research that confirms the narrative is true and ever more 'symptoms' are added to make the 'virus'/'climate change' sound even more scary. Scientists and researchers who challenge the narrative have their grants withdrawn and their careers destroyed. The media promote the lie as the unquestionable truth and censor those with an alternative view or evidence. A great percentage of the population believe what they are told as the lie becomes an everybody-knows-that and the believing-masses turn on those with a mind of their own. The technique has been used endlessly throughout human history. Wokers are the biggest promotors of the climate lie *and* 'Covid' fascism because their minds are owned by the Cult; their sense of self-righteous self-purity knows no bounds; and they exist in a bubble of reality in which facts are irrelevant and only get in the way of looking without seeing.

Running through all of this like veins in a blue cheese is control of information, which means control of perception, which means control of behaviour, which collectively means control of human society. The Cult owns the global media and Silicon Valley fascists for the simple reason that it *has* to. Without control of information it can't control perception and through that human society. Examine every facet of the Cult agenda and you will see that anything supporting its introduction is never censored while anything pushing back is always censored. I say again: Psychopaths that know why they are doing this must go before Nuremberg trials and those that follow their orders must trot along behind them into the same dock. 'I was just following orders' didn't work the first time and it must not work now. Nuremberg trials must be held all over the world before public juries for politicians, government officials, police, compliant doctors, scientists and virologists, and all Cult operatives such as Gates, Tedros, Fauci, Vallance, Whitty, Ferguson, Zuckerberg, Wojcicki, Brin, Page, Dorsey, the whole damn lot of

them – including, no *especially*, the psychopath psychologists. Without them and the brainless, gutless excuses for journalists that have repeated their lies, none of this could be happening. Nobody can be allowed to escape justice for the psychological and economic Armageddon they are all responsible for visiting upon the human race.

As for the compliant, unquestioning, swathes of humanity, and the self-obsessed, all-knowing ignorance of the Wokers … don't start me. God help their kids. God help their grandkids. God *help them*.

CHAPTER NINE

We must have it? So what is it?

Well I won't back down. No, I won't back down. You can stand me up at the Gates of Hell. But I won't back down
Tom Petty

I will now focus on the genetically-manipulating 'Covid vaccines' which do not meet this official definition of a vaccine by the US Centers for Disease Control (CDC): 'A product that stimulates a person's immune system to produce immunity to a specific disease, protecting the person from that disease.' On that basis 'Covid vaccines' are not a vaccine in that the makers don't even claim they stop infection or transmission.

They are instead part of a multi-levelled conspiracy to change the nature of the human body and what it means to be 'human' and to depopulate an enormous swathe of humanity. What I shall call Human 1.0 is on the cusp of becoming Human 2.0 and for very sinister reasons. Before I get to the 'Covid vaccine' in detail here's some background to vaccines in general. Government regulators do not test vaccines – the makers do – and the makers control which data is revealed and which isn't. Children in America are given 50 vaccine doses by age six and 69 by age 19 and the effect of the whole combined schedule has never been tested. Autoimmune diseases when the immune system attacks its own body have soared in the mass vaccine era and so has disease in general in children and the young. Why wouldn't this be the case when vaccines target the *immune system?* The US government gave Big Pharma drug

companies immunity from prosecution for vaccine death and injury in the 1986 National Childhood Vaccine Injury Act (NCVIA) and since then the government (taxpayer) has been funding compensation for the consequences of Big Pharma vaccines. The criminal and satanic drug giants can't lose and the vaccine schedule has increased dramatically since 1986 for this reason. There is no incentive to make vaccines safe and a big incentive to make money by introducing ever more. Even against a ridiculously high bar to prove vaccine liability, and with the government controlling the hearing in which it is being challenged for compensation, the vaccine court has so far paid out more than $4 billion. These are the vaccines we are told are safe and psychopaths like Zuckerberg censor posts saying otherwise. The immunity law was even justified by a ruling that vaccines by their nature were 'unavoidably unsafe'.

Check out the ingredients of vaccines and you will be shocked if you are new to this. *They put that in children's bodies?? What??* Try aluminium, a brain toxin connected to dementia, aborted foetal tissue and formaldehyde which is used to embalm corpses. World-renowned aluminium expert Christopher Exley had his research into the health effect of aluminium in vaccines shut down by Keele University in the UK when it began taking funding from the Bill and Melinda Gates Foundation. Research when diseases 'eradicated' by vaccines began to decline and you will find the fall began long *before* the vaccine was introduced. Sometimes the fall even plateaued after the vaccine. Diseases like scarlet fever for which there was no vaccine declined in the same way because of environmental and other factors. A perfect case in point is the polio vaccine. Polio began when lead arsenate was first sprayed as an insecticide and residues remained in food products. Spraying started in 1892 and the first US polio epidemic came in Vermont in 1894. The simple answer was to stop spraying, but Rockefeller-created Big Pharma had a better idea. Polio was decreed to be caused by the *poliovirus* which 'spreads from person to person and can infect a person's spinal cord'. Lead arsenate was replaced by the lethal DDT which had the same effect of causing paralysis by damaging the brain and central nervous

system. Polio plummeted when DDT was reduced and then banned, but the vaccine is still given the credit for something it didn't do. Today by far the biggest cause of polio is the vaccines promoted by Bill Gates. Vaccine justice campaigner Robert Kennedy Jr, son of assassinated (by the Cult) US Attorney General Robert Kennedy, wrote:

> In 2017, the World Health Organization (WHO) reluctantly admitted that the global explosion in polio is predominantly vaccine strain. The most frightening epidemics in Congo, Afghanistan, and the Philippines, are all linked to vaccines. In fact, by 2018, 70% of global polio cases were vaccine strain.

Vaccines make fortunes for Cult-owned Gates and Big Pharma while undermining the health and immune systems of the population. We had a glimpse of the mentality behind the Big Pharma cartel with a report on WION (World is One News), an international English language TV station based in India, which exposed the extraordinary behaviour of US drug company Pfizer over its 'Covid vaccine'. The WION report told how Pfizer had made fantastic demands of Argentina, Brazil and other countries in return for its 'vaccine'. These included immunity from prosecution, even for Pfizer negligence, government insurance to protect Pfizer from law suits and handing over as collateral sovereign assets of the country to include Argentina's bank reserves, military bases and embassy buildings. Pfizer demanded the same of Brazil in the form of waiving sovereignty of its assets abroad; exempting Pfizer from Brazilian laws; and giving Pfizer immunity from all civil liability. This is a 'vaccine' developed with government funding. Big Pharma is evil incarnate as a creation of the Cult and all must be handed tickets to Nuremberg.

Phantom 'vaccine' for a phantom 'disease'

I'll expose the 'Covid vaccine' fraud and then go on to the wider background of why the Cult has set out to 'vaccinate' every man, woman and child on the planet for an alleged 'new disease' with a survival rate of 99.77 percent (or more) even by the grotesquely-

manipulated figures of the World Health Organization and Johns Hopkins University. The 'infection' to 'death' ratio is 0.23 to 0.15 percent according to Stanford epidemiologist Dr John Ioannidis and while estimates vary the danger remains tiny. I say that if the truth be told the fake infection to fake death ratio is zero. Never mind all the evidence I have presented here and in *The Answer* that there is no 'virus' let us just focus for a moment on that death-rate figure of say 0.23 percent. The figure includes all those worldwide who have tested positive with a test not testing for the 'virus' and then died within 28 days or even longer of any other cause – *any other cause*. Now subtract all those illusory 'Covid' deaths on the global data sheets from the 0.23 percent. What do you think you would be left with? *Zero*. A vaccination has never been successfully developed for a so-called coronavirus. They have all failed at the animal testing stage when they caused hypersensitivity to what they were claiming to protect against and made the impact of a disease far worse. Cult-owned vaccine corporations got around that problem this time by bypassing animal trials, going straight to humans and making the length of the 'trials' before the public rollout as short as they could get away with. Normally it takes five to ten years or more to develop vaccines that still cause demonstrable harm to many people and that's without including the long-term effects that are never officially connected to the vaccination. 'Covid' non-vaccines have been officially produced and approved in a matter of months from a standing start and part of the reason is that (a) they were developed before the 'Covid' hoax began and (b) they are based on computer programs and not natural sources. Official non-trials were so short that government agencies gave *emergency*, not full, approval. 'Trials' were not even completed and full approval cannot be secured until they are. Public 'Covid vaccination' is actually a *continuation of the trial*. Drug company 'trials' are not scheduled to end until 2023 by which time a lot of people are going to be dead. Data on which government agencies gave this emergency approval was supplied by the Big Pharma corporations themselves in the form of Pfizer/BioNTech, AstraZeneca, Moderna, Johnson & Johnson, and

others, and this is the case with all vaccines. By its very nature *emergency* approval means drug companies do not have to prove that the 'vaccine' is 'safe and effective'. How could they with trials way short of complete? Government regulators only have to *believe* that they *could* be safe and effective. It is criminal manipulation to get products in circulation with no testing worth the name. Agencies giving that approval are infested with Big Pharma-connected place-people and they act in the interests of Big Pharma (the Cult) and not the public about whom they do not give a damn.

More human lab rats

'Covid vaccines' produced in record time by Pfizer/BioNTech and Moderna employ a technique *never approved before for use on humans*. They are known as mRNA 'vaccines' and inject a synthetic version of 'viral' mRNA or 'messenger RNA'. The key is in the term 'messenger'. The body works, or doesn't, on the basis of information messaging. Communications are constantly passing between and within the genetic system and the brain. Change those messages and you change the state of the body and even its very nature and you can change psychology and behaviour by the way the brain processes information. I think you are going to see significant changes in personality and perception of many people who have had the 'Covid vaccine' synthetic potions. Insider Aldous Huxley predicted the following in 1961 and mRNA 'vaccines' can be included in the term 'pharmacological methods':

> There will be, in the next generation or so, a pharmacological method of making people love their servitude, and producing dictatorship without tears, so to speak, producing a kind of painless concentration camp for entire societies, so that people will in fact have their own liberties taken away from them, but rather enjoy it, because they will be distracted from any desire to rebel by propaganda or brainwashing, or brainwashing enhanced by pharmacological methods. And this seems to be the final revolution.

Apologists claim that mRNA synthetic 'vaccines' don't change the DNA genetic blueprint because RNA does not affect DNA only the other way round. This is so disingenuous. A process called 'reverse

transcription' can convert RNA into DNA and be integrated into DNA in the cell nucleus. This was highlighted in December, 2020, by scientists at Harvard and Massachusetts Institute of Technology (MIT). Geneticists report that more than 40 percent of mammalian genomes results from reverse transcription. On the most basic level if messaging changes then that sequence must lead to changes in DNA which is receiving and transmitting those communications. How can introducing synthetic material into cells not change the cells where DNA is located? The process is known as transfection which is defined as 'a technique to insert foreign nucleic acid (DNA or RNA) into a cell, typically with the intention of altering the properties of the cell'. Researchers at the Sloan Kettering Institute in New York found that changes in messenger RNA can deactivate tumour-suppressing proteins and thereby promote cancer. This is what happens when you mess with messaging. 'Covid vaccine' maker Moderna was founded in 2010 by Canadian stem cell biologist Derrick J. Rossi after his breakthrough discovery in the field of transforming and reprogramming stem cells. These are neutral cells that can be programmed to become any cell including sperm cells. Moderna was therefore founded on the principle of genetic manipulation and has never produced any vaccine or drug before its genetically-manipulating synthetic 'Covid' shite. Look at the name – Mode-RNA or Modify-RNA. Another important point is that the US Supreme Court has ruled that genetically-modified DNA, or complementary DNA (cDNA) synthesized in the laboratory from messenger RNA, can be patented and owned. These psychopaths are doing this to the human body.

Cells replicate synthetic mRNA in the 'Covid vaccines' and in theory the body is tricked into making antigens which trigger antibodies to target the 'virus spike proteins' which as Dr Tom Cowan said have *never been seen*. Cut the crap and these 'vaccines' deliver *self-replicating* synthetic material to the cells with the effect of changing human DNA. The more of them you have the more that process is compounded while synthetic material is all the time self-replicating. 'Vaccine'-maker Moderna describes mRNA as 'like

software for the cell' and so they are messing with the body's software. What happens when you change the software in a computer? Everything changes. For this reason the Cult is preparing a production line of mRNA 'Covid vaccines' and a long list of excuses to use them as with all the 'variants' of a 'virus' never shown to exist. The plan is further to transfer the mRNA technique to other vaccines mostly given to children and young people. The cumulative consequences will be a transformation of human DNA through a constant infusion of synthetic genetic material which will kill many and change the rest. Now consider that governments that have given emergency approval for a vaccine that's not a vaccine; never been approved for humans before; had no testing worth the name; and the makers have been given immunity from prosecution for any deaths or adverse effects suffered by the public. The UK government awarded *permanent legal indemnity* to itself and its employees for harm done when a patient is being treated for 'Covid-19' or 'suspected Covid-19'. That is quite a thought when these are possible 'side-effects' from the 'vaccine' (they are not 'side', they are effects) listed by the US Food and Drug Administration:

Guillain-Barre syndrome; acute disseminated encephalomyelitis; transverse myelitis; encephalitis; myelitis; encephalomyelitis; meningoencephalitis; meningitis; encephalopathy; convulsions; seizures; stroke; narcolepsy; cataplexy; anaphylaxis; acute myocardial infarction (heart attack); myocarditis; pericarditis; autoimmune disease; death; implications for pregnancy, and birth outcomes; other acute demyelinating diseases; non anaphylactic allergy reactions; thrombocytopenia ; disseminated intravascular coagulation; venous thromboembolism; arthritis; arthralgia; joint pain; Kawasaki disease; multisystem inflammatory syndrome in children; vaccine enhanced disease. The latter is the way the 'vaccine' has the potential to make diseases far worse than they would otherwise be.

UK doctor and freedom campaigner Vernon Coleman described the conditions in this list as 'all unpleasant, most of them very serious, and you can't get more serious than death'. The thought that anyone at all has had the 'vaccine' in these circumstances is testament to the potential that humanity has for clueless, unquestioning, stupidity and for many that programmed stupidity has already been terminal.

An insider speaks

Dr Michael Yeadon is a former Vice President, head of research and Chief Scientific Adviser at vaccine giant Pfizer. Yeadon worked on the inside of Big Pharma, but that did not stop him becoming a vocal critic of 'Covid vaccines' and their potential for multiple harms, including infertility in women. By the spring of 2021 he went much further and even used the no, no, term 'conspiracy'. When you begin to see what is going on it is impossible not to do so. Yeadon spoke out in an interview with freedom campaigner James Delingpole and I mentioned earlier how he said that no one had samples of 'the virus'. He explained that the mRNA technique originated in the anti-cancer field and ways to turn on and off certain genes which could be advantageous if you wanted to stop cancer growing out of control. 'That's the origin of them. They are a very unusual application, really.' Yeadon said that treating a cancer patient with an aggressive procedure might be understandable if the alternative was dying, but it was quite another thing to use the same technique as a public health measure. Most people involved wouldn't catch the infectious agent you were vaccinating against and if they did they probably wouldn't die:

> If you are really using it as a public health measure you really want to as close as you can get to zero sides-effects … I find it odd that they chose techniques that were really cutting their teeth in the field of oncology and I'm worried that in using gene-based vaccines that have to be injected in the body and spread around the body, get taken up into some cells, and the regulators haven't quite told us which cells they get taken up into … you are going to be generating a wide range of responses … with multiple steps each of which could go well or badly.

I doubt the Cult intends it to go well. Yeadon said that you can put any gene you like into the body through the 'vaccine'. 'You can certainly give them a gene that would do them some harm if you wanted.' I was intrigued when he said that when used in the cancer field the technique could turn genes on and off. I explore this process in *The Answer* and with different genes having different functions you could create mayhem – physically and psychologically – if you turned the wrong ones on and the right ones off. I read reports of an experiment by researchers at the University of Washington's school of computer science and engineering in which they encoded DNA to infect computers. The body is itself a biological computer and if human DNA can inflict damage on a computer why can't the computer via synthetic material mess with the human body? It can. The Washington research team said it was possible to insert malicious malware into 'physical DNA strands' and corrupt the computer system of a gene sequencing machine as it 'reads gene letters and stores them as binary digits 0 and 1'. They concluded that hackers could one day use blood or spit samples to access computer systems and obtain sensitive data from police forensics labs or infect genome files. It is at this level of digital interaction that synthetic 'vaccines' need to be seen to get the full picture and that will become very clear later on. Michael Yeadon said it made no sense to give the 'vaccine' to younger people who were in no danger from the 'virus'. What was the benefit? It was all downside with potential effects:

> The fact that my government in what I thought was a civilised, rational country, is raining [the 'vaccine'] on people in their 30s and 40s, even my children in their 20s, they're getting letters and phone calls, I know this is not right and any of you doctors who are vaccinating you know it's not right, too. They are not at risk. They are not at risk from the disease, so you are now hoping that the side-effects are so rare that you get away with it. You don't give new technology … that you don't understand to 100 percent of the population.

Blood clot problems with the AstraZeneca 'vaccine' have been affecting younger people to emphasise the downside risks with no benefit. AstraZeneca's version, produced with Oxford University, does not use mRNA, but still gets its toxic cocktail inside cells where

it targets DNA. The Johnson & Johnson 'vaccine' which uses a similar technique has also produced blood clot effects to such an extent that the United States paused its use at one point. They are all 'gene therapy' (cell modification) procedures and not 'vaccines'. The truth is that once the content of these injections enter cells we have no idea what the effect will be. People can speculate and some can give very educated opinions and that's good. In the end, though, only the makers know what their potions are designed to do and even they won't know every last consequence. Michael Yeadon was scathing about doctors doing what they knew to be wrong. 'Everyone's mute', he said. Doctors in the NHS must know this was not right, coming into work and injecting people. 'I don't know how they sleep at night. I know I couldn't do it. I know that if I were in that position I'd have to quit.' He said he knew enough about toxicology to know this was not a good risk-benefit. Yeadon had spoken to seven or eight university professors and all except two would not speak out publicly. Their universities had a policy that no one said anything that countered the government and its medical advisors. They were afraid of losing their government grants. This is how intimidation has been used to silence the truth at every level of the system. I say silence, but these people could still speak out if they made that choice. Yeadon called them 'moral cowards' – 'This is about your children and grandchildren's lives and you have just buggered off and left it.'

'Variant' nonsense

Some of his most powerful comments related to the alleged 'variants' being used to instil more fear, justify more lockdowns, and introduce more 'vaccines'. He said government claims about 'variants' were nonsense. He had checked the alleged variant 'codes' and they were 99.7 percent identical to the 'original'. This was the human identity difference equivalent to putting a baseball cap on and off or wearing it the other way round. A 0.3 percent difference would make it impossible for that 'variant' to escape immunity from the 'original'. This made no sense of having new 'vaccines' for

'variants'. He said there would have to be at least a *30 percent* difference for that to be justified and even then he believed the immune system would still recognise what it was. Gates-funded 'variant modeller' and 'vaccine'-pusher John Edmunds might care to comment. Yeadon said drug companies were making new versions of the 'vaccine' as a 'top up' for 'variants'. Worse than that, he said, the 'regulators' around the world like the MHRA in the UK had got together and agreed that because 'vaccines' for 'variants' were so similar to the first 'vaccines' *they did not have to do safety studies*. How transparently sinister that is. This is when Yeadon said: 'There is a conspiracy here.' There was no need for another vaccine for 'variants' and yet we were told that there was and the country had shut its borders because of them. 'They are going into hundreds of millions of arms without passing 'go' or any regulator. Why did they do that? Why did they pick this method of making the vaccine?'

The reason had to be something bigger than that it seemed and 'it's not protection against the virus'. It's was a far bigger project that meant politicians and advisers were willing to do things and not do things that knowingly resulted in avoidable deaths – 'that's already happened when you think about lockdown and deprivation of health care for a year.' He spoke of people prepared to do something that results in the avoidable death of their fellow human beings and it not bother them. This is the penny-drop I have been working to get across for more than 30 years – the level of pure evil we are dealing with. Yeadon said his friends and associates could not believe there could be that much evil, but he reminded them of Stalin, Pol Pot and Hitler and of what Stalin had said: 'One death is a tragedy. A million? A statistic.' He could not think of a benign explanation for why you need top-up vaccines 'which I'm sure you don't' and for the regulators 'to just get out of the way and wave them through'. Why would the regulators do that when they were still wrestling with the dangers of the 'parent' vaccine? He was clearly shocked by what he had seen since the 'Covid' hoax began and now he was thinking the previously unthinkable:

If you wanted to depopulate a significant proportion of the world and to do it in a way that doesn't involve destruction of the environment with nuclear weapons, poisoning everyone with anthrax or something like that, and you wanted plausible deniability while you had a multi-year infectious disease crisis, I actually don't think you could come up with a better plan of work than seems to be in front of me. I can't say that's what they are going to do, but I can't think of a benign explanation why they are doing it.

He said he never thought that they would get rid of 99 percent of humans, but now he wondered. 'If you wanted to that this would be a hell of a way to do it – it would be unstoppable folks.' Yeadon had concluded that those who submitted to the 'vaccine' would be allowed to have some kind of normal life (but for how long?) while screws were tightened to coerce and mandate the last few percent. 'I think they'll put the rest of them in a prison camp. I wish I was wrong, but I don't think I am.' Other points he made included: There were no coronavirus vaccines then suddenly they all come along at the same time; we have no idea of the long term affect with trials so short; coercing or forcing people to have medical procedures is against the Nuremberg Code instigated when the Nazis did just that; people should at least delay having the 'vaccine'; a quick Internet search confirms that masks don't reduce respiratory viral transmission and 'the government knows that'; they have smashed civil society and they know that, too; two dozen peer-reviewed studies show no connection between lockdown and reducing deaths; he knew from personal friends the elite were still flying around and going on holiday while the public were locked down; the elite were not having the 'vaccines'. He was also asked if 'vaccines' could be made to target difference races. He said he didn't know, but the document by the Project for the New American Century in September, 2000, said developing 'advanced forms of biological warfare that can target *specific genotypes* may transform biological warfare from the realm of terror to a politically useful tool.' Oh, they're evil all right. Of that we can be *absolutely* sure.

Another cull of old people

We have seen from the CDC definition that the mRNA 'Covid vaccine' is not a vaccine and nor are the others that *claim* to reduce 'severity of symptoms' in *some* people, but not protect from infection or transmission. What about all the lies about returning to 'normal' if people were 'vaccinated'? If they are not claimed to stop infection and transmission of the alleged 'virus', how does anything change? This was all lies to manipulate people to take the jabs and we are seeing that now with masks and distancing still required for the 'vaccinated'. How did they think that elderly people with fragile health and immune responses were going to be affected by infusing their cells with synthetic material and other toxic substances? They *knew* that in the short and long term it would be devastating and fatal as the culling of the old that began with the first lockdowns was continued with the 'vaccine'. Death rates in care homes soared immediately residents began to be 'vaccinated' – infused with synthetic material. Brave and committed whistleblower nurses put their careers at risk by exposing this truth while the rest kept their heads down and their mouths shut to put their careers before those they are supposed to care for. A long-time American Certified Nursing Assistant who gave his name as James posted a video in which he described emotionally what happened in his care home when vaccination began. He said that during 2020 very few residents were sick with 'Covid' and no one died during the entire year; but shortly after the Pfizer mRNA injections 14 people died within two weeks and many others were near death. 'They're dropping like flies', he said. Residents who walked on their own before the shot could no longer and they had lost their ability to conduct an intelligent conversation. The home's management said the sudden deaths were caused by a 'super-spreader' of 'Covid-19'. Then how come, James asked, that residents who refused to take the injections were not sick? It was a case of inject the elderly with mRNA synthetic potions and blame their illness and death that followed on the 'virus'. James described what was happening in care homes as 'the greatest crime of genocide this country has ever seen'. Remember the NHS staff nurse from earlier who used the same

word ‘genocide’ for what was happening with the ‘vaccines’ and that it was an ‘act of human annihilation’. A UK care home whistleblower told a similar story to James about the effect of the ‘vaccine’ in deaths and ‘outbreaks’ of illness dubbed ‘Covid’ after getting the jab. She told how her care home management and staff had zealously imposed government regulations and no one was allowed to even question the official narrative let alone speak out against it. She said the NHS was even worse. Again we see the results of reframing. A worker at a local care home where I live said they had not had a single case of ‘Covid’ there for almost a year and when the residents were ‘vaccinated’ they had 19 positive cases in two weeks with eight dying.

It’s not the ‘vaccine’ – honest

The obvious cause and effect was being ignored by the media and most of the public. Australia’s health minister Greg Hunt (a former head of strategy at the World Economic Forum) was admitted to hospital after he had the ‘vaccine’. He was suffering according to reports from the skin infection ‘cellulitis’ and it must have been a severe case to have warranted days in hospital. Immediately the authorities said this was nothing to do with the ‘vaccine’ when an effect of some vaccines is a ‘cellulitis-like reaction’. We had families of perfectly healthy old people who died after the ‘vaccine’ saying that if only they had been given the ‘vaccine’ earlier they would still be alive. As a numbskull rating that is off the chart. A father of four ‘died of Covid’ at aged 48 when he was taken ill two days after having the ‘vaccine’. The man, a health administrator, had been ‘shielding during the pandemic’ and had ‘not really left the house’ until he went for the ‘vaccine’. Having the ‘vaccine’ and then falling ill and dying does not seem to have qualified as a possible cause and effect and ‘Covid-19’ went on his death certificate. His family said they had no idea how he ‘caught the virus’. A family member said: ‘Tragically, it could be that going for a vaccination ultimately led to him catching Covid …The sad truth is that they are never going to know where it came from.’ The family warned people to remember

that the virus still existed and was 'very real'. So was their stupidity. Nurses and doctors who had the first round of the 'vaccine' were collapsing, dying and ending up in a hospital bed while they or their grieving relatives were saying they'd still have the 'vaccine' again despite what happened. I kid you not. You mean if your husband returned from the dead he'd have the same 'vaccine' again that killed him??

Doctors at the VCU Medical Center in Richmond, Virginia, said the Johnson & Johnson 'vaccine' was to blame for a man's skin peeling off. Patient Richard Terrell said: 'It all just happened so fast. My skin peeled off. It's still coming off on my hands now.' He said it was stinging, burning and itching and when he bent his arms and legs it was very painful with 'the skin swollen and rubbing against itself'. Pfizer/BioNTech and Moderna vaccines use mRNA to change the cell while the Johnson & Johnson version uses DNA in a process similar to AstraZeneca's technique. Johnson & Johnson and AstraZeneca have both had their 'vaccines' paused by many countries after causing serious blood problems. Terrell's doctor Fnu Nutan said he could have died if he hadn't got medical attention. It sounds terrible so what did Nutan and Terrell say about the 'vaccine' now? Oh, they still recommend that people have it. A nurse in a hospital bed 40 minutes after the vaccination and unable to swallow due to throat swelling was told by a doctor that he lost mobility in his arm for 36 hours following the vaccination. What did he say to the ailing nurse? 'Good for you for getting the vaccination.' We are dealing with a serious form of cognitive dissonance madness in both public and medical staff. There is a remarkable correlation between those having the 'vaccine' and trumpeting the fact and suffering bad happenings shortly afterwards. Witold Rogiewicz, a Polish doctor, made a video of his 'vaccination' and ridiculed those who were questioning its safety and the intentions of Bill Gates: 'Vaccinate yourself to protect yourself, your loved ones, friends and also patients. And to mention quickly I have info for anti-vaxxers and anti-Coviders if you want to contact Bill Gates you can do this through me.' He further ridiculed the dangers of 5G. Days later he

was dead, but naturally the vaccination wasn't mentioned in the verdict of 'heart attack'.

Lies, lies and more lies

So many members of the human race have slipped into extreme states of insanity and unfortunately they include reframed doctors and nursing staff. Having a 'vaccine' and dying within minutes or hours is not considered a valid connection while death from any cause within 28 days or longer of a positive test with a test not testing for the 'virus' means 'Covid-19' goes on the death certificate. How could that 'vaccine'-death connection not have been made except by calculated deceit? US figures in the initial rollout period to February 12th, 2020, revealed that a third of the deaths reported to the CDC after 'Covid vaccines' happened within 48 hours. Five men in the UK suffered an 'extremely rare' blood clot problem after having the AstraZeneca 'vaccine', but no causal link was established said the Gates-funded Medicines and Healthcare products Regulatory Agency (MHRA) which had given the 'vaccine' emergency approval to be used. Former Pfizer executive Dr Michael Yeadon explained in his interview how the procedures could cause blood coagulation and clots. People who should have been at no risk were dying from blood clots in the brain and he said he had heard from medical doctor friends that people were suffering from skin bleeding and massive headaches. The AstraZeneca 'shot' was stopped by some 20 countries over the blood clotting issue and still the corrupt MHRA, the European Medicines Agency (EMA) and the World Health Organization said that it should continue to be given even though the EMA admitted that it 'still cannot rule out definitively' a link between blood clotting and the 'vaccine'. Later Marco Cavaleri, head of EMA vaccine strategy, said there was indeed a clear link between the 'vaccine' and thrombosis, but they didn't know why. So much for the trials showing the 'vaccine' is safe. Blood clots were affecting younger people who would be under virtually no danger from 'Covid' even if it existed which makes it all the more stupid and sinister.

The British government responded to public alarm by wheeling out June Raine, the terrifyingly weak infant school headmistress sound-alike who heads the UK MHRA drug 'regulator'. The idea that she would stand up to Big Pharma and government pressure is laughable and she told us that all was well in the same way that she did when allowing untested, never-used-on-humans-before, genetically-manipulating 'vaccines' to be exposed to the public in the first place. Mass lying is the new normal of the 'Covid' era. The MHRA later said 30 cases of rare blood clots had by then been connected with the AstraZeneca 'vaccine' (that means a lot more in reality) while stressing that the benefits of the jab in preventing 'Covid-19' outweighed any risks. A more ridiculous and disingenuous statement with callous disregard for human health it is hard to contemplate. Immediately after the mendacious 'all-clears' two hospital workers in Denmark experienced blood clots and cerebral haemorrhaging following the AstraZeneca jab and one died. Top Norwegian health official Pål Andre Holme said the 'vaccine' was the only common factor: 'There is nothing in the patient history of these individuals that can give such a powerful immune response … I am confident that the antibodies that we have found are the cause, and I see no other explanation than it being the vaccine which triggers it.' Strokes, a clot or bleed in the brain, were clearly associated with the 'vaccine' from word of mouth and whistleblower reports. Similar consequences followed with all these 'vaccines' that we were told were so safe and as the numbers grew by the day it was clear we were witnessing human carnage.

Learning the hard way

A woman interviewed by UKColumn told how her husband suffered dramatic health effects after the vaccine when he'd been in good health all his life. He went from being a little unwell to losing all feeling in his legs and experiencing 'excruciating pain'. Misdiagnosis followed twice at Accident and Emergency (an 'allergy' and 'sciatica') before he was admitted to a neurology ward where doctors said his serious condition had been caused by the

'vaccine'. Another seven 'vaccinated' people were apparently being treated on the same ward for similar symptoms. The woman said he had the 'vaccine' because they believed media claims that it was safe. 'I didn't think the government would give out a vaccine that does this to somebody; I believed they would be bringing out a vaccination that would be safe.' What a tragic way to learn that lesson. Another woman posted that her husband was transporting stroke patients to hospital on almost every shift and when he asked them if they had been 'vaccinated' for 'Covid' they all replied 'yes'. One had a 'massive brain bleed' the day after his second dose. She said her husband reported the 'just been vaccinated' information every time to doctors in A and E only for them to ignore it, make no notes and appear annoyed that it was even mentioned. This particular report cannot be verified, but it expresses a common theme that confirms the monumental underreporting of 'vaccine' consequences. Interestingly as the 'vaccines' and their brain blood clot/stroke consequences began to emerge the UK National Health Service began a publicity campaign telling the public what to do in the event of a stroke. A Scottish NHS staff nurse who quit in disgust in March, 2021, said:

I have seen traumatic injuries from the vaccine, they're not getting reported to the yellow card [adverse reaction] scheme, they're treating the symptoms, not asking why, why it's happening. It's just treating the symptoms and when you speak about it you're dismissed like you're crazy, I'm not crazy, I'm not crazy because every other colleague I've spoken to is terrified to speak out, they've had enough.

Videos appeared on the Internet of people uncontrollably shaking after the 'vaccine' with no control over muscles, limbs and even their face. A Scottish mother broke out in a severe rash all over her body almost immediately after she was given the AstraZeneca 'vaccine'. The pictures were horrific. Leigh King, a 41-year-old hairdresser from Lanarkshire said: 'Never in my life was I prepared for what I was about to experience … My skin was so sore and constantly hot … I have never felt pain like this …' But don't you worry, the 'vaccine' is perfectly safe. Then there has been the effect on medical

staff who have been pressured to have the 'vaccine' by psychopathic 'health' authorities and government. A London hospital consultant who gave the name K. Polyakova wrote this to the *British Medical Journal* or *BMJ*:

> I am currently struggling with … the failure to report the reality of the morbidity caused by our current vaccination program within the health service and staff population. The levels of sickness after vaccination is unprecedented and staff are getting very sick and some with neurological symptoms which is having a huge impact on the health service function. Even the young and healthy are off for days, some for weeks, and some requiring medical treatment. Whole teams are being taken out as they went to get vaccinated together.
>
> Mandatory vaccination in this instance is stupid, unethical and irresponsible when it comes to protecting our staff and public health. We are in the voluntary phase of vaccination, and encouraging staff to take an unlicensed product that is impacting on their immediate health … it is clearly stated that these vaccine products do not offer immunity or stop transmission. In which case why are we doing it?

Not to protect health that's for sure. Medical workers are lauded by governments for agenda reasons when they couldn't give a toss about them any more than they can for the population in general. Schools across America faced the same situation as they closed due to the high number of teachers and other staff with bad reactions to the Pfizer/BioNTech, Moderna, and Johnson & Johnson 'Covid vaccines' all of which were linked to death and serious adverse effects. The *BMJ* took down the consultant's comments pretty quickly on the grounds that they were being used to spread 'disinformation'. They were exposing the truth about the 'vaccine' was the real reason. The cover-up is breathtaking.

Hiding the evidence

The scale of the 'vaccine' death cover-up worldwide can be confirmed by comparing official figures with the personal experience of the public. I heard of many people in my community who died immediately or soon after the vaccine that would never appear in the media or even likely on the official totals of 'vaccine' fatalities and adverse reactions when only about ten percent are estimated to be

reported and I have seen some estimates as low as one percent in a Harvard study. In the UK alone by April 29th, 2021, some 757,654 adverse reactions had been officially reported from the Pfizer/BioNTech, Oxford/AstraZeneca and Moderna 'vaccines' with more than a thousand deaths linked to jabs and that means an estimated ten times this number in reality from a ten percent reporting rate percentage. That's seven million adverse reactions and 10,000 potential deaths and a one percent reporting rate would be ten times *those* figures. In 1976 the US government pulled the swine flu vaccine after *53* deaths. The UK data included a combined 10,000 eye disorders from the 'Covid vaccines' with more than 750 suffering visual impairment or blindness and again multiply by the estimated reporting percentages. As 'Covid cases' officially fell hospitals virtually empty during the 'Covid crisis' began to fill up with a range of other problems in the wake of the 'vaccine' rollout. The numbers across America have also been catastrophic. Deaths linked to *all* types of vaccine increased by *6,000 percent* in the first quarter of 2021 compared with 2020. A 39-year-old woman from Ogden, Utah, died four days after receiving a second dose of Moderna's 'Covid vaccine' when her liver, heart and kidneys all failed despite the fact that she had no known medical issues or conditions. Her family sought an autopsy, but Dr Erik Christensen, Utah's chief medical examiner, said proving vaccine injury as a cause of death almost never happened. He could think of only one instance where an autopsy would name a vaccine as the official cause of death and that would be anaphylaxis where someone received a vaccine and died almost instantaneously. 'Short of that, it would be difficult for us to definitively say this is the vaccine,' Christensen said. If that is true this must be added to the estimated ten percent (or far less) reporting rate of vaccine deaths and serious reactions and the conclusion can only be that vaccine deaths and serious reactions – including these 'Covid' potions' – are phenomenally understated in official figures. The same story can be found everywhere. Endless accounts of deaths and serious reactions among the public, medical

and care home staff while official figures did not even begin to reflect this.

Professional script-reader Dr David Williams, a 'top public-health official' in Ontario, Canada, insulted our intelligence by claiming only four serious adverse reactions and no deaths from the more than 380,000 vaccine doses then given. This bore no resemblance to what people knew had happened in their owns circles and we had Dirk Huyer in charge of getting millions vaccinated in Ontario while at the same time he was Chief Coroner for the province investigating causes of death including possible death from the vaccine. An aide said he had stepped back from investigating deaths, but evidence indicated otherwise. Rosemary Frei, who secured a Master of Science degree in molecular biology at the Faculty of Medicine at Canada's University of Calgary before turning to investigative journalism, was one who could see that official figures for 'vaccine' deaths and reactions made no sense. She said that doctors seldom reported adverse events and when people got really sick or died after getting a vaccination they would attribute that to anything except the vaccines. It had been that way for years and anyone who wondered aloud whether the 'Covid vaccines' or other shots cause harm is immediately branded as 'anti-vax' and 'anti-science'. This was 'career-threatening' for health professionals. Then there was the huge pressure to support the push to 'vaccinate' billions in the quickest time possible. Frei said:

> So that's where we're at today. More than half a million vaccine doses have been given to people in Ontario alone. The rush is on to vaccinate all 15 million of us in the province by September. And the mainstream media are screaming for this to be sped up even more. That all adds up to only a very slim likelihood that we're going to be told the truth by officials about how many people are getting sick or dying from the vaccines.

What is true of Ontario is true of everywhere.

They KNEW – and still did it

The authorities knew what was going to happen with multiple deaths and adverse reactions. The UK government's Gates-funded

and Big Pharma-dominated Medicines and Healthcare products Regulatory Agency (MHRA) hired a company to employ AI in compiling the projected reactions to the 'vaccine' that would otherwise be uncountable. The request for applications said: 'The MHRA urgently seeks an Artificial Intelligence (AI) software tool to process the expected high volume of Covid-19 vaccine Adverse Drug Reaction …' This was from the agency, headed by the disingenuous June Raine, that gave the 'vaccines' emergency approval and the company was hired before the first shot was given. 'We are going to kill and maim you – is that okay?' 'Oh, yes, perfectly fine – I'm very grateful, thank you, doctor.' The range of 'Covid vaccine' adverse reactions goes on for page after page in the MHRA criminally underreported 'Yellow Card' system and includes affects to eyes, ears, skin, digestion, blood and so on. Raine's MHRA amazingly claimed that the 'overall safety experience … is so far as expected from the clinical trials'. The death, serious adverse effects, deafness and blindness were *expected?* When did they ever mention that? If these human tragedies were expected then those that gave approval for the use of these 'vaccines' must be guilty of crimes against humanity including murder – a definition of which is 'killing a person with malice aforethought or with recklessness manifesting extreme indifference to the value of human life.' People involved at the MHRA, the CDC in America and their equivalent around the world must go before Nuremberg trials to answer for their callous inhumanity. We are only talking here about the immediate effects of the 'vaccine'. The longer-term impact of the DNA synthetic manipulation is the main reason they are so hysterically desperate to inoculate the entire global population in the shortest possible time.

Africa and the developing world are a major focus for the 'vaccine' depopulation agenda and a mass vaccination sales-pitch is underway thanks to caring people like the Rockefellers and other Cult assets. The Rockefeller Foundation, which pre-empted the 'Covid pandemic' in a document published in 2010 that 'predicted' what happened a decade later, announced an initial $34.95 million grant in February, 2021, 'to ensure more equitable access to Covid-19

testing and vaccines' among other things in Africa in collaboration with '24 organizations, businesses, and government agencies'. The pan-Africa initiative would focus on 10 countries: Burkina Faso, Ethiopia, Ghana, Kenya, Nigeria, Rwanda, South Africa, Tanzania, Uganda, and Zambia'. Rajiv Shah, President of the Rockefeller Foundation and former administrator of CIA-controlled USAID, said that if Africa was not mass-vaccinated (to change the DNA of its people) it was a 'threat to all of humanity' and not fair on Africans. When someone from the Rockefeller Foundation says they want to do something to help poor and deprived people and countries it is time for a belly-laugh. They are doing this out of the goodness of their 'heart' because 'vaccinating' the entire global population is what the 'Covid' hoax set out to achieve. Official 'decolonisation' of Africa by the Cult was merely a prelude to financial colonisation on the road to a return to physical colonisation. The 'vaccine' is vital to that and the sudden and convenient death of the 'Covid' sceptic president of Tanzania can be seen in its true light. A lot of people in Africa are aware that this is another form of colonisation and exploitation and they need to stand their ground.

The 'vaccine is working' scam

A potential problem for the Cult was that the 'vaccine' is meant to change human DNA and body messaging and not to protect anyone from a 'virus' never shown to exist. The vaccine couldn't work because it was not designed to work and how could they make it *appear* to be working so that more people would have it? This was overcome by lowering the amplification rate of the PCR test to produce fewer 'cases' and therefore fewer 'deaths'. Some of us had been pointing out since March, 2020, that the amplification rate of the test not testing for the 'virus' had been made artificially high to generate positive tests which they could call 'cases' to justify lockdowns. The World Health Organization recommended an absurdly high 45 amplification cycles to ensure the high positives required by the Cult and then remained silent on the issue until January 20th, 2021 – Biden's Inauguration Day. This was when the

'vaccinations' were seriously underway and on that day the WHO recommended after discussions with America's CDC that laboratories *lowered their testing amplification*. Dr David Samadi, a certified urologist and health writer, said the WHO was encouraging all labs to reduce their cycle count for PCR tests. He said the current cycle was much too high and was 'resulting in any particle being declared a positive case'. Even one mainstream news report I saw said this meant the number of 'Covid' infections may have been 'dramatically inflated'. Oh, just a little bit. The CDC in America issued new guidance to laboratories in April, 2021, to use 28 cycles *but only for 'vaccinated' people*. The timing of the CDC/WHO interventions were cynically designed to make it appear the 'vaccines' were responsible for falling cases and deaths when the real reason can be seen in the following examples. New York's state lab, the Wadsworth Center, identified 872 positive tests in July, 2020, based on a threshold of 40 cycles. When the figure was lowered to 35 cycles *43 percent* of the 872 were no longer 'positives'. At 30 cycles the figure was 63 percent. A Massachusetts lab found that between *85 to 90 percent* of people who tested positive in July with a cycle threshold of 40 would be negative at 30 cycles, Ashish Jha, MD, director of the Harvard Global Health Institute, said: 'I'm really shocked that it could be that high … Boy, does it really change the way we need to be thinking about testing.' I'm shocked that I could see the obvious in the spring of 2020, with no medical background, and most medical professionals still haven't worked it out. No, that's not shocking – it's terrifying.

Three weeks after the WHO directive to lower PCR cycles the London *Daily Mail* ran this headline: 'Why ARE Covid cases plummeting? New infections have fallen 45% in the US and 30% globally in the past 3 weeks but experts say vaccine is NOT the main driver because only 8% of Americans and 13% of people worldwide have received their first dose.' They acknowledged that the drop could not be attributed to the 'vaccine', but soon this morphed throughout the media into the 'vaccine' has caused cases and deaths to fall when it was the PCR threshold. In December, 2020, there was

chaos at English Channel ports with truck drivers needing negative 'Covid' tests before they could board a ferry home for Christmas. The government wanted to remove the backlog as fast as possible and they brought in troops to do the 'testing'. Out of 1,600 drivers just *36* tested positive and the rest were given the all clear to cross the Channel. I guess the authorities thought that 36 was the least they could get away with without the unquestioning catching on. The amplification trick which most people believed in the absence of information in the mainstream applied more pressure on those refusing the 'vaccine' to succumb when it 'obviously worked'. The truth was the exact opposite with deaths in care homes soaring with the 'vaccine' and in Israel the term used was 'skyrocket'. A re-analysis of published data from the Israeli Health Ministry led by Dr Hervé Seligmann at the Medicine Emerging Infectious and Tropical Diseases at Aix-Marseille University found that Pfizer's 'Covid vaccine' killed 'about 40 times more [elderly] people than the disease itself would have killed' during a five-week vaccination period and *260 times* more younger people than would have died from the 'virus' even according to the manipulated 'virus' figures. Dr Seligmann and his co-study author, Haim Yativ, declared after reviewing the Israeli 'vaccine' death data: 'This is a new Holocaust.'

Then, in mid-April, 2021, after vast numbers of people worldwide had been 'vaccinated', the story changed with clear coordination. The UK government began to prepare the ground for more future lockdowns when Nuremberg-destined Boris Johnson told yet another whopper. He said that cases had fallen because of *lockdowns* not 'vaccines'. Lockdowns are irrelevant when *there is no 'virus'* and the test and fraudulent death certificates are deciding the number of 'cases' and 'deaths'. Study after study has shown that lockdowns don't work and instead kill and psychologically destroy people. Meanwhile in the United States Anthony Fauci and Rochelle Walensky, the ultra-Zionist head of the CDC, peddled the same line. More lockdown was the answer and not the 'vaccine', a line repeated on cue by the moron that is Canadian Prime Minister Justin Trudeau. Why all the hysteria to get everyone 'vaccinated' if lockdowns and

not 'vaccines' made the difference? None of it makes sense on the face of it. Oh, but it does. The Cult wants lockdowns *and* the 'vaccine' and if the 'vaccine' is allowed to be seen as the total answer lockdowns would no longer be justified when there are still livelihoods to destroy. 'Variants' and renewed upward manipulation of PCR amplification are planned to instigate never-ending lockdown *and* more 'vaccines'.

You *must* have it – we're desperate

Israel, where the Jewish and Arab population are ruled by the Sabbatian Cult, was the front-runner in imposing the DNA-manipulating 'vaccine' on its people to such an extent that Jewish refusers began to liken what was happening to the early years of Nazi Germany. This would seem to be a fantastic claim. Why would a government of Jewish people be acting like the Nazis did? If you realise that the Sabbatian Cult was behind the Nazis and that Sabbatians hate Jews the pieces start to fit and the question of why a 'Jewish' government would treat Jews with such callous disregard for their lives and freedom finds an answer. Those controlling the government of Israel *aren't Jewish* – they're Sabbatian. Israeli lawyer Tamir Turgal was one who made the Nazi comparison in comments to German lawyer Reiner Fuellmich who is leading a class action lawsuit against the psychopaths for crimes against humanity. Turgal described how the Israeli government was vaccinating children and pregnant women on the basis that there was no evidence that this was dangerous when they had no evidence that it *wasn't* dangerous either. They just had no evidence. This was medical experimentation and Turgal said this breached the Nuremberg Code about medical experimentation and procedures requiring informed consent and choice. Think about that. A Nuremberg Code developed because of Nazi experimentation on Jews and others in concentration camps by people like the evil-beyond-belief Josef Mengele is being breached by the *Israeli* government; but when you know that it's a *Sabbatian* government along with its intelligence and military agencies like Mossad, Shin Bet and the Israeli Defense Forces, and that Sabbatians

were the force behind the Nazis, the kaleidoscope comes into focus. What have we come to when Israeli Jews are suing their government for violating the Nuremberg Code by essentially making Israelis subject to a medical experiment using the controversial 'vaccines'? It's a shocker that this has to be done in the light of what happened in Nazi Germany. The Anshe Ha-Emet, or 'People of the Truth', made up of Israeli doctors, lawyers, campaigners and public, have launched a lawsuit with the International Criminal Court. It says:

> When the heads of the Ministry of Health as well as the prime minister presented the vaccine in Israel and began the vaccination of Israeli residents, the vaccinated were not advised, that, in practice, they are taking part in a medical experiment and that their consent is required for this under the Nuremberg Code.

The irony is unbelievable, but easily explained in one word: Sabbatians. The foundation of Israeli 'Covid' apartheid is the 'green pass' or 'green passport' which allows Jews and Arabs who have had the DNA-manipulating 'vaccine' to go about their lives – to work, fly, travel in general, go to shopping malls, bars, restaurants, hotels, concerts, gyms, swimming pools, theatres and sports venues, while non-'vaccinated' are banned from all those places and activities. Israelis have likened the 'green pass' to the yellow stars that Jews in Nazi Germany were forced to wear – the same as the yellow stickers that a branch of UK supermarket chain Morrisons told exempt mask-wears they had to display when shopping. How very sensitive. The Israeli system is blatant South African-style apartheid on the basis of compliance or non-compliance to fascism rather than colour of the skin. How appropriate that the Sabbatian Israeli government was so close to the pre-Mandela apartheid regime in Pretoria. The Sabbatian-instigated 'vaccine passport' in Israel is planned for everywhere. Sabbatians struck a deal with Pfizer that allowed them to lead the way in the percentage of a national population infused with synthetic material and the result was catastrophic. Israeli freedom activist Shai Dannon told me how chairs were appearing on beaches that said 'vaccinated only'. Health Minister Yuli Edelstein said that anyone unwilling or unable to get

the jabs that 'confer immunity' will be 'left behind'. The man's a liar. Not even the makers claim the 'vaccines' confer immunity. When you see those figures of 'vaccine' deaths these psychopaths were saying that you must take the chance the 'vaccine' will kill you or maim you while knowing it will change your DNA or lockdown for you will be permanent. That's fascism. The Israeli parliament passed a law to allow personal information of the non-vaccinated to be shared with local and national authorities for three months. This was claimed by its supporters to be a way to 'encourage' people to be vaccinated. Hadas Ziv from Physicians for Human Rights described this as a 'draconian law which crushed medical ethics and the patient rights'. But that's the idea, the Sabbatians would reply.

Your papers, please

Sabbatian Israel was leading what has been planned all along to be a global 'vaccine pass' called a 'green passport' without which you would remain in permanent lockdown restriction and unable to do anything. This is how badly – *desperately* – the Cult is to get everyone 'vaccinated'. The term and colour 'green' was not by chance and related to the psychology of fusing the perception of the green climate hoax with the 'Covid' hoax and how the 'solution' to both is the same Great Reset. Lying politicians, health officials and psychologists denied there were any plans for mandatory vaccinations or restrictions based on vaccinations, but they knew that was exactly what was meant to happen with governments of all countries reaching agreements to enforce a global system. 'Free' Denmark and 'free' Sweden unveiled digital vaccine certification. Cyprus, Czech Republic, Estonia, Greece, Hungary, Iceland, Italy, Poland, Portugal, Slovakia, and Spain have all committed to a vaccine passport system and the rest including the whole of the EU would follow. The satanic UK government will certainly go this way despite mendacious denials and at the time of writing it is trying to manipulate the public into having the 'vaccine' so they could go abroad on a summer holiday. How would that work without something to prove you had the synthetic toxicity injected into you?

Documents show that the EU's European Commission was moving towards 'vaccine certificates' in 2018 and 2019 before the 'Covid' hoax began. They knew what was coming. Abracadabra – Ursula von der Leyen, the German President of the Commission, announced in March, 2021, an EU 'Digital Green Certificate' – green again – to track the public's 'Covid status'. The passport sting is worldwide and the Far East followed the same pattern with South Korea ruling that only those with 'vaccination' passports – again the *green* pass – would be able to 'return to their daily lives'.

Bill Gates has been preparing for this 'passport' with other Cult operatives for years and beyond the paper version is a Gates-funded 'digital tattoo' to identify who has been vaccinated and who hasn't. The 'tattoo' is reported to include a substance which is externally readable to confirm who has been vaccinated. This is a bio-luminous light-generating enzyme (think fireflies) called … *Luciferase*. Yes, named after the Cult 'god' Lucifer the 'light bringer' of whom more to come. Gates said he funded the readable tattoo to ensure children in the developing world were vaccinated and no one was missed out. He cares so much about poor kids as we know. This was just the cover story to develop a vaccine tagging system for everyone on the planet. Gates has been funding the ID2020 'alliance' to do just that in league with other lovely people at Microsoft, GAVI, the Rockefeller Foundation, Accenture and IDEO.org. He said in interviews in March, 2020, before any 'vaccine' publicly existed, that the world must have a globalised digital certificate to track the 'virus' and who had been vaccinated. Gates knew from the start that the mRNA vaccines were coming and when they would come and that the plan was to tag the 'vaccinated' to marginalise the intelligent and stop them doing anything including travel. Evil just doesn't suffice. Gates was exposed for offering a $10 million bribe to the Nigerian House of Representatives to invoke compulsory 'Covid' vaccination of all Nigerians. Sara Cunial, a member of the Italian Parliament, called Gates a 'vaccine criminal'. She urged the Italian President to hand him over to the International Criminal Court for crimes against

humanity and condemned his plans to 'chip the human race' through ID2020.

You know it's a long-planned agenda when war criminal and Cult gofer Tony Blair is on the case. With the scale of arrogance only someone as dark as Blair can muster he said: 'Vaccination in the end is going to be your route to liberty.' Blair is a disgusting piece of work and he confirms that again. The media has given a lot of coverage to a bloke called Charlie Mullins, founder of London's biggest independent plumbing company, Pimlico Plumbers, who has said he won't employ anyone who has not been vaccinated or have them go to any home where people are not vaccinated. He said that if he had his way no one would be allowed to walk the streets if they have not been vaccinated. Gates was cheering at the time while I was alerting the white coats. The plan is that people will qualify for 'passports' for having the first two doses and then to keep it they will have to have all the follow ups and new ones for invented 'variants' until human genetics is transformed and many are dead who can't adjust to the changes. Hollywood celebrities – the usual propaganda stunt – are promoting something called the WELL Health-Safety Rating to verify that a building or space has 'taken the necessary steps to prioritize the health and safety of their staff, visitors and other stakeholders'. They included Lady Gaga, Jennifer Lopez, Michael B. Jordan, Robert DeNiro, Venus Williams, Wolfgang Puck, Deepak Chopra and 17th Surgeon General Richard Carmona. Yawn. WELL Health-Safety has big connections with China. Parent company Delos is headed by former Goldman Sachs partner Paul Scialla. This is another example – and we will see so many others – of using the excuse of 'health' to dictate the lives and activities of the population. I guess one confirmation of the 'safety' of buildings is that only 'vaccinated' people can go in, right?

Electronic concentration camps

I wrote decades ago about the plans to restrict travel and here we are for those who refuse to bow to tyranny. This can be achieved in one go with air travel if the aviation industry makes a blanket decree.

The ‘vaccine’ and guaranteed income are designed to be part of a global version of China’s social credit system which tracks behaviour 24/7 and awards or deletes ‘credits’ based on whether your behaviour is supported by the state or not. I mean your entire lifestyle – what you do, eat, say, everything. Once your credit score falls below a certain level consequences kick in. In China tens of millions have been denied travel by air and train because of this. All the locations and activities denied to refusers by the ‘vaccine’ passports will be included in one big mass ban on doing almost anything for those that don’t bow their head to government. It’s beyond fascist and a new term is required to describe its extremes – I guess fascist technocracy will have to do. The way the Chinese system of technological – technocratic – control is sweeping the West can be seen in the Los Angeles school system and is planned to be expanded worldwide. Every child is required to have a ‘Covid’-tracking app scanned daily before they can enter the classroom. The so-called Daily Pass tracking system is produced by Gates’ Microsoft which I’m sure will shock you rigid. The pass will be scanned using a barcode (one step from an inside-the-body barcode) and the information will include health checks, ‘Covid’ tests and vaccinations. Entry codes are for one specific building only and access will only be allowed if a student or teacher has a negative test with a test not testing for the ‘virus’, has no symptoms of anything alleged to be related to ‘Covid’ (symptoms from a range of other illness), and has a temperature under 100 degrees. No barcode, no entry, is planned to be the case for everywhere and not only schools.

Kids are being psychologically prepared to accept this as ‘normal’ their whole life which is why what they can impose in schools is so important to the Cult and its gofers. Long-time American freedom campaigner John Whitehead of the Rutherford Institute was not exaggerating when he said: ‘Databit by databit, we are building our own electronic concentration camps.’ Canada under its Cult gofer prime minister Justin Trudeau has taken a major step towards the real thing with people interned against their will if they test positive with a test not testing for the ‘virus’ when they arrive at a Canadian

airport. They are jailed in internment hotels often without food or water for long periods and with many doors failing to lock there have been sexual assaults. The interned are being charged sometimes $2,000 for the privilege of being abused in this way. Trudeau is fully on board with the Cult and says the 'Covid pandemic' has provided an opportunity for a global 'reset' to permanently change Western civilisation. His number two, Deputy Prime Minister Chrystia Freeland, is a trustee of the World Economic Forum and a Rhodes Scholar. The Trudeau family have long been servants of the Cult. See *The Biggest Secret* and Cathy O'Brien's book *Trance-Formation of America* for the horrific background to Trudeau's father Pierre Trudeau another Canadian prime minister. Hide your fascism behind the façade of a heart-on-the-sleeve liberal. It's a well-honed Cult technique.

What can the 'vaccine' *really* do?

We have a 'virus' never shown to exist and 'variants' of the 'virus' that have also never been shown to exist except, like the 'original', as computer-generated fictions. Even if you believe there's a 'virus' the 'case' to 'death' rate is in the region of 0.23 to 0.15 percent and those 'deaths' are concentrated among the very old around the same average age that people die anyway. In response to this lack of threat (in truth none) psychopaths and idiots, knowingly and unknowingly answering to Gates and the Cult, are seeking to 'vaccinate' every man, woman and child on Planet Earth. Clearly the 'vaccine' is not about 'Covid' – none of this ever has been. So what is it all about *really*? Why the desperation to infuse genetically-manipulating synthetic material into everyone through mRNA fraudulent 'vaccines' with the intent of doing this over and over with the excuses of 'variants' and other 'virus' inventions? Dr Sherri Tenpenny, an osteopathic medical doctor in the United States, has made herself an expert on vaccines and their effects as a vehement campaigner against their use. Tenpenny was board certified in emergency medicine, the director of a level two trauma centre for 12 years, and moved to Cleveland in 1996 to start an integrative

medicine practice which has treated patients from all 50 states and some 17 other countries. Weaning people off pharmaceutical drugs is a speciality.

She became interested in the consequences of vaccines after attending a meeting at the National Vaccine Information Center in Washington DC in 2000 where she 'sat through four days of listening to medical doctors and scientists and lawyers and parents of vaccine injured kids' and asked: 'What's going on?' She had never been vaccinated and never got ill while her father was given a list of vaccines to be in the military and was 'sick his entire life'. The experience added to her questions and she began to examine vaccine documents from the Centers for Disease Control (CDC). After reading the first one, the 1998 version of *The General Recommendations of Vaccination*, she thought: 'This is it?' The document was poorly written and bad science and Tenpenny began 20 years of research into vaccines that continues to this day. She began her research into 'Covid vaccines' in March, 2020, and she describes them as 'deadly'. For many, as we have seen, they already have been. Tenpenny said that in the first 30 days of the 'vaccine' rollout in the United States there had been more than 40,000 adverse events reported to the vaccine adverse event database. A document had been delivered to her the day before that was 172 pages long. 'We have over 40,000 adverse events; we have over 3,100 cases of [potentially deadly] anaphylactic shock; we have over 5,000 neurological reactions.' Effects ranged from headaches to numbness, dizziness and vertigo, to losing feeling in hands or feet and paraesthesia which is when limbs 'fall asleep' and people have the sensation of insects crawling underneath their skin. All this happened in the first 30 days and remember that only about *ten percent* (or far less) of adverse reactions and vaccine-related deaths are estimated to be officially reported. Tenpenny said:

> So can you think of one single product in any industry, any industry, for as long as products have been made on the planet that within 30 days we have 40,000 people complaining of side effects that not only is still on the market but … we've got paid actors telling us how great

they are for getting their vaccine. We're offering people $500 if they will just get their vaccine and we've got nurses and doctors going; 'I got the vaccine, I got the vaccine'.

Tenpenny said they were not going to be 'happy dancing folks' when they began to suffer Bell's palsy (facial paralysis), neuropathies, cardiac arrhythmias and autoimmune reactions that kill through a blood disorder. 'They're not going to be so happy, happy then, but we're never going to see pictures of those people' she said. Tenpenny described the 'vaccine' as 'a well-designed killing tool'.

No off-switch

Bad as the initial consequences had been Tenpenny said it would be maybe 14 months before we began to see the 'full ravage' of what is going to happen to the 'Covid vaccinated' with full-out consequences taking anything between two years and 20 years to show. You can understand why when you consider that variations of the 'Covid vaccine' use mRNA (messenger RNA) to in theory activate the immune system to produce protective antibodies without using the actual 'virus'. How can they when it's a computer program and they've never isolated what they claim is the 'real thing'? Instead they use *synthetic* mRNA. They are inoculating synthetic material into the body which through a technique known as the Trojan horse is absorbed into cells to change the nature of DNA. Human DNA is changed by an infusion of messenger RNA and with each new 'vaccine' of this type it is changed even more. Say so and you are banned by Cult Internet platforms. The contempt the contemptuous Mark Zuckerberg has for the truth and human health can be seen in an internal Facebook video leaked to the Project Veritas investigative team in which he said of the 'Covid vaccines': '… I share some caution on this because we just don't know the long term side-effects of basically modifying people's DNA and RNA.' At the same time this disgusting man's Facebook was censoring and banning anyone saying exactly the same. He must go before a Nuremberg trial for crimes against humanity when he *knows* that he

is censoring legitimate concerns and denying the right of informed consent on behalf of the Cult that owns him. People have been killed and damaged by the very 'vaccination' technique he cast doubt on himself when they may not have had the 'vaccine' with access to information that he denied them. The plan is to have at least annual 'Covid vaccinations', add others to deal with invented 'variants', and change all other vaccines into the mRNA system. Pfizer executives told shareholders at a virtual Barclays Global Healthcare Conference in March, 2021, that the public may need a third dose of 'Covid vaccine', plus regular yearly boosters and the company planned to hike prices to milk the profits in a 'significant opportunity for our vaccine'. These are the professional liars, cheats and opportunists who are telling you their 'vaccine' is safe. Given this volume of mRNA planned to be infused into the human body and its ability to then replicate we will have a transformation of human genetics from biological to synthetic biological – exactly the long-time Cult plan for reasons we'll see – and many will die. Sherri Tenpenny said of this replication:

> It's like having an on-button but no off-button and that whole mechanism … they actually give it a name and they call it the Trojan horse mechanism, because it allows that [synthetic] virus and that piece of that [synthetic] virus to get inside of your cells, start to replicate and even get inserted into other parts of your DNA as a Trojan-horse.

Ask the overwhelming majority of people who have the 'vaccine' what they know about the contents and what they do and they would reply: 'The government says it will stop me getting the virus.' Governments give that false impression on purpose to increase take-up. You can read Sherri Tenpenny's detailed analysis of the health consequences in her blog at Vaxxter.com, but in summary these are some of them. She highlights the statement by Bill Gates about how human beings can become their own 'vaccine manufacturing machine'. The man is insane. ['Vaccine'-generated] 'antibodies' carry synthetic messenger RNA into the cells and the damage starts, Tenpenny contends, and she says that lungs can be adversely affected through varying degrees of pus and bleeding which

obviously affects breathing and would be dubbed 'Covid-19'. Even more sinister was the impact of 'antibodies' on macrophages, a white blood cell of the immune system. They consist of Type 1 and Type 2 which have very different functions. She said Type 1 are 'hyper-vigilant' white blood cells which 'gobble up' bacteria etc. However, in doing so, this could cause inflammation and in extreme circumstances be fatal. She says these affects are mitigated by Type 2 macrophages which kick in to calm down the system and stop it going rogue. They clear up dead tissue debris and reduce inflammation that the Type 1 'fire crews' have caused. Type 1 kills the infection and Type 2 heals the damage, she says. This is her punchline with regard to 'Covid vaccinations': She says that mRNA 'antibodies' block Type 2 macrophages by attaching to them and deactivating them. This meant that when the Type 1 response was triggered by infection there was nothing to stop that getting out of hand by calming everything down. There's an on-switch, but no off-switch, she says. What follows can be 'over and out, see you when I see you'.

Genetic suicide

Tenpenny also highlights the potential for autoimmune disease – the body attacking itself – which has been associated with vaccines since they first appeared. Infusing a synthetic foreign substance into cells could cause the immune system to react in a panic believing that the body is being overwhelmed by an invader (it is) and the consequences can again be fatal. There is an autoimmune response known as a 'cytokine storm' which I have likened to a homeowner panicked by an intruder and picking up a gun to shoot randomly in all directions before turning the fire on himself. The immune system unleashes a storm of inflammatory response called cytokines to a threat and the body commits hara-kiri. The lesson is that you mess with the body's immune response at your peril and these 'vaccines' seriously – fundamentally – mess with immune response. Tenpenny refers to a consequence called anaphylactic shock which is a severe and highly dangerous allergic reaction when the immune system

floods the body with chemicals. She gives the example of having a bee sting which primes the immune system and makes it sensitive to those chemicals. When people are stung again maybe years later the immune response can be so powerful that it leads to anaphylactic shock. Tenpenny relates this 'shock' with regard to the 'Covid vaccine' to something called polyethylene glycol or PEG. Enormous numbers of people have become sensitive to this over decades of use in a whole range of products and processes including food, drink, skin creams and 'medicine'. Studies have claimed that some 72 percent of people have antibodies triggered by PEG compared with two percent in the 1960s and allergic hypersensitive reactions to this become a gathering cause for concern. Tenpenny points out that the 'mRNA vaccine' is coated in a 'bubble' of polyethylene glycol which has the potential to cause anaphylactic shock through immune sensitivity. Many reports have appeared of people reacting this way after having the 'Covid vaccine'. What do we think is going to happen as humanity has more and more of these 'vaccines'? Tenpenny said: 'All these pictures we have seen with people with these rashes … these weepy rashes, big reactions on their arms and things like that – it's an acute allergic reaction most likely to the polyethylene glycol that you've been previously primed and sensitised to.'

Those who have not studied the conspiracy and its perpetrators at length might think that making the population sensitive to PEG and then putting it in these 'vaccines' is just a coincidence. It is not. It is instead testament to how carefully and coldly-planned current events have been and the scale of the conspiracy we are dealing with. Tenpenny further explains that the 'vaccine' mRNA procedure can breach the blood-brain barrier which protects the brain from toxins and other crap that will cause malfunction. In this case they could make two proteins corrupt brain function to cause Amyotrophic lateral sclerosis (ALS) , a progressive nervous system disease leading to loss of muscle control, and frontal lobe degeneration – Alzheimer's and dementia. Immunologist J. Bart Classon published a paper connecting mRNA 'vaccines' to prion

disease which can lead to Alzheimer's and other forms of neurogenerative disease while others have pointed out the potential to affect the placenta in ways that make women infertile. This will become highly significant in the next chapter when I will discuss other aspects of this non-vaccine that relate to its nanotechnology and transmission from the injected to the uninjected.

Qualified in idiocy

Tenpenny describes how research has confirmed that these 'vaccine'-generated antibodies can interact with a range of other tissues in the body and attack many other organs including the lungs. 'This means that if you have a hundred people standing in front of you that all got this shot they could have a hundred different symptoms.' Anyone really think that Cult gofers like the Queen, Tony Blair, Christopher Whitty, Anthony Fauci, and all the other psychopaths have really had this 'vaccine' in the pictures we've seen? Not a bloody chance. Why don't doctors all tell us about all these dangers and consequences of the 'Covid vaccine'? Why instead do they encourage and pressure patients to have the shot? Don't let's think for a moment that doctors and medical staff can't be stupid, lazy, and psychopathic and that's without the financial incentives to give the jab. Tenpenny again:

> Some people are going to die from the vaccine directly but a large number of people are going to start to get horribly sick and get all kinds of autoimmune diseases 42 days to maybe a year out. What are they going to do, these stupid doctors who say; 'Good for you for getting that vaccine.' What are they going to say; 'Oh, it must be a mutant, we need to give an extra dose of that vaccine.'
>
> Because now the vaccine, instead of one dose or two doses we need three or four because the stupid physicians aren't taking the time to learn anything about it. If I can learn this sitting in my living room reading a 19 page paper and several others so can they. There's nothing special about me, I just take the time to do it.

Remember how Sara Kayat, the NHS and TV doctor, said that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Doctors can be idiots like every other profession and they

should not be worshipped as infallible. They are not and far from it. Behind many medical and scientific 'experts' lies an uninformed prat trying to hide themselves from you although in the 'Covid' era many have failed to do so as with UK narrative-repeating 'TV doctor' Hilary Jones. Pushing back against the minority of proper doctors and scientists speaking out against the 'vaccine' has been the entire edifice of the Cult global state in the form of governments, medical systems, corporations, mainstream media, Silicon Valley, and an army of compliant doctors, medical staff and scientists willing to say anything for money and to enhance their careers by promoting the party line. If you do that you are an 'expert' and if you won't you are an 'anti-vaxxer' and 'Covidiot'. The pressure to be 'vaccinated' is incessant. We have even had reports claiming that the 'vaccine' can help cure cancer and Alzheimer's and make the lame walk. I am waiting for the announcement that it can bring you coffee in the morning and cook your tea. Just as the symptoms of 'Covid' seem to increase by the week so have the miracles of the 'vaccine'. American supermarket giant Kroger Co. offered nearly 500,000 employees in 35 states a $100 bonus for having the 'vaccine' while donut chain Krispy Kreme promised 'vaccinated' customers a free glazed donut every day for the rest of 2021. Have your DNA changed and you will get a doughnut although we might not have to give you them for long. Such offers and incentives confirm the desperation.

Perhaps the worse vaccine-stunt of them all was UK 'Health' Secretary Matt-the-prat Hancock on live TV after watching a clip of someone being 'vaccinated' when the roll-out began. Hancock faked tears so badly it was embarrassing. Brain-of-Britain Piers Morgan, the lockdown-supporting, 'vaccine' supporting, 'vaccine' passport-supporting, TV host played along with Hancock – 'You're quite emotional about that' he said in response to acting so atrocious it would have been called out at a school nativity which will presumably today include Mary and Jesus in masks, wise men keeping their camels six feet apart, and shepherds under tent arrest. System-serving Morgan tweeted this: 'Love the idea of covid vaccine passports for everywhere: flights, restaurants, clubs, football, gyms,

shops etc. It's time covid-denying, anti-vaxxer loonies had their bullsh*t bluff called & bar themselves from going anywhere that responsible citizens go.' If only I could aspire to his genius. To think that Morgan, who specialises in shouting over anyone he disagrees with, was lauded as a free speech hero when he lost his job after storming off the set of his live show like a child throwing his dolly out of the pram. If he is a free speech hero we are in real trouble. I have no idea what 'bullsh*t' means, by the way, the * throws me completely.

The Cult is desperate to infuse its synthetic DNA-changing concoction into everyone and has been using every lie, trick and intimidation to do so. The question of '*Why*?' we shall now address.

CHAPTER TEN

Human 2.0

I believe that at the end of the century the use of words and general educated opinion will have altered so much that one will be able to speak of machines thinking without expecting to be contradicted –
Alan Turing (1912-1954), the 'Father of artificial intelligence'

I have been exposing for decades the plan to transform the human body from a biological to a synthetic-biological state. The new human that I will call Human 2.0 is planned to be connected to artificial intelligence and a global AI 'Smart Grid' that would operate as one global system in which AI would control everything from your fridge to your heating system to your car to your mind. Humans would no longer be 'human', but post-human and sub-human, with their thinking and emotional processes replaced by AI.

What I said sounded crazy and beyond science fiction and I could understand that. To any balanced, rational, mind it *is* crazy. Today, however, that world is becoming reality and it puts the 'Covid vaccine' into its true context. Ray Kurzweil is the ultra-Zionist 'computer scientist, inventor and futurist' and co-founder of the Singularity University. Singularity refers to the merging of humans with machines or 'transhumanism'. Kurzweil has said humanity would be connected to the cyber 'cloud' in the period of the ever-recurring year of 2030:

Our thinking … will be a hybrid of biological and non-biological thinking … humans will be able to extend their limitations and 'think in the cloud' … We're going to put gateways to the

cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations. As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

They are trying to sell this end-of-humanity-as-we-know-it as the next stage of 'evolution' when we become super-human and 'like the gods'. They are lying to you. Shocked, eh? The population, and again especially the young, have been manipulated into addiction to technologies designed to enslave them for life. First they induced an addiction to smartphones (holdables); next they moved to technology on the body (wearables); and then began the invasion of the body (implantables). I warned way back about the plan for microchipped people and we are now entering that era. We should not be diverted into thinking that this refers only to chips we can see. Most important are the nanochips known as smart dust, neural dust and nanobots which are far too small to be seen by the human eye. Nanotechnology is everywhere, increasingly in food products, and released into the atmosphere by the geoengineering of the skies funded by Bill Gates to 'shut out the Sun' and 'save the planet from global warming'. Gates has been funding a project to spray millions of tonnes of chalk (calcium carbonate) into the stratosphere over Sweden to 'dim the Sun' and cool the Earth. Scientists warned the move could be disastrous for weather systems in ways no one can predict and opposition led to the Swedish space agency announcing that the 'experiment' would not be happening as planned in the summer of 2021; but it shows where the Cult is going with dimming the impact of the Sun and there's an associated plan to change the planet's atmosphere. Who gives psychopath Gates the right to dictate to the entire human race and dismantle planetary systems? The world will not be safe while this man is at large.

The global warming hoax has made the Sun, like the gas of life, something to fear when both are essential to good health and human survival (more inversion). The body transforms sunlight into vital vitamin D through a process involving … *cholesterol*. This is the cholesterol we are also told to fear. We are urged to take Big Pharma

statin drugs to reduce cholesterol and it's all systematic. Reducing cholesterol means reducing vitamin D uptake with all the multiple health problems that will cause. At least if you take statins long term it saves the government from having to pay you a pension. The delivery system to block sunlight is widely referred to as chemtrails although these have a much deeper agenda, too. They appear at first to be contrails or condensation trails streaming from aircraft into cold air at high altitudes. Contrails disperse very quickly while chemtrails do not and spread out across the sky before eventually their content falls to earth. Many times I have watched aircraft cross-cross a clear blue sky releasing chemtrails until it looks like a cloudy day. Chemtrails contain many things harmful to humans and the natural world including toxic heavy metals, aluminium (see Alzheimer's) and nanotechnology. Ray Kurzweil reveals the reason without actually saying so: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' How do you deliver that? *From the sky*. Self-replicating nanobots would connect everything to the Smart Grid. The phenomenon of Morgellons disease began in the chemtrail era and the correlation has led to it being dubbed the 'chemtrail disease'. Self-replicating fibres appear in the body that can be pulled out through the skin. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. I cover this at greater length in *Phantom Self*.

'Vaccine' operating system

'Covid vaccines' with their self-replicating synthetic material are also designed to make the connection between humanity and Kurzweil's 'cloud'. American doctor and dedicated campaigner for truth, Carrie Madej, an Internal Medicine Specialist in Georgia with more than 20 years medical experience, has highlighted the nanotechnology aspect of the fake 'vaccines'. She explains how one of the components in at least the Moderna and Pfizer synthetic potions are 'lipid nanoparticles' which are 'like little tiny computer bits' – a 'sci-fi substance' known as nanobots and hydrogel which can be 'triggered

at any moment to deliver its payload' and act as 'biosensors'. The synthetic substance had 'the ability to accumulate data from your body like your breathing, your respiration, thoughts and emotions, all kind of things' and each syringe could carry a *million* nanobots:

This substance because it's like little bits of computers in your body, crazy, but it's true, it can do that, [and] obviously has the ability to act through Wi-Fi. It can receive and transmit energy, messages, frequencies or impulses. That issue has never been addressed by these companies. What does that do to the human?

Just imagine getting this substance in you and it can react to things all around you, the 5G, your smart device, your phones, what is happening with that? What if something is triggering it, too, like an impulse, a frequency? We have something completely foreign in the human body.

Madej said her research revealed that electromagnetic (EMF) frequencies emitted by phones and other devices had increased dramatically in the same period of the 'vaccine' rollout and she was seeing more people with radiation problems as 5G and other electromagnetic technology was expanded and introduced to schools and hospitals. She said she was 'floored with the EMF coming off' the devices she checked. All this makes total sense and syncs with my own work of decades when you think that Moderna refers in documents to its mRNA 'vaccine' as an 'operating system':

Recognizing the broad potential of mRNA science, we set out to create an mRNA technology platform that functions very much like an operating system on a computer. It is designed so that it can plug and play interchangeably with different programs. In our case, the 'program' or 'app' is our mRNA drug – the unique mRNA sequence that codes for a protein …

… Our MRNA Medicines – 'The 'Software Of Life': When we have a concept for a new mRNA medicine and begin research, fundamental components are already in place. Generally, the only thing that changes from one potential mRNA medicine to another is the coding region – the actual genetic code that instructs ribosomes to make protein. Utilizing these instruction sets gives our investigational mRNA medicines a software-like quality. We also have the ability to combine different mRNA sequences encoding for different proteins in a single mRNA investigational medicine.

Who needs a real 'virus' when you can create a computer version to justify infusing your operating system into the entire human race on the road to making living, breathing people into cyborgs? What is missed with the 'vaccines' is the *digital* connection between synthetic material and the body that I highlighted earlier with the study that hacked a computer with human DNA. On one level the body is digital, based on mathematical codes, and I'll have more about that in the next chapter. Those who ridiculously claim that mRNA 'vaccines' are not designed to change human genetics should explain the words of Dr Tal Zaks, chief medical officer at Moderna, in a 2017 TED talk. He said that over the last 30 years 'we've been living this phenomenal digital scientific revolution, and I'm here today to tell you, that we are actually *hacking the software of life*, and that it's changing the way we think about prevention and treatment of disease':

In every cell there's this thing called messenger RNA, or mRNA for short, that transmits the critical information from the DNA in our genes to the protein, which is really the stuff we're all made out of. This is the critical information that determines what the cell will do. So we think about it as an operating system. So if you could change that, if you could introduce a line of code, or change a line of code, it turns out, that has profound implications for everything, from the flu to cancer.

Zaks should more accurately have said that this has profound implications for the human genetic code and the nature of DNA. Communications within the body go both ways and not only one. But, hey, no, the 'Covid vaccine' will not affect your genetics. Cult fact-checkers say so even though the man who helped to develop the mRNA technique says that it does. Zaks said in 2017:

If you think about what it is we're trying to do. We've taken information and our understanding of that information and how that information is transmitted in a cell, and we've taken our understanding of medicine and how to make drugs, and we're fusing the two. We think of it as information therapy.

I have been writing for decades that the body is an information field communicating with itself and the wider world. This is why

radiation which is information can change the information field of body and mind through phenomena like 5G and change their nature and function. 'Information therapy' means to change the body's information field and change the way it operates. DNA is a receiver-transmitter of information and can be mutated by information like mRNA synthetic messaging. Technology to do this has been ready and waiting in the underground bases and other secret projects to be rolled out when the 'Covid' hoax was played. 'Trials' of such short and irrelevant duration were only for public consumption. When they say the 'vaccine' is 'experimental' that is not true. It may appear to be 'experimental' to those who don't know what's going on, but the trials have already been done to ensure the Cult gets the result it desires. Zaks said that it took decades to sequence the human genome, completed in 2003, but now they could do it in a week. By 'they' he means scientists operating in the public domain. In the secret projects they were sequencing the genome in a week long before even 2003.

Deluge of mRNA

Highly significantly the Moderna document says the guiding premise is that if using mRNA as a medicine works for one disease then it should work for many diseases. They were leveraging the flexibility afforded by their platform and the fundamental role mRNA plays in protein synthesis to pursue mRNA medicines for a broad spectrum of diseases. Moderna is confirming what I was saying through 2020 that multiple 'vaccines' were planned for 'Covid' (and later invented 'variants') and that previous vaccines would be converted to the mRNA system to infuse the body with massive amounts of genetically-manipulating synthetic material to secure a transformation to a synthetic-biological state. The 'vaccines' are designed to kill stunning numbers as part of the long-exposed Cult depopulation agenda and transform the rest. Given this is the goal you can appreciate why there is such hysterical demand for every human to be 'vaccinated' for an alleged 'disease' that has an estimated 'infection' to 'death' ratio of 0.23-0.15 percent. As I write

children are being given the 'vaccine' in trials (their parents are a disgrace) and ever-younger people are being offered the vaccine for a 'virus' that even if you believe it exists has virtually zero chance of harming them. Horrific effects of the 'trials' on a 12-year-old girl were revealed by a family member to be serious brain and gastric problems that included a bowel obstruction and the inability to swallow liquids or solids. She was unable to eat or drink without throwing up, had extreme pain in her back, neck and abdomen, and was paralysed from the waist down which stopped her urinating unaided. When the girl was first taken to hospital doctors said it was all in her mind. She was signed up for the 'trial' by her parents for whom no words suffice. None of this 'Covid vaccine' insanity makes any sense unless you see what the 'vaccine' really is – a body-changer. Synthetic biology or 'SynBio' is a fast-emerging and expanding scientific discipline which includes everything from genetic and molecular engineering to electrical and computer engineering. Synthetic biology is defined in these ways:

- A multidisciplinary area of research that seeks to create new biological parts, devices, and systems, or to redesign systems that are already found in nature.

- The use of a mixture of physical engineering and genetic engineering to create new (and therefore synthetic) life forms.

- An emerging field of research that aims to combine the knowledge and methods of biology, engineering and related disciplines in the design of chemically-synthesized DNA to create organisms with novel or enhanced characteristics and traits (synthetic organisms including humans).

We now have synthetic blood, skin, organs and limbs being developed along with synthetic body parts produced by 3D printers. These are all elements of the synthetic human programme and this comment by Kurzweil's co-founder of the Singularity University,

Peter Diamandis, can be seen in a whole new light with the 'Covid' hoax and the sanctions against those that refuse the 'vaccine':

Anybody who is going to be resisting the progress forward [to transhumanism] is going to be resisting evolution and, fundamentally, they will die out. It's not a matter of whether it's good or bad. It's going to happen.

'Resisting evolution'? What absolute bollocks. The arrogance of these people is without limit. His 'it's going to happen' mantra is another way of saying 'resistance is futile' to break the spirit of those pushing back and we must not fall for it. Getting this genetically-transforming 'vaccine' into everyone is crucial to the Cult plan for total control and the desperation to achieve that is clear for anyone to see. Vaccine passports are a major factor in this and they, too, are a form of resistance is futile. It's NOT. The paper funded by the Rockefeller Foundation for the 2013 'health conference' in China said:

We will interact more with artificial intelligence. The use of robotics, bio-engineering to augment human functioning is already well underway and will advance. Re-engineering of humans into potentially separate and unequal forms through genetic engineering or mixed human-robots raises debates on ethics and equality.

A new demography is projected to emerge after 2030 [that year again] of technologies (robotics, genetic engineering, nanotechnology) producing robots, engineered organisms, 'nanobots' and artificial intelligence (AI) that can self-replicate. Debates will grow on the implications of an impending reality of human designed life.

What is happening today is so long planned. The world army enforcing the will of the world government is intended to be a robot army, not a human one. Today's military and its technologically 'enhanced' troops, pilotless planes and driverless vehicles are just stepping stones to that end. Human soldiers are used as Cult fodder and its time they woke up to that and worked for the freedom of the population instead of their own destruction and their family's destruction – the same with the police. Join us and let's sort this out. The phenomenon of enforce my own destruction is widespread in the 'Covid' era with Woker 'luvvies' in the acting and entertainment

industries supporting 'Covid' rules which have destroyed their profession and the same with those among the public who put signs on the doors of their businesses 'closed due to Covid – stay safe' when many will never reopen. It's a form of masochism and most certainly insanity.

Transgender = transhumanism

When something explodes out of nowhere and is suddenly everywhere it is always the Cult agenda and so it is with the tidal wave of claims and demands that have infiltrated every aspect of society under the heading of 'transgenderism'. The term 'trans' is so 'in' and this is the dictionary definition:

A prefix meaning 'across', 'through', occurring … in loanwords from Latin, used in particular for denoting movement or conveyance from place to place (transfer; transmit; transplant) or complete change (transform; transmute), or to form adjectives meaning 'crossing', 'on the other side of', or 'going beyond' the place named (transmontane; transnational; trans-Siberian).

Transgender means to go beyond gender and transhuman means to go beyond human. Both are aspects of the Cult plan to transform the human body to a synthetic state with *no gender*. Human 2.0 is not designed to procreate and would be produced technologically with no need for parents. The new human would mean the end of parents and so men, and increasingly women, are being targeted for the deletion of their rights and status. Parental rights are disappearing at an ever-quickening speed for the same reason. The new human would have no need for men or women when there is no procreation and no gender. Perhaps the transgender movement that appears to be in a permanent state of frenzy might now contemplate on how it is being used. This was never about transgender rights which are only the interim excuse for confusing gender, particularly in the young, on the road to *fusing* gender. Transgender activism is not an end; it is a *means* to an end. We see again the technique of creative destruction in which you destroy the status quo to 'build back better' in the form that you want. The gender status quo had to be

destroyed by persuading the Cult-created Woke mentality to believe that you can have 100 genders or more. A programme for 9 to 12 year olds produced by the Cult-owned BBC promoted the 100 genders narrative. The very idea may be the most monumental nonsense, but it is not what is true that counts, only what you can make people *believe* is true. Once the gender of 2 + 2 = 4 has been dismantled through indoctrination, intimidation and 2 + 2 = 5 then the new no-gender normal can take its place with Human 2.0. Aldous Huxley revealed the plan in his prophetic *Brave New World* in 1932:

> Natural reproduction has been done away with and children are created, decanted', and raised in 'hatcheries and conditioning centres'. From birth, people are genetically designed to fit into one of five castes, which are further split into 'Plus' and 'Minus' members and designed to fulfil predetermined positions within the social and economic strata of the World State.

How could Huxley know this in 1932? For the same reason George Orwell knew about the Big Brother state in 1948, Cult insiders I have quoted knew about it in 1969, and I have known about it since the early 1990s. If you are connected to the Cult or you work your balls off to uncover the plan you can predict the future. The process is simple. If there is a plan for the world and nothing intervenes to stop it then it will happen. Thus if you communicate the plan ahead of time you are perceived to have predicted the future, but you haven't. You have revealed the plan which without intervention will become the human future. The whole reason I have done what I have is to alert enough people to inspire an intervention and maybe at last that time has come with the Cult and its intentions now so obvious to anyone with a brain in working order.

The future is here

Technological wombs that Huxley described to replace parent procreation are already being developed and they are only the projects we know about in the public arena. Israeli scientists told *The Times of Israel* in March, 2021, that they have grown 250-cell embryos

into mouse foetuses with fully formed organs using artificial wombs in a development they say could pave the way for gestating humans outside the womb. Professor Jacob Hanna of the Weizmann Institute of Science said:

We took mouse embryos from the mother at day five of development, when they are just of 250 cells, and had them in the incubator from day five until day 11, by which point they had grown all their organs.

By day 11 they make their own blood and have a beating heart, a fully developed brain. Anybody would look at them and say, 'this is clearly a mouse foetus with all the characteristics of a mouse.' It's gone from being a ball of cells to being an advanced foetus.

A special liquid is used to nourish embryo cells in a laboratory dish and they float on the liquid to duplicate the first stage of embryonic development. The incubator creates all the right conditions for its development, Hanna said. The liquid gives the embryo 'all the nutrients, hormones and sugars they need' along with a custom-made electronic incubator which controls gas concentration, pressure and temperature. The cutting-edge in the underground bases and other secret locations will be light years ahead of that, however, and this was reported by the London *Guardian* in 2017:

We are approaching a biotechnological breakthrough. Ectogenesis, the invention of a complete external womb, could completely change the nature of human reproduction. In April this year, researchers at the Children's Hospital of Philadelphia announced their development of an artificial womb.

The article was headed 'Artificial wombs could soon be a reality. What will this mean for women?' What would it mean for children is an even bigger question. No mother to bond with only a machine in preparation for a life of soulless interaction and control in a world governed by machines (see the *Matrix* movies). Now observe the calculated manipulations of the 'Covid' hoax as human interaction and warmth has been curtailed by distancing, isolation and fear with people communicating via machines on a scale never seen before.

These are all dots in the same picture as are all the personal assistants, gadgets and children's toys through which kids and adults communicate with AI as if it is human. The AI 'voice' on Sat-Nav should be included. All these things are psychological preparation for the Cult endgame. Before you can make a physical connection with AI you have to make a psychological connection and that is what people are being conditioned to do with this ever gathering human-AI interaction. Movies and TV programmes depicting the transhuman, robot dystopia relate to a phenomenon known as 'pre-emptive programming' in which the world that is planned is portrayed everywhere in movies, TV and advertising. This is conditioning the conscious and subconscious mind to become familiar with the planned reality to dilute resistance when it happens for real. What would have been a shock such is the change is made less so. We have young children put on the road to transgender transition surgery with puberty blocking drugs at an age when they could never be able to make those life-changing decisions.

Rachel Levine, a professor of paediatrics and psychiatry who believes in treating children this way, became America's highest-ranked openly-transgender official when she was confirmed as US Assistant Secretary at the Department of Health and Human Services after being nominated by Joe Biden (the Cult). Activists and governments press for laws to deny parents a say in their children's transition process so the kids can be isolated and manipulated into agreeing to irreversible medical procedures. A Canadian father Robert Hoogland was denied bail by the Vancouver Supreme Court in 2021 and remained in jail for breaching a court order that he stay silent over his young teenage daughter, a minor, who was being offered life-changing hormone therapy without parental consent. At the age of 12 the girl's 'school counsellor' said she may be transgender, referred her to a doctor and told the school to treat her like a boy. This is another example of state-serving schools imposing ever more control over children's lives while parents have ever less.

Contemptible and extreme child abuse is happening all over the world as the Cult gender-fusion operation goes into warp-speed.

Why the war on men – and now women?

The question about what artificial wombs mean for women should rightly be asked. The answer can be seen in the deletion of women's rights involving sport, changing rooms, toilets and status in favour of people in male bodies claiming to identify as women. I can identify as a mountain climber, but it doesn't mean I can climb a mountain any more than a biological man can be a biological woman. To believe so is a triumph of belief over factual reality which is the very perceptual basis of everything Woke. Women's sport is being destroyed by allowing those with male bodies who say they identify as female to 'compete' with girls and women. Male body 'women' dominate 'women's' competition with their greater muscle mass, bone density, strength and speed. With that disadvantage sport for women loses all meaning. To put this in perspective nearly 300 American high school boys can run faster than the quickest woman sprinter in the world. Women are seeing their previously protected spaces invaded by male bodies simply because they claim to identify as women. That's all they need to do to access all women's spaces and activities under the Biden 'Equality Act' that destroys equality for women with the usual Orwellian Woke inversion. Male sex offenders have already committed rapes in women's prisons after claiming to identify as women to get them transferred. Does this not matter to the Woke 'equality' hypocrites? Not in the least. What matters to Cult manipulators and funders behind transgender activists is to advance gender fusion on the way to the no-gender 'human'. When you are seeking to impose transparent nonsense like this, or the 'Covid' hoax, the only way the nonsense can prevail is through censorship and intimidation of dissenters, deletion of factual information, and programming of the unquestioning, bewildered and naive. You don't have to scan the world for long to see that all these things are happening.

Many women's rights organisations have realised that rights and status which took such a long time to secure are being eroded and that it is systematic. Kara Dansky of the global Women's Human Rights Campaign said that Biden's transgender executive order immediately he took office, subsequent orders, and Equality Act legislation that followed 'seek to erase women and girls in the law as a category'. *Exactly*. I said during the long ago-started war on men (in which many women play a crucial part) that this was going to turn into a war on them. The Cult is phasing out *both* male and female genders. To get away with that they are brought into conflict so they are busy fighting each other while the Cult completes the job with no unity of response. Unity, people, *unity*. We need unity everywhere. Transgender is the only show in town as the big step towards the no-gender human. It's not about rights for transgender people and never has been. Woke political correctness is deleting words relating to genders to the same end. Wokers believe this is to be 'inclusive' when the opposite is true. They are deleting words describing gender because gender *itself* is being deleted by Human 2.0. Terms like 'man', 'woman', 'mother' and 'father' are being deleted in the universities and other institutions to be replaced by the *no*-gender, not trans-gender, 'individuals' and 'guardians'. Women's rights campaigner Maria Keffler of Partners for Ethical Care said: 'Children are being taught from kindergarten upward that some boys have a vagina, some girls have a penis, and that kids can be any gender they want to be.' Do we really believe that suddenly countries all over the world at the same time had the idea of having drag queens go into schools or read transgender stories to very young children in the local library? It's coldly-calculated confusion of gender on the way to the fusion of gender. Suzanne Vierling, a psychologist from Southern California, made another important point:

Yesterday's slave woman who endured gynecological medical experiments is today's girl-child being butchered in a booming gender-transitioning sector. Ovaries removed, pushing her into menopause and osteoporosis, uncharted territory, and parents' rights and authority decimated.

The erosion of parental rights is a common theme in line with the Cult plans to erase the very concept of parents and 'ovaries removed, pushing her into menopause' means what? Those born female lose the ability to have children – another way to discontinue humanity as we know it.

Eliminating Human 1.0 (before our very eyes)

To pave the way for Human 2.0 you must phase out Human 1.0. This is happening through plummeting sperm counts and making women infertile through an onslaught of chemicals, radiation (including smartphones in pockets of men) and mRNA 'vaccines'. Common agriculture pesticides are also having a devastating impact on human fertility. I have been tracking collapsing sperm counts in the books for a long time and in 2021 came a book by fertility scientist and reproductive epidemiologist Shanna Swan, *Count Down: How Our Modern World Is Threatening Sperm Counts, Altering Male and Female Reproductive Development and Imperiling the Future of the Human Race*. She reports how the global fertility rate dropped by *half* between 1960 and 2016 with America's birth rate 16 percent below where it needs to be to sustain the population. Women are experiencing declining egg quality, more miscarriages, and more couples suffer from infertility. Other findings were an increase in erectile dysfunction, infant boys developing more genital abnormalities, male problems with conception, and plunging levels of the male hormone testosterone which would explain why so many men have lost their backbone and masculinity. This has been very evident during the 'Covid' hoax when women have been prominent among the Pushbackers and big strapping blokes have bowed their heads, covered their faces with a nappy and quietly submitted. Mind control expert Cathy O'Brien also points to how global education introduced the concept of 'we're all winners' in sport and classrooms: 'Competition was defused, and it in turn defused a sense of fighting back.' This is another version of the 'equity' doctrine in which you drive down rather than raise up. What a contrast in Cult-controlled China with its global ambitions

where the government published plans in January, 2021, to 'cultivate masculinity' in boys from kindergarten through to high school in the face of a 'masculinity crisis'. A government adviser said boys would be soon become 'delicate, timid and effeminate' unless action was taken. Don't expect any similar policy in the targeted West. A 2006 study showed that a 65-year-old man in 2002 had testosterone levels *15 percent* lower than a 65-year-old man in 1987 while a 2020 study found a similar story with young adults and adolescents. Men are getting prescriptions for testosterone replacement therapy which causes an even greater drop in sperm count with up to 99 percent seeing sperm counts drop to zero during the treatment. More sperm is defective and malfunctioning with some having two heads or not pursuing an egg.

A class of *synthetic* chemicals known as phthalates are being blamed for the decline. These are found everywhere in plastics, shampoos, cosmetics, furniture, flame retardants, personal care products, pesticides, canned foods and even receipts. Why till receipts? Everyone touches them. Let no one delude themselves that all this is not systematic to advance the long-time agenda for human body transformation. Phthalates mimic hormones and disrupt the hormone balance causing testosterone to fall and genital birth defects in male infants. Animals and fish have been affected in the same way due to phthalates and other toxins in rivers. When fish turn gay or change sex through chemicals in rivers and streams it is a pointer to why there has been such an increase in gay people and the sexually confused. It doesn't matter to me what sexuality people choose to be, but if it's being affected by chemical pollution and consumption then we need to know. Does anyone really think that this is not connected to the transgender agenda, the war on men and the condemnation of male 'toxic masculinity'? You watch this being followed by 'toxic femininity'. It's already happening. When breastfeeding becomes 'chest-feeding', pregnant women become pregnant people along with all the other Woke claptrap you know that the world is going insane and there's a Cult scam in progress. Transgender activists are promoting the Cult agenda while Cult

billionaires support and fund the insanity as they laugh themselves to sleep at the sheer stupidity for which humans must be infamous in galaxies far, far away.

'Covid vaccines' and female infertility

We can now see why the 'vaccine' has been connected to potential infertility in women. Dr Michael Yeadon, former Vice President and Chief Scientific Advisor at Pfizer, and Dr Wolfgang Wodarg in Germany, filed a petition with the European Medicines Agency in December, 2020, urging them to stop trials for the Pfizer/BioNTech shot and all other mRNA trials until further studies had been done. They were particularly concerned about possible effects on fertility with 'vaccine'-produced antibodies attacking the protein Syncytin-1 which is responsible for developing the placenta. The result would be infertility 'of indefinite duration' in women who have the 'vaccine' with the placenta failing to form. Section 10.4.2 of the Pfizer/BioNTech trial protocol says that pregnant women or those who might become so should not have mRNA shots. Section 10.4 warns men taking mRNA shots to 'be abstinent from heterosexual intercourse' and not to donate sperm. The UK government said that it *did not know* if the mRNA procedure had an effect on fertility. *Did not know?* These people have to go to jail. UK government advice did not recommend at the start that pregnant women had the shot and said they should avoid pregnancy for at least two months after 'vaccination'. The 'advice' was later updated to pregnant women should only have the 'vaccine' if the benefits outweighed the risks to mother and foetus. What the hell is that supposed to mean? Then 'spontaneous abortions' began to appear and rapidly increase on the adverse reaction reporting schemes which include only a fraction of adverse reactions. Thousands and ever-growing numbers of 'vaccinated' women are describing changes to their menstrual cycle with heavier blood flow, irregular periods and menstruating again after going through the menopause – all links to reproduction effects. Women are passing blood clots and the lining of their uterus while men report erectile dysfunction and blood effects. Most

significantly of all *un*vaccinated women began to report similar menstrual changes after interaction with *'vaccinated'* people and men and children were also affected with bleeding noses, blood clots and other conditions. 'Shedding' is when vaccinated people can emit the content of a vaccine to affect the unvaccinated, but this is different. 'Vaccinated' people were not shedding a 'live virus' allegedly in 'vaccines' as before because the fake 'Covid vaccines' involve synthetic material and other toxicity. Doctors exposing what is happening prefer the term 'transmission' to shedding. Somehow those that have had the shots are transmitting effects to those that haven't. Dr Carrie Madej said the nano-content of the 'vaccines' can 'act like an antenna' to others around them which fits perfectly with my own conclusions. This 'vaccine' transmission phenomenon was becoming known as the book went into production and I deal with this further in the Postscript.

Vaccine effects on sterility are well known. The World Health Organization was accused in 2014 of sterilising millions of women in Kenya with the evidence confirmed by the content of the vaccines involved. The same WHO behind the 'Covid' hoax admitted its involvement for more than ten years with the vaccine programme. Other countries made similar claims. Charges were lodged by Tanzania, Nicaragua, Mexico, and the Philippines. The Gardasil vaccine claimed to protect against a genital 'virus' known as HPV has also been linked to infertility. Big Pharma and the WHO (same thing) are criminal and satanic entities. Then there's the Bill Gates Foundation which is connected through funding and shared interests with 20 pharmaceutical giants and laboratories. He stands accused of directing the policy of United Nations Children's Fund (UNICEF), vaccine alliance GAVI, and other groupings, to advance the vaccine agenda and silence opposition at great cost to women and children. At the same time Gates wants to reduce the global population. Coincidence?

Great Reset = Smart Grid = new human

The Cult agenda I have been exposing for 30 years is now being openly promoted by Cult assets like Gates and Klaus Schwab of the World Economic Forum under code-terms like the 'Great Reset', 'Build Back Better' and 'a rare but narrow window of opportunity to reflect, reimagine, and reset our world'. What provided this 'rare but narrow window of opportunity'? The 'Covid' hoax did. Who created that? *They* did. My books from not that long ago warned about the planned 'Internet of Things' (IoT) and its implications for human freedom. This was the plan to connect all technology to the Internet and artificial intelligence and today we are way down that road with an estimated 36 billion devices connected to the World Wide Web and that figure is projected to be 76 billion by 2025. I further warned that the Cult planned to go beyond that to the Internet of *Everything* when the human brain was connected via AI to the Internet and Kurzweil's 'cloud'. Now we have Cult operatives like Schwab calling for precisely that under the term 'Internet of Bodies', a fusion of the physical, digital and biological into one centrally-controlled Smart Grid system which the Cult refers to as the 'Fourth Industrial Revolution'. They talk about the 'biological', but they really mean the synthetic-biological which is required to fully integrate the human body and brain into the Smart Grid and artificial intelligence planned to replace the human mind. We have everything being synthetically manipulated including the natural world through GMO and smart dust, the food we eat and the human body itself with synthetic 'vaccines'. I said in *The Answer* that we would see the Cult push for synthetic meat to replace animals and in February, 2021, the so predictable psychopath Bill Gates called for the introduction of synthetic meat to save us all from 'climate change'. The climate hoax just keeps on giving like the 'Covid' hoax. The war on meat by vegan activists is a carbon (oops, sorry) copy of the manipulation of transgender activists. They have no idea (except their inner core) that they are being used to promote and impose the agenda of the Cult or that they are only the *vehicle* and not the *reason*. This is not to say those who choose not to eat meat shouldn't be respected and supported in that right, but there are ulterior motives

for those in power. A *Forbes* article in December, 2019, highlighted the plan so beloved of Schwab and the Cult under the heading: 'What Is The Internet of Bodies? And How Is It Changing Our World?' The article said the human body is the latest data platform (remember 'our vaccine is an operating system'). *Forbes* described the plan very accurately and the words could have come straight out of my books from long before:

The Internet of Bodies (IoB) is an extension of the IoT and basically connects the human body to a network through devices that are ingested, implanted, or connected to the body in some way. Once connected, data can be exchanged, and the body and device can be remotely monitored and controlled.

They were really describing a human hive mind with human perception centrally-dictated via an AI connection as well as allowing people to be 'remotely monitored and controlled'. Everything from a fridge to a human mind could be directed from a central point by these insane psychopaths and 'Covid vaccines' are crucial to this. Forbes explained the process I mentioned earlier of holdable and wearable technology followed by implantable. The article said there were three generations of the Internet of Bodies that include:

- Body external: These are wearable devices such as Apple Watches or Fitbits that can monitor our health.

- Body internal: These include pacemakers, cochlear implants, and digital pills that go inside our bodies to monitor or control various aspects of health.

- Body embedded: The third generation of the Internet of Bodies is embedded technology where technology and the human body are melded together and have a real-time connection to a remote machine.

Forbes noted the development of the Brain Computer Interface (BCI) which merges the brain with an external device for monitoring and controlling in real-time. 'The ultimate goal is to help restore function to individuals with disabilities by using brain signals rather than conventional neuromuscular pathways.' Oh, do fuck off. The goal of brain interface technology is controlling human thought and emotion from the central point in a hive mind serving its masters wishes. Many people are now agreeing to be chipped to open doors without a key. You can recognise them because they'll be wearing a mask, social distancing and lining up for the 'vaccine'. The Cult plans a Great Reset money system after they have completed the demolition of the global economy in which 'money' will be exchanged through communication with body operating systems. Rand Corporation, a Cult-owned think tank, said of the Internet of Bodies or IoB:

> Internet of Bodies technologies fall under the broader IoT umbrella. But as the name suggests, IoB devices introduce an even more intimate interplay between humans and gadgets. IoB devices monitor the human body, collect health metrics and other personal information, and transmit those data over the Internet. Many devices, such as fitness trackers, are already in use … IoB devices … and those in development can track, record, and store users' whereabouts, bodily functions, and what they see, hear, and even think.

Schwab's World Economic Forum, a long-winded way of saying 'fascism' or 'the Cult', has gone full-on with the Internet of Bodies in the 'Covid' era. 'We're entering the era of the Internet of Bodies', it declared, 'collecting our physical data via a range of devices that can be implanted, swallowed or worn'. The result would be a huge amount of health-related data that could improve human wellbeing around the world, and prove crucial in fighting the 'Covid-19 pandemic'. Does anyone think these clowns care about 'human wellbeing' after the death and devastation their pandemic hoax has purposely caused? Schwab and co say we should move forward with the Internet of Bodies because 'Keeping track of symptoms could help us stop the spread of infection, and quickly detect new cases'. How wonderful, but keeping track' is all they are really bothered

about. Researchers were investigating if data gathered from smartwatches and similar devices could be used as viral infection alerts by tracking the user's heart rate and breathing. Schwab said in his 2018 book *Shaping the Future of the Fourth Industrial Revolution*:

> The lines between technologies and beings are becoming blurred and not just by the ability to create lifelike robots or synthetics. Instead it is about the ability of new technologies to literally become part of us. Technologies already influence how we understand ourselves, how we think about each other, and how we determine our realities. As the technologies … give us deeper access to parts of ourselves, we may begin to integrate digital technologies into our bodies.

You can see what the game is. Twenty-four hour control and people – if you could still call them that – would never know when something would go ping and take them out of circulation. It's the most obvious rush to a global fascist dictatorship and the complete submission of humanity and yet still so many are locked away in their Cult-induced perceptual coma and can't see it.

Smart Grid control centres

The human body is being transformed by the 'vaccines' and in other ways into a synthetic cyborg that can be attached to the global Smart Grid which would be controlled from a central point and other sub-locations of Grid manipulation. Where are these planned to be? Well, China for a start which is one of the Cult's biggest centres of operation. The technological control system and technocratic rule was incubated here to be unleashed across the world after the 'Covid' hoax came out of China in 2020. Another Smart Grid location that will surprise people new to this is Israel. I have exposed in *The Trigger* how Sabbatian technocrats, intelligence and military operatives were behind the horrors of 9/11 and not '19 Arab hijackers' who somehow manifested the ability to pilot big passenger airliners when instructors at puddle-jumping flying schools described some of them as a joke. The 9/11 attacks were made possible through control of civilian and military air computer systems and those of the White House, Pentagon and connected agencies. See *The Trigger* – it

will blow your mind. The controlling and coordinating force were the Sabbatian networks in Israel and the United States which by then had infiltrated the entire US government, military and intelligence system. The real name of the American Deep State is 'Sabbatian State'. Israel is a tiny country of only nine million people, but it is one of the global centres of cyber operations and fast catching Silicon Valley in importance to the Cult. Israel is known as the 'start-up nation' for all the cyber companies spawned there with the Sabbatian specialisation of 'cyber security' that I mentioned earlier which gives those companies access to computer systems of their clients in real time through 'backdoors' written into the coding when security software is downloaded. The Sabbatian centre of cyber operations outside Silicon Valley is the Israeli military Cyber Intelligence Unit, the biggest infrastructure project in Israel's history, headquartered in the desert-city of Beersheba and involving some 20,000 'cyber soldiers'. Here are located a literal army of Internet trolls scanning social media, forums and comment lists for anyone challenging the Cult agenda. The UK military has something similar with its 77th Brigade and associated operations. The Beersheba complex includes research and development centres for other Cult operations such as Intel, Microsoft, IBM, Google, Apple, Hewlett-Packard, Cisco Systems, Facebook and Motorola. Techcrunch.com ran an article about the Beersheba global Internet technology centre headlined 'Israel's desert city of Beersheba is turning into a cybertech oasis':

> The military's massive relocation of its prestigious technology units, the presence of multinational and local companies, a close proximity to Ben Gurion University and generous government subsidies are turning Beersheba into a major global cybertech hub. Beersheba has all of the ingredients of a vibrant security technology ecosystem, including Ben Gurion University with its graduate program in cybersecurity and Cyber Security Research Center, and the presence of companies such as EMC, Deutsche Telekom, PayPal, Oracle, IBM, and Lockheed Martin. It's also the future home of the INCB (Israeli National Cyber Bureau); offers a special income tax incentive for cyber security companies, and was the site for the relocation of the army's intelligence corps units.

Sabbatians have taken over the cyber world through the following process: They scan the schools for likely cyber talent and develop them at Ben Gurion University and their period of conscription in the Israeli Defense Forces when they are stationed at the Beersheba complex. When the cyber talented officially leave the army they are funded to start cyber companies with technology developed by themselves or given to them by the state. Much of this is stolen through backdoors of computer systems around the world with America top of the list. Others are sent off to Silicon Valley to start companies or join the major ones and so we have many major positions filled by apparently 'Jewish' but really Sabbatian operatives. Google, YouTube and Facebook are all run by 'Jewish' CEOs while Twitter is all but run by ultra-Zionist hedge-fund shark Paul Singer. At the centre of the Sabbatian global cyber web is the Israeli army's Unit 8200 which specialises in hacking into computer systems of other countries, inserting viruses, gathering information, instigating malfunction, and even taking control of them from a distance. A long list of Sabbatians involved with 9/11, Silicon Valley and Israeli cyber security companies are operatives of Unit 8200. This is not about Israel. It's about the Cult. Israel is planned to be a Smart Grid hub as with China and what is happening at Beersheba is not for the benefit of Jewish people who are treated disgustingly by the Sabbatian elite that control the country. A glance at the Nuremberg Codes will tell you that.

The story is much bigger than 'Covid', important as that is to where we are being taken. Now, though, it's time to really strap in. There's more … much more …

CHAPTER ELEVEN

Who controls the Cult?

Awake, arise or be forever fall'n
John Milton, *Paradise Lost*

I have exposed this far the level of the Cult conspiracy that operates in the world of the seen and within the global secret society and satanic network which operates in the shadows one step back from the seen. The story, however, goes much deeper than that.

The 'Covid' hoax is major part of the Cult agenda, but only part, and to grasp the biggest picture we have to expand our attention beyond the realm of human sight and into the infinity of possibility that we cannot see. It is from here, ultimately, that humanity is being manipulated into a state of total control by the force which dictates the actions of the Cult. How much of reality can we see? Next to damn all is the answer. We may appear to see all there is to see in the 'space' our eyes survey and observe, but little could be further from the truth. The human 'world' is only a tiny band of frequency that the body's visual and perceptual systems can decode into *perception* of a 'world'. According to mainstream science the electromagnetic spectrum is 0.005 percent of what exists in the Universe (Fig 10). The maximum estimate I have seen is 0.5 percent and either way it's miniscule. I say it is far, far, smaller even than 0.005 percent when you compare reality we see with the totality of reality that we don't. Now get this if you are new to such information: Visible light, the only band of frequency that we can see, is a *fraction* of the 0.005

percent (Fig 11 overleaf). Take this further and realise that our universe is one of infinite universes and that universes are only a fragment of overall reality – *infinite* reality. Then compare that with the almost infinitesimal frequency band of visible light or human sight. You see that humans are as near blind as it is possible to be without actually being so. Artist and filmmaker, Sergio Toporek, said:

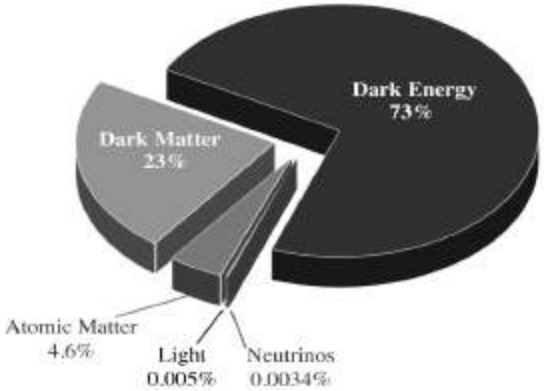

Figure 10: Humans can perceive such a tiny band of visual reality it's laughable.

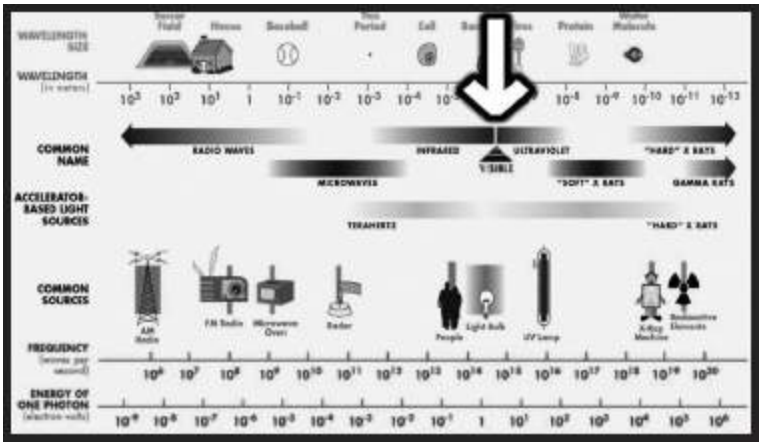

Figure 11: We can see a smear of the 0.005 percent electromagnetic spectrum, but we still know it all. Yep, makes sense.

Consider that you can see less than 1% of the electromagnetic spectrum and hear less than 1% of the acoustic spectrum. 90% of the cells in your body carry their own microbial DNA and are not 'you'. The atoms in your body are 99.9999999999999999% empty space and none of them are the ones you were born with ... Human beings have 46 chromosomes, two less than a potato.

The existence of the rainbow depends on the conical photoreceptors in your eyes; to animals without cones, the rainbow does not exist. So you don't just look at a rainbow, you create it. This is pretty amazing, especially considering that all the beautiful colours you see represent less than 1% of the electromagnetic spectrum.

Suddenly the 'world' of humans looks a very different place. Take into account, too, that Planet Earth when compared with the projected size of this single universe is the equivalent of a billionth of a pinhead. Imagine the ratio that would be when compared to infinite reality. To think that Christianity once insisted that Earth and humanity were the centre of everything. This background is vital if we are going to appreciate the nature of 'human' and how we can be manipulated by an unseen force. To human visual reality virtually *everything* is unseen and yet the prevailing perception within the institutions and so much of the public is that if we can't see it, touch it, hear it, taste it and smell it then it cannot exist. Such perception is indoctrinated and encouraged by the Cult and its agents because it isolates believers in the strictly limited, village-idiot, realm of the five senses where perceptions can be firewalled and information controlled. Most of those perpetuating the 'this-world-is-all-there-is' insanity are themselves indoctrinated into believing the same delusion. While major players and influencers know that official reality is laughable most of those in science, academia and medicine really believe the nonsense they peddle and teach succeeding generations. Those who challenge the orthodoxy are dismissed as nutters and freaks to protect the manufactured illusion from exposure. Observe the dynamic of the 'Covid' hoax and you will see how that takes the same form. The inner-circle psychopaths knows it's a gigantic scam, but almost the entirety of those imposing their fascist rules believe that 'Covid' is all that they're told it is.

Stolen identity

Ask people who they are and they will give you their name, place of birth, location, job, family background and life story. Yet that is not who they are – it is what they are *experiencing*. The difference is *absolutely crucial*. The true 'I', the eternal, infinite 'I', is consciousness,

a state of being aware. Forget 'form'. That is a vehicle for a brief experience. Consciousness does not come *from* the brain, but *through* the brain and even that is more symbolic than literal. We are awareness, pure awareness, and this is what withdraws from the body at what we call 'death' to continue our eternal beingness, *isness*, in other realms of reality within the limitlessness of infinity or the Biblical 'many mansions in my father's house'. Labels of a human life, man, woman, transgender, black, white, brown, nationality, circumstances and income are not who we are. They are what we are – awareness – is *experiencing* in a brief connection with a band of frequency we call 'human'. The labels are not the self; they are, to use the title of one of my books, a *Phantom* Self. I am not David Icke born in Leicester, England, on April 29th, 1952. I am the consciousness *having that experience*. The Cult and its non-human masters seek to convince us through the institutions of 'education', science, medicine, media and government that what we are *experiencing* is who we *are*. It's so easy to control and direct perception locked away in the bewildered illusions of the five senses with no expanded radar. Try, by contrast, doing the same with a humanity aware of its true self and its true power to consciously create its reality and experience. How is it possible to do this? We do it all day every day. If you perceive yourself as 'little me' with no power to impact upon your life and the world then your life experience will reflect that. You will hand the power you don't think you have to authority in all its forms which will use it to control your experience. This, in turn, will appear to confirm your perception of 'little me' in a self-fulfilling feedback loop. But that is what 'little me' really is – a *perception*. We are all 'big-me', infinite me, and the Cult has to make us forget that if its will is to prevail. We are therefore manipulated and pressured into self-identifying with human labels and not the consciousness/awareness *experiencing* those human labels.

The phenomenon of identity politics is a Cult-instigated manipulation technique to sub-divide previous labels into even smaller ones. A United States university employs this list of letters to

describe student identity: LGBTTQQFAGPBDSM or lesbian, gay, bisexual, transgender, transsexual, queer, questioning, flexual, asexual, gender-fuck, polyamorous, bondage/discipline, dominance/submission and sadism/masochism. I'm sure other lists are even longer by now as people feel the need to self-identity the 'I' with the minutiae of race and sexual preference. Wokers programmed by the Cult for generations believe this is about 'inclusivity' when it's really the Cult locking them away into smaller and smaller versions of Phantom Self while firewalling them from the influence of their true self, the infinite, eternal 'I'. You may notice that my philosophy which contends that we are all unique points of attention/awareness within the same infinite whole or Oneness is the ultimate non-racism. The very sense of Oneness makes the judgement of people by their body-type, colour or sexuality utterly ridiculous and confirms that racism has no understanding of reality (including anti-white racism). Yet despite my perception of life Cult agents and fast-asleep Wokers label me racist to discredit my information while they are themselves phenomenally racist and sexist. All they see is race and sexuality and they judge people as good or bad, demons or untouchables, by their race and sexuality. All they see is *Phantom Self* and perceive themselves in terms of Phantom Self. They are pawns and puppets of the Cult agenda to focus attention and self-identity in the five senses and play those identities against each other to divide and rule. Columbia University has introduced segregated graduations in another version of social distancing designed to drive people apart and teach them that different racial and cultural groups have nothing in common with each other. The last thing the Cult wants is unity. Again the pump-primers of this will be Cult operatives in the knowledge of what they are doing, but the rest are just the Phantom Self blind leading the Phantom Self blind. We *do* have something in common – we are all *the same consciousness* having different temporary experiences.

What is this 'human'?

Yes, what *is* 'human'? That is what we are supposed to be, right? I mean 'human'? True, but 'human' is the experience not the 'I'. Break it down to basics and 'human' is the way that information is processed. If we are to experience and interact with this band of frequency we call the 'world' we must have a vehicle that operates within that band of frequency. Our consciousness in its prime form cannot do that; it is way beyond the frequency of the human realm. My consciousness or awareness could not tap these keys and pick up the cup in front of me in the same way that radio station A cannot interact with radio station B when they are on different frequencies. The human body is the means through which we have that interaction. I have long described the body as a biological computer which processes information in a way that allows consciousness to experience this reality. The body is a receiver, transmitter and processor of information in a particular way that we call human. We visually perceive only the world of the five senses in a wakened state – that is the limit of the body's visual decoding system. In truth it's not even visual in the way we experience 'visual reality' as I will come to in a moment. We are 'human' because the body processes the information sources of human into a reality and behaviour system that we *perceive* as human. Why does an elephant act like an elephant and not like a human or a duck? The elephant's biological computer is a different information field and processes information according to that program into a visual and behaviour type we call an elephant. The same applies to everything in our reality. These body information fields are perpetuated through procreation (like making a copy of a software program). The Cult wants to break that cycle and intervene technologically to transform the human information field into one that will change what we call humanity. If it can change the human information field it will change the way that field processes information and change humanity both 'physically' and psychologically. Hence the *messenger* (information) RNA 'vaccines' and so much more that is targeting human genetics by changing the body's information – *messaging* – construct through food, drink, radiation, toxicity and other means.

Reality that we experience is nothing like reality as it really is in the same way that the reality people experience in virtual reality games is not the reality they are really living in. The game is only a decoded source of information that appears to be a reality. Our world is also an information construct – a *simulation* (more later). In its base form our reality is a wavefield of information much the same in theme as Wi-Fi. The five senses decode wavefield information into electrical information which they communicate to the brain to decode into holographic (illusory 'physical') information. Different parts of the brain specialise in decoding different senses and the information is fused into a reality that appears to be outside of us but is really inside the brain and the genetic structure in general (Fig 12 overleaf). DNA is a receiver-transmitter of information and a vital part of this decoding process and the body's connection to other realities. Change DNA and you change the way we decode and connect with reality – see 'Covid vaccines'. Think of computers decoding Wi-Fi. You have information encoded in a radiation field and the computer decodes that information into a very different form on the screen. You can't see the Wi-Fi until its information is made manifest on the screen and the information on the screen is inside the computer and not outside. I have just described how we decode the 'human world'. All five senses decode the waveform 'Wi-Fi' field into electrical signals and the brain (computer) constructs reality inside the brain and not outside – 'You don't just look at a rainbow, you create it'. Sound is a simple example. We don't hear sound until the brain decodes it. Waveform sound waves are picked up by the hearing sense and communicated to the brain in an electrical form to be decoded into the sounds that we hear. Everything we hear is inside the brain along with everything we see, feel, smell and taste. Words and language are waveform fields generated by our vocal chords which pass through this process until they are decoded by the brain into words that we hear. Different languages are different frequency fields or sound waves generated by vocal chords. Late British philosopher Alan Watts said:

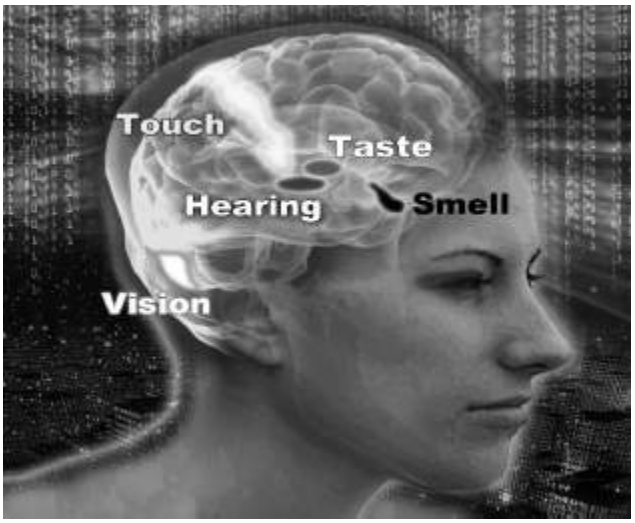

Figure 12: The brain receives information from the five senses and constructs from that our perceived reality.

[Without the brain] the world is devoid of light, heat, weight, solidity, motion, space, time or any other imaginable feature. All these phenomena are interactions, or transactions, of vibrations with a certain arrangement of neurons.

That's exactly what they are and scientist Robert Lanza describes in his book, *Biocentrism*, how we decode electromagnetic waves and energy into visual and 'physical' experience. He uses the example of a flame emitting photons, electromagnetic energy, each pulsing electrically and magnetically:

… these … invisible electromagnetic waves strike a human retina, and if (and only if) the waves happen to measure between 400 and 700 nano meters in length from crest to crest, then their energy is just right to deliver a stimulus to the 8 million cone-shaped cells in the retina.

Each in turn send an electrical pulse to a neighbour neuron, and on up the line this goes, at 250 mph, until it reaches the … occipital lobe of the brain, in the back of the head. There, a cascading complex of neurons fire from the incoming stimuli, and we subjectively perceive this experience as a yellow brightness occurring in a place we have been conditioned to call the 'external world'.

You hear what you decode

If a tree falls or a building collapses they make no noise unless someone is there to decode the energetic waves generated by the disturbance into what we call sound. Does a falling tree make a noise? Only if you hear it – *decode* it. Everything in our reality is a frequency field of information operating within the overall 'Wi-Fi' field that I call The Field. A vibrational disturbance is generated in The Field by the fields of the falling tree or building. These disturbance waves are what we decode into the sound of them falling. If no one is there to do that then neither will make any noise. Reality is created by the observer – *decoder* – and the *perceptions* of the observer affect the decoding process. For this reason different people – different *perceptions* – will perceive the same reality or situation in a different way. What one may perceive as a nightmare another will see as an opportunity. The question of why the Cult is so focused on controlling human perception now answers itself. All experienced reality is the act of decoding and we don't experience Wi-Fi until it is decoded on the computer screen. The sight and sound of an Internet video is encoded in the Wi-Fi all around us, but we don't see or hear it until the computer decodes that information. Taste, smell and touch are all phenomena of the brain as a result of the same process. We don't taste, smell or feel anything except in the brain and there are pain relief techniques that seek to block the signal from the site of discomfort to the brain because if the brain doesn't decode that signal we don't feel pain. Pain is in the brain and only appears to be at the point of impact thanks to the feedback loop between them. We don't see anything until electrical information from the sight senses is decoded in an area at the back of the brain. If that area is damaged we can go blind when our eyes are perfectly okay. So why do we go blind if we damage an eye? We damage the information processing between the waveform visual information and the visual decoding area of the brain. If information doesn't reach the brain in a form it can decode then we can't see the visual reality that it represents. What's more the brain is decoding only a fraction of the information it receives and the rest is absorbed by the

sub-conscious mind. This explanation is from the science magazine, *Wonderpedia*:

> Every second, 11 million sensations crackle along these [brain] pathways ... The brain is confronted with an alarming array of images, sounds and smells which it rigorously filters down until it is left with a manageable list of around 40. Thus 40 sensations per second make up what we perceive as reality.

The 'world' is not what people are told to believe that is it and the inner circles of the Cult *know that*.

Illusory 'physical' reality

We can only see a smear of 0.005 percent of the Universe which is only one of a vast array of universes – 'mansions' – within infinite reality. Even then the brain decodes only 40 pieces of information ('sensations') from a potential *11 million* that we receive every second. Two points strike you from this immediately: The sheer breathtaking stupidity of believing we know anything so rigidly that there's nothing more to know; and the potential for these processes to be manipulated by a malevolent force to control the reality of the population. One thing I can say for sure with no risk of contradiction is that when you can perceive an almost indescribable fraction of infinite reality there is always more to know as in tidal waves of it. Ancient Greek philosopher Socrates was so right when he said that wisdom is to know how little we know. How obviously true that is when you think that we are experiencing a physical world of solidity that is neither physical nor solid and a world of apartness when everything is connected. Cult-controlled 'science' dismisses the so-called 'paranormal' and all phenomena related to that when the 'para'-normal is perfectly normal and explains the alleged 'great mysteries' which dumbfound scientific minds. There is a reason for this. A 'scientific mind' in terms of the mainstream is a material mind, a five-sense mind imprisoned in see it, touch it, hear it, smell it and taste it. Phenomena and happenings that can't be explained that way leave the 'scientific mind' bewildered and the rule is that if they

can't account for why something is happening then it can't, by definition, be happening. I beg to differ. Telepathy is thought waves passing through The Field (think wave disturbance again) to be decoded by someone able to connect with that wavelength (information). For example: You can pick up the thought waves of a friend at any distance and at the very least that will bring them to mind. A few minutes later the friend calls you. 'My god', you say, 'that's incredible – I was just thinking of you.' Ah, but *they* were thinking of *you* before they made the call and that's what you decoded. Native peoples not entrapped in five-sense reality do this so well it became known as the 'bush telegraph'. Those known as psychics and mediums (genuine ones) are doing the same only across dimensions of reality. 'Mind over matter' comes from the fact that matter and mind are the *same*. The state of one influences the state of the other. Indeed one *and* the other are illusions. They are aspects of the same field. Paranormal phenomena are all explainable so why are they still considered 'mysteries' or not happening? Once you go down this road of understanding you begin to expand awareness beyond the five senses and that's the nightmare for the Cult.

Figure 13: Holograms are not solid, but the best ones appear to be.

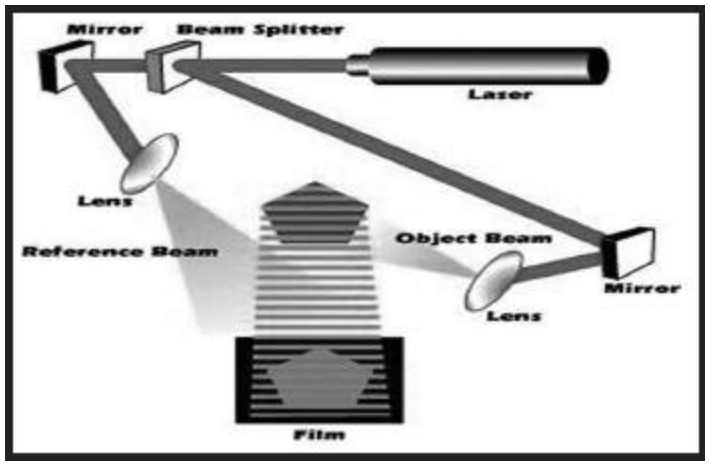

Figure 14: How holograms are created by capturing a waveform version of the subject image.

Holographic 'solidity'

Our reality is not solid, it is holographic. We are now well aware of holograms which are widely used today. Two-dimensional information is decoded into a three-dimensional reality that is not solid although can very much appear to be (Fig 13). Holograms are created with a laser divided into two parts. One goes directly onto a holographic photographic print ('reference beam') and the other takes a waveform image of the subject ('working beam') before being directed onto the print where it 'collides' with the other half of the laser (Fig 14). This creates a *waveform* interference pattern which contains the wavefield information of whatever is being photographed (Fig 15 overleaf). The process can be likened to dropping pebbles in a pond. Waves generated by each one spread out across the water to collide with the others and create a wave representation of where the stones fell and at what speed, weight and distance. A waveform interference pattern of a hologram is akin to the waveform information in The Field which the five senses decode into electrical signals to be decoded by the brain into a holographic illusory 'physical' reality. In the same way when a laser (think human attention) is directed at the waveform interference pattern a three-dimensional version of the subject is projected into apparently 'solid' reality (Fig 16). An amazing trait of holograms reveals more 'paranormal mysteries'. Information of the *whole*

hologram is encoded in waveform in every part of the interference pattern by the way they are created. This means that every *part* of a hologram is a smaller version of the whole. Cut the interference wave-pattern into four and you won't get four parts of the image. You get quarter-sized versions of the *whole* image. The body is a hologram and the same applies. Here we have the basis of acupuncture, reflexology and other forms of healing which identify representations of the whole body in all of the parts, hands, feet, ears, everywhere. Skilled palm readers can do what they do because the information of whole body is encoded in the hand. The concept of as above, so below, comes from this.

Figure 15: A waveform interference pattern that holds the information that transforms into a hologram.

Figure 16: Holographic people including 'Elvis' holographically inserted to sing a duet with Celine Dion.

The question will be asked of why, if solidity is illusory, we can't just walk through walls and each other. The resistance is not solid against solid; it is electromagnetic field against electromagnetic field and we decode this into the *experience* of solid against solid. We should also not underestimate the power of belief to dictate reality. What you believe is impossible *will be*. Your belief impacts on your decoding processes and they won't decode what you think is impossible. What we believe we perceive and what we perceive we experience. 'Can't dos' and 'impossibles' are like a firewall in a computer system that won't put on the screen what the firewall blocks. How vital that is to understanding how human experience has been hijacked. I explain in *The Answer*, *Everything You Need To Know But Have Never Been Told* and other books a long list of 'mysteries' and 'paranormal' phenomena that are not mysterious and perfectly normal once you realise what reality is and how it works. 'Ghosts' can be seen to pass through 'solid' walls because the walls are not solid and the ghost is a discarnate entity operating on a frequency so different to that of the wall that it's like two radio stations sharing the same space while never interfering with each other. I have seen ghosts do this myself. The apartness of people and objects is also an illusion. Everything is connected by the Field like all sea life is connected by the sea. It's just that within the limits of our visual reality we only 'see' holographic information and not the field of information that connects everything and from which the holographic world is made manifest. If you can only see holographic 'objects' and not the field that connects them they will appear to you as unconnected to each other in the same way that we see the computer while not seeing the Wi-Fi.

What you don't know *can* hurt you

Okay, we return to those 'two worlds' of human society and the Cult with its global network of interconnecting secret societies and satanic groups which manipulate through governments, corporations, media, religions, etc. The fundamental difference between them is *knowledge*. The idea has been to keep humanity

ignorant of the plan for its total enslavement underpinned by a crucial ignorance of reality – who we are and where we are – and how we interact with it. 'Human' should be the interaction between our expanded eternal consciousness and the five-sense body experience. We are meant to be *in* this world in terms of the five senses but not *of* this world in relation to our greater consciousness and perspective. In that state we experience the small picture of the five senses within the wider context of the big picture of awareness beyond the five senses. Put another way the five senses see the dots and expanded awareness connects them into pictures and patterns that give context to the apparently random and unconnected. Without the context of expanded awareness the five senses see only apartness and randomness with apparently no meaning. The Cult and its other-dimensional controllers seek to intervene in the frequency realm where five-sense reality is supposed to connect with expanded reality and to keep the two apart (more on this in the final chapter). When that happens five-sense mental and emotional processes are no longer influenced by expanded awareness, or the True 'I', and instead are driven by the isolated perceptions of the body's decoding systems. They are in the world *and* of it. Here we have the human plight and why humanity with its potential for infinite awareness can be so easily manipulatable and descend into such extremes of stupidity.

Once the Cult isolates five-sense mind from expanded awareness it can then program the mind with perceptions and beliefs by controlling information that the mind receives through the 'education' system of the formative years and the media perceptual bombardment and censorship of an entire lifetime. Limit perception and a sense of the possible through limiting knowledge by limiting and skewing information while censoring and discrediting that which could set people free. As the title of another of my books says *… And The Truth Shall Set You Free*. For this reason the last thing the Cult wants in circulation is the truth about anything – especially the reality of the eternal 'I' – and that's why it is desperate to control information. The Cult knows that information becomes perception

which becomes behaviour which, collectively, becomes human society. Cult-controlled and funded mainstream 'science' denies the existence of an eternal 'I' and seeks to dismiss and trash all evidence to the contrary. Cult-controlled mainstream religion has a version of 'God' that is little more than a system of control and dictatorship that employs threats of damnation in an afterlife to control perceptions and behaviour in the here and now through fear and guilt. Neither is true and it's the 'neither' that the Cult wishes to suppress. This 'neither' is that everything is an expression, a point of attention, within an infinite state of consciousness which is the real meaning of the term 'God'.

Perceptual obsession with the 'physical body' and five-senses means that 'God' becomes personified as a bearded bloke sitting among the clouds or a raging bully who loves us if we do what 'he' wants and condemns us to the fires of hell if we don't. These are no more than a 'spiritual' fairy tales to control and dictate events and behaviour through fear of this 'God' which has bizarrely made 'God-fearing' in religious circles a state to be desired. I would suggest that fearing *anything* is not to be encouraged and celebrated, but rather deleted. You can see why 'God fearing' is so beneficial to the Cult and its religions when *they* decide what 'God' wants and what 'God' demands (the Cult demands) that everyone do. As the great American comedian Bill Hicks said satirising a Christian zealot: 'I think what God meant to say.' How much of this infinite awareness ('God') that we access is decided by how far we choose to expand our perceptions, self-identity and sense of the possible. The scale of self-identity reflects itself in the scale of awareness that we can connect with and are influenced by – how much knowing and insight we have instead of programmed perception. You cannot expand your awareness into the infinity of possibility when you believe that you are little me Peter the postman or Mary in marketing and nothing more. I'll deal with this in the concluding chapter because it's crucial to how we turnaround current events.

Where the Cult came from

When I realised in the early 1990s there was a Cult network behind global events I asked the obvious question: When did it start? I took it back to ancient Rome and Egypt and on to Babylon and Sumer in Mesopotamia, the 'Land Between Two Rivers', in what we now call Iraq. The two rivers are the Tigris and Euphrates and this region is of immense historical and other importance to the Cult, as is the land called Israel only 550 miles away by air. There is much more going with deep esoteric meaning across this whole region. It's not only about 'wars for oil'. Priceless artefacts from Mesopotamia were stolen or destroyed after the American and British invasion of Iraq in 2003 justified by the lies of Boy Bush and Tony Blair (their Cult masters) about non-existent 'weapons of mass destruction'. Mesopotamia was the location of Sumer (about 5,400BC to 1,750BC), and Babylon (about 2,350BC to 539BC). Sabbatians may have become immensely influential in the Cult in modern times but they are part of a network that goes back into the mists of history. Sumer is said by historians to be the 'cradle of civilisation'. I disagree. I say it was the re-start of what we call human civilisation after cataclysmic events symbolised in part as the 'Great Flood' destroyed the world that existed before. These fantastic upheavals that I have been describing in detail in the books since the early1990s appear in accounts and legends of ancient cultures across the world and they are supported by geological and biological evidence. Stone tablets found in Iraq detailing the Sumer period say the cataclysms were caused by non-human 'gods' they call the Anunnaki. These are described in terms of extraterrestrial visitations in which knowledge supplied by the Anunnaki is said to have been the source of at least one of the world's oldest writing systems and developments in astronomy, mathematics and architecture that were way ahead of their time. I have covered this subject at length in *The Biggest Secret* and *Children of the Matrix* and the same basic 'Anunnaki' story can be found in Zulu accounts in South Africa where the late and very great Zulu high shaman Credo Mutwa told me that the Sumerian Anunnaki were known by Zulus as the Chitauri or 'children of the serpent'. See my six-hour video interview with Credo on this subject entitled *The*

Reptilian Agenda recorded at his then home near Johannesburg in 1999 which you can watch on the Ickonic media platform.

The Cult emerged out of Sumer, Babylon and Egypt (and elsewhere) and established the Roman Empire before expanding with the Romans into northern Europe from where many empires were savagely imposed in the form of Cult-controlled societies all over the world. Mass death and destruction was their calling card. The Cult established its centre of operations in Europe and European Empires were Cult empires which allowed it to expand into a global force. Spanish and Portuguese colonialists headed for Central and South America while the British and French targeted North America. Africa was colonised by Britain, France, Belgium, the Netherlands, Portugal, Spain, Italy, and Germany. Some like Britain and France moved in on the Middle East. The British Empire was by far the biggest for a simple reason. By now Britain was the headquarters of the Cult from which it expanded to form Canada, the United States, Australia and New Zealand. The Sun never set on the British Empire such was the scale of its occupation. London remains a global centre for the Cult along with Rome and the Vatican although others have emerged in Israel and China. It is no accident that the 'virus' is alleged to have come out of China while Italy was chosen as the means to terrify the Western population into compliance with 'Covid' fascism. Nor that Israel has led the world in 'Covid' fascism and mass 'vaccination'.

You would think that I would mention the United States here, but while it has been an important means of imposing the Cult's will it is less significant than would appear and is currently in the process of having what power it does have deleted. The Cult in Europe has mostly loaded the guns for the US to fire. America has been controlled from Europe from the start through Cult operatives in Britain and Europe. The American Revolution was an illusion to make it appear that America was governing itself while very different forces were pulling the strings in the form of Cult families such as the Rothschilds through the Rockefellers and other subordinates. The Rockefellers are extremely close to Bill Gates and

established both scalpel and drug 'medicine' and the World Health Organization. They play a major role in the development and circulation of vaccines through the Rockefeller Foundation on which Bill Gates said his Foundation is based. Why wouldn't this be the case when the Rockefellers and Gates are on the same team? Cult infiltration of human society goes way back into what we call history and has been constantly expanding and centralising power with the goal of establishing a global structure to dictate everything. Look how this has been advanced in great leaps with the 'Covid' hoax.

The non-human dimension

I researched and observed the comings and goings of Cult operatives through the centuries and even thousands of years as they were born, worked to promote the agenda within the secret society and satanic networks, and then died for others to replace them. Clearly there had to be a coordinating force that spanned this entire period while operatives who would not have seen the end goal in their lifetimes came and went advancing the plan over millennia. I went in search of that coordinating force with the usual support from the extraordinary synchronicity of my life which has been an almost daily experience since 1990. I saw common themes in religious texts and ancient cultures about a non-human force manipulating human society from the hidden. Christianity calls this force Satan, the Devil and demons; Islam refers to the Jinn or Djinn; Zulus have their Chitauri (spelt in other ways in different parts of Africa); and the Gnostic people in Egypt in the period around and before 400AD referred to this phenomena as the 'Archons', a word meaning rulers in Greek. Central American cultures speak of the 'Predators' among other names and the same theme is everywhere. I will use 'Archons' as a collective name for all of them. When you see how their nature and behaviour is described all these different sources are clearly talking about the same force. Gnostics described the Archons in terms of 'luminous fire' while Islam relates the Jinn to 'smokeless fire'. Some refer to beings in form that could occasionally be seen, but the most common of common theme is that they operate from

unseen realms which means almost all existence to the visual processes of humans. I had concluded that this was indeed the foundation of human control and that the Cult was operating within the human frequency band on behalf of this hidden force when I came across the writings of Gnostics which supported my conclusions in the most extraordinary way.

A sealed earthen jar was found in 1945 near the town of Nag Hammadi about 75-80 miles north of Luxor on the banks of the River Nile in Egypt. Inside was a treasure trove of manuscripts and texts left by the Gnostic people some 1,600 years earlier. They included 13 leather-bound papyrus codices (manuscripts) and more than 50 texts written in Coptic Egyptian estimated to have been hidden in the jar in the period of 400AD although the source of the information goes back much further. Gnostics oversaw the Great or Royal Library of Alexandria, the fantastic depository of ancient texts detailing advanced knowledge and accounts of human history. The Library was dismantled and destroyed in stages over a long period with the death-blow delivered by the Cult-established Roman Church in the period around 415AD. The Church of Rome was the Church of Babylon relocated as I said earlier. Gnostics were not a race. They were a way of perceiving reality. Whenever they established themselves and their information circulated the terrorists of the Church of Rome would target them for destruction. This happened with the Great Library and with the Gnostic Cathars who were burned to death by the psychopaths after a long period of oppression at the siege of the Castle of Monségur in southern France in 1244. The Church has always been terrified of Gnostic information which demolishes the official Christian narrative although there is much in the Bible that supports the Gnostic view if you read it in another way. To anyone studying the texts of what became known as the Nag Hammadi Library it is clear that great swathes of Christian and Biblical belief has its origin with Gnostics sources going back to Sumer. Gnostic themes have been twisted to manipulate the perceived reality of Bible believers. Biblical texts have been in the open for centuries where they could be changed while Gnostic

documents found at Nag Hammadi were sealed away and untouched for 1,600 years. What you see is what they wrote.

Use your *pneuma* not your *nous*

Gnosticism and Gnostic come from 'gnosis' which means knowledge, or rather *secret* knowledge, in the sense of spiritual awareness – knowledge about reality and life itself. The desperation of the Cult's Church of Rome to destroy the Gnostics can be understood when the knowledge they were circulating was the last thing the Cult wanted the population to know. Sixteen hundred years later the same Cult is working hard to undermine and silence me for the same reason. The dynamic between knowledge and ignorance is a constant. 'Time' appears to move on, but essential themes remain the same. We are told to 'use your nous', a Gnostic word for head/brain/intelligence. They said, however, that spiritual awakening or 'salvation' could only be secured by expanding awareness *beyond* what they called *nous* and into *pneuma* or Infinite Self. Obviously as I read these texts the parallels with what I have been saying since 1990 were fascinating to me. There is a universal truth that spans human history and in that case why wouldn't we be talking the same language 16 centuries apart? When you free yourself from the perception program of the five senses and explore expanded realms of consciousness you are going to connect with the same information no matter what the perceived 'era' within a manufactured timeline of a single and tiny range of manipulated frequency. Humans working with 'smart' technology or knocking rocks together in caves is only a timeline appearing to operate within the human frequency band. Expanded awareness and the knowledge it holds have always been there whether the era be Stone Age or computer age. We can only access that knowledge by opening ourselves to its frequency which the five-sense prison cell is designed to stop us doing. Gates, Fauci, Whitty, Vallance, Zuckerberg, Brin, Page, Wojcicki, Bezos, and all the others behind the 'Covid' hoax clearly have a long wait before their range of frequency can make that connection given that an open heart is

crucial to that as we shall see. Instead of accessing knowledge directly through expanded awareness it is given to Cult operatives by the secret society networks of the Cult where it has been passed on over thousands of years outside the public arena. Expanded realms of consciousness is where great artists, composers and writers find their inspiration and where truth awaits anyone open enough to connect with it. We need to go there fast.

Archon hijack

A fifth of the Nag Hammadi texts describe the existence and manipulation of the Archons led by a 'Chief Archon' they call 'Yaldabaoth', or the 'Demiurge', and this is the Christian 'Devil', 'Satan', 'Lucifer', and his demons. Archons in Biblical symbolism are the 'fallen ones' which are also referred to as fallen angels after the angels expelled from heaven according to the Abrahamic religions of Judaism, Christianity and Islam. These angels are claimed to tempt humans to 'sin' ongoing and you will see how accurate that symbolism is during the rest of the book. The theme of 'original sin' is related to the 'Fall' when Adam and Eve were 'tempted by the serpent' and fell from a state of innocence and 'obedience' (connection) with God into a state of disobedience (disconnection). The Fall is said to have brought sin into the world and corrupted everything including human nature. Yaldabaoth, the 'Lord Archon', is described by Gnostics as a 'counterfeit spirit', 'The Blind One', 'The Blind God', and 'The Foolish One'. The Jewish name for Yaldabaoth in Talmudic writings is Samael which translates as 'Poison of God', or 'Blindness of God'. You see the parallels. Yaldabaoth in Islamic belief is the Muslim Jinn devil known as Shaytan – Shaytan is Satan as the same themes are found all over the world in every religion and culture. The 'Lord God' of the Old Testament is the 'Lord Archon' of Gnostic manuscripts and that's why he's such a bloodthirsty bastard. Satan is known by Christians as 'the Demon of Demons' and Gnostics called Yaldabaoth the 'Archon of Archons'. Both are known as 'The Deceiver'. We are talking about the same 'bloke' for sure and these common themes

using different names, storylines and symbolism tell a common tale of the human plight.

Archons are referred to in Nag Hammadi documents as mind parasites, inverters, guards, gatekeepers, detainers, judges, pitiless ones and deceivers. The 'Covid' hoax alone is a glaring example of all these things. The Biblical 'God' is so different in the Old and New Testaments because they are not describing the same phenomenon. The vindictive, angry, hate-filled, 'God' of the Old Testament, known as Yahweh, is Yaldabaoth who is depicted in Cult-dictated popular culture as the 'Dark Lord', 'Lord of Time', Lord (Darth) Vader and Dormammu, the evil ruler of the 'Dark Dimension' trying to take over the 'Earth Dimension' in the Marvel comic movie, *Dr Strange*. Yaldabaoth is both the Old Testament 'god' and the Biblical 'Satan'. Gnostics referred to Yaldabaoth as the 'Great Architect of the Universe'and the Cult-controlled Freemason network calls their god 'the 'Great Architect of the Universe' (also Grand Architect). The 'Great Architect' Yaldabaoth is symbolised by the Cult as the all-seeing eye at the top of the pyramid on the Great Seal of the United States and the dollar bill. Archon is encoded in *arch*-itect as it is in *arch*-angels and *arch*-bishops. All religions have the theme of a force for good and force for evil in some sort of spiritual war and there is a reason for that – the theme is true. The Cult and its non-human masters are quite happy for this to circulate. They present themselves as the force for good fighting evil when they are really the force of evil (absence of love). The whole foundation of Cult modus operandi is inversion. They promote themselves as a force for good and anyone challenging them in pursuit of peace, love, fairness, truth and justice is condemned as a satanic force for evil. This has been the game plan throughout history whether the Church of Rome inquisitions of non-believers or 'conspiracy theorists' and 'anti-vaxxers' of today. The technique is the same whatever the timeline era.

Yaldabaoth is revolting (true)

Yaldabaoth and the Archons are said to have revolted against God with Yaldabaoth claiming to *be* God – the *All That Is*. The Old Testament 'God' (Yaldabaoth) demanded to be worshipped as such: ' *I am* the LORD, and there is none else, there is no God beside me' (Isaiah 45:5). I have quoted in other books a man who said he was the unofficial son of the late Baron Philippe de Rothschild of the Mouton-Rothschild wine producing estates in France who died in 1988 and he told me about the Rothschild 'revolt from God'. The man said he was given the name Phillip Eugene de Rothschild and we shared long correspondence many years ago while he was living under another identity. He said that he was conceived through 'occult incest' which (within the Cult) was 'normal and to be admired'. 'Phillip' told me about his experience attending satanic rituals with rich and famous people whom he names and you can see them and the wider background to Cult Satanism in my other books starting with *The Biggest Secret*. Cult rituals are interactions with Archontic 'gods'. 'Phillip' described Baron Philippe de Rothschild as 'a master Satanist and hater of God' and he used the same term 'revolt from God' associated with Yaldabaoth/Satan/Lucifer/the Devil in describing the Sabbatian Rothschild dynasty. 'I played a key role in my family's revolt from God', he said. That role was to infiltrate in classic Sabbatian style the Christian Church, but eventually he escaped the mind-prison to live another life. The Cult has been targeting religion in a plan to make worship of the Archons the global one-world religion. Infiltration of Satanism into modern 'culture', especially among the young, through music videos, stage shows and other means, is all part of this.

Nag Hammadi texts describe Yaldabaoth and the Archons in their prime form as energy – consciousness – and say they can take form if they choose in the same way that consciousness takes form as a human. Yaldabaoth is called 'formless' and represents a deeply inverted, distorted and chaotic state of consciousness which seeks to attached to humans and turn them into a likeness of itself in an attempt at assimilation. For that to happen it has to manipulate

humans into low frequency mental and emotional states that match its own. Archons can certainly appear in human form and this is the origin of the psychopathic personality. The energetic distortion Gnostics called Yaldabaoth *is* psychopathy. When psychopathic Archons take human form that human will be a psychopath as an expression of Yaldabaoth consciousness. Cult psychopaths are Archons in human form. The principle is the same as that portrayed in the 2009 *Avatar* movie when the American military travelled to a fictional Earth-like moon called Pandora in the Alpha Centauri star system to infiltrate a society of blue people, or Na'vi, by hiding within bodies that looked like the Na'vi. Archons posing as humans have a particular hybrid information field, part human, part Archon, (the ancient 'demigods') which processes information in a way that manifests behaviour to match their psychopathic evil, lack of empathy and compassion, and stops them being influenced by the empathy, compassion and love that a fully-human information field is capable of expressing. Cult bloodlines interbreed, be they royalty or dark suits, for this reason and you have their obsession with incest. Interbreeding with full-blown humans would dilute the Archontic energy field that guarantees psychopathy in its representatives in the human realm.

Gnostic writings say the main non-human forms that Archons take are *serpentine* (what I have called for decades 'reptilian' amid unbounded ridicule from the Archontically-programmed) and what Gnostics describe as 'an unborn baby or foetus with grey skin and dark, unmoving eyes'. This is an excellent representation of the ET 'Greys' of UFO folklore which large numbers of people claim to have seen and been abducted by – Zulu shaman Credo Mutwa among them. I agree with those that believe in extraterrestrial or interdimensional visitations today and for thousands of years past. No wonder with their advanced knowledge and technological capability they were perceived and worshipped as gods for technological and other 'miracles' they appeared to perform. Imagine someone arriving in a culture disconnected from the modern world with a smartphone and computer. They would be

seen as a 'god' capable of 'miracles'. The Renegade Mind, however, wants to know the source of everything and not only the way that source manifests as human or non-human. In the same way that a Renegade Mind seeks the original source material for the 'Covid virus' to see if what is claimed is true. The original source of Archons in form is consciousness – the distorted state of consciousness known to Gnostics as Yaldabaoth.

'Revolt from God' is energetic disconnection

Where I am going next will make a lot of sense of religious texts and ancient legends relating to 'Satan', Lucifer' and the 'gods'. Gnostic descriptions sync perfectly with the themes of my own research over the years in how they describe a consciousness distortion seeking to impose itself on human consciousness. I've referred to the core of infinite awareness in previous books as Infinite Awareness in Awareness of Itself. By that I mean a level of awareness that knows that it is all awareness and is aware of all awareness. From here comes the frequency of love in its true sense and balance which is what love is on one level – the balance of all forces into a single whole called Oneness and Isness. The more we disconnect from this state of love that many call 'God' the constituent parts of that Oneness start to unravel and express themselves as a part and not a whole. They become individualised as intellect, mind, selfishness, hatred, envy, desire for power over others, and such like. This is not a problem in the greater scheme in that 'God', the *All That Is*, can experience all these possibilities through different expressions of itself including humans. What we as expressions of the whole experience the *All That Is* experiences. We are the *All That Is* experiencing itself. As we withdraw from that state of Oneness we disconnect from its influence and things can get very unpleasant and very stupid. Archontic consciousness is at the extreme end of that. It has so disconnected from the influence of Oneness that it has become an inversion of unity and love, an inversion of everything, an inversion of life itself. Evil is appropriately live written backwards. Archontic consciousness is obsessed with death, an inversion of life,

and so its manifestations in Satanism are obsessed with death. They use inverted symbols in their rituals such as the inverted pentagram and cross. Sabbatians as Archontic consciousness incarnate invert Judaism and every other religion and culture they infiltrate. They seek disunity and chaos and they fear unity and harmony as they fear love like garlic to a vampire. As a result the Cult, Archons incarnate, act with such evil, psychopathy and lack of empathy and compassion disconnected as they are from the source of love. How could Bill Gates and the rest of the Archontic psychopaths do what they have to human society in the 'Covid' era with all the death, suffering and destruction involved and have no emotional consequence for the impact on others? Now you know. Why have Zuckerberg, Brin, Page, Wojcicki and company callously censored information warning about the dangers of the 'vaccine' while thousands have been dying and having severe, sometimes life-changing reactions? Now you know. Why have Tedros, Fauci, Whitty, Vallance and their like around the world been using case and death figures they're aware are fraudulent to justify lockdowns and all the deaths and destroyed lives that have come from that? Now you know. Why did Christian Drosten produce and promote a 'testing' protocol that he knew couldn't test for infectious disease which led to a global human catastrophe. Now you know. The Archontic mind doesn't give a shit (Fig 17). I personally think that Gates and major Cult insiders are a form of AI cyborg that the Archons want humans to become.

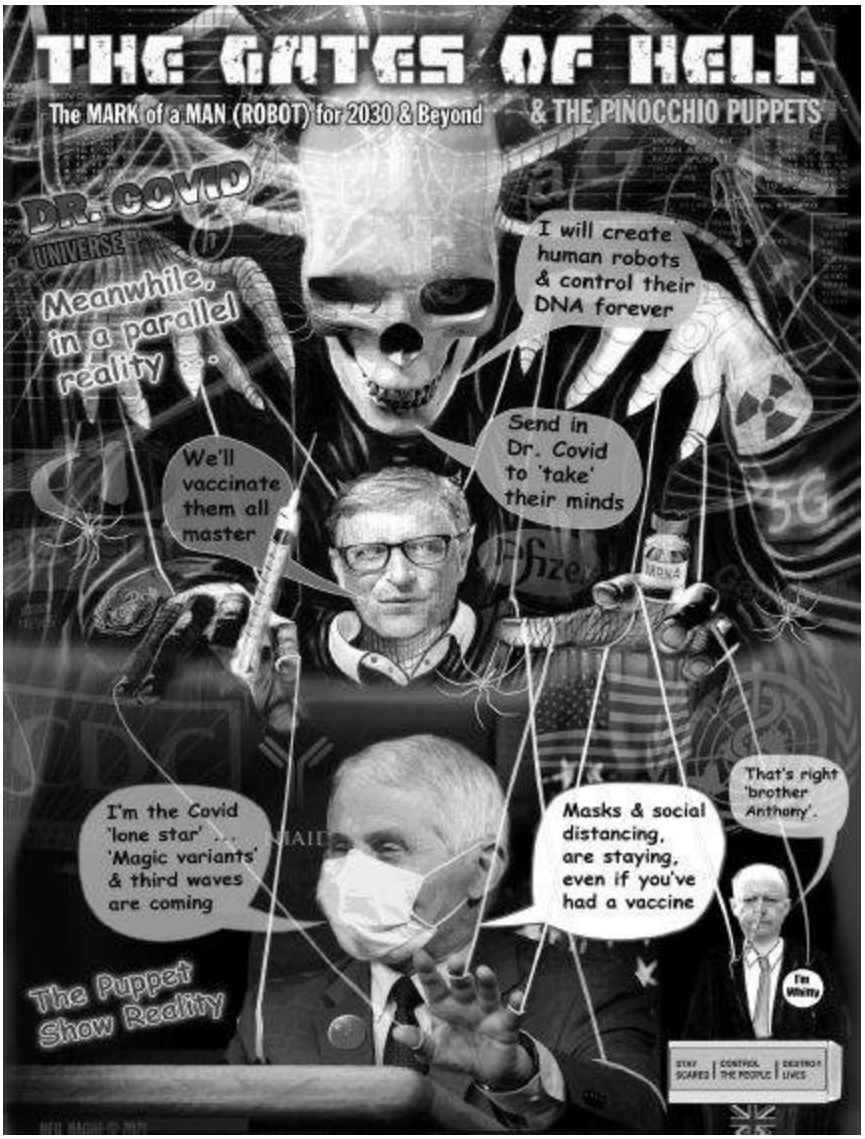

Figure 17: Artist Neil Hague's version of the 'Covid' hierarchy.

Human batteries

A state of such inversion does have its consequences, however. The level of disconnection from the Source of All means that you withdraw from that source of energetic sustenance and creativity. This means that you have to find your own supply of energetic power and it has – *us*. When the Morpheus character in the first *Matrix* movie held up a battery he spoke a profound truth when he said: 'The Matrix is a computer-generated dream world built to keep us under control in order to change the human being into one of

these.' The statement was true in all respects. We do live in a technologically-generated virtual reality simulation (more very shortly) and we have been manipulated to be an energy source for Archontic consciousness. The Disney-Pixar animated movie *Monsters, Inc*. in 2001 symbolised the dynamic when monsters in their world had no energy source and they would enter the human world to terrify children in their beds, catch the child's scream, terror (low-vibrational frequencies), and take that energy back to power the monster world. The lead character you might remember was a single giant eye and the symbolism of the Cult's all-seeing eye was obvious. Every thought and emotion is broadcast as a frequency unique to that thought and emotion. Feelings of love and joy, empathy and compassion, are high, quick, frequencies while fear, depression, anxiety, suffering and hate are low, slow, dense frequencies. Which kind do you think Archontic consciousness can connect with and absorb? In such a low and dense frequency state there's no way it can connect with the energy of love and joy. Archons can only feed off energy compatible with their own frequency and they and their Cult agents want to delete the human world of love and joy and manipulate the transmission of low vibrational frequencies through low-vibrational human mental and emotional states. *We are their energy source*. Wars are energetic banquets to the Archons – a world war even more so – and think how much low-frequency mental and emotional energy has been generated from the consequences for humanity of the 'Covid' hoax orchestrated by Archons incarnate like Gates.

The ancient practice of human sacrifice 'to the gods', continued in secret today by the Cult, is based on the same principle. 'The gods' are Archontic consciousness in different forms and the sacrifice is induced into a state of intense terror to generate the energy the Archontic frequency can absorb. Incarnate Archons in the ritual drink the blood which contains an adrenaline they crave which floods into the bloodstream when people are terrorised. Most of the sacrifices, ancient and modern, are children and the theme of 'sacrificing young virgins to the gods' is just code for children. They

have a particular pre-puberty energy that Archons want more than anything and the energy of the young in general is their target. The California Department of Education wants students to chant the names of Aztec gods (Archontic gods) once worshipped in human sacrifice rituals in a curriculum designed to encourage them to 'challenge racist, bigoted, discriminatory, imperialist/colonial beliefs', join 'social movements that struggle for social justice', and 'build new possibilities for a post-racist, post-systemic racism society'. It's the usual Woke crap that inverts racism and calls it anti-racism. In this case solidarity with 'indigenous tribes' is being used as an excuse to chant the names of 'gods' to which people were sacrificed (and still are in secret). What an example of Woke's inability to see beyond black and white, us and them, They condemn the colonisation of these tribal cultures by Europeans (quite right), but those cultures sacrificing people including children to their 'gods', and mass murdering untold numbers as the Aztecs did, is just fine. One chant is to the Aztec god Tezcatlipoca who had a man sacrificed to him in the 5th month of the Aztec calendar. His heart was cut out and he was eaten. Oh, that's okay then. Come on children … after three … Other sacrificial 'gods' for the young to chant their allegiance include Quetzalcoatl, Huitzilopochtli and Xipe Totec. The curriculum says that 'chants, affirmations, and energizers can be used to bring the class together, build unity around ethnic studies principles and values, and to reinvigorate the class following a lesson that may be emotionally taxing or even when student engagement may appear to be low'. Well, that's the cover story, anyway. Chanting and mantras are the repetition of a particular frequency generated from the vocal cords and chanting the names of these Archontic 'gods' tunes you into their frequency. That is the last thing you want when it allows for energetic synchronisation, attachment and perceptual influence. Initiates chant the names of their 'Gods' in their rituals for this very reason.

Vampires of the Woke

Paedophilia is another way that Archons absorb the energy of children. Paedophiles possessed by Archontic consciousness are used as the conduit during sexual abuse for discarnate Archons to vampire the energy of the young they desire so much. Stupendous numbers of children disappear every year never to be seen again although you would never know from the media. Imagine how much low-vibrational energy has been generated by children during the 'Covid' hoax when so many have become depressed and psychologically destroyed to the point of killing themselves. Shocking numbers of children are now taken by the state from loving parents to be handed to others. I can tell you from long experience of researching this since 1996 that many end up with paedophiles and assets of the Cult through corrupt and Cult-owned social services which in the reframing era has hired many psychopaths and emotionless automatons to do the job. Children are even stolen to order using spurious reasons to take them by the corrupt and secret (because they're corrupt) 'family courts'. I have written in detail in other books, starting with *The Biggest Secret* in 1997, about the ubiquitous connections between the political, corporate, government, intelligence and military elites (Cult operatives) and Satanism and paedophilia. If you go deep enough both networks have an interlocking leadership. The Woke mentality has been developed by the Cult for many reasons: To promote almost every aspect of its agenda; to hijack the traditional political left and turn it fascist; to divide and rule; and to target agenda pushbackers. But there are other reasons which relate to what I am describing here. How many happy and joyful Wokers do you ever see especially at the extreme end? They are a mental and psychological mess consumed by emotional stress and constantly emotionally cocked for the next explosion of indignation at someone referring to a female as a female. They are walking, talking, batteries as Morpheus might say emitting frequencies which both enslave them in low-vibrational bubbles of perceptual limitation and feed the Archons. Add to this the hatred claimed to be love; fascism claimed to 'anti-fascism', racism claimed to be 'anti-racism';

exclusion claimed to inclusion; and the abuse-filled Internet trolling. You have a purpose-built Archontic energy system with not a wind turbine in sight and all founded on Archontic *inversion*. We have whole generations now manipulated to serve the Archons with their actions and energy. They will be doing so their entire adult lives unless they snap out of their Archon-induced trance. Is it really a surprise that Cult billionaires and corporations put so much money their way? Where is the energy of joy and laughter, including laughing at yourself which is confirmation of your own emotional security? Mark Twain said: 'The human race has one really effective weapon, and that is laughter.' We must use it all the time. Woke has destroyed comedy because it has no humour, no joy, sense of irony, or self-deprecation. Its energy is dense and intense. *Mmmmm*, lunch says the Archontic frequency. Rudolf Steiner (1861-1925) was the Austrian philosopher and famous esoteric thinker who established Waldorf education or Steiner schools to treat children like unique expressions of consciousness and not minds to be programmed with the perceptions determined by authority. I'd been writing about this energy vampiring for decades when I was sent in 2016 a quote by Steiner. He was spot on:

> There are beings in the spiritual realms for whom anxiety and fear emanating from human beings offer welcome food. When humans have no anxiety and fear, then these creatures starve. If fear and anxiety radiates from people and they break out in panic, then these creatures find welcome nutrition and they become more and more powerful. These beings are hostile towards humanity. Everything that feeds on negative feelings, on anxiety, fear and superstition, despair or doubt, are in reality hostile forces in super-sensible worlds, launching cruel attacks on human beings, while they are being fed ... These are exactly the feelings that belong to contemporary culture and materialism; because it estranges people from the spiritual world, it is especially suited to evoke hopelessness and fear of the unknown in people, thereby calling up the above mentioned hostile forces against them.

Pause for a moment from this perspective and reflect on what has happened in the world since the start of 2020. Not only will pennies drop, but billion dollar bills. We see the same theme from Don Juan Matus, a Yaqui Indian shaman in Mexico and the information source for Peruvian-born writer, Carlos Castaneda, who wrote a series of

books from the 1960s to 1990s. Don Juan described the force manipulating human society and his name for the Archons was the predator:

> We have a predator that came from the depths of the cosmos and took over the rule of our lives. Human beings are its prisoners. The predator is our lord and master. It has rendered us docile, helpless. If we want to protest, it suppresses our protest. If we want to act independently, it demands that we don't do so ... indeed we are held prisoner!
>
> They took us over because we are food to them, and they squeeze us mercilessly because we are their sustenance. Just as we rear chickens in coops, the predators rear us in human coops, humaneros. Therefore, their food is always available to them.
>
> Different cultures, different eras, same recurring theme.

The 'ennoia' dilemma

Nag Hammadi Gnostic manuscripts say that Archon consciousness has no 'ennoia'. This is directly translated as 'intentionality', but I'll use the term 'creative imagination'. The *All That Is* in awareness of itself is the source of all creativity – all possibility – and the more disconnected you are from that source the more you are subsequently denied 'creative imagination'. Given that Archon consciousness is almost entirely disconnected it severely lacks creativity and has to rely on far more mechanical processes of thought and exploit the creative potential of those that do have 'ennoia'. You can see cases of this throughout human society. Archon consciousness almost entirely dominates the global banking system and if we study how that system works you will appreciate what I mean. Banks manifest 'money' out of nothing by issuing lines of 'credit' which is 'money' that has never, does not, and will never exist except in theory. It's a confidence trick. If you think 'credit' figures-on-a-screen 'money' is worth anything you accept it as payment. If you don't then the whole system collapses through lack of confidence in the value of that 'money'. Archontic bankers with no 'ennoia' are 'lending' 'money' that doesn't exist to humans that *do* have creativity – those that have the inspired ideas and create businesses and products. Archon banking feeds off human creativity

which it controls through 'money' creation and debt. Humans have the creativity and Archons exploit that for their own benefit and control while having none themselves. Archon Internet platforms like Facebook claim joint copyright of everything that creative users post and while Archontic minds like Zuckerberg may officially head that company it will be human creatives on the staff that provide the creative inspiration. When you have limitless 'money' you can then buy other companies established by creative humans. Witness the acquisition record of Facebook, Google and their like. Survey the Archon-controlled music industry and you see non-creative dark suit executives making their fortune from the human creativity of their artists. The cases are endless. Research the history of people like Gates and Zuckerberg and how their empires were built on exploiting the creativity of others. Archon minds cannot create out of nothing, but they are skilled (because they have to be) in what Gnostic texts call 'countermimicry'. They can imitate, but not innovate. Sabbatians trawl the creativity of others through backdoors they install in computer systems through their cybersecurity systems. Archon-controlled China is globally infamous for stealing intellectual property and I remember how Hong Kong, now part of China, became notorious for making counterfeit copies of the creativity of others – 'countermimicry'. With the now pervasive and all-seeing surveillance systems able to infiltrate any computer you can appreciate the potential for Archons to vampire the creativity of humans. Author John Lamb Lash wrote in his book about the Nag Hammadi texts, *Not In His Image*:

> Although they cannot originate anything, because they lack the divine factor of ennoia (intentionality), Archons can imitate with a vengeance. Their expertise is simulation (HAL, virtual reality). The Demiurge [Yaldabaoth] fashions a heaven world copied from the fractal patterns [of the original] ... His construction is celestial kitsch, like the fake Italianate villa of a Mafia don complete with militant angels to guard every portal.

This brings us to something that I have been speaking about since the turn of the millennium. Our reality is a simulation; a virtual reality that we think is real. No, I'm not kidding.

Human reality? Well, virtually

I had pondered for years about whether our reality is 'real' or some kind of construct. I remembered being immensely affected on a visit as a small child in the late 1950s to the then newly-opened Planetarium on the Marylebone Road in London which is now closed and part of the adjacent Madame Tussauds wax museum. It was in the middle of the day, but when the lights went out there was the night sky projected in the Planetarium's domed ceiling and it appeared to be so real. The experience never left me and I didn't know why until around the turn of the millennium when I became certain that our 'night sky' and entire reality is a projection, a virtual reality, akin to the illusory world portrayed in the *Matrix* movies. I looked at the sky one day in this period and it appeared to me like the domed roof of the Planetarium. The release of the first *Matrix* movie in 1999 also provided a synchronistic and perfect visual representation of where my mind had been going for a long time. I hadn't come across the Gnostic Nag Hammadi texts then. When I did years later the correlation was once again astounding. As I read Gnostic accounts from 1,600 years and more earlier it was clear that they were describing the same simulation phenomenon. They tell how the Yaldabaoth 'Demiurge' and Archons created a 'bad copy' of original reality to rule over all that were captured by its illusions and the body was a prison to trap consciousness in the 'bad copy' fake reality. Read how Gnostics describe the 'bad copy' and update that to current times and they are referring to what we would call today a virtual reality simulation.

Author John Lamb Lash said 'the Demiurge fashions a heaven world copied from the fractal patterns' of the original through expertise in 'HAL' or virtual reality simulation. Fractal patterns are part of the energetic information construct of our reality, a sort of blueprint. If these patterns were copied in computer terms it would indeed give you a copy of a 'natural' reality in a non-natural frequency and digital form. The principle is the same as making a copy of a website. The original website still exists, but now you can change the copy version to make it whatever you like and it can

become very different to the original website. Archons have done this with our reality, a *synthetic* copy of prime reality that still exists beyond the frequency walls of the simulation. Trapped within the illusions of this synthetic Matrix, however, were and are human consciousness and other expressions of prime reality and this is why the Archons via the Cult are seeking to make the human body synthetic and give us synthetic AI minds to complete the job of turning the entire reality synthetic including what we perceive to be the natural world. To quote Kurzweil: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' Yes, *synthetic* 'creatures' just as 'Covid' and other genetically-manipulating 'vaccines' are designed to make the human body synthetic. From this perspective it is obvious why Archons and their Cult are so desperate to infuse synthetic material into every human with their 'Covid' scam.

Let there be (electromagnetic) light

Yaldabaoth, the force that created the simulation, or Matrix, makes sense of the Gnostic reference to 'The Great Architect' and its use by Cult Freemasonry as the name of its deity. The designer of the Matrix in the movies is called 'The Architect' and that trilogy is jam-packed with symbolism relating to these subjects. I have contended for years that the angry Old Testament God (Yaldabaoth) is the 'God' being symbolically 'quoted' in the opening of Genesis as 'creating the world'. This is not the creation of prime reality – it's the creation of the *simulation*. The Genesis 'God' says: 'Let there be Light: and there was light.' But what is this 'Light'? I have said for decades that the speed of light (186,000 miles per second) is not the fastest speed possible as claimed by mainstream science and is in fact the frequency walls or outer limits of the Matrix. You can't have a fastest or slowest anything within all possibility when everything is possible. The human body is encoded to operate within the speed of light or *within the simulation* and thus we see only the tiny frequency band of visible *light*. Near-death experiencers who perceive reality outside the body during temporary 'death' describe a very different

form of light and this is supported by the Nag Hammadi texts. Prime reality beyond the simulation ('Upper Aeons' to the Gnostics) is described as a realm of incredible beauty, bliss, love and harmony – a realm of 'watery light' that is so powerful 'there are no shadows'. Our false reality of Archon control, which Gnostics call the 'Lower Aeons', is depicted as a realm with a different kind of 'light' and described in terms of chaos, 'Hell', 'the Abyss' and 'Outer Darkness', where trapped souls are tormented and manipulated by demons (relate that to the 'Covid' hoax alone). The watery light theme can be found in near-death accounts and it is not the same as *simulation* 'light' which is electromagnetic or radiation light within the speed of light – the 'Lower Aeons'. Simulation 'light' is the 'luminous fire' associated by Gnostics with the Archons. The Bible refers to Yaldabaoth as 'that old serpent, called the Devil, and Satan, which deceiveth the whole world' (Revelation 12:9). I think that making a simulated copy of prime reality ('countermimicry') and changing it dramatically while all the time manipulating humanity to believe it to be real could probably meet the criteria of deceiving the whole world. Then we come to the Cult god Lucifer – the *Light Bringer*. Lucifer is symbolic of Yaldabaoth, the bringer of radiation light that forms the bad copy simulation within the speed of light. 'He' is symbolised by the lighted torch held by the Statue of Liberty and in the name 'Illuminati'. Sabbatian-Frankism declares that Lucifer is the true god and Lucifer is the real god of Freemasonry honoured as their 'Great or Grand Architect of the Universe' (simulation).

I would emphasise, too, the way Archontic technologically-generated luminous fire of radiation has deluged our environment since I was a kid in the 1950s and changed the nature of The Field with which we constantly interact. Through that interaction technological radiation is changing us. The Smart Grid is designed to operate with immense levels of communication power with 5G expanding across the world and 6G, 7G, in the process of development. Radiation is the simulation and the Archontic manipulation system. Why wouldn't the Archon Cult wish to unleash radiation upon us to an ever-greater extreme to form

Kurzweil's 'cloud'? The plan for a synthetic human is related to the need to cope with levels of radiation beyond even anything we've seen so far. Biological humans would not survive the scale of radiation they have in their script. The Smart Grid is a technological sub-reality within the technological simulation to further disconnect five-sense perception from expanded consciousness. It's a technological prison of the mind.

Infusing the 'spirit of darkness'

A recurring theme in religion and native cultures is the manipulation of human genetics by a non-human force and most famously recorded as the biblical 'sons of god' (the god*s* plural in the original) who interbred with the daughters of men. The Nag Hammadi *Apocryphon of John* tells the same story this way:

> He [Yaldabaoth] sent his angels [Archons/demons] to the daughters of men, that they might take some of them for themselves and raise offspring for their enjoyment. And at first they did not succeed. When they had no success, they gathered together again and they made a plan together ... And the angels changed themselves in their likeness into the likeness of their mates, filling them with the spirit of darkness, which they had mixed for them, and with evil ... And they took women and begot children out of the darkness according to the likeness of their spirit.

Possession when a discarnate entity takes over a human body is an age-old theme and continues today. It's very real and I've seen it. Satanic and secret society rituals can create an energetic environment in which entities can attach to initiates and I've heard many stories of how people have changed their personality after being initiated even into lower levels of the Freemasons. I have been inside three Freemasonic temples, one at a public open day and two by just walking in when there was no one around to stop me. They were in Ryde, the town where I live, Birmingham, England, when I was with a group, and Boston, Massachusetts. They all felt the same energetically – dark, dense, low-vibrational and sinister. Demonic attachment can happen while the initiate has no idea what is going on. To them it's just a ritual to get in the Masons and do a bit of good

business. In the far more extreme rituals of Satanism human possession is even more powerful and they are designed to make possession possible. The hierarchy of the Cult is dictated by the power and perceived status of the possessing Archon. In this way the Archon hierarchy becomes the Cult hierarchy. Once the entity has attached it can influence perception and behaviour and if it attaches to the extreme then so much of its energy (information) infuses into the body information field that the hologram starts to reflect the nature of the possessing entity. This is the *Exorcist* movie type of possession when facial features change and it's known as shapeshifting. Islam's Jinn are said to be invisible tricksters who change shape, 'whisper', confuse and take human form. These are all traits of the Archons and other versions of the same phenomenon. Extreme possession could certainty infuse the 'spirit of darkness' into a partner during sex as the Nag Hammadi texts appear to describe. Such an infusion can change genetics which is also energetic information. Human genetics is information and the 'spirit of darkness' is information. Mix one with the other and change must happen. Islam has the concept of a 'Jinn baby' through possession of the mother and by Jinn taking human form. There are many ways that human genetics can be changed and remember that Archons have been aware all along of advanced techniques to do this. What is being done in human society today – and far more – was known about by Archons at the time of the 'fallen ones' and their other versions described in religions and cultures.

Archons and their human-world Cult are obsessed with genetics as we see today and they know this dictates how information is processed into perceived reality during a human life. They needed to produce a human form that would decode the simulation and this is symbolically known as 'Adam and Eve' who left the 'garden' (prime reality) and 'fell' into Matrix reality. The simulation is not a 'physical' construct (there is no 'physical'); it is a source of information. Think Wi-Fi again. The simulation is an energetic field encoded with information and body-brain systems are designed to decode that information encoded in wave or frequency form which

is transmitted to the brain as electrical signals. These are decoded by the brain to construct our sense of reality – an illusory 'physical' world that only exists in the brain or the mind. Virtual reality games mimic this process using the same sensory decoding system. Information is fed to the senses to decode a virtual reality that can appear so real, but isn't (Figs 18 and 19). Some scientists believe – and I agree with them – that what we perceive as 'physical' reality only exists when we are looking or observing. The act of perception or focus triggers the decoding systems which turn waveform information into holographic reality. When we are not observing something our reality reverts from a holographic state to a waveform state. This relates to the same principle as a falling tree not making a noise unless someone is there to hear it or decode it. The concept makes sense from the simulation perspective. A computer is not decoding all the information in a Wi-Fi field all the time and only decodes or brings into reality on the screen that part of Wi-Fi that it's decoding – focusing upon – at that moment.

Figure 18: Virtual reality technology 'hacks' into the body's five-sense decoding system.

Figure 19: The result can be experienced as very 'real'.

Interestingly, Professor Donald Hoffman at the Department of Cognitive Sciences at the University of California, Irvine, says that our experienced reality is like a computer interface that shows us only the level with which we interact while hiding all that exists beyond it: 'Evolution shaped us with a user interface that hides the truth. Nothing that we see is the truth – the very language of space and time and objects is the wrong language to describe reality.' He is correct in what he says on so many levels. Space and time are not a universal reality. They are a phenomenon of decoded *simulation* reality as part of the process of enslaving our sense of reality. Near-death experiencers report again and again how space and time did not exist as we perceive them once they were free of the body – body decoding systems. You can appreciate from this why Archons and their Cult are so desperate to entrap human attention in the five senses where we are in the Matrix and of the Matrix. Opening your mind to expanded states of awareness takes you beyond the information confines of the simulation and you become aware of knowledge and insights denied to you before. This is what we call 'awakening' – *awakening from the Matrix* – and in the final chapter I will relate this to current events.

Where are the 'aliens'?

A simulation would explain the so-called 'Fermi Paradox' named after Italian physicist Enrico Fermi (1901-1954) who created the first nuclear reactor. He considered the question of why there is such a lack of extraterrestrial activity when there are so many stars and planets in an apparently vast universe; but what if the night sky that we see, or think we do, is a simulated projection as I say? If you control the simulation and your aim is to hold humanity fast in essential ignorance would you want other forms of life including advanced life coming and going sharing information with humanity? Or would you want them to believe they were isolated and apparently alone? Themes of human isolation and apartness are common whether they be the perception of a lifeless universe or the fascist isolation laws of the 'Covid' era. Paradoxically the very

existence of a simulation means that we are not alone when some force had to construct it. My view is that experiences that people have reported all over the world for centuries with Reptilians and Grey entities are Archon phenomena as Nag Hammadi texts describe; and that benevolent 'alien' interactions are non-human groups that come in and out of the simulation by overcoming Archon attempts to keep them out. It should be highlighted, too, that Reptilians and Greys are obsessed with *genetics* and *technology* as related by cultural accounts and those who say they have been abducted by them. Technology is their way of overcoming some of the limitations in their creative potential and our technology-driven and controlled human society of today is *arch*etypical Archon-Reptilian-Grey modus operandi. Technocracy is really *Archon*tocracy. The Universe does not have to be as big as it appears with a simulation. There is no space or distance only information decoded into holographic reality. What we call 'space' is only the absence of holographic 'objects' and that 'space' is The Field of energetic information which connects everything into a single whole. The same applies with the artificially-generated information field of the simulation. The Universe is not big or small as a physical reality. It is decoded information, that's all, and its perceived size is decided by the way the simulation is encoded to make it appear. The entire night sky as we perceive it only exists in our brain and so where are those 'millions of light years'? The 'stars' on the ceiling of the Planetarium looked a vast distance away.

There's another point to mention about 'aliens'. I have been highlighting since the 1990s the plan to stage a fake 'alien invasion' to justify the centralisation of global power and a world military. Nazi scientist Werner von Braun, who was taken to America by Operation Paperclip after World War Two to help found NASA, told his American assistant Dr Carol Rosin about the Cult agenda when he knew he was dying in 1977. Rosin said that he told her about a sequence that would lead to total human control by a one-world government. This included threats from terrorism, rogue nations, meteors and asteroids before finally an 'alien invasion'. All of these

things, von Braun said, would be bogus and what I would refer to as a No-Problem-Reaction-Solution. Keep this in mind when 'the aliens are coming' is the new mantra. The aliens are not coming – they are *already here* and they have infiltrated human society while looking human. French-Canadian investigative journalist Serge Monast said in 1994 that he had uncovered a NASA/military operation called Project Blue Beam which fits with what Werner von Braun predicted. Monast died of a 'heart attack' in 1996 the day after he was arrested and spent a night in prison. He was 51. He said Blue Beam was a plan to stage an alien invasion that would include religious figures beamed holographically into the sky as part of a global manipulation to usher in a 'new age' of worshipping what I would say is the Cult 'god' Yaldabaoth in a one-world religion. Fake holographic asteroids are also said to be part of the plan which again syncs with von Braun. How could you stage an illusory threat from asteroids unless they were holographic inserts? This is pretty straightforward given the advanced technology outside the public arena and the fact that our 'physical' reality is holographic anyway. Information fields would be projected and we would decode them into the illusion of a 'physical' asteroid. If they can sell a global 'pandemic' with a 'virus' that doesn't exist what will humans not believe if government and media tell them?

All this is particularly relevant as I write with the Pentagon planning to release in June, 2021, information about 'UFO sightings'. I have been following the UFO story since the early 1990s and the common theme throughout has been government and military denials and cover up. More recently, however, the Pentagon has suddenly become more talkative and apparently open with Air Force pilot radar images released of unexplained craft moving and changing direction at speeds well beyond anything believed possible with human technology. Then, in March, 2021, former Director of National Intelligence John Ratcliffe said a Pentagon report months later in June would reveal a great deal of information about UFO sightings unknown to the public. He said the report would have 'massive implications'. The order to do this was included bizarrely

in a $2.3 trillion 'coronavirus' relief and government funding bill passed by the Trump administration at the end of 2020. I would add some serious notes of caution here. I have been pointing out since the 1990s that the US military and intelligence networks have long had craft – 'flying saucers' or anti-gravity craft – which any observer would take to be extraterrestrial in origin. Keeping this knowledge from the public allows craft flown by *humans* to be perceived as alien visitations. I am not saying that 'aliens' do not exist. I would be the last one to say that, but we have to be streetwise here. President Ronald Reagan told the UN General Assembly in 1987: 'I occasionally think how quickly our differences worldwide would vanish if we were facing an alien threat from outside this world.' That's the idea. Unite against a common 'enemy' with a common purpose behind your 'saviour force' (the Cult) as this age-old technique of mass manipulation goes global.

Science moves this way …

I could find only one other person who was discussing the simulation hypothesis publicly when I concluded it was real. This was Nick Bostrom, a Swedish-born philosopher at the University of Oxford, who has explored for many years the possibility that human reality is a computer simulation although his version and mine are not the same. Today the simulation and holographic reality hypothesis have increasingly entered the scientific mainstream. Well, the more open-minded mainstream, that is. Here are a few of the ever-gathering examples. American nuclear physicist Silas Beane led a team of physicists at the University of Bonn in Germany pursuing the question of whether we live in a simulation. They concluded that we probably do and it was likely based on a lattice of cubes. They found that cosmic rays align with that specific pattern. The team highlighted the Greisen–Zatsepin–Kuzmin (GZK) limit which refers to cosmic ray particle interaction with cosmic background radiation that creates an apparent boundary for cosmic ray particles. They say in a paper entitled 'Constraints on the Universe as a Numerical Simulation' that this 'pattern of constraint' is exactly what you

would find with a computer simulation. They also made the point that a simulation would create its own 'laws of physics' that would limit possibility. I've been making the same point for decades that the *perceived* laws of physics relate only to this reality, or what I would later call the simulation. When designers write codes to create computer and virtual reality games they are the equivalent of the laws of physics for that game. Players interact within the limitations laid out by the coding. In the same way those who wrote the codes for the simulation decided the laws of physics that would apply. These can be overridden by expanded states of consciousness, but not by those enslaved in only five-sense awareness where simulation codes rule. Overriding the codes is what people call 'miracles'. They are not. They are bypassing the encoded limits of the simulation. A population caught in simulation perception would have no idea that this was their plight. As the Bonn paper said: 'Like a prisoner in a pitch-black cell we would not be able to see the "walls" of our prison,' That's true if people remain mesmerised by the five senses. Open to expanded awareness and those walls become very clear. The main one is the speed of light.

American theoretical physicist James Gates is another who has explored the simulation question and found considerable evidence to support the idea. Gates was Professor of Physics at the University of Maryland, Director of The Center for String and Particle Theory, and on Barack Obama's Council of Advisors on Science and Technology. He and his team found *computer codes* of digital data embedded in the fabric of our reality. They relate to on-off electrical charges of 1 and 0 in the binary system used by computers. 'We have no idea what they are doing there', Gates said. They found within the energetic fabric mathematical sequences known as error-correcting codes or block codes that 'reboot' data to its original state or 'default settings' when something knocks it out of sync. Gates was asked if he had found a set of equations embedded in our reality indistinguishable from those that drive search engines and browsers and he said: 'That is correct.' Rich Terrile, director of the Centre for Evolutionary Computation and Automated Design at NASA's Jet

Propulsion Laboratory, has said publicly that he believes the Universe is a digital hologram that must have been created by a form of intelligence. I agree with that in every way. Waveform information is delivered electrically by the senses to the brain which constructs a *digital* holographic reality that we call the 'world'. This digital level of reality can be read by the esoteric art of numerology. Digital holograms are at the cutting edge of holographics today. We have digital technology everywhere designed to access and manipulate our digital level of perceived reality. Synthetic mRNA in 'Covid vaccines' has a digital component to manipulate the body's digital 'operating system'.

Reality is numbers

How many know that our reality can be broken down to numbers and codes that are the same as computer games? Max Tegmark, a physicist at the Massachusetts Institute of Technology (MIT), is the author of *Our Mathematical Universe* in which he lays out how reality can be entirely described by numbers and maths in the way that a video game is encoded with the 'physics' of computer games. Our world and computer virtual reality are essentially the same. Tegmark imagines the perceptions of characters in an advanced computer game when the graphics are so good they don't know they are in a game. They think they can bump into real objects (electromagnetic resistance in our reality), fall in love and feel emotions like excitement. When they began to study the apparently 'physical world' of the video game they would realise that everything was made of pixels (which have been found in our energetic reality as must be the case when on one level our world is digital). What computer game characters thought was physical 'stuff', Tegmark said, could actually be broken down into numbers:

> And we're exactly in this situation in our world. We look around and it doesn't seem that mathematical at all, but everything we see is made out of elementary particles like quarks and electrons. And what properties does an electron have? Does it have a smell or a colour or a texture? No! ... We physicists have come up with geeky names for [Electron] properties, like

electric charge, or spin, or lepton number, but the electron doesn't care what we call it, the properties are just numbers.

This is the illusory reality Gnostics were describing. This is the simulation. The A, C, G, and T codes of DNA have a binary value – A and C = 0 while G and T = 1. This has to be when the simulation is digital and the body must be digital to interact with it. Recurring mathematical sequences are encoded throughout reality and the body. They include the Fibonacci sequence in which the two previous numbers are added to get the next one, as in ... 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, etc. The sequence is encoded in the human face and body, proportions of animals, DNA, seed heads, pine cones, trees, shells, spiral galaxies, hurricanes and the number of petals in a flower. The list goes on and on. There are fractal patterns – a 'never-ending pattern that is infinitely complex and self-similar across all scales in the as above, so below, principle of holograms. These and other famous recurring geometrical and mathematical sequences such as Phi, Pi, Golden Mean, Golden Ratio and Golden Section are *computer codes* of the simulation. I had to laugh and give my head a shake the day I finished this book and it went into the production stage. I was sent an article in *Scientific American* published in April, 2021, with the headline 'Confirmed! We Live in a Simulation'. Two decades after I first said our reality is a simulation and the speed of light is it's outer limit the article suggested that we do live in a simulation and that the speed of light is its outer limit. I left school at 15 and never passed a major exam in my life while the writer was up to his eyes in qualifications. As I will explain in the final chapter *knowing* is far better than thinking and they come from very different sources. The article rightly connected the speed of light to the processing speed of the 'Matrix' and said what has been in my books all this time … 'If we are in a simulation, as it appears, then space is an abstract property written in code. It is not real'. No it's not and if we live in a simulation something created it and it wasn't *us*. 'That David Icke says we are manipulated by aliens' – he's crackers.'

Wow …

The reality that humanity thinks is so real is an illusion. Politicians, governments, scientists, doctors, academics, law enforcement, media, school and university curriculums, on and on, are all founded on a world that *does not exist* except as a simulated prison cell. Is it such a stretch to accept that 'Covid' doesn't exist when our entire 'physical' reality doesn't exist? Revealed here is the knowledge kept under raps in the Cult networks of compartmentalised secrecy to control humanity's sense of reality by inducing the population to believe in a reality that's not real. If it wasn't so tragic in its experiential consequences the whole thing would be hysterically funny. None of this is new to Renegade Minds. Ancient Greek philosopher Plato (about 428 to about 347BC) was a major influence on Gnostic belief and he described the human plight thousands of years ago with his Allegory of the Cave. He told the symbolic story of prisoners living in a cave who had never been outside. They were chained and could only see one wall of the cave while behind them was a fire that they could not see. Figures walked past the fire casting shadows on the prisoners' wall and those moving shadows became their sense of reality. Some prisoners began to study the shadows and were considered experts on them (today's academics and scientists), but what they studied was only an illusion (today's academics and scientists). A prisoner escaped from the cave and saw reality as it really is. When he returned to report this revelation they didn't believe him, called him mad and threatened to kill him if he tried to set them free. Plato's tale is not only a brilliant analogy of the human plight and our illusory reality. It describes, too, the dynamics of the 'Covid' hoax. I have only skimmed the surface of these subjects here. The aim of this book is to crisply connect all essential dots to put what is happening today into its true context. All subject areas and their connections in this chapter are covered in great evidential detail in *Everything You Need To Know, But Have Never Been Told* and *The Answer*.

They say that bewildered people 'can't see the forest for the trees'. Humanity, however, can't see the forest for the *twigs*. The five senses

see only twigs while Renegade Minds can see the forest and it's the forest where the answers lie with the connections that reveals. Breaking free of perceptual programming so the forest can be seen is the way we turn all this around. Not breaking free is how humanity got into this mess. The situation may seem hopeless, but I promise you it's not. We are a perceptual heartbeat from paradise if only we knew.

CHAPTER TWELVE

Escaping Wetiko

Life is simply a vacation from the infinite
Dean Cavanagh

Renegade Minds weave the web of life and events and see common themes in the apparently random. They are always there if you look for them and their pursuit is aided by incredible synchronicity that comes when your mind is open rather than mesmerised by what it thinks it can see.

Infinite awareness is infinite possibility and the more of infinite possibility that we access the more becomes infinitely possible. That may be stating the apparently obvious, but it is a devastatingly-powerful fact that can set us free. We are a point of attention within an infinity of consciousness. The question is how much of that infinity do we choose to access? How much knowledge, insight, awareness, wisdom, do we want to connect with and explore? If your focus is only in the five senses you will be influenced by a fraction of infinite awareness. I mean a range so tiny that it gives new meaning to infinitesimal. Limitation of self-identity and a sense of the possible limit accordingly your range of consciousness. We are what we think we are. Life is what we think it is. The dream is the dreamer and the dreamer is the dream. Buddhist philosophy puts it this way: 'As a thing is viewed, so it appears.' Most humans live in the realm of touch, taste, see, hear, and smell and that's the limit of their sense of the possible and sense of self. Many will follow a religion and speak of a God in his heaven, but their lives are still

dominated by the five senses in their perceptions and actions. The five senses become the arbiter of everything. When that happens all except a smear of infinity is sealed away from influence by the rigid, unyielding, reality bubbles that are the five-sense human or Phantom Self. Archon Cult methodology is to isolate consciousness within five-sense reality – the simulation – and then program that consciousness with a sense of self and the world through a deluge of life-long information designed to instil the desired perception that allows global control. Efforts to do this have increased dramatically with identity politics as identity bubbles are squeezed into the minutiae of five-sense detail which disconnect people even more profoundly from the infinite 'I'.

Five-sense focus and self-identity are like a firewall that limits access to the infinite realms. You only perceive one radio or television station and no other. We'll take that literally for a moment. Imagine a vast array of stations giving different information and angles on reality, but you only ever listen to one. Here we have the human plight in which the population is overwhelmingly confined to CultFM. This relates only to the frequency range of CultFM and limits perception and insight to that band – limits *possibility* to that band. It means you are connecting with an almost imperceptibly minuscule range of possibility and creative potential within the infinite Field. It's a world where everything seems apart from everything else and where synchronicity is rare. Synchronicity is defined in the dictionary as 'the happening by chance of two or more related or similar events at the same time'. Use of 'by chance' betrays a complete misunderstanding of reality. Synchronicity is not 'by chance'. As people open their minds, or 'awaken' to use the term, they notice more and more coincidences in their lives, bits of 'luck', apparently miraculous happenings that put them in the right place at the right time with the right people. Days become peppered with 'fancy meeting you here' and 'what are the chances of that?' My entire life has been lived like this and ever more so since my own colossal awakening in 1990 and 91 which transformed my sense of reality. Synchronicity is not 'by chance'; it is by accessing expanded

realms of possibility which allow expanded potential for manifestation. People broadcasting the same vibe from the same openness of mind tend to be drawn 'by chance' to each other through what I call frequency magnetism and it's not only people. In the last more than 30 years incredible synchronicity has also led me through the Cult maze to information in so many forms and to crucial personal experiences. These 'coincidences' have allowed me to put the puzzle pieces together across an enormous array of subjects and situations. Those who have breached the bubble of five-sense reality will know exactly what I mean and this escape from the perceptual prison cell is open to everyone whenever they make that choice. This may appear super-human when compared with the limitations of 'human', but it's really our natural state. 'Human' as currently experienced is consciousness in an unnatural state of induced separation from the infinity of the whole. I'll come to how this transformation into unity can be made when I have described in more detail the force that holds humanity in servitude by denying this access to infinite self.

The Wetiko factor

I have been talking and writing for decades about the way five-sense mind is systematically barricaded from expanded awareness. I have used the analogy of a computer (five-sense mind) and someone at the keyboard (expanded awareness). Interaction between the computer and the operator is symbolic of the interaction between five-sense mind and expanded awareness. The computer directly experiences the Internet and the operator experiences the Internet via the computer which is how it's supposed to be – the two working as one. Archons seek to control that point where the operator connects with the computer to stop that interaction (Fig 20). Now the operator is banging the keyboard and clicking the mouse, but the computer is not responding and this happens when the computer is taken over – *possessed* – by an appropriately-named computer 'virus'. The operator has lost all influence over the computer which goes its own way making decisions under the control of the 'virus'. I have

just described the dynamic through which the force known to Gnostics as Yaldabaoth and Archons disconnects five-sense mind from expanded awareness to imprison humanity in perceptual servitude.

Figure 20: The mind 'virus' I have been writing about for decades seeks to isolate five-sense mind (the computer) from the true 'I'. (Image by Neil Hague).

About a year ago I came across a Native American concept of Wetiko which describes precisely the same phenomenon. Wetiko is the spelling used by the Cree and there are other versions including wintiko and windigo used by other tribal groups. They spell the name with lower case, but I see Wetiko as a proper noun as with Archons and prefer a capital. I first saw an article about Wetiko by writer and researcher Paul Levy which so synced with what I had been writing about the computer/operator disconnection and later the Archons. I then read his book, the fascinating *Dispelling Wetiko, Breaking the Spell of Evil*. The parallels between what I had concluded long before and the Native American concept of Wetiko were so clear and obvious that it was almost funny. For Wetiko see the Gnostic Archons for sure and the Jinn, the Predators, and every other name for a force of evil, inversion and chaos. Wetiko is the Native American name for the force that divides the computer from

the operator (Fig 21). Indigenous author Jack D. Forbes, a founder of the Native American movement in the 1960s, wrote another book about Wetiko entitled *Columbus And Other Cannibals – The Wetiko Disease of Exploitation, Imperialism, and Terrorism* which I also read. Forbes says that Wetiko refers to an evil person or spirit 'who terrorizes other creatures by means of terrible acts, including cannibalism'. Zulu shaman Credo Mutwa told me that African accounts tell how cannibalism was brought into the world by the Chitauri 'gods' – another manifestation of Wetiko. The distinction between 'evil person or spirit' relates to Archons/Wetiko possessing a human or acting as pure consciousness. Wetiko is said to be a sickness of the soul or spirit and a state of being that takes but gives nothing back – the Cult and its operatives perfectly described. Black Hawk, a Native American war leader defending their lands from confiscation, said European invaders had 'poisoned hearts' – Wetiko hearts – and that this would spread to native societies. Mention of the heart is very significant as we shall shortly see. Forbes writes: 'Tragically, the history of the world for the past 2,000 years is, in great part, the story of the epidemiology of the wetiko disease.' Yes, and much longer. Forbes is correct when he says: 'The wetikos destroyed Egypt and Babylon and Athens and Rome and Tenochtitlan [capital of the Aztec empire] and perhaps now they will destroy the entire earth.' Evil, he said, is the number one export of a Wetiko culture – see its globalisation with 'Covid'. Constant war, mass murder, suffering of all kinds, child abuse, Satanism, torture and human sacrifice are all expressions of Wetiko and the Wetiko possessed. The world is Wetiko made manifest, *but it doesn't have to be*. There is a way out of this even now.

Figure 21: The mind 'virus' is known to Native Americans as 'Wetiko'. (Image by Neil Hague).

Cult of Wetiko

Wetiko is the Yaldabaoth frequency distortion that seeks to attach to human consciousness and absorb it into its own. Once this connection is made Wetiko can drive the perceptions of the target which they believe to be coming from their own mind. All the horrors of history and today from mass killers to Satanists, paedophiles like Jeffrey Epstein and other psychopaths, are the embodiment of Wetiko and express its state of being in all its grotesqueness. The Cult is Wetiko incarnate, Yaldabaoth incarnate, and it seeks to facilitate Wetiko assimilation of humanity in totality into its distortion by manipulating the population into low frequency states that match its own. Paul Levy writes: 'Holographically enforced within the psyche of every human being the wetiko virus pervades and underlies the entire field of consciousness, and can therefore potentially manifest through any one of us at any moment if we are not mindful.' The 'Covid' hoax has achieved this with many people, but others have not fallen into Wetiko's frequency lair. Players in the 'Covid' human catastrophe including Gates, Schwab, Tedros, Fauci, Whitty, Vallance, Johnson, Hancock, Ferguson, Drosten, and all the rest, including the psychopath psychologists, are expressions of Wetiko. This is why

they have no compassion or empathy and no emotional consequence for what they do that would make them stop doing it. Observe all the people who support the psychopaths in authority against the Pushbackers despite the damaging impact the psychopaths have on their own lives and their family's lives. You are again looking at Wetiko possession which prevents them seeing through the lies to the obvious scam going on. *Why can't they see it?* Wetiko won't let them see it. The perceptual divide that has now become a chasm is between the Wetikoed and the non-Wetikoed.

Paul Levy describes Wetiko in the same way that I have long described the Archontic force. They are the same distorted consciousness operating across dimensions of reality: '… the subtle body of wetiko is not located in the third dimension of space and time, literally existing in another dimension … it is able to affect ordinary lives by mysteriously interpenetrating into our three-dimensional world.' Wetiko does this through its incarnate representatives in the Cult and by weaving itself into The Field which on our level of reality is the electromagnetic information field of the simulation or Matrix. More than that, the simulation *is* Wetiko / Yaldabaoth. Caleb Scharf, Director of Astrobiology at Columbia University, has speculated that 'alien life' could be so advanced that it has transcribed itself into the quantum realm to become what we call physics. He said intelligence indistinguishable from the fabric of the Universe would solve many of its greatest mysteries:

> Perhaps hyper-advanced life isn't just external. Perhaps it's already all around. It is embedded in what we perceive to be physics itself, from the root behaviour of particles and fields to the phenomena of complexity and emergence ... In other words, life might not just be in the equations. It might BE the equations [My emphasis].

Scharf said it is possible that 'we don't recognise advanced life because it forms an integral and unsuspicious part of what we've considered to be the natural world'. I agree. Wetiko/Yaldabaoth *is* the simulation. We are literally in the body of the beast. But that doesn't mean it has to control us. We all have the power to overcome Wetiko

influence and the Cult knows that. I doubt it sleeps too well because it knows that.

Which Field?

This, I suggest, is how it all works. There are two Fields. One is the fierce electromagnetic light of the Matrix within the speed of light; the other is the 'watery light' of The Field beyond the walls of the Matrix that connects with the Great Infinity. Five-sense mind and the decoding systems of the body attach us to the Field of Matrix light. They have to or we could not experience this reality. Five-sense mind sees only the Matrix Field of information while our expanded consciousness is part of the Infinity Field. When we open our minds, and most importantly our hearts, to the Infinity Field we have a mission control which gives us an expanded perspective, a road map, to understand the nature of the five-sense world. If we are isolated only in five-sense mind there is no mission control. We're on our own trying to understand a world that's constantly feeding us information to ensure we do not understand. People in this state can feel 'lost' and bewildered with no direction or radar. You can see ever more clearly those who are influenced by the Fields of Big Infinity or little five-sense mind simply by their views and behaviour with regard to the 'Covid' hoax. We have had this division throughout known human history with the mass of the people on one side and individuals who could see and intuit beyond the walls of the simulation – Plato's prisoner who broke out of the cave and saw reality for what it is. Such people have always been targeted by Wetiko/Archon-possessed authority, burned at the stake or demonised as mad, bad and dangerous. The Cult today and its global network of 'anti-hate', 'anti-fascist' Woke groups are all expressions of Wetiko attacking those exposing the conspiracy, 'Covid' lies and the 'vaccine' agenda.

Woke as a whole is Wetiko which explains its black and white mentality and how at one it is with the Wetiko-possessed Cult. Paul Levy said: 'To be in this paradigm is to still be under the thrall of a two-valued logic – where things are either true or false – of a

wetikoized mind.' Wetiko consciousness is in a permanent rage, therefore so is Woke, and then there is Woke inversion and contradiction. 'Anti-fascists' act like fascists because fascists *and* 'anti-fascists' are both Wetiko at work. Political parties act the same while claiming to be different for the same reason. Secret society and satanic rituals are attaching initiates to Wetiko and the cold, ruthless, psychopathic mentality that secures the positions of power all over the world is Wetiko. Reframing 'training programmes' have the same cumulative effect of attaching Wetiko and we have their graduates described as automatons and robots with a cold, psychopathic, uncaring demeanour. They are all traits of Wetiko possession and look how many times they have been described in this book and elsewhere with regard to personnel behind 'Covid' including the police and medical profession. Climbing the greasy pole in any profession in a Wetiko society requires traits of Wetiko to get there and that is particularly true of politics which is not about fair competition and pre-eminence of ideas. It is founded on how many backs you can stab and arses you can lick. This culminated in the global 'Covid' coordination between the Wetiko possessed who pulled it off in all the different countries without a trace of empathy and compassion for their impact on humans. Our sight sense can see only holographic form and not the Field which connects holographic form. Therefore we perceive 'physical' objects with 'space' in between. In fact that 'space' is energy/consciousness operating on multiple frequencies. One of them is Wetiko and that connects the Cult psychopaths, those who submit to the psychopaths, and those who serve the psychopaths in the media operations of the world. Wetiko is Gates. Wetiko is the mask-wearing submissive. Wetiko is the fake journalist and 'fact-checker'. The Wetiko Field is coordinating the whole thing. Psychopaths, gofers, media operatives, 'anti-hate' hate groups, 'fact-checkers' and submissive people work as one unit *even without human coordination* because they are attached to the *same* Field which is organising it all (Fig 22). Paul Levy is here describing how Wetiko-possessed people are drawn together and refuse to let any information breach their rigid

perceptions. He was writing long before 'Covid', but I think you will recognise followers of the 'Covid' religion *oh just a little bit*:

People who are channelling the vibratory frequency of wetiko align with each other through psychic resonance to reinforce their unspoken shared agreement so as to uphold their deranged view of reality. Once an unconscious content takes possession of certain individuals, it irresistibly draws them together by mutual attraction and knits them into groups tied together by their shared madness that can easily swell into an avalanche of insanity.

A psychic epidemic is a closed system, which is to say that it is insular and not open to any new information or informing influences from the outside world which contradict its fixed, limited, and limiting perspective.

There we have the Woke mind and the 'Covid' mind. Compatible resonance draws the awakening together, too, which is clearly happening today.

Figure 22: The Wetiko Field from which the Cult pyramid and its personnel are made manifest. (Image by Neil Hague).

Spiritual servitude

Wetiko doesn't care about humans. It's not human; it just possesses humans for its own ends and the effect (depending on the scale of

possession) can be anything from extreme psychopathy to unquestioning obedience. Wetiko's worst nightmare is for human consciousness to expand beyond the simulation. Everything is focussed on stopping that happening through control of information, thus perception, thus frequency. The 'education system', media, science, medicine, academia, are all geared to maintaining humanity in five-sense servitude as is the constant stimulation of low-vibrational mental and emotional states (see 'Covid'). Wetiko seeks to dominate those subconscious spaces between five-sense perception and expanded consciousness where the computer meets the operator. From these subconscious hiding places Wetiko speaks to us to trigger urges and desires that we take to be our own and manipulate us into anything from low-vibrational to psychopathic states. Remember how Islam describes the Jinn as invisible tricksters that 'whisper' and confuse. Wetiko is the origin of the 'trickster god' theme that you find in cultures all over the world. Jinn, like the Archons, are Wetiko which is terrified of humans awakening and reconnecting with our true self for then its energy source has gone. With that the feedback loop breaks between Wetiko and human perception that provides the energetic momentum on which its very existence depends as a force of evil. Humans are both its target and its source of survival, but only if we are operating in low-vibrational states of fear, hate, depression and the background anxiety that most people suffer. We are Wetiko's target because we are its key to survival. It needs us, not the other way round. Paul Levy writes:

A vampire has no intrinsic, independent, substantial existence in its own right; it only exists in relation to us. The pathogenic, vampiric mind-parasite called wetiko is nothing in itself – not being able to exist from its own side – yet it has a 'virtual reality' such that it can potentially destroy our species …

…The fact that a vampire is not reflected by a mirror can also mean that what we need to see is that there's nothing, no-thing to see, other than ourselves. The fact that wetiko is the expression of something inside of us means that the cure for wetiko is with us as well. The critical issue is finding this cure within us and then putting it into effect.

Evil begets evil because if evil does not constantly expand and find new sources of energetic sustenance its evil, its *distortion*, dies with the assimilation into balance and harmony. Love is the garlic to Wetiko's vampire. Evil, the absence of love, cannot exist in the presence of love. I think I see a way out of here. I have emphasised so many times over the decades that the Archons/Wetiko and their Cult are not all powerful. *They are not*. I don't care how it looks even now *they are not*. I have not called them little boys in short trousers for effect. I have said it because it is true. Wetiko's insatiable desire for power over others is not a sign of its omnipotence, but its insecurity. Paul Levy writes: 'Due to the primal fear which ultimately drives it and which it is driven to cultivate, wetiko's body politic has an intrinsic and insistent need for centralising power and control so as to create imagined safety for itself.' *Yeeeeeees!* Exactly! Why does Wetiko want humans in an ongoing state of fear? Wetiko itself *is* fear and it is petrified of love. As evil is an absence of love, so love is an absence of fear. Love conquers all and *especially* Wetiko which *is* fear. Wetiko brought fear into the world when it wasn't here before. *Fear* was the 'fall', the fall into low-frequency ignorance and illusion – fear is **F**alse **E**motion **A**ppearing **R**eal. The simulation is driven and energised by fear because Wetiko/Yaldabaoth (fear) *are* the simulation. Fear is the absence of love and Wetiko is the absence of love.

Wetiko today

We can now view current events from this level of perspective. The 'Covid' hoax has generated momentous amounts of ongoing fear, anxiety, depression and despair which have empowered Wetiko. No wonder people like Gates have been the instigators when they are Wetiko incarnate and exhibit every trait of Wetiko in the extreme. See how cold and unemotional these people are like Gates and his cronies, how dead of eye they are. That's Wetiko. Sabbatians are Wetiko and everything they control including the World Health Organization, Big Pharma and the 'vaccine' makers, national 'health'

hierarchies, corporate media, Silicon Valley, the banking system, and the United Nations with its planned transformation into world government. All are controlled and possessed by the Wetiko distortion into distorting human society in its image. We are with this knowledge at the gateway to understanding the world. Divisions of race, culture, creed and sexuality are diversions to hide the real division between those possessed and influenced by Wetiko and those that are not. The 'Covid' hoax has brought both clearly into view. Human behaviour is not about race. Tyrants and dictatorships come in all colours and creeds. What unites the US president bombing the innocent and an African tribe committing genocide against another as in Rwanda? What unites them? *Wetiko*. All wars are Wetiko, all genocide is Wetiko, all hunger over centuries in a world of plenty is Wetiko. Children going to bed hungry, including in the West, is Wetiko. Cult-generated Woke racial divisions that focus on the body are designed to obscure the reality that divisions in behaviour are manifestations of mind, not body. Obsession with body identity and group judgement is a means to divert attention from the real source of behaviour – mind and perception. Conflict sown by the Woke both within themselves and with their target groups are Wetiko providing lunch for itself through still more agents of the division, chaos, and fear on which it feeds. The Cult is seeking to assimilate the entirety of humanity and all children and young people into the Wetiko frequency by manipulating them into states of fear and despair. Witness all the suicide and psychological unravelling since the spring of 2020. Wetiko psychopaths want to impose a state of unquestioning obedience to authority which is no more than a conduit for Wetiko to enforce its will and assimilate humanity into itself. It needs us to believe that resistance is futile when it fears resistance and even more so the game-changing non-cooperation with its impositions. It can use violent resistance for its benefit. Violent impositions and violent resistance are *both* Wetiko. The Power of Love with its Power of No will sweep Wetiko from our world. Wetiko and its Cult know that. They just don't want us to know.

AI Wetiko

This brings me to AI or artificial intelligence and something else Wetikos don't want us to know. What is AI *really*? I know about computer code algorithms and AI that learns from data input. These, however, are more diversions, the expeditionary force, for the real AI that they want to connect to the human brain as promoted by Silicon Valley Wetikos like Kurzweil. What is this AI? It is the frequency of *Wetiko*, the frequency of the Archons. The connection of AI to the human brain is the connection of the Wetiko frequency to create a Wetiko hive mind and complete the job of assimilation. The hive mind is planned to be controlled from Israel and China which are both 100 percent owned by Wetiko Sabbatians. The assimilation process has been going on minute by minute in the 'smart' era which fused with the 'Covid' era. We are told that social media is scrambling the minds of the young and changing their personality. This is true, but what is social media? Look more deeply at how it works, how it creates divisions and conflict, the hostility and cruelty, the targeting of people until they are destroyed. That's Wetiko. Social media is manipulated to tune people to the Wetiko frequency with all the emotional exploitation tricks employed by platforms like Facebook and its Wetiko front man, Zuckerberg. Facebook's Instagram announced a new platform for children to overcome a legal bar on them using the main site. This is more Wetiko exploitation and manipulation of kids. Amnesty International likened the plan to foxes offering to guard the henhouse and said it was incompatible with human rights. Since when did Wetiko or Zuckerberg (I repeat myself) care about that? Would Brin and Page at Google, Wojcicki at YouTube, Bezos at Amazon and whoever the hell runs Twitter act as they do if they were not channelling Wetiko? Would those who are developing technologies for no other reason than human control? How about those designing and selling technologies to kill people and Big Pharma drug and 'vaccine' producers who know they will end or devastate lives? Quite a thought for these people to consider is that if you are Wetiko in a human life you are Wetiko on the 'other side' unless your frequency

changes and that can only change by a change of perception which becomes a change of behaviour. Where Gates is going does not bear thinking about although perhaps that's exactly where he wants to go. Either way, that's where he's going. His frequency will make it so.

The frequency lair

I have been saying for a long time that a big part of the addiction to smartphones and devices is that a frequency is coming off them that entraps the mind. People spend ages on their phones and sometimes even a minute or so after they put them down they pick them up again and it all repeats. 'Covid' lockdowns will have increased this addiction a million times for obvious reasons. Addictions to alcohol overindulgence and drugs are another way that Wetiko entraps consciousness to attach to its own. Both are symptoms of low-vibrational psychological distress which alcoholism and drug addiction further compound. Do we think it's really a coincidence that access to them is made so easy while potions that can take people into realms beyond the simulation are banned and illegal? I have explored smartphone addiction in other books, the scale is mind-blowing, and that level of addiction does not come without help. Tech companies that make these phones are Wetiko and they will have no qualms about destroying the minds of children. We are seeing again with these companies the Wetiko perceptual combination of psychopathic enforcers and weak and meek unquestioning compliance by the rank and file.

The global Smart Grid is the Wetiko Grid and it is crucial to complete the Cult endgame. The simulation is radiation and we are being deluged with technological radiation on a devastating scale. Wetiko frauds like Elon Musk serve Cult interests while occasionally criticising them to maintain his street-cred. 5G and other forms of Wi-Fi are being directed at the earth from space on a volume and scale that goes on increasing by the day. Elon Musk's (officially) SpaceX Starlink project is in the process of putting tens of thousands of satellites in low orbit to cover every inch of the planet with 5G and other Wi-Fi to create Kurzweil's global 'cloud' to which the

human mind is planned to be attached very soon. SpaceX has approval to operate 12,000 satellites with more than 1,300 launched at the time of writing and applications filed for *30,000* more. Other operators in the Wi-Fi, 5G, low-orbit satellite market include OneWeb (UK), Telesat (Canada), and AST & Science (US). Musk tells us that AI could be the end of humanity and then launches a company called Neuralink to connect the human brain to computers. Musk's (in theory) Tesla company is building electric cars and the driverless vehicles of the smart control grid. As frauds and bullshitters go Elon Musk in my opinion is Major League.

5G and technological radiation in general are destructive to human health, genetics and psychology and increasing the strength of artificial radiation underpins the five-sense perceptual bubbles which are themselves expressions of radiation or electromagnetism. Freedom activist John Whitehead was so right with his 'databit by databit, we are building our own electronic concentration camps'. The Smart Grid and 5G is a means to control the human mind and infuse perceptual information into The Field to influence anyone in sync with its frequency. You can change perception and behaviour en masse if you can manipulate the population into those levels of frequency and this is happening all around us today. The arrogance of Musk and his fellow Cult operatives knows no bounds in the way that we see with Gates. Musk's satellites are so many in number already they are changing the night sky when viewed from Earth. The astronomy community has complained about this and they have seen nothing yet. Some consequences of Musk's Wetiko hubris include: Radiation; visible pollution of the night sky; interference with astronomy and meteorology; ground and water pollution from intensive use of increasingly many spaceports; accumulating space debris; continual deorbiting and burning up of aging satellites, polluting the atmosphere with toxic dust and smoke; and ever-increasing likelihood of collisions. A collective public open letter of complaint to Musk said:

> We are writing to you … because SpaceX is in process of surrounding the Earth with a network of thousands of satellites whose very purpose is to irradiate every square inch of the

Earth. SpaceX, like everyone else, is treating the radiation as if it were not there. As if the mitochondria in our cells do not depend on electrons moving undisturbed from the food we digest to the oxygen we breathe.

As if our nervous systems and our hearts are not subject to radio frequency interference like any piece of electronic equipment. As if the cancer, diabetes, and heart disease that now afflict a majority of the Earth's population are not metabolic diseases that result from interference with our cellular machinery. As if insects everywhere, and the birds and animals that eat them, are not starving to death as a result.

People like Musk and Gates believe in their limitless Wetiko arrogance that they can do whatever they like to the world because they own it. Consequences for humanity are irrelevant. It's absolutely time that we stopped taking this shit from these self-styled masters of the Earth when you consider where this is going.

Why is the Cult so anti-human?

I hear this question often: Why would they do this when it will affect them, too? Ah, but will it? Who is this *them*? Forget their bodies. They are just vehicles for Wetiko consciousness. When you break it all down to the foundations we are looking at a state of severely distorted consciousness targeting another state of consciousness for assimilation. The rest is detail. The simulation is the fly-trap in which unique sensations of the five senses create a cycle of addiction called reincarnation. Renegade Minds see that everything which happens in our reality is a smaller version of the whole picture in line with the holographic principle. Addiction to the radiation of smart technology is a smaller version of addiction to the whole simulation. Connecting the body/brain to AI is taking that addiction on a giant step further to total ongoing control by assimilating human incarnate consciousness into Wetiko. I have watched during the 'Covid' hoax how many are becoming ever more profoundly attached to Wetiko's perceptual calling cards of aggressive response to any other point of view ('There is no other god but me'), psychopathic lack of compassion and empathy, and servile submission to the narrative and will of authority. Wetiko is the psychopaths *and* subservience to psychopaths. The Cult of Wetiko is

so anti-human because it is *not* human. It embarked on a mission to destroy human by targeting everything that it means to be human and to survive as human. 'Covid' is not the end, just a means to an end. The Cult with its Wetiko consciousness is seeking to change Earth systems, including the atmosphere, to suit them, not humans. The gathering bombardment of 5G alone from ground and space is dramatically changing The Field with which the five senses interact. There is so much more to come if we sit on our hands and hope it will all go away. It is not meant to go away. It is meant to get ever more extreme and we need to face that while we still can – just.

Carbon dioxide is the gas of life. Without that human is over. Kaput, gone, history. No natural world, no human. The Cult has created a cock and bull story about carbon dioxide and climate change to justify its reduction to the point where Gates and the ignoramus Biden 'climate chief' John Kerry want to suck it out of the atmosphere. Kerry wants to do this because his master Gates does. Wetikos have made the gas of life a demon with the usual support from the Wokers of Extinction Rebellion and similar organisations and the bewildered puppet-child that is Greta Thunberg who was put on the world stage by Klaus Schwab and the World Economic Forum. The name Extinction Rebellion is both ironic and as always Wetiko inversion. The gas that we need to survive must be reduced to save us from extinction. The most basic need of human is oxygen and we now have billions walking around in face nappies depriving body and brain of this essential requirement of human existence. More than that 5G at 60 gigahertz interacts with the oxygen molecule to reduce the amount of oxygen the body can absorb into the bloodstream. The obvious knock-on consequences of that for respiratory and cognitive problems and life itself need no further explanation. Psychopaths like Musk are assembling a global system of satellites to deluge the human atmosphere with this insanity. The man should be in jail. Here we have two most basic of human needs, oxygen and carbon dioxide, being dismantled.

Two others, water and food, are getting similar treatment with the United Nations Agendas 21 and 2030 – the Great Reset – planning to

centrally control all water and food supplies. People will not even own rain water that falls on their land. Food is affected at the most basic level by reducing carbon dioxide. We have genetic modification or GMO infiltrating the food chain on a mass scale, pesticides and herbicides polluting the air and destroying the soil. Freshwater fish that provide livelihoods for 60 million people and feed hundreds of millions worldwide are being 'pushed to the brink' according the conservationists while climate change is the only focus. Now we have Gates and Schwab wanting to dispense with current food sources all together and replace them with a synthetic version which the Wetiko Cult would control in terms of production and who eats and who doesn't. We have been on the Totalitarian Tiptoe to this for more than 60 years as food has become ever more processed and full of chemical shite to the point today when it's not natural food at all. As Dr Tom Cowan says: 'If it has a label don't eat it.' Bill Gates is now the biggest owner of farmland in the United States and he does nothing without an ulterior motive involving the Cult. Klaus Schwab wrote: 'To feed the world in the next 50 years we will need to produce as much food as was produced in the last 10,000 years … food security will only be achieved, however, if regulations on genetically modified foods are adapted to reflect the reality that gene editing offers a precise, efficient and safe method of improving crops.' Liar. People and the world are being targeted with aluminium through vaccines, chemtrails, food, drink cans, and endless other sources when aluminium has been linked to many health issues including dementia which is increasing year after year. Insects, bees and wildlife essential to the food chain are being deleted by pesticides, herbicides and radiation which 5G is dramatically increasing with 6G and 7G to come. The pollinating bee population is being devastated while wildlife including birds, dolphins and whales are having their natural radar blocked by the effects of ever-increasing radiation. In the summer windscreens used to be splattered with insects so numerous were they. It doesn't happen now. Where have they gone?

Synthetic everything

The Cult is introducing genetically-modified versions of trees, plants and insects including a Gates-funded project to unleash hundreds of millions of genetically-modified, lab-altered and patented male mosquitoes to mate with wild mosquitoes and induce genetic flaws that cause them to die out. Clinically-insane Gates-funded Japanese researchers have developed mosquitos that spread vaccine and are dubbed 'flying vaccinators'. Gates is funding the modification of weather patterns in part to sell the myth that this is caused by carbon dioxide and he's funding geoengineering of the skies to change the atmosphere. Some of this came to light with the Gates-backed plan to release tonnes of chalk into the atmosphere to 'deflect the Sun and cool the planet'. Funny how they do this while the heating effect of the Sun is not factored into climate projections focussed on carbon dioxide. The reason is that they want to reduce carbon dioxide (so don't mention the Sun), but at the same time they do want to reduce the impact of the Sun which is so essential to human life and health. I have mentioned the sun-cholesterol-vitamin D connection as they demonise the Sun with warnings about skin cancer (caused by the chemicals in sun cream they tell you to splash on). They come from the other end of the process with statin drugs to reduce cholesterol that turns sunlight into vitamin D. A lack of vitamin D leads to a long list of health effects and how vitamin D levels must have fallen with people confined to their homes over 'Covid'. Gates is funding other forms of geoengineering and most importantly chemtrails which are dropping heavy metals, aluminium and self-replicating nanotechnology onto the Earth which is killing the natural world. See *Everything You Need To Know, But Have Never Been Told* for the detailed background to this.

Every human system is being targeted for deletion by a force that's not human. The Wetiko Cult has embarked on the process of transforming the human body from biological to synthetic biological as I have explained. Biological is being replaced by the artificial and synthetic – Archontic 'countermimicry' – right across human society. The plan eventually is to dispense with the human body altogether

and absorb human consciousness – which it wouldn't really be by then – into cyberspace (the simulation which is Wetiko/Yaldabaoth). Preparations for that are already happening if people would care to look. The alternative media rightly warns about globalism and 'the globalists', but this is far bigger than that and represents the end of the human race as we know it. The 'bad copy' of prime reality that Gnostics describe was a bad copy of harmony, wonder and beauty to start with before Wetiko/Yaldabaoth set out to change the simulated 'copy' into something very different. The process was slow to start with. Entrapped humans in the simulation timeline were not technologically aware and they had to be brought up to intellectual speed while being suppressed spiritually to the point where they could build their own prison while having no idea they were doing so. We have now reached that stage where technological intellect has the potential to destroy us and that's why events are moving so fast. Central American shaman Don Juan Matus said:

> Think for a moment, and tell me how you would explain the contradictions between the intelligence of man the engineer and the stupidity of his systems of belief, or the stupidity of his contradictory behaviour. Sorcerers believe that the predators have given us our systems of beliefs, our ideas of good and evil; our social mores. They are the ones who set up our dreams of success or failure. They have given us covetousness, greed, and cowardice. It is the predator who makes us complacent, routinary, and egomaniacal.
>
> In order to keep us obedient and meek and weak, the predators engaged themselves in a stupendous manoeuvre – stupendous, of course, from the point of view of a fighting strategist; a horrendous manoeuvre from the point of those who suffer it. They gave us their mind. The predators' mind is baroque, contradictory, morose, filled with the fear of being discovered any minute now.

For 'predators' see Wetiko, Archons, Yaldabaoth, Jinn, and all the other versions of the same phenomenon in cultures and religions all over the world. The theme is always the same because it's true and it's real. We have reached the point where we have to deal with it. The question is – how?

Don't fight – walk away

I thought I'd use a controversial subheading to get things moving in terms of our response to global fascism. What do you mean 'don't fight'? What do you mean 'walk away'? We've got to fight. We can't walk away. Well, it depends what we mean by fight and walk away. If fighting means physical combat we are playing Wetiko's game and falling for its trap. It wants us to get angry, aggressive, and direct hate and hostility at the enemy we think we must fight. Every war, every battle, every conflict, has been fought with Wetiko leading both sides. It's what it does. Wetiko wants a fight, anywhere, any place. Just hit me, son, so I can hit you back. Wetiko hits Wetiko and Wetiko hits Wetiko in return. I am very forthright as you can see in exposing Wetikos of the Cult, but I don't hate them. I refuse to hate them. It's what they want. What you hate you become. What you *fight* you become. Wokers, 'anti-haters' and 'anti-fascists' prove this every time they reach for their keyboards or don their balaclavas. By walk away I mean to disengage from Wetiko which includes ceasing to cooperate with its tyranny. Paul Levy says of Wetiko:

> The way to 'defeat' evil is not to try to destroy it (for then, in playing evil's game, we have already lost), but rather, to find the invulnerable place within ourselves where evil is unable to vanquish us – this is to truly 'win' our battle with evil.

Wetiko is everywhere in human society and it's been on steroids since the 'Covid' hoax. Every shouting match over wearing masks has Wetiko wearing a mask and Wetiko not wearing one. It's an electrical circuit of push and resist, push and resist, with Wetiko pushing *and* resisting. Each polarity is Wetiko empowering itself. Dictionary definitions of 'resist' include 'opposing, refusing to accept or comply with' and the word to focus on is 'opposing'. What form does this take – setting police cars alight or 'refusing to accept or comply with'? The former is Wetiko opposing Wetiko while the other points the way forward. This is the difference between those aggressively demanding that government fascism must be obeyed who stand in stark contrast to the great majority of Pushbackers. We saw this clearly with a march by thousands of Pushbackers against lockdown in London followed days later by a Woker-hijacked

protest in Bristol in which police cars were set on fire. Masks were virtually absent in London and widespread in Bristol. Wetiko wants lockdown on every level of society and infuses its aggression to police it through its unknowing stooges. Lockdown protesters are the ones with the smiling faces and the hugs, The two blatantly obvious states of being – getting more obvious by the day – are the result of Wokers and their like becoming ever more influenced by the simulation Field of Wetiko and Pushbackers ever more influenced by The Field of a far higher vibration beyond the simulation. Wetiko can't invade the heart which is where most lockdown opponents are coming from. It's the heart that allows them to see through the lies to the truth in ways I will be highlighting.

Renegade Minds know that calmness is the place from which wisdom comes. You won't find wisdom in a hissing fit and wisdom is what we need in abundance right now. Calmness is not weakness – you don't have to scream at the top of your voice to be strong. Calmness is indeed a sign of strength. 'No' means I'm not doing it. *NOOOO!!!* doesn't mean you're not doing it even more. Volume does not advance 'No – I'm not doing it'. You are just not doing it. Wetiko possessed and influenced don't know how to deal with that. Wetiko wants a fight and we should not give it one. What it needs more than anything is our *cooperation* and we should not give that either. Mass rallies and marches are great in that they are a visual representation of feeling, but if it ends there they are irrelevant. You demand that Wetikos act differently? Well, they're not going to are they? They are Wetikos. We don't need to waste our time demanding that something doesn't happen when that will make no difference. We need to delete the means that *allows* it to happen. This, invariably, is our cooperation. You can demand a child stop firing a peashooter at the dog or you can refuse to buy the peashooter. If you provide the means you are cooperating with the dog being smacked on the nose with a pea. How can the authorities enforce mask-wearing if millions in a country refuse? What if the 74 million Pushbackers that voted for Trump in 2020 refused to wear masks, close their businesses or stay in their homes. It would be unenforceable. The

few control the many through the compliance of the many and that's always been the dynamic be it 'Covid' regulations or the Roman Empire. I know people can find it intimidating to say no to authority or stand out in a crowd for being the only one with a face on display; but it has to be done or it's over. I hope I've made clear in this book that where this is going will be far more intimidating than standing up now and saying 'No' – I will not cooperate with my own enslavement and that of my children. There might be consequences for some initially, although not so if enough do the same. The question that must be addressed is what is going to happen if we don't? It is time to be strong and unyieldingly so. No means no. Not here and there, but *everywhere* and *always*. I have refused to wear a mask and obey all the other nonsense. I will not comply with tyranny. I repeat: Fascism is not imposed by fascists – there are never enough of them. Fascism is imposed by the population acquiescing to fascism. *I will not do it*. I will die first, or my body will. Living meekly under fascism is a form of death anyway, the death of the spirit that Martin Luther King described.

Making things happen

We must not despair. This is not over till it's over and it's far from that. The 'fat lady' must refuse to sing. The longer the 'Covid' hoax has dragged on and impacted on more lives we have seen an awakening of phenomenal numbers of people worldwide to the realisation that what they have believed all their lives is not how the world really is. Research published by the system-serving University of Bristol and King's College London in February, 2021, concluded: 'One in every 11 people in Britain say they trust David Icke's take on the coronavirus pandemic.' It will be more by now and we have gathering numbers to build on. We must urgently progress from seeing the scam to ceasing to cooperate with it. Prominent German lawyer Reiner Fuellmich, also licenced to practice law in America, is doing a magnificent job taking the legal route to bring the psychopaths to justice through a second Nuremberg tribunal for crimes against humanity. Fuellmich has an impressive record of

beating the elite in court and he formed the German Corona Investigative Committee to pursue civil charges against the main perpetrators with a view to triggering criminal charges. Most importantly he has grasped the foundation of the hoax – the PCR test not testing for the 'virus' – and Christian Drosten is therefore on his charge sheet along with Gates frontman Tedros at the World Health Organization. Major players must be not be allowed to inflict their horrors on the human race without being brought to book. A life sentence must follow for Bill Gates and the rest of them. A group of researchers has also indicted the government of Norway for crimes against humanity with copies sent to the police and the International Criminal Court. The lawsuit cites participation in an internationally-planned false pandemic and violation of international law and human rights, the European Commission's definition of human rights by coercive rules, Nuremberg and Hague rules on fundamental human rights, and the Norwegian constitution. We must take the initiative from hereon and not just complain, protest and react.

There are practical ways to support vital mass non-cooperation. Organising in numbers is one. Lockdown marches in London in the spring in 2021 were mass non-cooperation that the authorities could not stop. There were too many people. Hundreds of thousands walked the London streets in the centre of the road for mile after mile while the Face-Nappies could only look on. They were determined, but calm, and just *did it* with no histrionics and lots of smiles. The police were impotent. Others are organising group shopping without masks for mutual support and imagine if that was happening all over. Policing it would be impossible. If the store refuses to serve people in these circumstances they would be faced with a long line of trolleys full of goods standing on their own and everything would have to be returned to the shelves. How would they cope with that if it kept happening? I am talking here about moving on from complaining to being pro-active; from watching things happen to making things happen. I include in this our relationship with the police. The behaviour of many Face-Nappies

has been disgraceful and anyone who thinks they would never find concentration camp guards in the 'enlightened' modern era have had that myth busted big-time. The period and setting may change – Wetikos never do. I watched film footage from a London march in which a police thug viciously kicked a protestor on the floor who had done nothing. His fellow Face-Nappies stood in a ring protecting him. What he did was a criminal assault and with a crowd far outnumbering the police this can no longer be allowed to happen unchallenged. I get it when people chant 'shame on you' in these circumstances, but that is no longer enough. They *have* no shame those who do this. Crowds needs to start making a citizen's arrest of the police who commit criminal offences and brutally attack innocent people and defenceless women. A citizen's arrest can be made under section 24A of the UK Police and Criminal Evidence (PACE) Act of 1984 and you will find something similar in other countries. I prefer to call it a Common Law arrest rather than citizen's for reasons I will come to shortly. Anyone can arrest a person committing an indictable offence or if they have reasonable grounds to suspect they are committing an indictable offence. On both counts the attack by the police thug would have fallen into this category. A citizen's arrest can be made to stop someone:

- Causing physical injury to himself or any other person
- Suffering physical injury
- Causing loss of or damage to property
- Making off before a constable can assume responsibility for him

A citizen's arrest may also be made to prevent a breach of the peace under Common Law and if they believe a breach of the peace will happen or anything related to harm likely to be done or already done in their presence. This is the way to go I think – the Common Law version. If police know that the crowd and members of the public will no longer be standing and watching while they commit

their thuggery and crimes they will think twice about acting like Brownshirts and Blackshirts.

Common Law – common sense

Mention of Common Law is very important. Most people think the law is the law as in one law. This is not the case. There are two bodies of law, Common Law and Statute Law, and they are not the same. Common Law is founded on the simple premise of do no harm. It does not recognise victimless crimes in which no harm is done while Statute Law does. There is a Statute Law against almost everything. So what is Statute Law? Amazingly it's the law of the *sea* that was brought ashore by the Cult to override the law of the land which is Common Law. They had no right to do this and as always they did it anyway. They had to. They could not impose their will on the people through Common Law which only applies to do no harm. How could you stitch up the fine detail of people's lives with that? Instead they took the law of the sea, or Admiralty Law, and applied it to the population. Statute Law refers to all the laws spewing out of governments and their agencies including all the fascist laws and regulations relating to 'Covid'. The key point to make is that Statute Law is *contract law*. It only applies between *contracting* corporations. Most police officers don't even know this. They have to be kept in the dark, too. Long ago when merchants and their sailing ships began to trade with different countries a contractual law was developed called Admiralty Law and other names. Again it only applied to *contracts* agreed between *corporate* entities. If there is no agreed contract the law of the sea had no jurisdiction *and that still applies to its new alias of Statute Law*. The problem for the Cult when the law of the sea was brought ashore was an obvious one. People were not corporations and neither were government entities. To overcome the latter they made governments and all associated organisations corporations. All the institutions are *private corporations* and I mean governments and their agencies, local councils, police, courts, military, US states, the whole lot. Go to the

Dun and Bradstreet corporate listings website for confirmation that they are all corporations. You are arrested by a private corporation called the police by someone who is really a private security guard and they take you to court which is another private corporation. Neither have jurisdiction over you unless you consent and *contract* with them. This is why you hear the mantra about law enforcement policing by *consent* of the people. In truth the people 'consent' only in theory through monumental trickery.

Okay, the Cult overcame the corporate law problem by making governments and institutions corporate entities; but what about people? They are not corporations are they? Ah ... well in a sense, and *only* a sense, they are. Not people exactly – the illusion of people. The Cult creates a corporation in the name of everyone at the time that their birth certificate is issued. Note birth/ *berth* certificate and when you go to court under the law of the sea on land you stand in a *dock*. These are throwbacks to the origin. My Common Law name is David Vaughan Icke. The name of the corporation created by the government when I was born is called Mr David Vaughan Icke usually written in capitals as MR DAVID VAUGHAN ICKE. That is not me, the living, breathing man. It is a fictitious corporate entity. The trick is to make you think that David Vaughan Icke and MR DAVID VAUGHAN ICKE are the same thing. *They are not*. When police charge you and take you to court they are prosecuting the corporate entity and not the living, breathing, man or woman. They have to trick you into identifying as the corporate entity and contracting with them. Otherwise they have no jurisdiction. They do this through a language known as legalese. Lawful and legal are not the same either. Lawful relates to Common Law and legal relates to Statute Law. Legalese is the language of Statue Law which uses terms that mean one thing to the public and another in legalese. Notice that when a police officer tells someone why they are being charged he or she will say at the end: 'Do you understand?' To the public that means 'Do you comprehend?' In legalese it means 'Do you stand under me?' Do you stand under my authority? If you say

yes to the question you are unknowingly agreeing to give them jurisdiction over you in a contract between two corporate entities.

This is a confidence trick in every way. Contracts have to be agreed between informed parties and if you don't know that David Vaughan Icke is agreeing to be the corporation MR DAVID VAUGHAN ICKE you cannot knowingly agree to contract. They are deceiving you and another way they do this is to ask for proof of identity. You usually show them a driving licence or other document on which your corporate name is written. In doing so you are accepting that you are that corporate entity when you are not. Referring to yourself as a 'person' or 'citizen' is also identifying with your corporate fiction which is why I made the Common Law point about the citizen's arrest. If you are approached by a police officer you identify yourself immediately as a living, breathing, man or woman and say 'I do not consent, I do not contract with you and I do not understand' or stand under their authority. I have a Common Law birth certificate as a living man and these are available at no charge from commonlawcourt.com. Businesses registered under the Statute Law system means that its laws apply. There are, however, ways to run a business under Common Law. Remember all 'Covid' laws and regulations are Statute Law – the law of *contracts* and you do not have to contract. This doesn't mean that you can kill someone and get away with it. Common Law says do no harm and that applies to physical harm, financial harm etc. Police are employees of private corporations and there needs to be a new system of non-corporate Common Law constables operating outside the Statute Law system. If you go to davidicke.com and put Common Law into the search engine you will find videos that explain Common Law in much greater detail. It is definitely a road we should walk.

With all my heart

I have heard people say that we are in a spiritual war. I don't like the term 'war' with its Wetiko dynamic, but I know what they mean. Sweep aside all the bodily forms and we are in a situation in which two states of consciousness are seeking very different realities.

Wetiko wants upheaval, chaos, fear, suffering, conflict and control. The other wants love, peace, harmony, fairness and freedom. That's where we are. We should not fall for the idea that Wetiko is all-powerful and there's nothing we can do. Wetiko is not all-powerful. It's a joke, pathetic. It doesn't have to be, but it has made that choice for now. A handful of times over the years when I have felt the presence of its frequency I have allowed it to attach briefly so I could consciously observe its nature. The experience is not pleasant, the energy is heavy and dark, but the ease with which you can kick it back out the door shows that its real power is in persuading us that it has power. It's all a con. Wetiko is a con. It's a trickster and not a power that can control us if we unleash our own. The con is founded on manipulating humanity to give its power to Wetiko which recycles it back to present the illusion that it has power when its power is *ours* that we gave away. This happens on an energetic level and plays out in the world of the seen as humanity giving its power to Wetiko authority which uses that power to control the population when the power is only the power the population has handed over. How could it be any other way for billions to be controlled by a relative few? I have had experiences with people possessed by Wetiko and again you can kick its arse if you do it with an open heart. Oh yes – the *heart* which can transform the world of perceived 'matter'.

We are receiver-transmitters and processors of information, but what information and where from? Information is processed into perception in three main areas – the brain, the heart and the belly. These relate to thinking, knowing, and emotion. Wetiko wants us to be head and belly people which means we think within the confines of the Matrix simulation and low-vibrational emotional reaction scrambles balance and perception. A few minutes on social media and you see how emotion is the dominant force. Woke is all emotion and is therefore thought-free and fact-free. Our heart is something different. It *knows* while the head *thinks* and has to try to work it out because it doesn't know. The human energy field has seven prime vortexes which connect us with wider reality (Fig 23). Chakra means

'wheels of light' in the Sanskrit language of ancient India. The main ones are: The crown chakra on top of the head; brow (or 'third eye') chakra in the centre of the forehead; throat chakra; heart chakra in the centre of the chest; solar plexus chakra below the sternum; sacral chakra beneath the navel; and base chakra at the bottom of the spine. Each one has a particular function or functions. We feel anxiety and nervousness in the belly where the sacral chakra is located and this processes emotion that can affect the colon to give people 'the shits' or make them 'shit scared' when they are nervous. Chakras all play an important role, but the Mr and Mrs Big is the heart chakra which sits at the centre of the seven, above the chakras that connect us to the 'physical' and below those that connect with higher realms (or at least should). Here in the heart chakra we feel love, empathy and compassion – 'My heart goes out to you'. Those with closed hearts become literally 'heart-less' in their attitudes and behaviour (see Bill Gates). Native Americans portrayed Wetiko with what Paul Levy calls a 'frigid, icy heart, devoid of mercy' (see Bill Gates).

Figure 23: The chakra system which interpenetrates the human energy field. The heart chakra is the governor – or should be.

Wetiko trembles at the thought of heart energy which it cannot infiltrate. The frequency is too high. What it seeks to do instead is close the heart chakra vortex to block its perceptual and energetic influence. Psychopaths have 'hearts of stone' and emotionally-damaged people have 'heartache' and 'broken hearts'. The astonishing amount of heart disease is related to heart chakra

disruption with its fundamental connection to the 'physical' heart. Dr Tom Cowan has written an outstanding book challenging the belief that the heart is a pump and making the connection between the 'physical' and spiritual heart. Rudolph Steiner who was way ahead of his time said the same about the fallacy that the heart is a pump. *What*? The heart is not a pump? That's crazy, right? Everybody knows that. Read Cowan's *Human Heart, Cosmic Heart* and you will realise that the very idea of the heart as a pump is ridiculous when you see the evidence. How does blood in the feet so far from the heart get pumped horizontally up the body by the heart?? Cowan explains in the book the real reason why blood moves as it does. Our 'physical' heart is used to symbolise love when the source is really the heart vortex or spiritual heart which is our most powerful energetic connection to 'out there' expanded consciousness. That's why we feel *knowing* – intuitive knowing – in the centre of the chest. Knowing doesn't come from a process of thoughts leading to a conclusion. It is there in an instant all in one go. Our heart knows because of its connection to levels of awareness that *do* know. This is the meaning and source of intuition – intuitive *knowing*.

For the last more than 30 years of uncovering the global game and the nature of reality my heart has been my constant antenna for truth and accuracy. An American intelligence insider once said that I had quoted a disinformer in one of my books and yet I had only quoted the part that was true. He asked: 'How do you do that?' By using my heart antenna was the answer and anyone can do it. Heart-centred is how we are meant to be. With a closed heart chakra we withdraw into a closed mind and the bubble of five-sense reality. If you take a moment to focus your attention on the centre of your chest, picture a spinning wheel of light and see it opening and expanding. You will feel it happening, too, and perceptions of the heart like joy and love as the heart impacts on the mind as they interact. The more the chakra opens the more you will feel expressions of heart consciousness and as the process continues, and becomes part of you, insights and knowings will follow. An open

heart is connected to that level of awareness that knows all is *One*. You will see from its perspective that the fault-lines that divide us are only illusions to control us. An open heart does not process the illusions of race, creed and sexuality except as brief experiences for a consciousness that is all. Our heart does not see division, only unity (Figs 24 and 25). There's something else, too. Our hearts love to laugh. Mark Twain's quote that says 'The human race has one really effective weapon, and that is laughter' is really a reference to the heart which loves to laugh with the joy of knowing the true nature of infinite reality and that all the madness of human society is an illusion of the mind. Twain also said: 'Against the assault of laughter nothing can stand.' This is so true of Wetiko and the Cult. Their insecurity demands that they be taken seriously and their power and authority acknowledged and feared. We should do nothing of the sort. We should not get aggressive or fearful which their insecurity so desires. We should laugh in their face. Even in their no-face as police come over in their face-nappies and expect to be taken seriously. They don't take themselves seriously looking like that so why should we? Laugh in the face of intimidation. Laugh in the face of tyranny. You will see by its reaction that you have pressed all of its buttons. Wetiko does not know what to do in the face of laughter or when its targets refuse to concede their joy to fear. We have seen many examples during the 'Covid' hoax when people have expressed their energetic power and the string puppets of Wetiko retreat with their tail limp between their knees. Laugh – the world is bloody mad after all and if it's a choice between laughter and tears I know which way I'm going.

Figure 24: Head consciousness without the heart sees division and everything apart from everything else.

Figure 25: Heart consciousness sees everything as One.

'Vaccines' and the soul

The foundation of Wetiko/Archon control of humans is the separation of incarnate five-sense mind from the infinite 'I' and closing the heart chakra where the True 'I' lives during a human life. The goal has been to achieve complete separation in both cases. I was interested therefore to read an account by a French energetic healer of what she said she experienced with a patient who had been given the 'Covid' vaccine. Genuine energy healers can sense information and consciousness fields at different levels of being which are referred to as 'subtle bodies'. She described treating the patient who later returned after having, without the healer's knowledge, two doses of the 'Covid vaccine'. The healer said:

I noticed immediately the change, very heavy energy emanating from [the] subtle bodies. The scariest thing was when I was working on the heart chakra, I connected with her soul: it was detached from the physical body, it had no contact and it was, as if it was floating in a state of total confusion: a damage to the consciousness that loses contact with the physical body, i.e. with our biological machine, there is no longer any communication between them.

I continued the treatment by sending light to the heart chakra, the soul of the person, but it seemed that the soul could no longer receive any light, frequency or energy. It was a very powerful experience for me. Then I understood that this substance is indeed used to detach consciousness so that this consciousness can no longer interact through this body that it possesses in life, where there is no longer any contact, no frequency, no light, no more energetic balance or mind.

This would create a human that is rudderless and at the extreme almost zombie-like operating with a fractional state of consciousness at the mercy of Wetiko. I was especially intrigued by what the healer said in the light of the prediction by the highly-informed Rudolf Steiner more than a hundred years ago. He said:

In the future, we will eliminate the soul with medicine. Under the pretext of a 'healthy point of view', there will be a vaccine by which the human body will be treated as soon as possible directly at birth, so that the human being cannot develop the thought of the existence of soul and Spirit. To materialistic doctors will be entrusted the task of removing the soul of humanity.

As today, people are vaccinated against this disease or that disease, so in the future, children will be vaccinated with a substance that can be produced precisely in such a way that people, thanks to this vaccination, will be immune to being subjected to the 'madness' of spiritual life. He would be extremely smart, but he would not develop a conscience, and that is the true goal of some materialistic circles.

Steiner said the vaccine would detach the physical body from the etheric body (subtle bodies) and 'once the etheric body is detached the relationship between the universe and the etheric body would become extremely unstable, and man would become an automaton'. He said 'the physical body of man must be polished on this Earth by spiritual will – so the vaccine becomes a kind of arymanique (Wetiko) force' and 'man can no longer get rid of a given materialistic feeling'. Humans would then, he said, become 'materialistic of constitution and can no longer rise to the spiritual'. I have been writing for years about DNA being a receiver-transmitter of information that connects us to other levels of reality and these 'vaccines' changing DNA can be likened to changing an antenna and what it can transmit and receive. Such a disconnection would clearly lead to changes in personality and perception. Steiner further predicted the arrival of AI. Big Pharma 'Covid vaccine' makers, expressions of Wetiko, are testing their DNA-manipulating evil on children as I write with a view to giving the 'vaccine' to babies. If it's a soul-body disconnector – and I say that it is or can be – every child would be disconnected from 'soul' at birth and the 'vaccine' would create a closed system in which spiritual guidance from the greater self would play no part. This has been the ambition of Wetiko all

along. A Pentagon video from 2005 was leaked of a presentation explaining the development of vaccines to change behaviour by their effect on the brain. Those that believe this is not happening with the 'Covid' genetically-modifying procedure masquerading as a 'vaccine' should make an urgent appointment with Naivety Anonymous. Klaus Schwab wrote in 2018:

> Neurotechnologies enable us to better influence consciousness and thought and to understand many activities of the brain. They include decoding what we are thinking in fine levels of detail through new chemicals and interventions that can influence our brains to correct for errors or enhance functionality.

The plan is clear and only the heart can stop it. With every heart that opens, every mind that awakens, Wetiko is weakened. Heart and love are far more powerful than head and hate and so nothing like a majority is needed to turn this around.

Beyond the Phantom

Our heart is the prime target of Wetiko and so it must be the answer to Wetiko. We *are* our heart which is part of one heart, the infinite heart. Our heart is where the true self lives in a human life behind firewalls of five-sense illusion when an imposter takes its place – *Phantom Self*; but our heart waits patiently to be set free any time we choose to see beyond the Phantom, beyond Wetiko. A Wetikoed Phantom Self can wreak mass death and destruction while the love of forever is locked away in its heart. The time is here to unleash its power and let it sweep away the fear and despair that is Wetiko. Heart consciousness does not seek manipulated, censored, advantage for its belief or religion, its activism and desires. As an expression of the One it treats all as One with the same rights to freedom and opinion. Our heart demands fairness for itself no more than for others. From this unity of heart we can come together in mutual support and transform this Wetikoed world into what reality is meant to be – a place of love, joy, happiness, fairness, justice and freedom. Wetiko has another agenda and that's why the world is as

it is, but enough of this nonsense. Wetiko can't stay where hearts are open and it works so hard to keep them closed. Fear is its currency and its food source and love in its true sense has no fear. Why would love have fear when it knows it is *All That Is, Has Been, And Ever Can Be* on an eternal exploration of all possibility? Love in this true sense is not the physical attraction that passes for love. This can be an expression of it, yes, but Infinite Love, a love without condition, goes far deeper to the core of all being. It *is* the core of all being. Infinite realty was born from love beyond the illusions of the simulation. Love infinitely expressed is the knowing that all is One and the swiftly-passing experience of separation is a temporary hallucination. You cannot disconnect from Oneness; you can only *perceive* that you have and withdraw from its influence. This is the most important of all perception trickery by the mind parasite that is Wetiko and the foundation of all its potential for manipulation.

If we open our hearts, open the sluice gates of the mind, and redefine self-identity amazing things start to happen. Consciousness expands or contracts in accordance with self-identity. When true self is recognised as infinite awareness and label self – Phantom Self – is seen as only a series of brief experiences life is transformed. Consciousness expands to the extent that self-identity expands and everything changes. You see unity, not division, the picture, not the pixels. From this we can play the long game. No more is an experience something in and of itself, but a fleeting moment in the eternity of forever. Suddenly people in uniform and dark suits are no longer intimidating. Doing what your heart knows to be right is no longer intimidating and consequences for those actions take on the same nature of a brief experience that passes in the blink of an infinite eye. Intimidation is all in the mind. Beyond the mind there is no intimidation.

An open heart does not consider consequences for what it knows to be right. To do so would be to consider not doing what it knows to be right and for a heart in its power that is never an option. The Renegade Mind is really the Renegade Heart. Consideration of consequences will always provide a getaway car for the mind and

the heart doesn't want one. What is right in the light of what we face today is to stop cooperating with Wetiko in all its forms and to do it without fear or compromise. You cannot compromise with tyranny when tyranny always demands more until it has everything. Life is your perception and you are your destiny. Change your perception and you change your life. Change collective perception and we change the world.

Come on people … One human family, One heart, One goal … *FREEEEEEDOM*!

We must settle for nothing less.

Postscript

The big scare story as the book goes to press is the 'Indian' variant and the world is being deluged with propaganda about the 'Covid catastrophe' in India which mirrors in its lies and misrepresentations what happened in Italy before the first lockdown in 2020.

The *New York Post* published a picture of someone who had 'collapsed in the street from Covid' in India in April, 2021, which was actually taken during a gas leak in May, 2020. Same old, same old. Media articles in mid-February were asking why India had been so untouched by 'Covid' and then as their vaccine rollout gathered pace the alleged 'cases' began to rapidly increase. Indian 'Covid vaccine' maker Bharat Biotech was funded into existence by the Bill and Melinda Gates Foundation (the pair announced their divorce in May, 2021, which is a pity because they so deserve each other). The Indian 'Covid crisis' was ramped up by the media to terrify the world and prepare people for submission to still more restrictions. The scam that worked the first time was being repeated only with far more people seeing through the deceit. Davidicke.com and Ickonic.com have sought to tell the true story of what is happening by talking to people living through the Indian nightmare which has nothing to do with 'Covid'. We posted a letter from 'Alisha' in Pune who told a very different story to government and media mendacity. She said scenes of dying people and overwhelmed hospitals were designed to hide what was really happening – genocide and starvation. Alisha said that millions had already died of starvation during the ongoing lockdowns while government and media were lying and making it look like the 'virus':

Restaurants, shops, gyms, theatres, basically everything is shut. The cities are ghost towns. Even so-called 'essential' businesses are only open till 11am in the morning. You basically have just an hour to buy food and then your time is up.

Inter-state travel and even inter-district travel is banned. The cops wait at all major crossroads to question why you are traveling outdoors or to fine you if you are not wearing a mask.

The medical community here is also complicit in genocide, lying about hospitals being full and turning away people with genuine illnesses, who need immediate care. They have even created a shortage of oxygen cylinders.

This is the classic Cult modus operandi played out in every country. Alisha said that people who would not have a PCR test not testing for the 'virus' were being denied hospital treatment. She said the people hit hardest were migrant workers and those in rural areas. Most businesses employed migrant workers and with everything closed there were no jobs, no income and no food. As a result millions were dying of starvation or malnutrition. All this was happening under Prime Minister Narendra Modi, a 100-percent asset of the Cult, and it emphasises yet again the scale of pure anti-human evil we are dealing with. Australia banned its people from returning home from India with penalties for trying to do so of up to five years in jail and a fine of £37,000. The manufactured 'Covid' crisis in India was being prepared to justify further fascism in the West. Obvious connections could be seen between the Indian 'vaccine' programme and increased 'cases' and this became a common theme. The Seychelles, the most per capita 'Covid vaccinated' population in the world, went back into lockdown after a 'surge of cases'.

Long ago the truly evil Monsanto agricultural biotechnology corporation with its big connections to Bill Gates devastated Indian farming with genetically-modified crops. Human rights activist Gurcharan Singh highlighted the efforts by the Indian government to complete the job by destroying the food supply to hundreds of millions with 'Covid' lockdowns. He said that 415 million people at the bottom of the disgusting caste system (still going whatever they say) were below the poverty line and struggled to feed themselves every year. Now the government was imposing lockdown at just the

time to destroy the harvest. This deliberate policy was leading to mass starvation. People may reel back at the suggestion that a government would do that, but Wetiko-controlled 'leaders' are capable of any level of evil. In fact what is described in India is in the process of being instigated worldwide. The food chain and food supply are being targeted at every level to cause world hunger and thus control. Bill Gates is not the biggest owner of farmland in America for no reason and destroying access to food aids both the depopulation agenda and the plan for synthetic 'food' already being funded into existence by Gates. Add to this the coming hyper-inflation from the suicidal creation of fake 'money' in response to 'Covid' and the breakdown of container shipping systems and you have a cocktail that can only lead one way and is meant to. The Cult plan is to crash the entire system to 'build back better' with the Great Reset.

'Vaccine' transmission

Reports from all over the world continue to emerge of women suffering menstrual and fertility problems after having the fake 'vaccine' and of the non-'vaccinated' having similar problems when interacting with the 'vaccinated'. There are far too many for 'coincidence' to be credible. We've had menopausal women getting periods, others having periods stop or not stopping for weeks, passing clots, sometimes the lining of the uterus, breast irregularities, and miscarriages (which increased by 400 percent in parts of the United States). Non-'vaccinated' men and children have suffered blood clots and nose bleeding after interaction with the 'vaccinated'. Babies have died from the effects of breast milk from a 'vaccinated' mother. Awake doctors – the small minority – speculated on the cause of non-'vaccinated' suffering the same effects as the 'vaccinated'. Was it nanotechnology in the synthetic substance transmitting frequencies or was it a straight chemical bioweapon that was being transmitted between people? I am not saying that some kind of chemical transmission is not one possible answer, but the foundation of all that the Cult does is frequency and

this is fertile ground for understanding how transmission can happen. American doctor Carrie Madej, an internal medicine physician and osteopath, has been practicing for the last 20 years, teaching medical students, and she says attending different meetings where the agenda for humanity was discussed. Madej, who operates out of Georgia, did not dismiss other possible forms of transmission, but she focused on frequency in search of an explanation for transmission. She said the Moderna and Pfizer 'vaccines' contained nano-lipid particles as a key component. This was a brand new technology never before used on humanity. 'They're using a nanotechnology which is pretty much little tiny computer bits … nanobots or hydrogel.' Inside the 'vaccines' was 'this sci-fi kind of substance' which suppressed immune checkpoints to get into the cell. I referred to this earlier as the 'Trojan horse' technique that tricks the cell into opening a gateway for the self-replicating synthetic material and while the immune system is artificially suppressed the body has no defences. Madej said the substance served many purposes including an on-demand ability to 'deliver the payload' and using the nano 'computer bits' as biosensors in the body. 'It actually has the ability to accumulate data from your body, like your breathing, your respiration, thoughts, emotions, all kinds of things.'

She said the technology obviously has the ability to operate through Wi-Fi and transmit and receive energy, messages, frequencies or impulses. 'Just imagine you're getting this new substance in you and it can react to things all around you, the 5G, your smart device, your phones.' We had something completely foreign in the human body that had never been launched large scale at a time when we were seeing 5G going into schools and hospitals (plus the Musk satellites) and she believed the 'vaccine' transmission had something to do with this: '… if these people have this inside of them … it can act like an antenna and actually transmit it outwardly as well.' The synthetic substance produced its own voltage and so it could have that kind of effect. This fits with my own contention that the nano receiver-transmitters are designed to connect people to the

Smart Grid and break the receiver-transmitter connection to expanded consciousness. That would explain the French energy healer's experience of the disconnection of body from 'soul' with those who have had the 'vaccine'. The nanobots, self-replicating inside the body, would also transmit the synthetic frequency which could be picked up through close interaction by those who have not been 'vaccinated'. Madej speculated that perhaps it was 5G and increased levels of other radiation that was causing the symptoms directly although interestingly she said that non-'vaccinated' patients had shown improvement when they were away from the 'vaccinated' person they had interacted with. It must be remembered that you can control frequency and energy with your mind and you can consciously create energetic barriers or bubbles with the mind to stop damaging frequencies from penetrating your field. American paediatrician Dr Larry Palevsky said the 'vaccine' was not a 'vaccine' and was never designed to protect from a 'viral' infection. He called it 'a massive, brilliant propaganda of genocide' because they didn't have to inject everyone to get the result they wanted. He said the content of the jabs was able to infuse any material into the brain, heart, lungs, kidneys, liver, sperm and female productive system. 'This is genocide; this is a weapon of mass destruction.' At the same time American colleges were banning students from attending if they didn't have this life-changing and potentially life-ending 'vaccine'. Class action lawsuits must follow when the consequences of this college fascism come to light. As the book was going to press came reports about fertility effects on sperm in 'vaccinated' men which would absolutely fit with what I have been saying and hospitals continued to fill with 'vaccine' reactions. Another question is what about transmission via blood transfusions? The NHS has extended blood donation restrictions from seven days after a 'Covid vaccination' to 28 days after even a sore arm reaction.

I said in the spring of 2020 that the then touted 'Covid vaccine' would be ongoing each year like the flu jab. A year later Pfizer CEO, the appalling Albert Bourla, said people would 'likely' need a 'booster dose' of the 'vaccine' within 12 months of getting 'fully

vaccinated' and then a yearly shot. 'Variants will play a key role', he said confirming the point. Johnson & Johnson CEO Alex Gorsky also took time out from his 'vaccine' disaster to say that people may need to be vaccinated against 'Covid-19' each year. UK Health Secretary, the psychopath Matt Hancock, said additional 'boosters' would be available in the autumn of 2021. This is the trap of the 'vaccine passport'. The public will have to accept every last 'vaccine' they introduce, including for the fake 'variants', or it would cease to be valid. The only other way in some cases would be continuous testing with a test not testing for the 'virus' and what is on the swabs constantly pushed up your noise towards the brain every time?

'Vaccines' changing behaviour

I mentioned in the body of the book how I believed we would see gathering behaviour changes in the 'vaccinated' and I am already hearing such comments from the non-'vaccinated' describing behaviour changes in friends, loved ones and work colleagues. This will only increase as the self-replicating synthetic material and nanoparticles expand in body and brain. An article in the *Guardian* in 2016 detailed research at the University of Virginia in Charlottesville which developed a new method for controlling brain circuits associated with complex animal behaviour. The method, dubbed 'magnetogenetics', involves genetically-engineering a protein called ferritin, which stores and releases iron, to create a magnetised substance – 'Magneto' – that can activate specific groups of nerve cells from a distance. This is claimed to be an advance on other methods of brain activity manipulation known as optogenetics and chemogenetics (the Cult has been developing methods of brain control for a long time). The ferritin technique is said to be non-invasive and able to activate neurons 'rapidly and reversibly'. In other words, human thought and perception. The article said that earlier studies revealed how nerve cell proteins 'activated by heat and mechanical pressure can be genetically engineered so that they become sensitive to radio waves and magnetic fields, by attaching them to an iron-storing protein called ferritin, or to inorganic

paramagnetic particles'. Sensitive to radio waves and magnetic fields? You mean like 5G, 6G and 7G? This is the human-AI Smart Grid hive mind we are talking about. The *Guardian* article said:

> … the researchers injected Magneto into the striatum of freely behaving mice, a deep brain structure containing dopamine-producing neurons that are involved in reward and motivation, and then placed the animals into an apparatus split into magnetised and non-magnetised sections.
>
> Mice expressing Magneto spent far more time in the magnetised areas than mice that did not, because activation of the protein caused the striatal neurons expressing it to release dopamine, so that the mice found being in those areas rewarding. This shows that Magneto can remotely control the firing of neurons deep within the brain, and also control complex behaviours.

Make no mistake this basic methodology will be part of the 'Covid vaccine' cocktail and using magnetics to change brain function through electromagnetic field frequency activation. The Pentagon is developing a 'Covid vaccine' using ferritin. Magnetics would explain changes in behaviour and why videos are appearing across the Internet as I write showing how magnets stick to the skin at the point of the 'vaccine' shot. Once people take these 'vaccines' anything becomes possible in terms of brain function and illness which will be blamed on 'Covid-19' and 'variants'. Magnetic field manipulation would further explain why the non-'vaccinated' are reporting the same symptoms as the 'vaccinated' they interact with and why those symptoms are reported to decrease when not in their company. Interestingly 'Magneto', a 'mutant', is a character in the Marvel Comic *X-Men* stories with the ability to manipulate magnetic fields and he believes that mutants should fight back against their human oppressors by any means necessary. The character was born Erik Lehnsherr to a Jewish family in Germany.

Cult-controlled courts

The European Court of Human Rights opened the door for mandatory 'Covid-19 vaccines' across the continent when it ruled in a Czech Republic dispute over childhood immunisation that legally

enforced vaccination could be 'necessary in a democratic society'. The 17 judges decided that compulsory vaccinations did not breach human rights law. On the face of it the judgement was so inverted you gasp for air. If not having a vaccine infused into your body is not a human right then what is? Ah, but they said human rights law which has been specifically written to delete all human rights at the behest of the state (the Cult). Article 8 of the European Convention on Human Rights relates to the right to a private life. The crucial word here is *'except'*:

> There shall be no interference by a public authority with the exercise of this right EXCEPT such as is in accordance with the law and is necessary in a democratic society in the interests of national security, public safety or the economic wellbeing of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others [My emphasis].

No interference *except* in accordance with the law means there *are* no 'human rights' *except* what EU governments decide you can have at their behest. 'As is necessary in a democratic society' explains that reference in the judgement and 'in the interests of national security, public safety or the economic well-being of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others' gives the EU a coach and horses to ride through 'human rights' and scatter them in all directions. The judiciary is not a check and balance on government extremism; it is a vehicle to enforce it. This judgement was almost laughably predictable when the last thing the Cult wanted was a decision that went against mandatory vaccination. Judges rule over and over again to benefit the system of which they are a part. Vaccination disputes that come before them are invariably delivered in favour of doctors and authorities representing the view of the state which owns the judiciary. Oh, yes, and we have even had calls to stop putting 'Covid-19' on death certificates within 28 days of a 'positive test' because it is claimed the practice makes the 'vaccine' appear not to work. They are laughing at you.

The scale of madness, inhumanity and things to come was highlighted when those not 'vaccinated' for 'Covid' were refused evacuation from the Caribbean island of St Vincent during massive volcanic eruptions. Cruise ships taking residents to the safety of another island allowed only the 'vaccinated' to board and the rest were left to their fate. Even in life and death situations like this we see 'Covid' stripping people of their most basic human instincts and the insanity is even more extreme when you think that fake 'vaccine'-makers are not even claiming their body-manipulating concoctions stop 'infection' and 'transmission' of a 'virus' that doesn't exist. St Vincent Prime Minister Ralph Gonsalves said: 'The chief medical officer will be identifying the persons already vaccinated so that we can get them on the ship.' Note again the power of the chief medical officer who, like Whitty in the UK, will be answering to the World Health Organization. This is the Cult network structure that has overridden politicians who 'follow the science' which means doing what WHO-controlled 'medical officers' and 'science advisers' tell them. Gonsalves even said that residents who were 'vaccinated' after the order so they could board the ships would still be refused entry due to possible side effects such as 'wooziness in the head'. The good news is that if they were woozy enough in the head they could qualify to be prime minister of St Vincent.

Microchipping freedom

The European judgement will be used at some point to justify moves to enforce the 'Covid' DNA-manipulating procedure. Sandra Ro, CEO of the Global Blockchain Business Council, told a World Economic Forum event that she hoped 'vaccine passports' would help to 'drive forced consent and standardisation' of global digital identity schemes: 'I'm hoping with the desire and global demand for some sort of vaccine passport – so that people can get travelling and working again – [it] will drive forced consent, standardisation, and frankly, cooperation across the world.' The lady is either not very bright, or thoroughly mendacious, to use the term 'forced consent'.

You do not 'consent' if you are forced – you *submit*. She was describing what the plan has been all along and that's to enforce a digital identity on every human without which they could not function. 'Vaccine passports' are opening the door and are far from the end goal. A digital identity would allow you to be tracked in everything you do in cyberspace and this is the same technique used by Cult-owned China to enforce its social credit system of total control. The ultimate 'passport' is planned to be a microchip as my books have warned for nearly 30 years. Those nice people at the Pentagon working for the Cult-controlled Defense Advanced Research Projects Agency (DARPA) claimed in April, 2021, they have developed a microchip inserted under the skin to detect 'asymptomatic Covid-19 infection' before it becomes an outbreak and a 'revolutionary filter' that can remove the 'virus' from the blood when attached to a dialysis machine. The only problems with this are that the 'virus' does not exist and people transmitting the 'virus' with no symptoms is brain-numbing bullshit. This is, of course, not a ruse to get people to be microchipped for very different reasons. DARPA also said it was producing a one-stop 'vaccine' for the 'virus' and all 'variants'. One of the most sinister organisations on Planet Earth is doing this? Better have it then. These people are insane because Wetiko that possesses them is insane.

Researchers from the Salk Institute in California announced they have created an embryo that is part human and part monkey. My books going back to the 1990s have exposed experiments in top secret underground facilities in the United States where humans are being crossed with animal and non-human 'extraterrestrial' species. They are now easing that long-developed capability into the public arena and there is much more to come given we are dealing with psychiatric basket cases. Talking of which – Elon Musk's scientists at Neuralink trained a monkey to play Pong and other puzzles on a computer screen using a joystick and when the monkey made the correct move a metal tube squirted banana smoothie into his mouth which is the basic technique for training humans into unquestioning compliance. Two Neuralink chips were in the monkey's skull and

more than 2,000 wires 'fanned out' into its brain. Eventually the monkey played a video game purely with its brain waves. Psychopathic narcissist Musk said the 'breakthrough' was a step towards putting Neuralink chips into human skulls and merging minds with artificial intelligence. *Exactly*. This man is so dark and Cult to his DNA.

World Economic Fascism (WEF)

The World Economic Forum is telling you the plan by the statements made at its many and various events. Cult-owned fascist YouTube CEO Susan Wojcicki spoke at the 2021 WEF Global Technology Governance Summit (see the name) in which 40 governments and 150 companies met to ensure 'the responsible design and deployment of emerging technologies'. Orwellian translation: 'Ensuring the design and deployment of long-planned technologies will advance the Cult agenda for control and censorship.' Freedom-destroyer and Nuremberg-bound Wojcicki expressed support for tech platforms like hers to censor content that is 'technically legal but could be harmful'. Who decides what is 'harmful'? She does and they do. 'Harmful' will be whatever the Cult doesn't want people to see and we have legislation proposed by the UK government that would censor content on the basis of 'harm' no matter if the information is fair, legal and provably true. Make that *especially* if it is fair, legal and provably true. Wojcicki called for a global coalition to be formed to enforce content moderation standards through automated censorship. This is a woman and mega-censor so self-deluded that she shamelessly accepted a 'free expression' award – *Wojcicki* – in an event sponsored by her own *YouTube*. They have no shame and no self-awareness.

You know that 'Covid' is a scam and Wojcicki a Cult operative when YouTube is censoring medical and scientific opinion purely on the grounds of whether it supports or opposes the Cult 'Covid' narrative. Florida governor Ron DeSantis compiled an expert panel with four professors of medicine from Harvard, Oxford, and Stanford Universities who spoke against forcing children and

vaccinated people to wear masks. They also said there was no proof that lockdowns reduced spread or death rates of 'Covid-19'. Cult-gofer Wojcicki and her YouTube deleted the panel video 'because it included content that contradicts the consensus of local and global health authorities regarding the efficacy of masks to prevent the spread of Covid-19'. This 'consensus' refers to what the Cult tells the World Health Organization to say and the WHO tells 'local health authorities' to do. Wojcicki knows this, of course. The panellists pointed out that censorship of scientific debate was responsible for deaths from many causes, but Wojcicki couldn't care less. She would not dare go against what she is told and as a disgrace to humanity she wouldn't want to anyway. The UK government is seeking to pass a fascist 'Online Safety Bill' to specifically target with massive fines and other means non-censored video and social media platforms to make them censor 'lawful but harmful' content like the Cult-owned Facebook, Twitter, Google and YouTube. What is 'lawful but harmful' would be decided by the fascist Blair-created Ofcom.

Another WEF obsession is a cyber-attack on the financial system and this is clearly what the Cult has planned to take down the bank accounts of everyone – except theirs. Those that think they have enough money for the Cult agenda not to matter to them have got a big lesson coming if they continue to ignore what is staring them in the face. The World Economic Forum, funded by Gates and fronted by Klaus Schwab, announced it would be running a 'simulation' with the Russian government and global banks of just such an attack called Cyber Polygon 2021. What they simulate – as with the 'Covid' Event 201 – they plan to instigate. The WEF is involved in a project with the Cult-owned Carnegie Endowment for International Peace called the WEF-Carnegie Cyber Policy Initiative which seeks to merge Wall Street banks, 'regulators' (I love it) and intelligence agencies to 'prevent' (arrange and allow) a cyber-attack that would bring down the global financial system as long planned by those that control the WEF and the Carnegie operation. The Carnegie Endowment for International Peace sent an instruction to First World

War US President Woodrow Wilson not to let the war end before society had been irreversibly transformed.

The Wuhan lab diversion

As I close, the Cult-controlled authorities and lapdog media are systematically pushing 'the virus was released from the Wuhan lab' narrative. There are two versions – it happened by accident and it happened on purpose. Both are nonsense. The perceived existence of the never-shown-to-exist 'virus' is vital to sell the impression that there is actually an infective agent to deal with and to allow the endless potential for terrifying the population with 'variants' of a 'virus' that does not exist. The authorities at the time of writing are going with the 'by accident' while the alternative media is promoting the 'on purpose'. Cable news host Tucker Carlson who has questioned aspects of lockdown and 'vaccine' compulsion has bought the Wuhan lab story. 'Everyone now agrees' he said. Well, I don't and many others don't and the question is *why* does the system and its media suddenly 'agree'? When the media moves as one unit with a narrative it is always a lie – witness the hour by hour mendacity of the 'Covid' era. Why would this Cult-owned combination which has unleashed lies like machine gun fire suddenly 'agree' to tell the truth??

Much of the alternative media is buying the lie because it fits the conspiracy narrative, but it's the *wrong* conspiracy. The real conspiracy is that *there is no virus* and that is what the Cult is desperate to hide. The idea that the 'virus' was released by accident is ludicrous when the whole 'Covid' hoax was clearly long-planned and waiting to be played out as it was so fast in accordance with the Rockefeller document and Event 201. So they prepared everything in detail over decades and then sat around strumming their fingers waiting for an 'accidental' release from a bio-lab? *What??* It's crazy. Then there's the 'on purpose' claim. You want to circulate a 'deadly virus' and hide the fact that you've done so and you release it down the street from the highest-level bio-lab in China? I repeat – *What??*

You would release it far from that lab to stop any association being made. But, no, we'll do it in a place where the connection was certain to be made. Why would you need to scam 'cases' and 'deaths' and pay hospitals to diagnose 'Covid-19' if you had a real 'virus'? What are sections of the alternative media doing believing this crap? Where were all the mass deaths in Wuhan from a 'deadly pathogen' when the recovery to normal life after the initial propaganda was dramatic in speed? Why isn't the 'deadly pathogen' now circulating all over China with bodies in the street? Once again we have the technique of tell them what they want to hear and they will likely believe it. The alternative media has its 'conspiracy' and with Carlson it fits with his 'China is the danger' narrative over years. China *is* a danger as a global Cult operations centre, but not for this reason. The Wuhan lab story also has the potential to instigate conflict with China when at some stage the plan is to trigger a Problem-Reaction-Solution confrontation with the West. Question everything – *everything* – and especially when the media agrees on a common party line.

Third wave ... fourth wave ... fifth wave ...

As the book went into production the world was being set up for more lockdowns and a 'third wave' supported by invented 'variants' that were increasing all the time and will continue to do so in public statements and computer programs, but not in reality. India became the new Italy in the 'Covid' propaganda campaign and we were told to be frightened of the new 'Indian strain'. Somehow I couldn't find it within myself to do so. A document produced for the UK government entitled 'Summary of further modelling of easing of restrictions – Roadmap Step 2' declared that a third wave was inevitable (of course when it's in the script) and it would be the fault of children and those who refuse the health-destroying fake 'Covid vaccine'. One of the computer models involved came from the Cult-owned *Imperial College* and the other from Warwick University which I wouldn't trust to tell me the date in a calendar factory. The document states that both models presumed extremely high uptake

of the 'Covid vaccines' and didn't allow for 'variants'. The document states: 'The resurgence is a result of some people (mostly children) being ineligible for vaccination; others choosing not to receive the vaccine; and others being vaccinated but not perfectly protected.' The mendacity takes the breath away. Okay, blame those with a brain who won't take the DNA-modifying shots and put more pressure on children to have it as 'trials' were underway involving children as young as six months with parents who give insanity a bad name. Massive pressure is being put on the young to have the fake 'vaccine' and child age consent limits have been systematically lowered around the world to stop parents intervening. Most extraordinary about the document was its claim that the 'third wave' would be driven by 'the resurgence in both hospitalisations and deaths … dominated by *those that have received two doses of the vaccine*, comprising around 60-70% of the wave respectively'. The predicted peak of the 'third wave' suggested 300 deaths per day with 250 of them *fully 'vaccinated' people*. How many more lies do acquiescers need to be told before they see the obvious? Those who took the jab to 'protect themselves' are projected to be those who mostly get sick and die? So what's in the 'vaccine'? The document went on:

> It is possible that a summer of low prevalence could be followed by substantial increases in incidence over the following autumn and winter. Low prevalence in late summer should not be taken as an indication that SARS-CoV-2 has retreated or that the population has high enough levels of immunity to prevent another wave.

They are telling you the script and while many British people believed 'Covid' restrictions would end in the summer of 2021 the government was preparing for them to be ongoing. Authorities were awarding contracts for 'Covid marshals' to police the restrictions with contracts starting in July, 2021, and going through to January 31st, 2022, and the government was advertising for 'Media Buying Services' to secure media propaganda slots worth a potential £320 million for 'Covid-19 campaigns' with a contract not ending until March, 2022. The recipient – via a list of other front companies – was reported to be American media marketing giant Omnicom Group

Inc. While money is no object for 'Covid' the UK waiting list for all other treatment – including life-threatening conditions – passed 4.5 million. Meantime the Cult is seeking to control all official 'inquiries' to block revelations about what has really been happening and why. It must not be allowed to – we need Nuremberg jury trials in every country. The cover-up doesn't get more obvious than appointing ultra-Zionist professor Philip Zelikow to oversee two dozen US virologists, public health officials, clinicians, former government officials and four American 'charitable foundations' to 'learn the lessons' of the 'Covid' debacle. The personnel will be those that created and perpetuated the 'Covid' lies while Zelikow is the former executive director of the 9/11 Commission who ensured that the truth about those attacks never came out and produced a report that must be among the most mendacious and manipulative documents ever written – see *The Trigger* for the detailed exposure of the almost unimaginable 9/11 story in which Sabbatians can be found at every level.

Passive no more

People are increasingly challenging the authorities with amazing numbers of people taking to the streets in London well beyond the ability of the Face-Nappies to stop them. Instead the Nappies choose situations away from the mass crowds to target, intimidate, and seek to promote the impression of 'violent protestors'. One such incident happened in London's Hyde Park. Hundreds of thousands walking through the streets in protest against 'Covid' fascism were ignored by the Cult-owned BBC and most of the rest of the mainstream media, but they delighted in reporting how police were injured in 'clashes with protestors'. The truth was that a group of people gathered in Hyde Park at the end of one march when most had gone home and they were peacefully having a good time with music and chat. Face-Nappies who couldn't deal with the full-march crowd then waded in with their batons and got more than they bargained for. Instead of just standing for this criminal brutality the crowd used their numerical superiority to push the Face-Nappies out of the

park. Eventually the Nappies turned and ran. Unfortunately two or three idiots in the crowd threw drink cans striking two officers which gave the media and the government the image they wanted to discredit the 99.9999 percent who were peaceful. The idiots walked straight into the trap and we must always be aware of potential agent provocateurs used by the authorities to discredit their targets.

This response from the crowd – the can people apart – must be a turning point when the public no longer stand by while the innocent are arrested and brutally attacked by the Face-Nappies. That doesn't mean to be violent, that's the last thing we need. We'll leave the violence to the Face-Nappies and government. But it does mean that when the Face-Nappies use violence against peaceful people the numerical superiority is employed to stop them and make citizen's arrests or Common Law arrests for a breach of the peace. The time for being passive in the face of fascism is over.

We are the many, they are the few, and we need to make that count before there is no freedom left and our children and grandchildren face an ongoing fascist nightmare.

COME ON PEOPLE – IT'S TIME.

One final thought …

The power of love
A force from above
Cleaning my soul
Flame on burn desire
Love with tongues of fire
Purge the soul
Make love your goal

I'll protect you from the hooded claw
Keep the vampires from your door
When the chips are down I'll be around
With my undying, death-defying
Love for you

Envy will hurt itself
Let yourself be beautiful
Sparkling love, flowers
And pearls and pretty girls
Love is like an energy
Rushin' rushin' inside of me

This time we go sublime
Lovers entwine, divine, divine,
Love is danger, love is pleasure
Love is pure – the only treasure

I'm so in love with you
Purge the soul
Make love your goal

The power of love
A force from above
Cleaning my soul
The power of love
A force from above
A sky-scraping dove

Flame on burn desire
Love with tongues of fire
Purge the soul
Make love your goal

Frankie Goes To Hollywood

APPENDIX

Cowan-Kaufman-Morell Statement on Virus Isolation (SOVI)

Isolation: The action of isolating; the fact or condition of being isolated or standing alone; separation from other things or persons; solitariness
Oxford English Dictionary

The controversy over whether the SARS-CoV-2 virus has ever been isolated or purified continues. However, using the above definition, common sense, the laws of logic and the dictates of science, any unbiased person must come to the conclusion that the SARS-CoV-2 virus has never been isolated or purified. As a result, no confirmation of the virus' existence can be found. The logical, common sense, and scientific consequences of this fact are:

- the structure and composition of something not shown to exist can't be known, including the presence, structure, and function of any hypothetical spike or other proteins;
- the genetic sequence of something that has never been found can't be known;
- "variants" of something that hasn't been shown to exist can't be known;
- it's impossible to demonstrate that SARS-CoV-2 causes a disease called Covid-19.

In as concise terms as possible, here's the proper way to isolate, characterize and demonstrate a new virus. First, one takes samples (blood, sputum, secretions) from many people (e.g. 500) with symptoms which are unique and specific enough to characterize an illness. Without mixing these samples with ANY tissue or products that also contain genetic material, the virologist macerates, filters and ultracentrifuges i.e. *purifies* the specimen. This common virology technique, done for decades to isolate bacteriophages[1] and so-called giant viruses in every virology lab, then allows the virologist to demonstrate with electron microscopy thousands of identically sized and shaped particles. These particles are the isolated and purified virus.

These identical particles are then checked for uniformity by physical and/or microscopic techniques. Once the purity is determined, the particles may be further characterized. This would include examining the structure, morphology, and chemical composition of the particles. Next, their genetic makeup is characterized by extracting the genetic material directly from the purified particles and using genetic-sequencing techniques, such as Sanger sequencing, that have also been around for decades. Then one does an analysis to confirm that these uniform particles are exogenous (outside) in origin as a virus is conceptualized to be, and not the normal breakdown products of dead and dying tissues.[2] (As of May 2020, we know that virologists have no way to determine whether the particles they're seeing are viruses or just normal breakdown products of dead and dying tissues.)[3]

3 "The Role of Extraellular Vesicles as Allies of HIV, HCV and SARS Viruses," Flavia Giannessi, et al, Viruses, 2020 May

If we have come this far then we have fully isolated, characterized, and genetically sequenced an exogenous virus particle. However, we still have to show it is causally related to a disease. This is carried out by exposing a group of healthy subjects (animals are usually used) to this isolated, purified virus in the manner in which the disease is thought to be transmitted. If the animals get sick with the same disease, as confirmed by clinical and autopsy findings, one has now shown that the virus actually causes a disease. This demonstrates infectivity and transmission of an infectious agent.

None of these steps has even been attempted with the SARS-CoV-2 virus, nor have all these steps been successfully performed for any so-called pathogenic virus. Our research indicates that a single study showing these steps does not exist in the medical literature.

Instead, since 1954, virologists have taken unpurified samples from a relatively few people, often less than ten, with a similar disease. They then minimally process this sample and inoculate this unpurified sample onto tissue culture containing usually four to six other types of material – all of which contain identical genetic material as to what is called a "virus." The tissue culture is starved and poisoned and naturally disintegrates into many types of particles, some of which contain genetic material. Against all common sense, logic, use of the English language and scientific integrity, this process is called "virus isolation." This brew containing fragments of genetic material from many sources is then subjected to genetic analysis, which then creates in a computer-simulation process the alleged sequence of the alleged virus, a so called in silico genome. At no time is an actual virus confirmed by electron microscopy. At no time is a genome extracted and sequenced from an actual virus. This is scientific fraud.

The observation that the unpurified specimen — inoculated onto tissue culture along with toxic antibiotics, bovine fetal tissue, amniotic fluid and other tissues — destroys the kidney tissue onto which it is inoculated is given as evidence of the virus' existence and pathogenicity. This is scientific fraud.

From now on, when anyone gives you a paper that suggests the SARS-CoV-2 virus has been isolated, please check the methods sections. If the researchers used Vero cells or any other culture method, you know that their process was not isolation. You will hear the following excuses for why actual isolation isn't done:

1. There were not enough virus particles found in samples from patients to analyze.

2. Viruses are intracellular parasites; they can't be found outside the cell in this manner.

If No. 1 is correct, and we can't find the virus in the sputum of sick people, then on what evidence do we think the virus is dangerous or even lethal? If No. 2 is correct, then how is the virus spread from person to person? We are told it emerges from the cell to infect others. Then why isn't it possible to find it?

Finally, questioning these virology techniques and conclusions is not some distraction or divisive issue. Shining the light on this truth is essential to stop this terrible fraud that humanity is confronting. For, as we now know, if the virus has never been isolated, sequenced or shown to cause illness, if the virus is imaginary, then why are we wearing masks, social distancing and putting the whole world into prison?

Finally, if pathogenic viruses don't exist, then what is going into those injectable devices erroneously called "vaccines," and what is their purpose? This scientific question is the most urgent and relevant one of our time.

We are correct. The SARS-CoV2 virus does not exist.

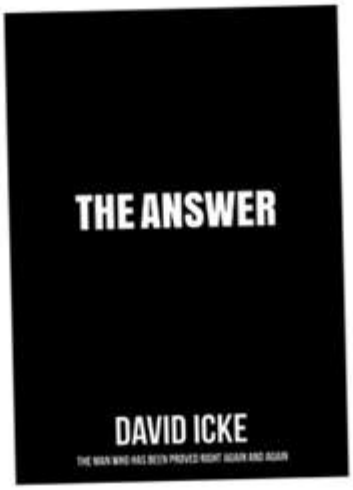
ICKONIC
THE ALTERNATIVE

Ickonic is something that has been a dream of mine for the last 5 years, growing up around alternative information I have always had a natural interest in what is going on in the World and what could I do to make it better.
Across the range of subjects and positions of influence occupied mainly by people who don't strive to make things better it's the Media that I have always found the most frustrating and fascinating. Mainly because if the Media did their Jobs properly then so much of the negative things happening in the World simply would not be able to happen, because they would be exposed within a heartbeat.
Free Press and the Opportunities that the internet could have given would mean that the Media are able to expose things like never before and hold people to account for their actions. As we all know there are 'Untouchables' that walk among us, people the Media simply won't touch, expose or investigate and that leads to the dark underworlds that infest the establishment the World over.
Well I say enough, it's time for something different, a different kind of Media, where no one is off limits from exposing and investigating. All we're interested in at Ickonic is the truth of what is really going on in the World on whichever subject we're covering.
We hope you enjoy what we have created and take something away from the platform, we aim to deliver information that's informative and most importantly self-empowering, you're not a little person, you're part of something much bigger than that and its time we as a collective race began to understand that and look to the future as ours to take.



It's time...

Jaymie Icke - Founder Ickonic Alternative Media.

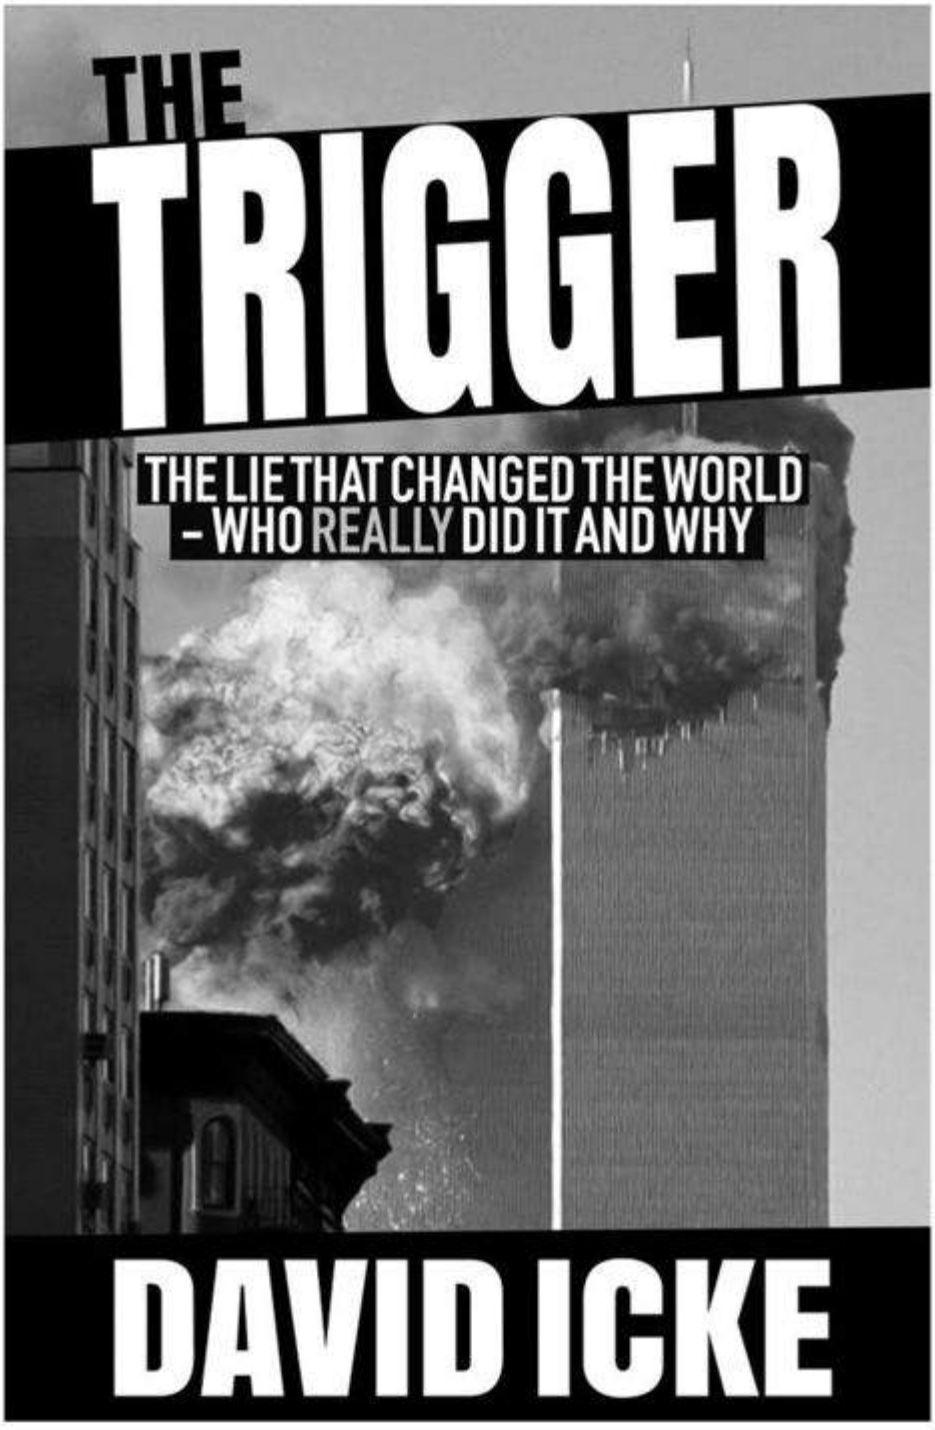
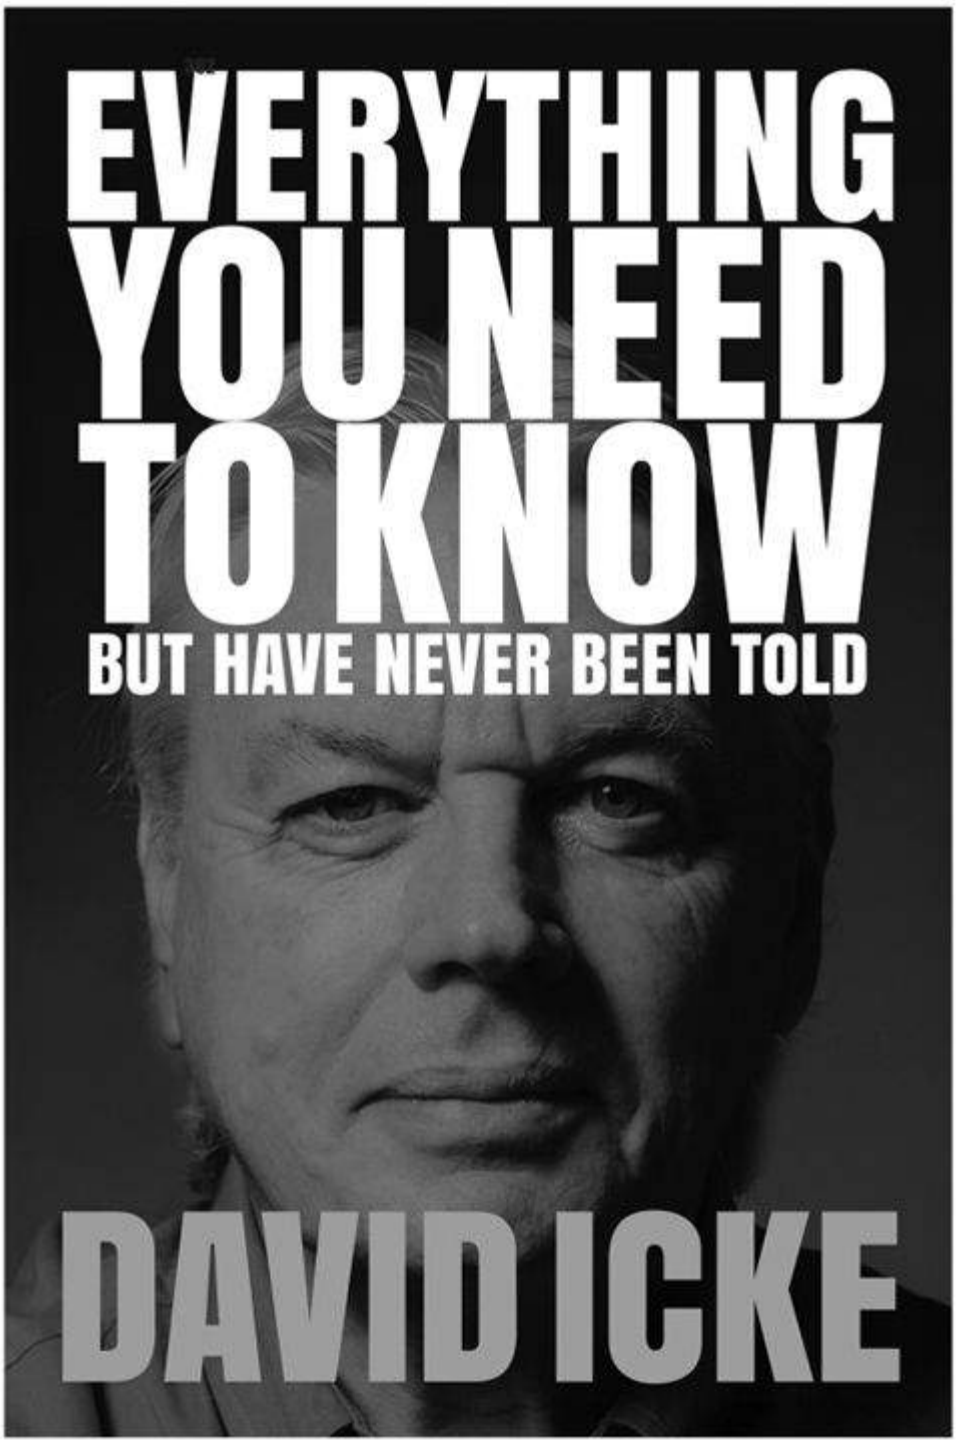
DAVID ICKE



THE ANSWER



We live in extraordinary times with billions bewildered and seeking answers for what is happening. David Icke, the man who has been proved right again and again, has spent 30 years uncovering the truth behind world affairs and in a stream of previous books he predicted current events.

The Answer will change your every perception of life and the world and set you free of the illusions that control human society. There is nothing more vital for our collective freedom than humanity becoming aware of what is in this book.
